

# ADS58J89 Quad Channel 14-Bit 250/500 MSPS Receiver and Feedback IC

## 1 Features

- 4-Ch, 14-Bit 500MSPS With Digital Signal Processing
- Power Amplifier Linearization (Feedback) Modes
  - 14-Bits Every Other Sample at 250MSPS
  - Programmable Resolution vs Duty Cycle
    - Duty Cycle 3:2 (60% 11-Bit, 40% 9-Bit)
    - Duty Cycle 2:3 (40% 12-Bit, 60% 9-Bit)
    - Duty Cycle 1:3 (25% 14-Bit, 75% 9-Bit)
- Traffic Receiver Modes
  - 14-Bit 250MSPS: Decimate by 2 Filter, High/Low Pass
  - 9-Bit SNR-Boost Filter (150-MHz Max Bandwidth)
  - 9-to-14-Bit TDD Burst (200-MHz Max Bandwidth)
- Flexible Input Clock Buffer With Divide by 1/2/4
- JESD204B Digital Interface up to 5.0Gbps
  - 1 or 2 Lanes per Channel, With Subclass 1
- 64-Pin VQFN Package (9 × 9 mm)

## 2 Applications

- Multi-Carrier, Multi-Mode, Multi-Band Cellular Receivers
  - TDD-LTE
  - FDD-LTE
  - CDMA, WCDMA, CMDA2k
  - GSM
- RF and Microwave Backhaul
  - Point-to-Point Backhaul
  - Point-to-Multi-Point Backhaul
- Wireless Repeaters
- Distributed Antenna Systems (DAS)
- Broadband Wireless

## 3 Description

The ADS58J89 is a high-linearity, quad-channel, 14-bit, 250/500-MSPS IF (intermediate frequency) receiver. The four channels contain 500MSPS 14-bit ADCs followed by signal processing for wireless infrastructure systems. The channels can be configured in various modes depending on bandwidth, resolution and sample time requirements. The signal processing block contains selectable modes for decimation filters, SNR Boost filters, resolution versus time and time-division duplex (TDD) burst mode. Designed for high antenna count systems, the 4 channels provides high bandwidth and linearity to multi-channel receivers in a small footprint. The device can be dual function as traffic receiver and power amplifier linearization feedback path in TDD systems.

### Key Specifications:

- Power Dissipation: 875 mW/ch
- Input Bandwidth (3dB): 900 MHz
- Aperture Jitter: 98 fs rms
- Channel Isolation: 85 dB
- Performance at  $f_{in} = 170$  MHz at 1.25 V<sub>pp</sub>, -1 dBFS
  - SNR: 65.8 dBFS
  - SFDR: 85 dBc HD2,3; 95 dBFS non-HD2,3

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	MAX OUTPUT RATE
ADS58J89	VQFN (64)	500 MSPS

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

DATE	REVISION	NOTES
November 2014	*	Initial release.

## 5 Pin Configuration and Functions

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
<b>INPUT OR REFERENCE</b>			
INAP, INAM	63, 62	I	Differential analog input for channel A
INBP, INBM	58, 59	I	Differential analog input for channel B
INCP, INCM	18, 19	I	Differential analog input for channel C
INDP, INDM	23, 22	I	Differential analog input for channel D
VCM	16	O	Common mode output voltage to bias analog inputs, Vcm = 2.0 V
VREF	15	O	Voltage reference output. A 0.1- $\mu$ F bypass capacitor to ground close to the pin is recommended
<b>CLOCK/SYNC</b>			
CLKINP, CLKINM	9, 8	I	Differential clock input for channel
SYSREFABP, SYSREFABM	6, 5	I	LVDS input with internal 100- $\Omega$ termination. External SYSREF input for channels A, B, C, and D

**Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
SYSREFCDP, SYSREFCDM	11, 12	I	LVDS input with internal 100-Ω termination. External SYSREF input for channels C and D if output rate of channel A/B is different from channel C/D. Can be configured to trigger input for burst modes with SPI register write. Can be used as differential input or two single-ended inputs (SYSREFCDP becomes TRIGGERAB and SYSREFCDM becomes TRIGGERCD) for channel A/B and channel C/D.
<b>CONTROL OR SERIAL</b>			
ENABLE	14	I	Chip enable. Active high. Power down functionality can be configured through SPI register setting and exercised using the ENABLE pin. Internal 51-kΩ pull-down resistor.
SCLK	3	I	Serial interface clock input
SDATA	2	I/O	Bidirectional serial data in 3-pin mode. In 4-pin interface, the SDATA pin is an input only.
SDENb	4	I	Serial interface enable
SDOUT	1	O	Serial interface data output
SRESETb	13	I	Hardware reset. Active low. Initializes internal registers during high to low transition. This pin has an internal 51-kΩ pullup resistor.
<b>DATA OUTPUT INTERFACE</b>			
DA[0,1]P, DA[0,1]M	55, 54, 52, 51	O	JESD204B output interface for channel A
DB[0,1]P, DB[0,1]M	46, 45, 43, 42	O	JESD204B output interface for channel B
DC[0,1]P, DC[0,1]M	26, 27, 29, 30	O	JESD204B output interface for channel C
DD[0,1]P, DD[0,1]M	35, 36, 38, 39	O	JESD204B output interface for channel D
OVRA	50	I/O	Fast over-range indicator channel A. In burst mode can be configured to TRIGGERAB input.
OVRB	49	O	Fast over-range indicator channel B. In burst mode can be configured to TRDY output.
OVRD	31	I/O	Fast over-range indicator channel C. In burst mode can be configured to TRIGGERCD input.
OVRD	32	O	Fast over-range indicator channel D. In burst mode can be configured to TRDY output.
SYNCbABP, SYNCbABM	47, 48	I	SYNCb input for JESD204B interface for channel A/B, internal 100-Ω termination
SYNCbCDP, SYNCbCDM	34, 33	I	SYNCb input for JESD204B interface for channel C/D, internal 100-Ω termination
<b>POWER SUPPLY</b>			
AVDDC	7, 10	I	Clock 1.8-V power supply
AVDD18	21, 24, 57, 60	I	Analog 1.9-V power supply
AVDD33	17, 20, 61, 64	I	Analog 3.3-V power supply
DVDD	25, 56	I	Digital 1.8-V power supply
GND	PowerPAD™	I	Ground
IOVDD	28, 37, 44, 53	I	JESD204B output interface 1.8-V power supply
PLLVDD	40, 41	I	PLL 1.8-V power supply

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage	AVDD33	-0.3	3.6	V
	AVDD18	-0.3	2.1	
	AVDDC	-0.3	2.1	
	DVDD	-0.3	2.1	
	IOVDD	-0.3	2.1	
	PLLVDD	-0.3	2.1	
Voltage between AGND and DGND		-0.3	0.3	V
Voltage applied to input pins	INAP, INBP, INCP, INDP, INAM, INBM, INCM, INDM	-0.3	3	V
	CLKINP, CLKINM	-0.3	AVDD18 + 0.3 V	
	SYNCbABP, SYNCbABM, SYNCbCDP, SYNCbCDM	-0.3	AVDD18 + 0.3 V	
	SYSREFABP, SYSREFABM, SYSREFCDP, SYSREFCDM	-0.3	AVDD18 + 0.3 V	
	SCLK, SDENb, SDATA, SRESETb, ENABLE	-0.3	DVDD + 0.5 V	
T <sub>A</sub>	Operating free-air temperature	-40	85	°C
T <sub>J</sub>	Operating junction temperature <sup>(2)</sup>		125	°C

- (1) Stresses beyond those listed as *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated as *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Prolonged use at this junction temperature may increase the device failure-in-time (FIT) rate.

### 6.2 Handling Ratings

			MIN	MAX	UNIT
T <sub>stg</sub>	Storage temperature		-65	150	°C
V <sub>ESD</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	-2	2	kV

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
ADC clock frequency		250		500	MSPS
Resolution		14		14	bits
Supply	AVDD33	3.15	3.3	3.45	V
	AVDD18	1.8	1.9	2.0	
	AVDDC	1.7	1.8	1.9	
	DVDD	1.7	1.8	1.9	
	IOVDD	1.7	1.8	1.9	
	PLLVDD	1.7	1.8	1.9	
T <sub>A</sub>	Operating free-air temperature	-40		85	°C
T <sub>J</sub>	Operating junction temperature			125	°C

## 6.4 Thermal Information

Thermal Metric <sup>(1)</sup>		RGC (64 PINS)	UNIT
$R_{\Theta JA}$	Junction-to-ambient thermal resistance	23.5	°C/W
$R_{\Theta JC(top)}$	Junction-to-case, top	7.0	
$R_{\Theta JB}$	Junction-to-board thermal resistance	2.6	
$\Phi_{JT}$	Junction-to-top of package	0.1	
$\Phi_{JB}$	Junction-to-board characterization parameter	2.6	
$R_{\Theta JC(bot)}$	Junction-to-case, bottom	0.3	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

