31, 30, 27, 26, 23 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29, 28	VIR_ACT[1:0]	B'00	R/W	Virtual RPF Start Enable in BRU These bits enable start of the virtual RPF in the BRU as the source RPF for the WPFn when the WPFn is started. For details of the virtual RPF, refer to the following. Section 33.2.15.1, BRU Input Control Register (VI6_BRU_INCTRL) Section 33.2.15.2, Size Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_SIZE) Section 33.2.15.3, Display Location Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_LOC) Section 33.2.15.4, Color Information Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_COL) Note that the virtual RPF is in the BRU as shown in Figure 33.45 and there are no register bits for DPR setting related to the virtual RPF. B'00: The virtual RPF in the BRU is not started. B'01: The virtual RPF in the BRU is started as a sublayer source RPF for the WPFn. B'10: The virtual RPF in the BRU is started as the master-layer source RPF for the WPFn. B'11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
25, 24	VIR_ACT2 [1:0]	B’00	R/W	Virtual RPF Start Enable in BRS [RZ/G2H, RZ/G2N] These bits enable start of the virtual RPF in the BRS as the source RPF for the WPF0 when the WPF0 is started. For details of the virtual RPF, refer to the following. Section 33.2.19.1, BRS Input Control Register (VI6_BRS_INCTRL) Section 33.2.19.2, Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE) Section 33.2.19.3, Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC) Section 33.2.19.4, Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL) Note that the virtual RPF is in the BRS as shown in Figure 33.55 and there are no register bits for DPR setting related to the virtual RPF. B’00: The virtual RPF in the BRS is not started. B’01: The virtual RPF in the BRS is started as a sublayer source RPF for the WPFn. B’10: The virtual RPF in the BRS is started as the master-layer source RPF for the WPFn. B’11: Setting prohibited
9, 8	RPF4_ACT [1:0]	B’00	R/W	RPFn Start Enable (RPFn_ACT, n = 0 to 4) These bits enable start of RPFn as the source RPF for the WPFn when the WPFn is started. When RPFn is not started by any of the WPF0 to WPF1, set the VI6_DPR_RPFn_ROUTE.RT_RPFn bits to D'63. When ILV is used and image size of ILV output is equal to output size of the WPFn, set the RPFn_ACT, which ILVL (ILV left) is connected, to 2. B’00: RPFn is not started. B’01: RPFn is started as a sublayer source RPF for the WPFn. B’10: RPFn is started as the master-layer source RPF for the WPFn. B’11: Setting prohibited
7, 6	RPF3_ACT [1:0]	B’00	R/W	
5, 4	RPF2_ACT [1:0]	B’00	R/W	
3, 2	RPF1_ACT [1:0]	B’00	R/W	
1, 0	RPF0_ACT [1:0]	B’00	R/W	

When the WPFn is started through the VSP2 start register n (VI6_CMDn: n = 0, 1), the RPF and virtual RPF in the BRU specified as the source RPF in this register are also started to supply data to the VSP2 internal modules.

Note the following when specifying the source RPF.

(1) Each source RPF can be assigned to only one target WPFn; a single RPF cannot be assigned as the source RPF for multiple WPFs. For example, when setting VI6_WPF0_SRCRPF to H’0000_0008 and VI6_WPF1_SRCRPF to H’0000_0004 is attempted, the VSP2 will not operate correctly (these settings are prohibited) because RPF1 is assigned as both the master-layer source RPF for WPF0 and a sublayer source RPF for WPF1.

(2) When blending or ROP operation is applied to multiple images through the BRU or BRS, multiple source RPFs are necessary for one WPF. When multiple source RPFs are used, images should be classified into a master layer and sublayers; assign one of the source RPFs as the master-layer source RPF and other RPFs as sublayer source RPFs. Do not assign all RPFs as sublayer source RPFs (VI6_WPF1_SRCRPF = H’0000_0015) or two or more RPFs as the master-layer source RPF (VI6_WPF0_SRCRPF = H’0000_025A) (such settings are prohibited).

(3) When the BRU is not used, there should be only one source RPF for one WPF. In this case, the source RPF should be assigned as the master-layer source RPF.

