## Quick Start

### Recommended Equipment

- A DC power supply capable of supplying a voltage between 2.7V to 3.6V at 500mA
- CVBS and S-video signal generator
- Video measurement equipment (e.g., Tektronix VM700T or equivalent)

### Procedure

The MAX9588 EV kit is fully assembled and tested. Follow the steps below to verify board operation.

**Caution: Do not turn on the power supply until all connections are completed.**

- 1) Connect the power supply to the pads labeled VDD and GND on the MAX9588 EV kit.
- 2) Connect the desired test signals from the video signal generator to the IN\_A/CVBS, IN\_B/LUMA(Y), and IN\_C/CHROMA(C) BNC connectors.
- 3) Connect the output signals from the OUT\_A, OUT\_B, and OUT\_C BNC connectors to the inputs of the video measurement equipment.
- 4) Turn on the power supply and verify the output signals.

# MAX9588 Evaluation Kit

## Detailed Description

The MAX9588 EV kit demonstrates the MAX9588 low-power, triple-channel video filter amplifier with integrated reconstruction filters. The EV kit operates from 2.7V to 3.6V with a 2V/V fixed gain.

The MAX9588 has  $\pm 1\text{dB}$  (typ) passband flatness at 7MHz and 40dB attenuation at 27MHz and the outputs can be DC-coupled to a  $75\Omega$  load, which is the equivalent of two video loads, or AC-coupled to a  $150\Omega$  load.

## AC-Coupling the Output

The output of the MAX9588 can be AC-coupled. To keep the highpass formed by the  $150\Omega$  equivalent resistance of the video transmission line to a corner frequency of 4.8Hz or lower, remove the  $0\Omega$  resistors on R7, R8, and R9 and install  $\geq 220\mu\text{F}$  coupling capacitors on the C6, C7, and C8 pads.