Typical values at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 85^\circ\text{C}$ , ADC sampling rate = 500 MSPS, 50% clock duty cycle, AVDD33 = 3.3 V; AVDD18 = 1.9 V; AVDDC, DVDD, IOVDD, PLLVDD = 1.8 V, -1-dBFS differential input, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLY</b>						
$I_{\text{AVDD33}}$	3.3-V analog supply current			500		mA
$I_{\text{AVDD18}}$	1.9-V analog supply current			320		mA
$I_{\text{AVDDC}}$	1.8-V clock supply current			18		mA
$I_{\text{DVDD}}$	1.8-V digital supply current	4-channel SNR boost		472		mA
		4-channel decimation filter		323		
		4-channel burst mode		324		
		2-channel burst mode, 2-channel SNR boost		398		
		2-channel decimation filter, 2-channel burst mode		324		
		2-channel decimation filter, 2-channel, discard every other sample		289		
$I_{\text{IOVDD}}$	I/O voltage supply current	2 lanes per ADC		373		mA
		1 lane per ADC		185		
$I_{\text{PLLVDD}}$	PLL voltage supply current			42		mA
Pdis	Total power dissipation	4-channel SNR boost		3.94		W
		4-channel Burst mode		3.67		
		4-channel decimation filter		3.34		
		4-channel decimation filter, 1 lane per ADC		3.27	3.5	
		2-channel SNR Boost, 2-channel burst mode		3.81		
		2-channel decimation filter, 2-channel burst mode		3.51		
Deep sleep mode power				791		mW
Wake-up time from deep sleep mode		SNR > 60 dB		1.4		ms
Light sleep mode power				1.68		W
Wake-up time from light sleep mode		SNR > 60 dB		8		$\mu\text{s}$
<b>ANALOG INPUTS</b>						
Differential input full-scale			1.0	1.25	1.5	V <sub>pp</sub>
Input common mode voltage			V <sub>cm</sub> ± 50 mV			V
Input resistance	Differential at DC		1			k $\Omega$
Input capacitance	Each input to GND		2.75			pF
VCM	Common mode voltage output		2.18			V
Analog input bandwidth (-3 dB)			900			MHz
<b>CHANNEL-TO-CHANNEL ISOLATION</b>						
Crosstalk <sup>(1)</sup>	Near channel	$f_{\text{IN}} = 170 \text{ MHz}$	85			dB
	Far channel	$f_{\text{IN}} = 170 \text{ MHz}$	95			
<b>CLOCK INPUT</b>						
Input clock frequency			250	2000 <sup>(2)</sup>		MHz
Input clock amplitude			0.4	1.5		V <sub>pp</sub>
Input clock duty cycle			45%	50%	55%	
Internal clock biasing			0.9			V

(1) Crosstalk is measured with a -1-dBFS input signal on aggressor channel and no input on victim channel.

(2) CLK / 4 mode

## 6.6 Electrical Characteristics: 250 MSPS Output, 2x Decimation Filter

Typical values at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 85^\circ\text{C}$ , ADC sampling rate = 500 MSPS, 50% clock duty cycle, AVDD33 = 3.3 V; AVDD18 = 1.9 V; AVDDC, DVDD, IOVDD, PLLVDD = 1.8 V, -1-dBFS differential input, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SNR	Signal-to-noise ratio	$f_{\text{IN}} = 10 \text{ MHz}$		68.3		dBFS
		$f_{\text{IN}} = 100 \text{ MHz}$		68.2		
		$f_{\text{IN}} = 170 \text{ MHz}$	65	68.2		
		$f_{\text{IN}} = 310 \text{ MHz}$		67.6		
		$f_{\text{IN}} = 450 \text{ MHz}$		66.8		
HD2	Second harmonic distortion	$f_{\text{IN}} = 10 \text{ MHz}$		85		dBc
		$f_{\text{IN}} = 100 \text{ MHz}$		85		
		$f_{\text{IN}} = 170 \text{ MHz}$	75	85		
		$f_{\text{IN}} = 310 \text{ MHz}$		85		
		$f_{\text{IN}} = 450 \text{ MHz}$		75		
HD3	Third harmonic distortion	$f_{\text{IN}} = 10 \text{ MHz}$		85		dBc
		$f_{\text{IN}} = 100 \text{ MHz}$		85		
		$f_{\text{IN}} = 170 \text{ MHz}$	75	85		
		$f_{\text{IN}} = 310 \text{ MHz}$		85		
		$f_{\text{IN}} = 450 \text{ MHz}$		85		
SFDR (Non-HD2, Non-HD3)	Spur free dynamic range (excluding HD2 and HD3)	$f_{\text{IN}} = 10 \text{ MHz}$		95		dBc
		$f_{\text{IN}} = 100 \text{ MHz}$		95		
		$f_{\text{IN}} = 170 \text{ MHz}$	75	95		
		$f_{\text{IN}} = 310 \text{ MHz}$		90		
		$f_{\text{IN}} = 450 \text{ MHz}$		85		
IMD3	2F1-F2, 2F2-F1, $A_{\text{in}} = -7 \text{ dBFS}$	$F_{\text{IN}} = 169 \text{ and } 171 \text{ MHz}$		93		dBFS

## 6.7 Electrical Characteristics: 500 MSPS Output

Typical values at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 85^\circ\text{C}$ , ADC sampling rate = 500 MSPS, 50% clock duty cycle, AVDD33 = 3.3 V; AVDD18 = 1.9 V; AVDDC, DVDD, IOVDD, PLLVDD = 1.8 V, -1-dBFS differential input, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SNR	Signal-to-Noise Ratio	SNR Boost (150-MHz bandwidth)	$f_{\text{IN}} = 100 \text{ MHz}$	65.7		dBFS
			$f_{\text{IN}} = 170 \text{ MHz}$	65.7		
			$f_{\text{IN}} = 350 \text{ MHz}$	65		
	Burst Mode (14 bit)		$f_{\text{IN}} = 10 \text{ MHz}$	65.3		dBFS
			$f_{\text{IN}} = 100 \text{ MHz}$	65.2		
			$f_{\text{IN}} = 170 \text{ MHz}$	65.1		
			$f_{\text{IN}} = 370 \text{ MHz}$	64.7		
		$f_{\text{IN}} = 450 \text{ MHz}$	64.6			
HD2	Second Harmonic Distortion		$f_{\text{IN}} = 10 \text{ MHz}$	85		dBc
			$f_{\text{IN}} = 100 \text{ MHz}$	85		
			$f_{\text{IN}} = 170 \text{ MHz}$	85		
			$f_{\text{IN}} = 370 \text{ MHz}$	75		
			$f_{\text{IN}} = 450 \text{ MHz}$	75		
HD3	Third Harmonic Distortion		$f_{\text{IN}} = 10 \text{ MHz}$	85		dBc
			$f_{\text{IN}} = 100 \text{ MHz}$	85		
			$f_{\text{IN}} = 170 \text{ MHz}$	85		
			$f_{\text{IN}} = 370 \text{ MHz}$	78.3		
			$f_{\text{IN}} = 450 \text{ MHz}$	85		
SFDR (Non-HD2, Non-HD3)	Spur Free Dynamic Range (excluding HD2 and HD3)		$f_{\text{IN}} = 10 \text{ MHz}$	85		dBFS
			$f_{\text{IN}} = 100 \text{ MHz}$	85		
			$f_{\text{IN}} = 170 \text{ MHz}$	85		
			$f_{\text{IN}} = 370 \text{ MHz}$	83		
			$f_{\text{IN}} = 450 \text{ MHz}$	83		
IMD3	2F1-F2, 2F2-F1, $A_{\text{in}} = -7 \text{ dBFS}$	$F_{\text{IN}} = 169 \text{ and } 171 \text{ MHz}$		87		dBFS

## 6.8 Electrical Characteristics: Sample Clock Timing Characteristics

Typical values at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 85^\circ\text{C}$ , ADC sampling rate = 500 MSPS, 50% clock duty cycle, AVDD33 = 3.3 V; AVDD18 = 1.9 V; AVDDC, DVDD, IOVDD, PLLVDD = 1.8 V, -1 dBFS differential input, unless otherwise noted.

PARAMETER		MIN	TYP	MAX	UNIT
Aperture jitter, RMS			98		fs rms
Data latency			38		Sample clock cycles
Fast over-range (OVR) latency			6		
$t_{\text{PDI}}$	Clock aperture delay		1.1		ns

## 6.9 Electrical Characteristics: Digital Outputs

The DC specifications refer to the condition where the digital outputs are not switching, but are permanently at a valid logic level 0 or 1. AVDD33 = 3.3 V; AVDD18 = 1.9 V; AVDDC, DVDD, IOVDD, PLLVDD = 1.8 V.

PARAMETER		MIN	TYP	MAX	UNIT
<b>DIGITAL OUTPUTS: JESD204B INTERFACE (DA[0,1], DB[0,1], DC[0,1], DD[0,1])</b>					
Output differential voltage,  VOD		450	577	750	mV
Transmitter short circuit current	Transmitter terminals shorted to any voltage between -0.25 and 1.45 V		45		mA
Single ended output impedance			50		$\Omega$
Output capacitance	Output capacitance inside the device, from either output to ground		2		pF
Unit interval, UI	5.0 Gbps		200		ps
Rise and fall times			110		ps
Output jitter			57		ps
Serial output data rate			5.0		Gbps

### 6.10 Timing Requirements

		MIN	TYP	MAX	UNIT
<b>DIGITAL INPUTS:</b> <b>SRESETb, SCLK, SDENb, SDATA, ENABLE, OVRA, OVRC, SYSREFCDP, SYSREFCDM</b>					
High-level input voltage	All digital inputs support 1.8-V and 3.3-V logic levels	1.2			V
Low-level input voltage		0.4			V
High-level input current		50			μA
Low-level input current		-50			μA
Input capacitance		4			pF
<b>DIGITAL OUTPUTS:</b> <b>SDOUT, OVRA, OVRB, OVRC, OVRD</b>					
High-level output voltage	$I_{Load} = -100 \mu A$	DVDD - 0.2	DVDD	V	
Low-level output voltage		0.2			V
<b>DIGITAL INPUTS:</b> <b>SYNCbABP/M, SYNCbCDP/M, SYSREFABP/M, SYSREFCDP/M</b>					
Input voltage VID		250	350	450	mV
Input common mode voltage VCM		0.4	0.9	1.4	V
$t_{S\_SYSREFxx}$	Referenced to rising edge of input clock	100			ps
$t_{H\_SYSREFxx}$	Referenced to rising edge of input clock	100			ps