33.2.7.2 WPFn Horizontal Input Size Clipping Registers (VI6_WPFn_HSZCLIP)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HCL_SIZE[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 24, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	HCEN	B'0	R/W	Horizontal Size Clipping Enable/Disable Enables or disables clipping of the horizontal size of the WPFn input image. 0: Horizontal size clipping is disabled 1: Horizontal size clipping is enabled
23 to 16	HCL_OFST [7:0]	All 0	R/W	Horizontal Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the left end of the image in horizontal size clipping when the HCEN bit is 1 (Figure 33.24). The left side of the image input to the WPF is cut off for the size specified in these bits. When the HCEN bit is 0, this setting is ignored. For WPF0, specify the left-side offset size (pixels) for the image before rotation. A value from 0 to 255 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in Figure 33.24 is made, VSP2 does not operate correctly.

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	HCL_SIZE [12:0]	All 0	R/W	Horizontal Clipping Size Setting When the HCEN bit is 1, these bits specify the clipping size for horizontal clipping processing. Through this processing, the area of the horizontal size specified through the HCL_SIZE bits starting from the offset position specified through the HCL_OFST bits is determined as the valid image area. Accordingly, the right-side pixels beyond the (HCL_OFST + HCL_SIZE) size in the WPFn input image are discarded. When the HCEN bit is 0, this setting is ignored. For WPF0, specify the horizontal clipping size for the image before rotation. A value from 1 to 8190 can be specified. (HCL_OFST + HCL_SIZE) should not exceed the horizontal size of the WPF input. If the setting shown in the bottom example in Figure 33.24 is made, VSP2 does not operate correctly. (Note) When the WPFn does not execute 90° or 270° rotation (bit 2 in VI6_WPFn_OUTFMT.ROT is 0) and the WPFn output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits. When the WPFn executes 90° or 270° rotation (bit 2 in VI6_WPFn_OUTFMT.ROT is 1) and the WPFn output format is YCbCr4:2:0, specify an even value in these bits.

