Wireless Sensor Network Based on LoRa Technology

Wireless Turbidity Sensor

General Description

The RA0710 is connected to the ZS-206 integrated online turbidity sensor, and the ZS-206 is designed and manufactured using the principle of scattered light turbidity measurement. The LoRa module of the RA0710 communicates with the turbidity sensor in the form of RS485 communication to obtain the current turbidity signal value and display it through the wireless gateway.

Principle of Operation

When a beam of light is incident on a water sample, the light is scattered by the turbidity substance in the water sample, and the intensity of the scattered light in the direction perpendicular to the incident light is measured and compared with the internal calibration value to calculate the turbidity in the water sample which will be linearized to output the final value.

Example Applications

- Water quality turbidity test
- Smart washing machine
- Other