### 6.11 Reset Timing

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_1$ Power-on delay	Delay from power up to active-low RESET pulse	3			ms
$t_2$ Reset pulse duration	Active-low RESET pulse duration	20			ns
$t_3$ Register write delay	Delay from RESET disable to SDENb active	100			ns

Figure 1. Reset Timing Diagram

- A.  $t_{PD}$  is the propagation delay from sample clock input edge to serial data output transition

**Figure 2. Timing Diagram: 250 MSPS Output Data Rate**

B.  $t_{PD}$  is the propagation delay from sample clock input edge to serial data output transition

Figure 3. Timing Diagram: 500 MSPS Output Data Rate

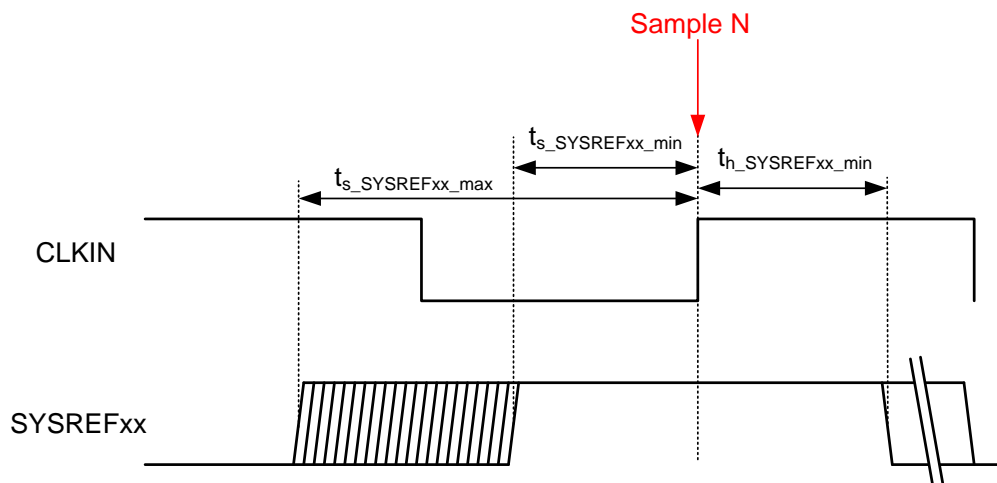

Figure 4. Timing Using SYSREF (Subclass 1)

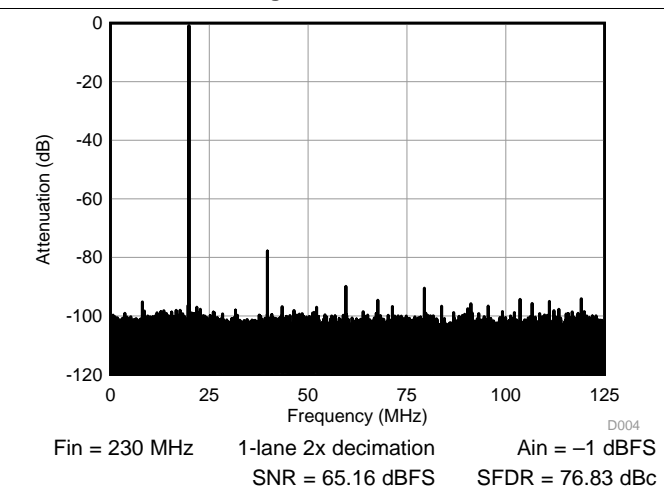

- C. Trigger is allowed to be asynchronous to the sample clock. If the trigger input does not meet setup and hold timing around one clock cycle, then the trigger will be caught on the next cycle.

**Figure 5. Timing for External Manual Trigger Input**

## 6.12 Typical Characteristics

Typical values at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 85^\circ\text{C}$ , Device clock frequency = 500 MHz, Output sample data rate = 5Gbps, 50% Device clock duty cycle, AVDD33 = 3.3 V, AVDD18 = 1.9 V, AVDDC = 1.8 V, IOVDD = 1.8 V, PLLVDD = 1.8 V, DVDD = 1.8 V, -1 dBFS differential input, unless otherwise noted, FFT sample size = 32768.

Typical Characteristics (continued)

Typical values at  $T_A = 25^\circ\text{C}$ , full temperature range is  $T_{\text{MIN}} = -40^\circ\text{C}$  to  $T_{\text{MAX}} = 85^\circ\text{C}$ , Device clock frequency = 500 MHz, Output sample data rate = 5Gbps, 50% Device clock duty cycle, AVDD33 = 3.3 V, AVDD18 = 1.9 V, AVDDC = 1.8 V, IOVDD = 1.8 V, PLLVDD = 1.8 V, DVDD = 1.8 V, -1 dBFS differential input, unless otherwise noted, FFT sample size = 32768.

## 7 Detailed Description

### 7.1 Overview

The ADS58J89 is a pin-to-pin compatible, very-low power, wide bandwidth 14-bit 250 or 500 MSPS quad channel receiver and feedback IC. It supports the JESD204B serial interface with data rates up to 5.0 Gbps supporting 1 or 2 lanes per channel. The buffered analog input provides uniform input impedance across a wide frequency range while minimizing sample-and-hold glitch energy. A sampling clock divider allows more flexibility for system clock architecture design. The ADS58J89 provides excellent SFDR over a large input frequency range with very-low power consumption.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Decimation by 2 (250 MSPS Output)

Each channel has a digital filter in the data path as shown in Figure 39. The filter can be programmed as a low-pass or high-pass filter and the normalized frequency response of both filters is shown in Figure 40.

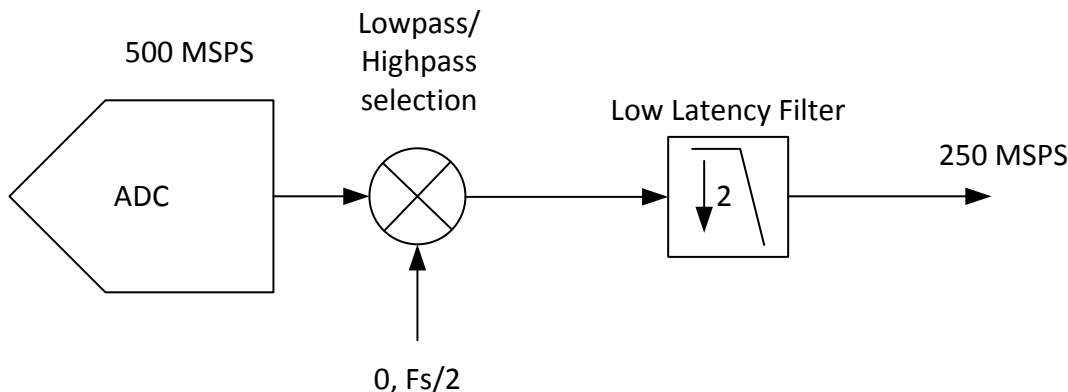

Figure 39. 2x Decimation Filter

The decimation filter response has a 0.1-dB pass band ripple with approximately 41% pass-band bandwidth. The stop-band attenuation is approximately 40 dB.

Figure 40. Decimation Filter Response

Figure 41. Decimation Filter Response Passband Ripple Detail

#### 7.3.2 Over-Range Indication

The ADS58J89 provides a fast over-range indication on the OVRA, OVRB, OVRC, and OVRD pins. The fast OVR is triggered if the input voltage exceeds the programmable over-range threshold and is output after just 6 clock cycles, enabling a quicker reaction to an over-range event. The OVR threshold can be configured using SPI register writes.

The input voltage level at which the overload is detected is referred to as the threshold and is programmable using the over-range threshold bits.

The threshold at which fast OVR is triggered is (full-scale × [the decimal value of the FAST OVR THRESH bits] / 8). After reset, the default value of the over-range threshold is set to 7 (decimal), which corresponds to a threshold of 1.12 dB below full scale (20 × log(7/8)).

**Table 1. Fast Over Range Threshold Settings**

OVR Setting (decimal)	OVR Threshold (dBFS)
1	-18.1
2	-12.0
3	-8.5
4	-6.0
5	-4.1
6	-2.5
7 (default)	-1.1

Because the fast over-range indicator is single-ended LVCMOS logic, the ADS58J89 device can be configured through the SPI register write to keep the over-range indicator asserted high for an extra one, two, or four clock cycles. This longer assertion of the signal ensures the processor can capture the over-range event.

**Figure 42. Fast Over Range Output Timing**

The ADS58J89 device also provides the fast over-range indication bit in the JESD204B output data stream.

**Figure 43. Sample Data and Status Bit Format**

### 7.3.3 JESD204B Interface

The ADS58J89 supports device subclass 1 with a maximum output data rate of 5.0 Gbps for each serial transmitter. It allows independent JESD204B format configuration for channel A and B and channel C and D.

An external SYSREF signal is used to align all internal clock phases and the local multi-frame clock to a specific sampling clock edge. This allows synchronization of multiple devices in a system and minimizes timing and alignment uncertainty. SYNCbAB input is used to control all the JESD204B SerDes blocks for channel A and B while SYNCbCD is used to control channel C and D. If the same LMFS configuration is used for all four channels, the SYNCbAB and SYNCbCD signals can be tied together externally and driven from the same source.

Depending on the channel output data rate, the JESD204B output interface can be operated with either 1 or 2 lanes per single channel. The JESD204B setup and configuration of the frame assembly parameters are controlled via SPI interface.

