

LX2207 THREE LEVEL BATTERY CHARGER (1A MAXIMUM)

INTRODUCING TO PRODUCT

The LX2207 Evaluation Board is available from Microsemi for evaluating the performance of the LX2207 Battery Charger Integrated Circuit. The component sizes used on the evaluation board facilitate easy probing, however, in practice, smaller component sizes are recommended to minimize the circuit physical size.

KEY FEATURES

- Three charge levels for adapter, and USB Hi and Low
- 0.5% Float voltage tolerance
- Charging up to 1A.
- Charging from USB port.
- USB current compliance
- Full battery Indicator
- CC/CV w thermal Feedback
- Battery temp monitor
- Precision charge termination
- Power Good Indication

APPLICATIONS

- MP3 player
- PDA
- PMC
- Digital Camera
- Charge cradle

PART SPECIFIC INFORMATION

Part Number	Product

Connections. The LX2207 Evaluation Board has one power input and one power output connection.

FUNCTION	PIN NAME	VOLTAGE
Input Power	PWR	5V +/- 0.65V
Input RTN	GND	0V
Battery +	BAT+	0V to 4.3V
Battery -	RTN	0V

Jumpers. The LX2207 Evaluation Board has three two position jumper blocks. The jumper can be moved to select either a high logic level or low logic level. It is also possible to remove the jumper and apply a voltage directly to the center pin of the jumper block.

Hookup. The following is a demonstration scenario that can be used to evaluate the LX2207.

- 1) Apply the single cell Lithium Ion or Lithium polymer battery to the battery screw terminal block. Be sure to connect the positive terminal of the battery to the BAT+ terminal and the Negative terminal to the RTN terminal.
- 2) Move the SHUTDOWN jumper to the ON position, the USB jumper to the 500mA position and the POWER SELLECT jumper to the WALL position.
- 3) Apply a +5V power source to the PWR terminal and the power supply return to the GND terminal.
- 4) The POWER ATTACHED and CHARGING LEDs should be lit when the battery is charging and the POWER ATTACHED and FULL LEDs should be lit when the battery is fully charged.
- 5) Monitor the charge current into the battery with a current probe.
- 6) Verify the charge current changes from approximately 1A to approximately 460mA when the POWER SELECT jumper is moved from the WALL to the USB position.
- 7) With the POWER SELECT jumper in the USB position, verify the charge current changes from approximately 460mA to approximately 92mA when the USB jumper is moved from the 500mA position to the 100mA position.
- 8) Verify that moving the SHUTDOWN battery to the OFF position extinguishes the LEDs and terminates the charge cycle.
- 9) The thermal lockout can be tested by momentarily applying a jumper between the RTC and RTN on the BAT TEMP jumper terminal. When the jumper is in place, the charging current will drop to zero, but the charge LED will remain illuminated.

PCB LAYOUT RECOMMENDATIONS

It is recommended that C1 and C2 be located within 1cm of the LX2207. The CMP capacitor¹ should be located close to the IN and CMP pins. Also the high impedance summing node connecting to the TMP pin should be kept as short as possible. It is important that the LX2207 have a good thermal path to ambient

to dissipate heat. The simplest way to do this is to heatsink the LX2207 bottom pad directly to the ground plane by placing 4 or more vias in the ground pad directly under the LX2207 footprint.

¹ Since the initial release of the LX2207 evaluation board, our recommended CMP circuit has changed from a 0.47uF capacitor alone to a series combination of a 1K resistor and 0.47uF capacitor.