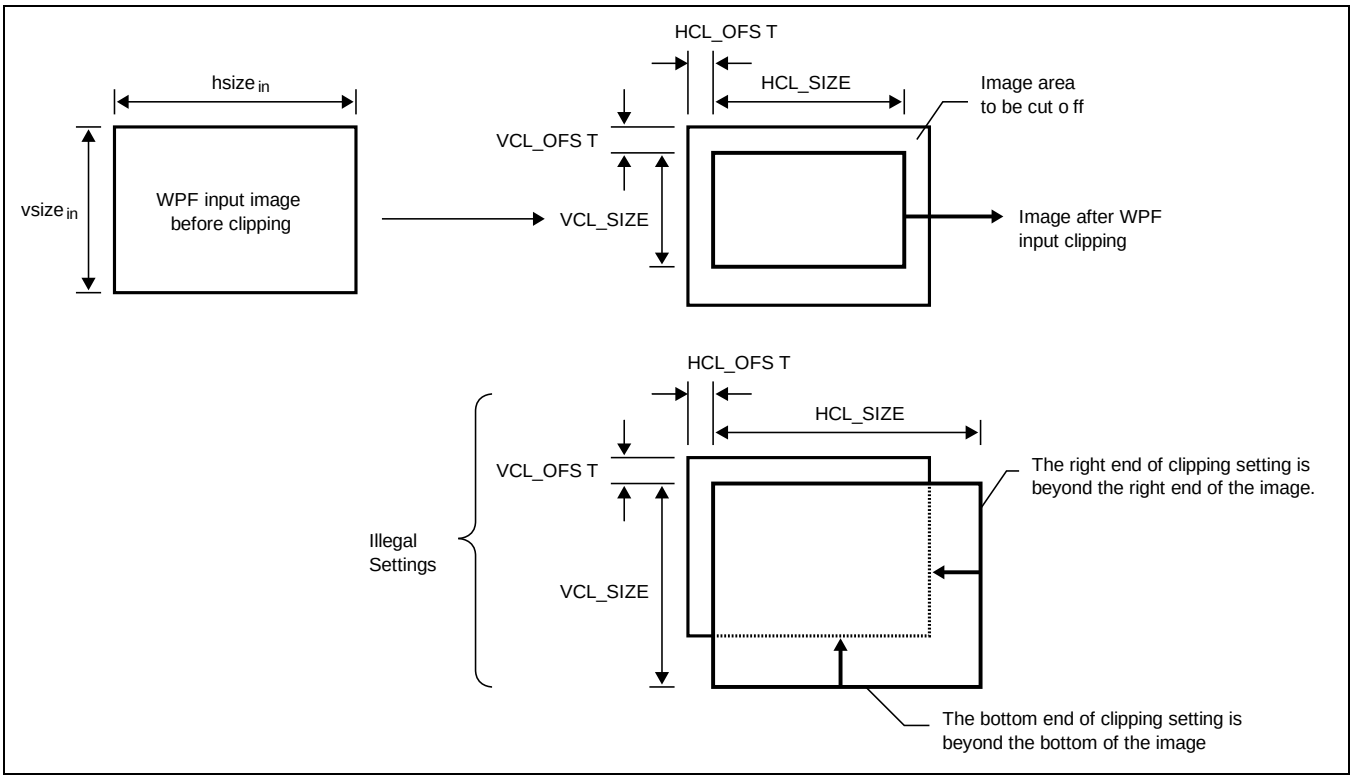

Figure 33.24 Image Clipping in WPF Input Section

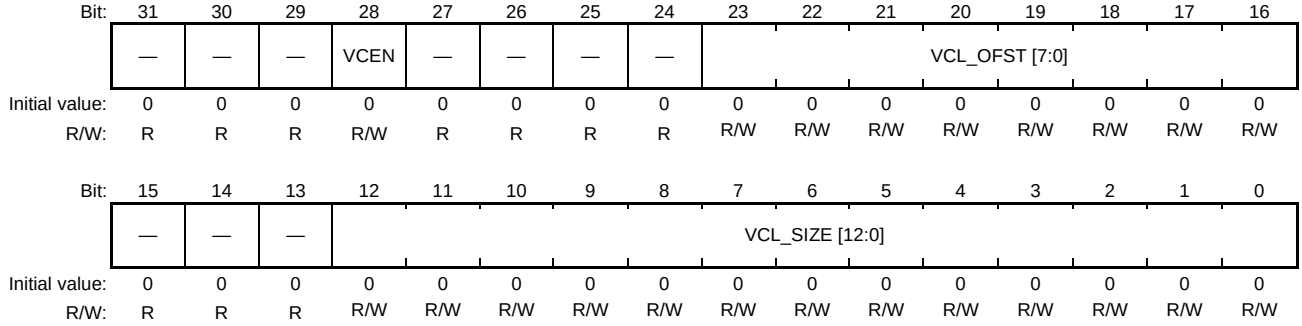
33.2.7.3 WPFn Vertical Input Size Clipping Registers (VI6_WPFn_VSZCLIP)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 24, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	VCEN	B'0	R/W	Vertical Size Clipping Enable/Disable Enables or disables clipping of the vertical size of the WPFn input image. 0: Vertical size clipping is disabled 1: Vertical size clipping is enabled
23 to 16	VCL_OFST [7:0]	All 0	R/W	Vertical Size Clipping Offset Value Setting These bits specify the offset size (pixels) from the top end of the image in vertical size clipping when the VCEN bit is 1 (Figure 33.24). The top of the image input to the WPF is cut off for the size specified in these bits. When the VCEN bit is 0, this setting is ignored. For WPF0, specify the top offset size (pixels) for the image before rotation. A value from 0 to 255 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in Figure 33.24 is made, VSP2 does not operate correctly.