The JESD204B transmitter block consists of the transport layer, the data scrambler and the link layer. The transport layer maps the channel output data into the selected JESD204B frame data format and manages if the channel output data or test patterns are being transmitted. The link layer performs the 8b/10b data encoding as well as the synchronization and initial lane alignment using the SYNCb input signal. Optionally, data from the transport layer can be scrambled.

Figure 44. JESD204B Lane Assignment

Figure 45. JESD204B Block

### 7.3.3.1 JESD204B Initial Lane Alignment (ILA)

The ILA process is started by the receiving device by deasserting the SYNCb signal. Upon detecting a logic low on the SYNCbAB input pins, the ADS58J89 device starts transmitting comma (K28.5) characters on channels A and B to establish code group synchronization. Upon detecting a logic high on the SYNCbCD input pins, the ADS58J89 device starts transmitting comma (K28.5) characters on channels C and D to establish code group synchronization.

After synchronization is completed, the receiving device asserts the SYNCb signal and the ADS58J89 starts the ILA sequence with the next local multi-frame clock boundary. The ADS58J89 device transmits 4 multi-frames each containing K frames (K is SPI programmable). Each of the multi-frames contains the frame start and end symbols and the second multi-frame also contains the JESD204 link configuration data.

Figure 46. Initial Lane Assignment Format

### 7.3.3.2 JESD204B Test Patterns

There are three different test patterns available in the transport layer of the JESD204B interface. The ADS58J89 supports a RAMP, 1555/2AAA and different PRBS patterns. They can be enabled through SPI register write and are located in address 0x1D and 0x32/33.

### 7.3.3.3 JESD204B Frame Assembly

The JESD204B standard defines the following parameters:

- L = number of lanes per link
- M = number of converters for device
- F = number of octets per frame clock period
- S = number of samples per frame
- HD = high density mode

The ADS58J89 supports independent configuration of the JESD204B format for channel A and B and channel C and D. Table 2 lists the available JESD204B formats and valid ranges for the ADS58J89. The ranges are limited by the SerDes line rate and the maximum channel sample frequency.

Table 2. Permissible LMFS Settings

L	M	F	S	HD	Max Channel Output Rate (MSPS)	Max $f_{SerDes}$ (Gbps)
8	4	1	1	1	500	5.0
4	4	2	1	0	250	5.0

The detailed frame assembly is shown in [Table 3](#).

**Table 3. LMFS Data Formats**

	LMFS = 8411				LMFS = 4421					
Lane DA0	A0[13:6]	A1[13:6]	A2[13:6]	A3[13:6]	A0[13:6]	A0[5:0], 00	A1[13:6]	A1[5:0], 00	A2[13:6]	A2[5:0], 00

Lane DC1	C0[5:0], 00	C1[5:0], 00	C2[5:0], 00	C3[5:0], 00						
Lane DD0	D0[13:6]	D1[13:6]	D2[13:6]	D3[13:6]	D0[13:6]	D0[5:0], 00	D1[13:6]	D1[5:0], 00	D2[13:6]	D2[5:0], 00
Lane DD1	D0[5:0], 00	D1[5:0], 00	D2[5:0], 00	D3[5:0], 00						

### 7.3.4 SYSREF Clocking Schemes

**Periodic:** The SYSREF signal is always on. This mode is supported, but not recommended as the continuous SYSREF signal appears like an additional clock input, which can cause clock mixing spurs in the channel output spectrum.

**Gapped-Periodic (recommended):** A periodic SYSREF signal is presented to the ADS58J89 SYSREF inputs for a very short period of time. This configuration requires a DC-coupled SYSREF connection for proper operation. Most of the time the SYSREF signal is in a logic-low state, and thus cannot cause any glitches and spurs in the channel output spectrum.

**Pulse/One Shot (recommended):** A single SYSREF reset pulse is used to synchronize the ADS58J89. The ADS58J89 device requires a minimum of 3 SYSREF pulses to complete the synchronization phase. The SYSREF signal is in a logic-low state most of the time, and thus cannot cause any glitches and spurs in the channel output spectrum. Special attention should be given to ensure the single pulse meets required the SYSREF input setup and hold time.

### 7.3.5 Split-Mode Operation

The ADS58J89 provides several different options to interface it to the digital processor or processors. If the ADS58J89 device is operated in split sampling rate (2 channels at 500-MSPS output rate and 2 channels at 250-MSPS output rate), then it requires dual SYSREF (SYSREFAB and SYSREFCD) and dual SYNC (SYNCbAB and SYNCbCD).

**Subclass 1 – Deterministic Latency:** The device clock and synchronous SYSREF signal are provided by the timing unit to the ADS58J89 and the processor. The processor controls the SYNCb input signals for the JESD204B state machine for all four channels. In case the ADS58J89 is connected to two different processors, the differential SYNCb inputs of the ADS58J89 can be configured to two single-ended inputs where each pin controls the JESD204B state machine of the two corresponding channels.

Figure 47. Four Channel and Dual Two Channel Usage

Split Mode Operation: If the ADS58J89 device is operated with 2-channel output at 500 MSPS and 2-channel output at 250 MSPS, then dual SYSREF (SYSREFAB for channel A and B, SYSREFCD for channel C and D) as well as dual SYNC (SYNCbAB for channel A and B, SYNCbCD for channel C and D) is required to ensure normal operation because the JESD204B link configuration is different for the two channel pairs.

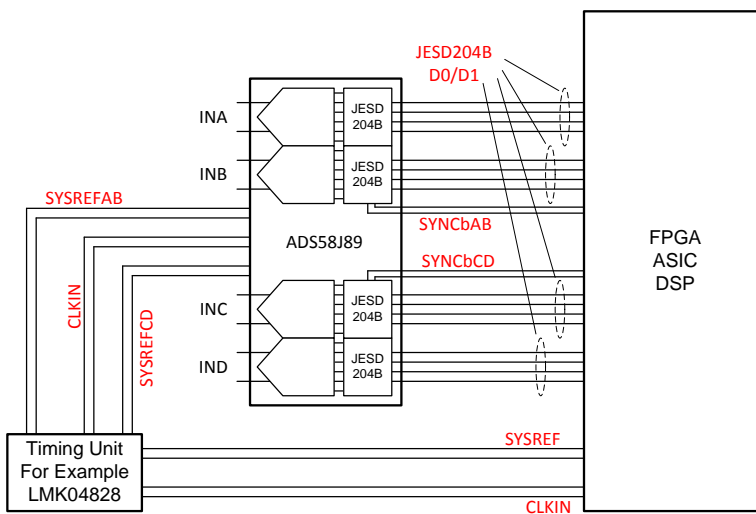

Figure 48. Dual SYSREF Usage

### 7.3.6 Eye Diagram Information

Figure 49 and Figure 50 is the measured eye diagram at 2.5 and 5Gbps output data rate, respectively. These are overlaid with the JESD204B LV-OIF-6G-SR specification.

### 7.3.7 Analog Inputs

The ADS58J89 analog signal inputs are designed to be driven differentially. The analog input pins have internal analog buffers that drive the sampling circuit. As a result of the analog buffer, the input pins present a high-impedance input across a very-wide frequency range to the external driving source, which enables great flexibility in the external analog filter design as well as excellent 50-Ω matching for RF applications. The buffer also helps isolate the external driving circuit from the internal switching currents of the sampling circuit, which results in a more constant SFDR performance across input frequencies.

The common-mode voltage of the signal inputs is internally biased to 2 V using 500-Ω resistors, which allows for AC coupling of the input drive network. Each input pin (INP, INM) must swing symmetrically between (VCM + 0.3125 V) and (VCM – 0.3125 V), resulting in a 1.25-Vpp (default) differential input swing. The input sampling circuit has a 3-dB bandwidth that extends up to 900 MHz.

Figure 51. Normalized Input Bandwidth

Figure 52. Equivalent Analog Input Circuit

### 7.3.8 Clock Inputs

The ADS58J89 clock input can be driven differentially with a sine wave or LVPECL source with little or no difference in performance. The common mode voltage of the clock input is set to 0.9 V using internal 2-kΩ resistors. This allows for AC coupling of the clock inputs. The termination resistors should be placed as close as possible to the clock inputs in order to minimize signal reflections and jitter degradation.

**Figure 53. Equivalent Clock Input Circuit**

### 7.3.9 Input Clock Divider

The ADS58J89 is equipped with two internal dividers on the clock input – one on channel AB and one on channel CD. The clock divider allows operation with a faster input clock simplifying the system clock distribution design. The clock dividers can be bypassed (/1) for operation with a 500-MHz clock while /2 option supports a maximum input clock of 1 GHz and the /4 option a maximum input clock frequency of 2 GHz. Different divider options can be selected for channel AB and channel CD clock output. By default the divider output of channel AB block is routed to all 4 channels but the configuration can be customized with different SPI register settings to use either the channel AB or CD divider blocks for any two channels.

**Figure 54. Input Clock Divider**

### 7.3.10 Power-Down Control

The power down functions of the ADS58J89 can be controlled either through the parallel control pin (ENABLE) or through a SPI register setting. Power-down modes for the different channels as well as for the JESD204B interface are supported.

The ADS58J89 supports the following power-down modes. The analog sleep mode configurations are in register 0x05/06 and the JESD204b sleep mode configurations are in register 0x1E and 0x1F.

