### Notes on Electrical Characteristics:

<sup>1</sup>Guaranteed by design and characterization, not 100% tested in production.

<sup>2</sup>Slew rate measured through V<sub>swing</sub> centered around differential zero

<sup>3</sup>V<sub>xabs</sub> is defined as the voltage where CLK = CLK#

<sup>4</sup>Only applies to the differential rising edge (CLK rising and CLK# falling)

<sup>5</sup>Defined as the total variation of all crossing voltages of CLK rising and CLK# falling. Matching applies to rising edge rate of CLK and falling edge of CLK#. It is measured using a +/-75mV window centered on the average cross point where CLK meets CLK#. The average cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations

<sup>6</sup>All Long Term Accuracy and Clock Period specifications are guaranteed assuming that REFOUT is at 14.31818MHz

<sup>7</sup>Operation under these conditions is neither implied, nor guaranteed.

<sup>8</sup>Maximum input voltage is not to exceed maximum VDD

<sup>9</sup>See PCI Clock-to-Clock Delay Figure

## Test Clarification Table

Comments	HW		SW		OUTPUT
	TEST_SEL HW PIN	TEST_MODE HW PIN	TEST ENTRY BIT B9b3	REF/N or HI-Z B9b4	
	<2.0V	X	0	0	NORMAL
Power-up w/ TEST_SEL = 1 to enter test mode Cycle power to disable test mode TEST_MODE --> low Vth input TEST_MODE is a real time input	>2.0V	0	X	0	HI-Z
	>2.0V	0	X	1	REF/N
	>2.0V	1	X	0	REF/N
	>2.0V	1	X	1	REF/N
If TEST_SEL HW pin is 0 during power-up, test mode can be invoked through B9b3. If test mode is invoked by B9b3, only B9b4 is used to select HI-Z or REF/N FSLB/TEST_Mode pin is not used. Cycle power to disable test mode, one shot control	<2.0V	X	1	0	HI-Z
	<2.0V	X	1	1	REF/N

B9b3: 1= ENTER TEST MODE, Default = 0 (NORMAL OPERATION)

B9b4: 1= REF/N, Default = 0 (HI-Z)
