## Package Information

## GaN HEMT Frequently Asked Questions

1	<p><b>Q: Can we do pin to pin switch for silicon MOSFET or IGBT?</b></p> <p>A: The short answer is no. GaN HEMT power devices are far superior than the best silicon devices such as super junction MOSFETs. However, due to different requirements of gate driving voltage and extremely high dv/dt slew rate, special drivers and optimized PCB layouts are recommended to minimize the impact from circuit parasitics.</p>
2	<p><b>Q: How do GaN power devices compare with SiC?</b></p> <p>A: Currently GaN power HEMT devices are most suitable for low to medium voltage (<math>\leq 1200V</math>) and power (&lt;20KW) applications. GaN is the ideal choice for high frequency applications. SiC devices are better choice for high voltage and high-power applications (&gt;20KW).</p>
3	<p><b>Q: Do we need to parallel an FRD for applications such as inverters?</b></p> <p>A: GaN devices are different from silicon MOSFET or IGBT in that they have no inherent PN junction diodes that cause reverse recovery issue. User do not need to parallel an FRD for the purpose of suppressing the body diode reverse recovery effect, since GaN HEMT can operate in both first and third quadrants. However, care should be taken for the dead time power loss since the Vsd voltage of GaN HEMT is usually close to 2V. This is especially true when a negative gate voltage is applied.</p>
4	<p><b>Q: Can we parallel GaN HEMT devices?</b></p> <p>A: Yes, GaN HEMT is ideal for paralleling, due to the positive temperature coefficient of <math>R_{ds,on}</math>. Hence, paralleling GaN HEMT devices are encouraged.</p>