**Table 4. Low-Power Mode Power Consumption and Wake-Up Times**

Configuration	Power Consumption	Wake-Up Time
Global power down	24 mW	Needs JESD resynch
Standby	31 mW	Needs JESD resynch
Deep sleep	791 mW	1.4 ms
Light sleep	1.68 W	8 $\mu$ s

Control power-down function through ENABLE pin:

1. Configure power-down mode in register 0x05 and 0x1E
2. Normal operation: ENABLE pin high
3. Power-down mode: ENABLE pin low

Control power-down function through SPI (ENABLE pin always high):

1. Assign power-down mode in register 0x06 and 0x1F
2. Normal operation: 0x06 and 0x1F are 0xFFFF
3. Power-down mode: configure power down mode in register 0x06 and 0x1F

### 7.3.11 Device Configuration

The serial interface (SIF) included in the ADS58J89 is a simple 3- or 4-pin interface. In normal mode, 3 pins are used to communicate with the device. There is an enable (SDENb), a clock (SCLK), and a bidirectional IO port (SDATA). If the user would like to use the 4-pin interface, one write must be implemented in the 3-pin mode to enable 4-pin communications. In this mode, the SDOOUT pin becomes the dedicated output. The serial interface has an 8-bit address word and a 16-bit data word. The first rising edge of SCLK after SDENb goes low will latch the read or write bit. If a high is registered, then a read is requested, if it is low, then a write is requested. SDENb must be brought high again before another transfer can be requested.

### 7.3.12 JESD204B Interface Initialization Sequence

After power-up, the internal JESD204B digital block must be initialized with the following sequence of steps:

1. Set JESD RESET AB/CD and JESD INIT AB/CD to 0 (address 0x0D, value 0x0000)
2. Set JESD INIT AB/CD to 1 (0x0D, 0x0202)
3. Set JESD RESET AB/CD to 1 (0x0D, 0x0303)
4. Configure all other JESD register and clock settings. If those settings change later on, this initialization sequence must be repeated.
5. Set JESD RESET AB/CD to 0 (0x0D, 0x0202)
6. Set JESD RESET AB/CD to 1 (0x0D, 0x0303)
7. Wait for two SYSREF pulses
8. Set JESD INIT AB/CD to 0 (0x0D, 0x0101)

### 7.3.13 Device and Register Initialization

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a low pulse on the SRESETb pin (of width greater than 10 ns), as shown in [Figure 1](#). If required later during operation, the serial interface registers can be cleared by applying:

- Another hardware reset using the SRESETb pin
- A software reset (bit D0 in register 0x00). This setting resets the internal registers to the default values and then self-resets the RESET bit (D0) back to 0. In this case, the RESET pin is kept high.

## 7.4 Device Functional Modes

### 7.4.1 Operating Modes

[Table 5](#) details the five different operating modes. A pair of channels (channel A and B and channel C and D) can be configured in the same operating mode.

**Device Functional Modes (continued)**

**Table 5. Operating Modes Information**

Channel Sampling Rate (MSPS)	Digital Feature	Output Data Rate (MSPS)	Output Resolution	Output SerDes Rate (GSPS)	Number of Lanes per Channel
500	Decimation by 2	250	14 bit	5.0	1
	Burst mode of every other sample	250	11 to 14 bit	5.0	1
500	SNR boost (150-MHz BW)	500	9 bit	5.0	2
	Burst mode	500	9 to 14 bit	5.0	2
	TDD-burst mode	500	9 to 14 bit	5.0	2

**7.4.2 Mode Configuration**

Table 6 shows examples for different mode configurations for channel A/B and channel C/D regarding input options for SYSREF as well as the trigger for the different burst mode options. Each channel pair (A/B and C/D) can support each mode for 250-MSPS and 500-MSPS output.

**Table 6. SYSREF and Trigger Options by Operating Mode**

Channel	Output Rate	Mode	SYSREF Input	Trigger Input
2	500 MSPS	SNR boost	SYSREFAB	-
2	500 MSPS	SNR boost		
2	500 MSPS	TDD burst mode	SYSREFAB	SYSREFP/M
2	500 MSPS	TDD burst mode		OVRA/C
2	500 MSPS	TDD burst mode	SYSREFAB	SYSREFCDP/M
2	500 MSPS	Burst mode		OVRA/C
2	500 MSPS	SNR boost	SYSREFAB	SYSREFCDP/M
2	500 MSPS	Burst mode		OVRA/C
2	500 MSPS	SNR boost	SYSREFAB	OVRA/C
2	250 MSPS	Burst mode of every other sample	SYSREFCD	
2	500 MSPS	Burst mode	SYSREFAB	OVRA/C
2	250 MSPS	Decimation by 2	SYSREFCD	
2	250 MSPS	Decimation by 2	SYSREFAB	SYSREFCDP/M
2	250 MSPS	Burst mode of every other sample		OVRA/C
2	250 MSPS	Decimation by 2	SYSREFAB	-
2	250 MSPS	Decimation by 2		

### 7.4.3 Output Format

Table 7 provides detailed information on how the MSB or LSB get aligned for the different output data rates and resolution in the different operating modes.

**Table 7. Output Data Formats**

Function	Output Rate	Mode	Resolution	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
RX	250 MSPS	Decimate by 2	14 bit	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	OVR	0
FB	250 MSPS	Burst Mode	14 bit	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	OVR	HRES
RX	500 MSPS	SNR Boost	9 bit	D8	D7	D6	D5	D4	D3	D2	D1	D0	0	0	0	0	0	OVR	0
FB	500 MSPS	Burst Mode	11 bit	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	0	0	0	OVR	HRES
			12 bit	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	0	0	OVR	HRES
			14 bit	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	OVR	HRES

### 7.4.4 Burst Mode of Every Other Sample (250 MSPS Output)

In this mode, the channel is sampling at full sampling rate but the output only transmits every other sample with burst mode. During burst mode operation the output is alternated between low resolution 11-bit and high resolution 12- or 14-bit output. The burst mode operation can be configured to auto or manual trigger (see [Burst Mode](#)).

Figure 55. Timing Diagram Burst Mode of Every Other Sample

### 7.4.5 SNR Boost (500 MSPS Output)

In this mode, the channel output data is truncated to 9-bit resolution and the quantization noise is shaped using TI SNR Boost 3G technology. The SNR Boost passband bandwidth maximum is 150 MHz at 500 MSPS centered at the mid-point of the Nyquist zone.

Figure 56. SNR Boost Noise Shape Response

### 7.4.6 Burst Mode

The ADS58J89 supports TI's next generation burst mode technology which can be used for the DPD feedback path as well for the receive path (TDD burst mode) in TDD applications. In receive mode, the TDD burst mode is used to support very wide band and high resolution or duty cycle operation. Both modes can also be used simultaneously where two channels operate in burst mode and two channels in TDD burst mode.

In burst mode operation, the ADS58J89 alternatively transmits low resolution (11 bit for 250 MSPS operation and 9 bit for 500 MSPS operation, LSBs are set to 0) and high resolution (11-, 12-, or 14-bit) output data and can be configured via SPI register writes. The number of low and high resolution samples is configured through programmable counters.

#### 7.4.6.1 Burst Mode Counters

The ADS58J89 provides eight independent counters each for channel A and B and channel C and D for burst mode operation. The TDD burst mode employs all eight counters (four for the low resolution samples and four for the high resolution samples) while the normal burst mode uses only  $H_1$  and  $L_1$ . Each count corresponds to four samples and each counter can be programmed through a 22-bit register entry (1 to 4194303).

The counter values can be updated at any time, but the update does not go into effect until the start of the next burst mode cycle with low resolution output data ( $L_1$ ). After programming the counters, the ADS58J89 calculates the corresponding duty cycle for the selected high resolution output. If the duty cycle violates the limits, the digital outputs are limited to low resolution output.

$$\text{Duty Cycle} = \frac{H_1(+H_2 + H_3 + H_4)}{L_1(+L_2 + L_3 + L_4)} \quad (1)$$

The duty cycle limits per selected high resolution output is shown in [Table 8](#).

**Table 8. Burst Mode Maximum Allowed Duty Cycle**

Maximum Allowed Duty Cycle (High : Low Resolution Output)	500 MSPS	250 MSPS
14 bit	1/3	1/1
12 bit	2/3	4/1
11 bit	3/2	–

#### 7.4.6.2 Burst Mode

The number of high and low resolution samples is  $H_1 \times 2^2$  and  $L_1 \times 2^2$ . The maximum number of low resolution samples is  $2^2 \times 2^{22} = 2^{24}$  while the maximum number of high resolution samples depends on the duty cycle.

#### 7.4.6.3 TDD Burst Mode

The number of high and low resolution samples per cycle is  $(H_1 + H_2 + H_3 + H_4) \times 2^2$  and  $(L_1 + L_2 + L_3 + L_4) \times 2^2$ .

In TDD burst mode, the output data gets transmitted in the following order:  $L_1, H_1, L_2, H_2, L_3, H_3, L_4, H_4, L_1, H_1$ , and so forth

#### 7.4.6.4 Trigger Input

The burst mode can be operated in auto trigger or manual trigger mode while the TDD burst mode supports only the manual trigger mode.

In manual trigger mode, the trigger input releases the first high resolution data ( $H_1$ ) burst after the low resolution data counter  $L_1$  has timed out. The OVRB outputs can be configured via SPI (address 0x6F) as output flags TRDY for channel A and B. The OVRD outputs can be configured via SPI (address 0x6F) as output flags TRDY for channel C and D. Both these configurations indicate that counter  $L_1$  timed out and the high resolution output data burst can be triggered.

The ADS58J89 provides a lot of flexibility for the configuration of the trigger input. In default operation, the single-ended input pin TRIGGERAB controls all four channels. Alternatively, the trigger input can be changed to the OVRA pin as single-ended input or as a differential input with TRIGGERAB as positive and TRIGGERCD as negative input (differential input requires external 100- $\Omega$  termination).

