

LEGO compatible Brick Bracket for DC Gearbox "TT" Motor

PRODUCT ID: 3815

Who doesn't love LEGO and compatible bricks? Nobody! Except when we accidentally step on them. There are soooo many mechanical things one can make with those ubiquitous bricks, plates, gears, pulleys. Say a 13-meter high LEGO London Tower Bridge...

But what do you do when you want to add LEGO-compatible bricks and parts to your robotics project? This is the bracket you need! Just push onto the body of your DC Gearbox "TT" motor, secure with screws, and it's ready to adapt to the standard LEGO-compatible parts. So easy, we think this will enable many creative endeavors.

Please note: We didn't design this bracket and we're mystified as to why they have bumps on both sides rather than having bumps/holes so it can work better with bricks. That said, this is what we've found and its low cost so perhaps it's still of some use!

Comes with:

- 2 x M3 nuts
- 2 x M3 screws ~20mm
- 2 x M3 screws ~8mm

Does not include the DC Gearbox "TT" Motor (we do sell 'em in the shop though)
