## General Description

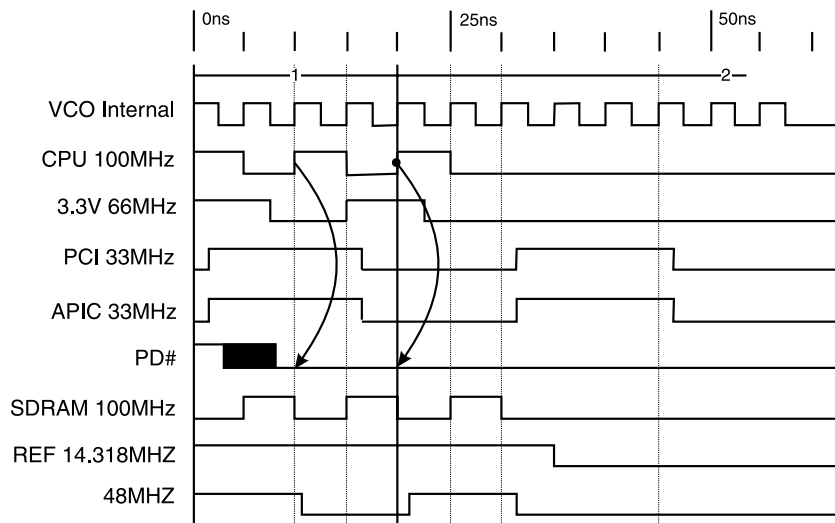

The **ICS9250-28** is part of a two chip clock solution for 810/810E and 815 type chipset. Combined with the ICS9112-17, the **ICS9250-28** provides all necessary clock signals for such a system.

Spread spectrum may be enabled through I<sup>2</sup>C programming. Spread spectrum typically reduces EMI by 8dB to 10 dB. This simplifies EMI qualification without resorting to board design iterations or costly shielding. The ICS9250-28 employs a proprietary closed loop design, which tightly controls the percentage of spreading over process and temperature variations.

**Note 1:** For system operation, the BSEL lines of the CPU will program FS0, FS2 for the appropriate CPU speed, always with SDRAM = 100MHz. After BIOS verifies the SDRAM is PC133 speed, then bit 0 can be written from the default 0 to 1 to change the SDRAM output frequency from 100MHz to 133MHz. This will only change if the CPU is at the 133MHz FSB speed as shown in this table. The CPU, 3V66, PCI, and IOAPIC clocks will be glitch free during this transition, and only SDRAM will change.

## General I<sup>2</sup>C serial interface information

The information in this section assumes familiarity with I<sup>2</sup>C programming.  
For more information, contact ICS for an I<sup>2</sup>C programming application note.

### How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D2<sub>(H)</sub>
- ICS clock will **acknowledge**
- Controller (host) sends a dummy command code
- ICS clock will **acknowledge**
- Controller (host) sends a dummy byte count
- ICS clock will **acknowledge**
- Controller (host) starts sending first byte (Byte 0) through byte 5
- ICS clock will **acknowledge** each byte *one at a time*.
- Controller (host) sends a Stop bit

How to Write:	
Controller (Host)	ICS (Slave/Receiver)

### How to Read:

- Controller (host) will send start bit.

- ICS clock will **acknowledge**
- ICS clock will send the **byte count**
- Controller (host) acknowledges
- ICS clock sends first byte (**Byte 0**) through **byte 5**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

How to Read:

### Notes:

1. The ICS clock generator is a slave/receiver, I<sup>2</sup>C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol.**
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I<sup>2</sup>C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.

### General Layout Precautions:

- 1) Use a ground plane on the top routing layer of the PCB in all areas not used by traces.
- 2) Make all power traces and ground traces as wide as the via pad for lower inductance.

### Notes:

- ① All clock outputs should have provisions for a 15pF capacitor between the clock output and series terminating resistor. Not shown in all places to improve readability of diagram.
- ② Optional crystal load capacitors are recommended. They should be included in the layout but not inserted unless needed.

### Component Values:

C1 : Crystal load values determined by user

C2 : 22 $\mu$ F/20V/D case/Tantalum

C3 : 15pF capacitor

All unmarked capacitors are 0.01 $\mu$ F ceramic