For simultaneous receive and DPD feedback applications, it may be more useful to split the control where the TRIGGERAB or OVRA pin controls channel A and B and the TRIGGERCD or OVRC pin controls channel C and D. In addition, the OVRB and OVRD pins can be configured to output the TRDY flag for channel A and B and channel C and D, respectively.

The trigger input for channel A/B and channel C/D can each be selected with 2 register bits (address 0x2C and 0x3A) as shown in [Table 9](#).

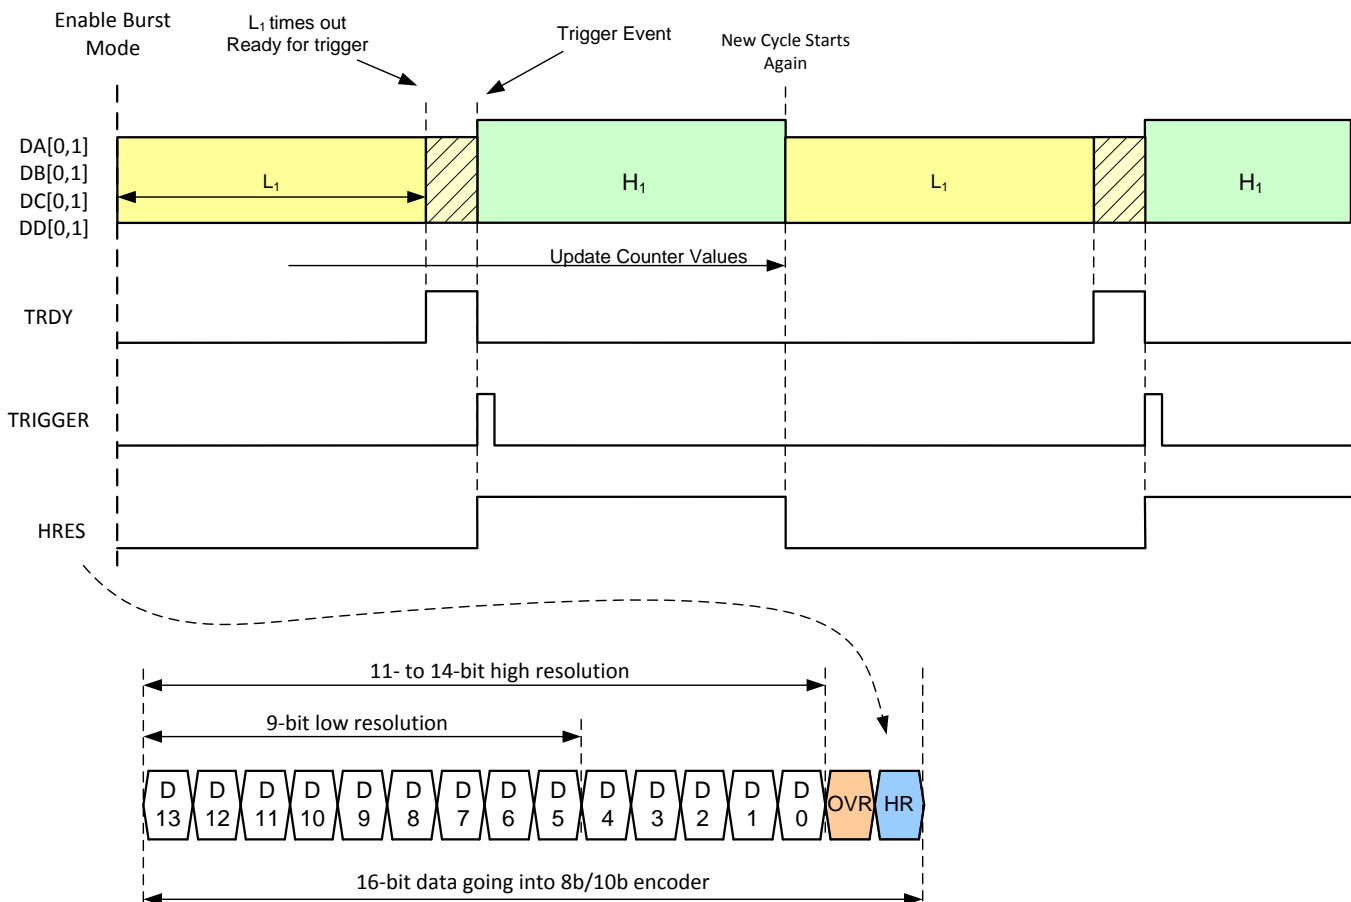

**Table 9. Burst Mode Trigger Sources**

Register Setting	Trigger Source
00	TRIGGERAB (= pin SYSREFCDP)
01	TRIGGERCD (= pin SYSREFCDM)
10	OVRA (for channel A/B) OVRC (for channel C/D)
11	TRIGGERAB/CD (as differential LVDS input, single trigger input for all 4 channels)

### 7.4.6.5 Manual Trigger Mode

Upon enabling manual trigger mode, the ADS58J89 starts transmission of low resolution data. As soon as the  $L_1$  counter is finished, the manual trigger is unlocked and the high resolution output  $H_1$  or burst mode sequence of  $H_1, L_2, H_2, L_3, H_3, L_4, H_4, L_1$  can be triggered. After the low resolution counter  $L_1$  is finished, the next high resolution output or burst mode sequence can be triggered again. The HRES flag is embedded in the JESD204B output data stream. The counter values can be updated until a new burst mode cycles starts with transmission of low resolution samples.

See [Figure 57](#) for an example of normal burst mode with manual trigger.

**Figure 57. Burst Mode Duty Cycle Timing**

See Figure 58 for an example of TDD burst mode with manual trigger:

Figure 58. TDD Burst Mode Duty Cycle Timing

### 7.4.6.6 Auto Trigger Mode

This mode is primarily intended for the DPD observation path. Upon enabling auto trigger mode, the ADS58J89 starts transmission of low resolution data. As soon as the L<sub>1</sub> counter is finished, the ADS58J89 immediately begins transmitting the high resolution output H<sub>1</sub>. The HRES flag can also be embedded in the JESD204B output data stream. The counter values can be updated until a new burst mode cycles starts with transmission of low resolution samples. Any input on the trigger input pins is ignored.

See Figure 59 for an example of normal burst mode with automatic trigger:

Figure 59. Auto-Trigger Mode Duty Cycle Timing

### 7.4.6.7 TDD-Burst Mode

This mode is intended for the receive path in TDD LTE receivers. The individual counters for high and low resolution output data can be programmed so that the high resolution samples line up with receive (uplink) frames and the low resolution samples line up with transmit (downlink) and setup frames where no data is present in the receive path.

**Table 10. TDD Burst Mode Duty Cycle**

Option	Number of Setup Frames	Number of Downlink Frames	Number of Uplink Frames	Duty Cycle	High Resolution Output (500 MSPS)
1	1	8	1	1:9 (0.11)	14 bit
2		7	2	2:8 (0.25)	14 bit
3		6	3	3:7 (0.43)	12 bit
4		5	4	4:6 (0.67)	11/12 bit
5		1 to 4	5 to 8	(1+)	11 bit
6	2	6	2	2:8 (0.25)	14 bit
7		5	3	3:7 (0.43)	12 bit
8		4	4	4:6 (0.67)	11/12 bit
9		1 to 3	5 to 7	>1	11 bit

#### 7.4.6.7.1 TDD Burst Mode Examples

Following are two examples to illustrate the intention for the TDD burst mode. The TDD frame has 10 equal size sub frames. For the downlink-uplink (DL-UL) configuration number 2 for example, the high and low resolution counters can be set for a given channel sampling rate to match the downlink-uplink profile as shown in [Figure 60](#). The manual trigger is used to initiate the high resolution output data, which maintains synchronization. The counter L<sub>1</sub> covers the low resolution data across two consecutive TDD frames and most of setup frame.

For configuration number 2, a duty cycle of approximately 2 / 8 can be achieved; with a sampling rate of 500 MSPS, the high resolution output of 14 bit can be used.

DL-UL Config	Subframe Number									
	0	1	2	3	4	5	6	7	8	9
2	D	S	U	D	D	D	S	U	D	D

**Figure 60. TDD Burst Mode Example 1**

For configuration number 3, a duty cycle of approximately 3 / 7 can be achieved and only two counters have to be programmed. With a sampling rate of 500 MSPS, a high resolution output of 12 bit can be used.

DL-UL Config	Subframe Number									
	0	1	2	3	4	5	6	7	8	9
3	D	S	U	U	U	D	D	D	D	D

Figure 61. TDD Burst Mode Example 2

## 7.5 Programming

### 7.5.1 Serial Register Write

The internal register of the ADS58J89 can be programmed following these steps:

1. Drive SDENb pin low.
2. Set the R/W bit to '0' (bit A7 of the 8 bit address).
3. Initiate a serial interface cycle specifying the address of the register (A6 to A0) whose content has to be written.
4. Write 16-bit data which is latched on the rising edge of SCLK.

Table 11. Serial Register Read or Write Timing<sup>(1)</sup>

PARAMETER	MIN	TYP	MAX	UNIT
$f_{SCLK}$ SCLK frequency (equal to $1 / t_{SCLK}$ )	>DC		10	MHz
$t_{LOADS}$ SDENb to SCLK setup time	50			ns
$t_{LOADH}$ SCLK to SDENb hold time	50			ns
$t_{DSU}$ SDATA setup time	50			ns
$t_{DH}$ SDATA hold time	50			ns

(1) Typical values at 25°C; minimum and maximum values across the full temperature range:  $T_{MIN} = -40^{\circ}C$  to  $T_{MAX} = 85^{\circ}C$ , AVDD33 = 3.3 V; AVDD18, AVDDC, DVDD, IOVDD, PLLVDD = 1.8 V, unless otherwise noted.

Figure 62. Serial Register Write Timing Diagram

### 7.5.2 Serial Register Readout

The device includes a mode where the contents of the internal registers can be read back using the SDOOUT and SDATA pins. This read-back mode may be useful as a diagnostic check to verify the serial interface communication between the external controller and the channel.

1. Drive SDENb pin low.
2. Set the RW bit (A7) to 1. This setting disables any further writes to the registers.
3. Initiate a serial interface cycle specifying the address of the register (A6 to A0) whose content has to be read.
4. The device outputs the contents (D15 to D0) of the selected register on the SDOOUT/SDATA pin.
5. The external controller can latch the contents at the SCLK rising edge.
6. To enable register writes, reset the RW register bit to 0.

**Figure 63. Serial Register Read Timing Diagram**

**Table 20. Register Address 6 Field Descriptions**

Bit	Field	Type	Reset	Description
D15:D1	ANALOG SLEEP MODES – SPI			Power-down function controlled via SPI. When a bit is set to 0, the function is powered down when ENABLE pin is high. However, register 0x05 has higher priority. For example, if D13 (deep sleep channel A) in 0x05 is enabled, it cannot be powered down with the SPI.
D13				Light sleep channel A
D11				Light sleep channel B
D9				Light sleep channel C
D7				Light sleep channel D
D6				Temperature sensor
D4				Clock buffer
D3				Clock divider channel AB
D2				Clock divider channel CD
D1				Buffer SYSREFAB
D0	SYSREFCD EN			Enables SYSREFCD input for dual SYSREF operation 0 = TRIGGER input for burst mode (differential or single ended, see address 0x2C/3A) 1 = SYSREF input for channel C/D (default)

**Table 21. Configurations When ENABLE Pin is High**

	Description
0000 0000 0000 000	Global power down
1000 0000 0000 000	Standby
1000 0000 0001 111	Deep sleep

**Table 21. Configurations When ENABLE Pin is High (continued)**

	Description
1010 1010 1001 111	Light sleep
1111 1111 1111 111	Normal operation

Control power down function through ENABLE pin:

1. Configure power-down mode in register 0x05
2. Normal operation: ENABLE pin high
3. Power-down mode: ENABLE pin low

Control power down function through SPI (ENABLE pin always high):

1. Assign power-down mode in register 0x06
2. Normal operation 0x06 is 0xFFFF
3. Power-down mode: configure power down mode in register 0x06

### 7.6.1.8 Register Address 7

**Figure 72. Register Address 7, Default: 0x0124, Hex = 7**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	CLK SW AB	1	0	1	0	0	0	1	0	0

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 22. Register Address 7 Field Descriptions**

Bit	Field	Type	Reset	Description
D9	CLK SW AB			User should set this bit to 1 when changing the clock phase of the clock divider AB. After the change is complete user needs to write this bit back to 0.
D8				Reads back 1
D6				Reads back 1
D2				Reads back 1

### 7.6.1.9 Register Address 8

**Figure 73. Register Address 8, Default: 0x0124, Hex = 8**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	CLK SW CD	1	0	1	0	0	0	1	0	0

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 23. Register Address 8 Field Descriptions**

Bit	Field	Type	Reset	Description
D9	CLK SW CD			User should set this bit to 1 when changing the clock phase of the clock divider CD. After the change is complete user needs to write this bit back to 0.
D8				Reads back 1
D6				Reads back 1
D2				Reads back 1

### 7.6.1.10 Register Address 12

**Figure 74. Register Address 12, Default: 0x31E4, Hex = C**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	1	1	0	0	0	1	1	1	SYSREF JESD MODE CD			SYSREF JESD MODE AB		

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 24. Register Address 12 Field Descriptions**

Bit	Field	Type	Reset	Description
D13				Reads back 1
D12				Reads back 1
D8				Reads back 1
D7				Reads back 1
D6				Reads back 1
D5:D3	SYSREF JESD MODE CD			Determines how SYSREF is used in the JESD block for channel CD 000 = Ignore SYSREF input 001 = Use all SYSREF pulses 010 = Use only the next SYSREF pulse 011 = Skip one SYSREF pulse then use only the next one 100 = Skip one SYSREF pulse then use all pulses (default) 101 = Skip two SYSREF pulses and then use one 111 = Skip two SYSREF pulses and then use all
D2:D0	SYSREF JESD MODE AB			Determines how SYSREF is used in the JESD block for channel AB. Same functionality as SYSREF JESD MODE CD

### 7.6.1.11 Register Address 13

**Figure 75. Register Address 13, Default: 0x0202, Hex = D**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	JESD INIT CD	JESD RESET CD	0	0	0	0	0	0	JESD INIT AB	JESD RESET AB

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 25. Register Address 13 Field Descriptions**

Bit	Field	Type	Reset	Description
D9	JESD INIT CD			Puts the JESD block in INITIALIZATION state when set high. In this state the JESD parameters can be programmed and the outputs will stay at 0. See also JESD start-up sequence.
D8	JESD RESET CD			Resets the JESD block when low
D1	JESD INIT AB			Puts the JESD block in initialization state when set high. In this state the JESD parameters can be programmed and the outputs will stay at 0.
D0	JESD RESET AB			Resets the JESD block when low

### 7.6.1.12 Register Address 14

**Figure 76. Register Address 14, Default: 0x00FF, Hex = E**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
0	0	0	0	0	0	0	0	TX LANE EN CD				TX LANE EN AB			

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 26. Register Address 14 Field Descriptions**

Bit	Field	Type	Reset	Description
D7:D4	TX LANE EN CD			Enables JESD204B transmitter for channel C and D. Set to 1 to enable. D7 = Lane DD1 D6 = Lane DD0 D5 = Lane DC1 D4 = Lane DC0
D3:D0	TX LANE EN AB			Enables JESD204B transmitter for channel A and B. Set to 1 to enable. D3 = Lane DB1 D2 = Lane DB0 D1 = Lane DA1 D0 = Lane DA0

**7.6.1.13 Register Address 15**

**Figure 77. Register Address 15, Default: 0x0001, Hex = F**

JESD SLEEP MODES – SPI

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 36. Register Address 31 Field Descriptions**

Bit	Field	Type	Reset	Description
D15:D0	JESD SLEEP MODES – SPI			Power-down function controlled via SPI. When a bit is set to 0, the function is powered down when ENABLE pin is high. However register 0x1E has higher priority. For example, if D9 (JESD PLL channel CD) in 0x1E is enabled, it cannot be powered down with the ENABLE pin. D9 = JESD PLL channel CD D8 = JESD PLL channel AB D7 = Lane DD1 D6 = Lane DD0 D5 = Lane DC1 D4 = Lane DC0 D3 = Lane DB1 D2 = Lane DB0 D1 = Lane DA1 D0 = Lane DA0

**Table 37. Configurations**

	Description
00 0000 0000	Global power down
00 0000 0000	Standby
11 0000 0000	Deep sleep
11 0000 0000	Light sleep
11 1111 1111	Normal operation (default)

Control power down function through ENABLE pin:

1. Configure power down mode in register 0x1E
2. Normal operation: ENABLE pin high
3. Power down mode: ENABLE pin low

Control power down function through SPI (ENABLE pin always high):

1. Assign power down mode in register 0x1F
2. Normal operation 0x1F is 0xFFFF
3. Power-down mode: configure power down mode in register 0x1F

**7.6.1.22 Register Address 32**

**Figure 86. Register Address 32, Default: 0x0000, Hex = 20**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
JESD LANE POLARITY INVERT								PRBS EN							

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

In the design of any application involving a high-speed data converter, particular attention should be paid the design of the analog input, the clocking solution, and careful layout of the clock and analog signals. In addition, the JESD204B interface means there now are high-speed serial lines that should be handled to preserve adequate signal integrity at the device that receives the sample data. The ADS58J89 evaluation module (EVM) is one practical example of the design of the analog input circuit and clocking solution, as well as a practical example of good circuit board layout practices around the ADC.

#### 8.1.1 SNR and Clock Jitter

The signal-to-noise ratio of the channel is limited by three different factors: the quantization noise is typically not noticeable in pipeline converters and is 84 dB for a 14-bit channel. The thermal noise limits the SNR at low input frequencies while the clock jitter sets the SNR for higher input frequencies.

$$SNR_{ADC}[dBc] = -20 \cdot \log \sqrt{\left(10^{\frac{SNR_{Quantization\ Noise}}{20}}\right)^2 + \left(10^{\frac{SNR_{Thermal\ Noise}}{20}}\right)^2 + \left(10^{\frac{SNR_{Jitter}}{20}}\right)^2} \quad (2)$$

Calculate the SNR limitation due to sample clock jitter using the following:

$$SNR_{Jitter}[dBc] = -20 \cdot \log(2\pi \cdot f_{in} \cdot T_{Jitter}) \quad (3)$$

The total clock jitter ( $t_{jitter}$ ) has two components – the internal aperture jitter (85 fs for ADS58J89), which is set by the noise of the clock input buffer, the external clock jitter, and the jitter from the analog input signal. Calculate total clock jitter using the following:

$$T_{Jitter} = \sqrt{(T_{Jitter,Ext.Clock\_Input})^2 + (T_{Aperture\_ADC})^2} \quad (4)$$

External clock jitter can be minimized by using high quality clock sources and jitter cleaners, as well as bandpass filters at the clock input while a faster clock slew rate improves the channel aperture jitter.

The ADS58J89 has a thermal noise of 66 dBFS and internal aperture jitter of 98 fs. The SNR depending on amount of external jitter for different input frequencies is shown in [Figure 107](#).

Figure 107. SNR vs Input Frequency and External Clock Jitter

## 8.2 Typical Application

The analog inputs of the ADS58J89 must be fully differential and biased to a desired common mode voltage, VCM. Therefore, there will be a signal conditioning circuit for each of the analog inputs. If the amplitude of the input circuit is such that no gain is needed to make full use of the full-scale range of the ADC, then a transformer coupled circuit as in Figure 108 may be used with good results. The transformer coupling is inherently low-noise, and inherently AC-coupled so that the signal may be biased to VCM after the transformer coupling. If signal gain is required, or the input bandwidth is to include the spectrum all the way down to DC such that AC coupling is not possible, then an amplifier-based signal conditioning circuit would be required.

By using the simple drive circuit of Figure 108, uniform performance can be obtained over a wide frequency range. The buffers present at the analog inputs of the device help isolate the external drive source from the switching currents of the sampling circuit.

Figure 108. Input Drive Circuit

Figure 109. Recommended Differential Clock Driving Circuit

### 8.2.1 Design Requirements

The ADS58J89 requires a fully differential analog input with a full-scale range not to exceed 1.25 V peak to peak, biased to a common mode voltage of 2.0 V. In addition the input circuit must provide proper transmission line termination (or proper load resistors in an amplifier-based solution) so the input of the impedance of the ADC analog inputs should be considered as well.

The clocking solution will have a direct impact on performance in terms of SNR, as shown in Figure 107. The ADS58J89 is capable of a typical SNR of 66 dBFS for input frequencies of about 100 MHz (in 14-bit burst mode), so we will want to have a clocking solution that can preserve this level of performance.

## Typical Application (continued)

### 8.2.2 Detailed Design Procedure

The ADS58J89 has an input bandwidth of approximately 900 MHz, but we will consider an application involving the first or second Nyquist zones, so we will limit the frequency bandwidth here to be under 250 MHz. We will also consider a 50-ohm signal source, so the proper termination would be 50-Ω differential. As seen in [Figure 110](#) and [Figure 111](#), the input impedance of the analog input at 250 MHz is large compared to 50 Ω, so the proper termination can be 50-Ω differential as shown in [Figure 108](#). Splitting the termination into two 25-Ω resistors with an AC capacitor to ground provides a path to filter out any ripple on the common mode that may result from any amplitude or phase imbalance of the differential input, improving SFDR performance. The ADS58J89 provides a VCM output that may be used to bias the input to the desired level, but as seen in [Figure 52](#) the signal is internally biased inside the ADC so an external biasing to VCM is not required. If an external biasing to VCM were to be employed, the VCM voltage may be applied to the mid-point of the two 25-Ω termination resistors in [Figure 108](#).

For the clock input, [Figure 107](#) shows the SNR of the device above 100 MHz begins to degrade with external clock jitter of greater than 100 fs rms, so we will recommend the clock source be limited to approximately 100 fs of rms jitter. For the ADS58J89 EVM, the LMK04828 clock device is capable of providing a low-jitter sample clock as well as providing the SYSREF signal required as shown in [Figure 47](#) and [Figure 48](#), so that clocking device is one good choice for the clocking solution for the ADS58J89.

### 8.2.3 Application Curves

[Figure 110](#) and [Figure 111](#) show the differential impedance between the channel INP and INM pins. The impedance is modeled as a parallel combination of RIN and CIN ( $RIN \parallel 1 / j\omega CIN$ ).

## 9 Power Supply Recommendations

The device requires a 1.8-V nominal supply for AVDDC, IOVDD, PLLVDD, and DVDD. The device also requires a 1.9-V supply for AVDD18 and a 3.3-V supply for AVDD33. There are no specific sequence power-supply requirements during device power-up. AVDD, DVDD, IOVDD, PLLVDD, and AVDD33 can power up in any order.

## 10 Layout

### 10.1 Layout Guidelines

The Device EVM layout can be used as a reference layout to obtain the best performance. A layout diagram of the EVM top layer is provided in . Some important points to remember during laying out the board are:

- Analog inputs are located on opposite sides of the device pinout to ensure minimum crosstalk on the package level. To minimize crosstalk on-board, the analog inputs should exit the pinout in opposite directions, as shown in the reference layout of as much as possible.
- In the device pinout, the sampling clock is located on a side perpendicular to the analog inputs in order to minimize coupling between them. This configuration is also maintained on the reference layout of as much as possible.
- Digital outputs should be kept away from the analog inputs. When these digital outputs exit the pinout, the digital output traces should not be kept parallel to the analog input traces because this configuration may result in coupling from digital outputs to analog inputs and degrade performance. The digital sample data rate can be as high as 5.0 Gbps, so care must be taken to maintain the signal integrity of these signals. A low-loss dielectric circuit board is recommended or else these traces should be kept as short as possible. These traces should be kept away from the analog inputs and clock input to the device as well.
- At each power-supply pin (AVDD, DRVDD, or AVDDD3V), a 0.1- $\mu$ F decoupling capacitor should be kept close to the device. A separate decoupling capacitor group consisting of a parallel combination of 10- $\mu$ F, 1- $\mu$ F, and 0.1- $\mu$ F capacitors can be kept close to the supply source.

#### 10.1.1 CML SerDes Transmitter Interface

Each of the 5 Gbps SerDes CML transmitter outputs requires AC coupling between transmitter and receiver. The differential pair should be terminated with a 100- $\Omega$  resistor as close to the receiving device as possible to avoid unwanted reflections and signal degradation.

### 10.2 Layout Example

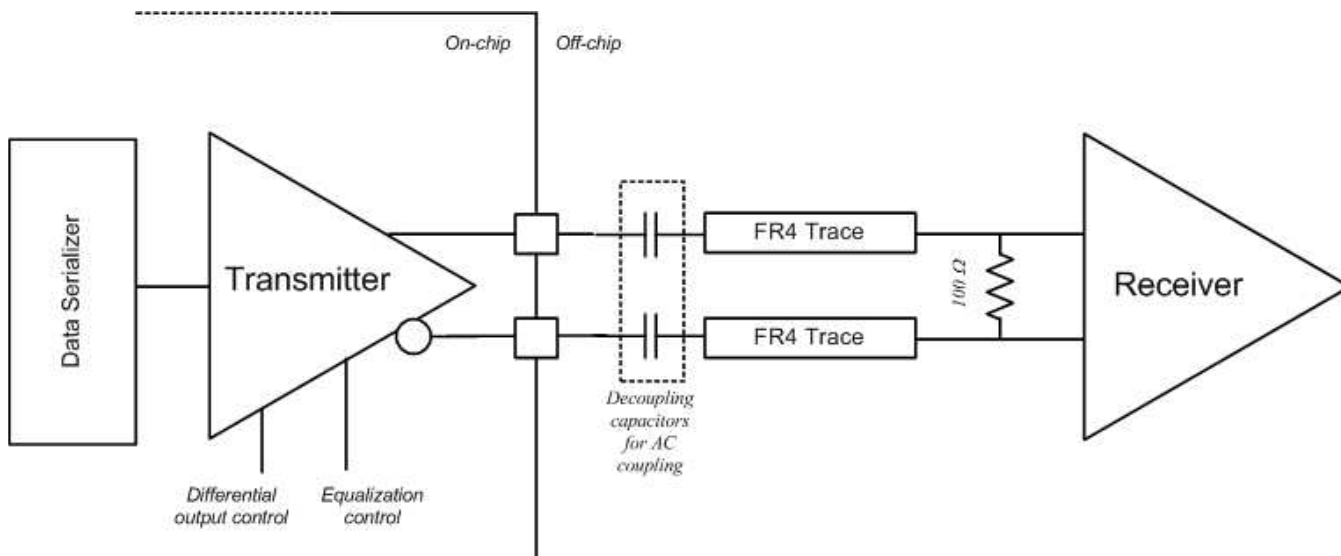

Figure 112. Layout Example Schematic

**Layout Example (continued)**

**Figure 113. Top and Bottom Layers**

## 11 Device and Documentation Support

### 11.1 Trademarks

PowerPAD is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.3 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS58J89IRGCR	ACTIVE	VQFN	RGC	64	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ58J89	<a href="#">Samples</a>
ADS58J89IRGCT	ACTIVE	VQFN	RGC	64	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-40 to 85	AZ58J89	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. # THERMAL PAD MECHANICAL DATA

RGC (S-PVQFN-N64)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in thermal pad.

## IMPORTANT NOTICE FOR TI DESIGN INFORMATION AND RESOURCES

Texas Instruments Incorporated ("TI") technical, application or other design advice, services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using any particular TI Resource in any way, you (individually or, if you are acting on behalf of a company, your company) agree to use it solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources.

You understand and agree that you remain responsible for using your independent analysis, evaluation and judgment in designing your applications and that you have full and exclusive responsibility to assure the safety of your applications and compliance of your applications (and of all TI products used in or for your applications) with all applicable regulations, laws and other applicable requirements. You represent that, with respect to your applications, you have all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. You agree that prior to using or distributing any applications that include TI products, you will thoroughly test such applications and the functionality of such TI products as used in such applications. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

You are authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING TI RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY YOU AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

You agree to fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of your non-compliance with the terms and provisions of this Notice.

This Notice applies to TI Resources. Additional terms apply to the use and purchase of certain types of materials, TI products and services. These include; without limitation, TI's standard terms for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>), [evaluation modules](#), and [samples](http://www.ti.com/sc/docs/sampterm.htm) (<http://www.ti.com/sc/docs/sampterm.htm>).