Bit	Bit Name	Initial Value	R/W	Description
12 to 0	VCL_SIZE [12:0]	All 0	R/W	Vertical Clipping Size Setting When the VCEN bit is 1, these bits specify the clipping size for vertical clipping processing. Through this processing, the area of the vertical size specified through the VCL_SIZE bits starting from the offset position specified through the VCL_OFST bits is determined as the valid image area. Accordingly, the bottom pixels beyond the (VCL_OFST + VCL_SIZE) size in the WPFn input image are discarded. When the VCEN bit is 0, this setting is ignored. For WPF0, specify the vertical clipping size for the image before rotation. A value from 1 to 8190 can be specified. (VCL_OFST + VCL_SIZE) should not exceed the vertical size of the WPF input. If the setting shown in the bottom example in Figure 33.24 is made, VSP2 does not operate correctly. (Note) When the WPFn does not execute 90° or 270° rotation (bit 2 in VI6_WPFn_OUTFMT.ROT is 0) and the WPFn output format is YCbCr4:2:0, specify an even value in these bits. When the WPFn executes 90° or 270° rotation (bit 2 in VI6_WPFn_OUTFMT.ROT is 1) and the WPFn output format is YCbCr4:2:2 or YCbCr4:2:0, specify an even value in these bits.

33.2.7.4 WPFn Output Format Registers (VI6_WPFn_OUTFMT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
21,19, 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
31 to 24	PDV [7:0]	All 0	R/W	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in Table 33.18. To store this value in PAD, specify 0 in the PXA bit. A value from 0 to 255 can be specified.
23	PXA	B'0	R/W	PAD Data Select Selects the value to be stored in the bit field indicated as PAD or P in the packed RGB output formats shown in Table 33.18. Both the value specified in the PDV bits and the α data input from the DPR to WPF are 8 bits, but some of the PAD and P bit fields shown in Table 33.18 are four bits or one bit. When the target bit field is not 8 bits, the number of bits in the PDV value and the α data input from the DPR to WPF is reduced according to the VI6_WPFn_RNDCTRL.ABRM setting. For bit count reduction, refer to Figure 33.25 and the description of VI6_WPFn_RNDCTRL.ABRM. 0: The value specified in the PDV bits is stored in the PAD shown in Table 33.18. 1: The α value output from DPR in pixel units is stored in the PAD shown in Table 33.18.
22	ODE	B'0	R/W	Ordered Dither (mode A) Enable/Disable 0: Ordered dither (mode A) is disabled. 1: Ordered dither (mode A) is enabled. When the output format specified through the WRFMT bits is YCbCr, specify 0 in this bit. And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in this bit even in the case that the output format specified through the WRFMT bits is RGB. Ordered dither is available only for 18bpp. So, when ODE bit is equal to 1, set WRFMT at 18bpp format. When ODE bit is equal to 0, WPF dither method is specified by DITH[1:0] in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.

Bit	Bit Name	Initial Value	R/W	Description
20	FCNL	B'0	R/W	FCNL compression activation. 0: Not compress data with FCNL 1: Compress data with FCNL. FCNL compression is realized in the FCPV, but setting of FCNL is in the VSP2 register. Setting timing of the FCNL should be same with other bit in the register. FCNL compression cannot be enabled for VSPBS, VSPD and VSPDL. Set 0 to this bit for VSPBS, VSPD and VSPDL. See section 35 FCP User's Manual for register setting related to FCNL.
18 to 16	ROT [2:0]	B'000	R/W	Rotation Processing Select These bits select the rotation/flipping processing to be applied to the WPFn output image. 90° rotation and 270° rotation are done clockwise. Figure 33.26 and Figure 33.27 show the correspondence between the original image and the rotation/flipping result according to each setting. B'000: No rotation or flipping B'001: Vertical flipping B'010: Horizontal flipping B'011: 180° rotation B'100: 90° rotation B'101: 90° rotation + vertical flipping (equal to 270° rotation + horizontal flipping) B'110: 90° rotation + horizontal flipping (equal to 270° rotation + vertical flipping) B'111: 270° rotation Rotation/flipping can be specified only in VSPI - WPF0. In other channels, refer to section 33.4.5 for restriction of these bits. Note that the destination address setting should be changed according to the setting of these bits. For details, refer to section 33.2.7.10. When the LIF module is used (VI6_LIF_CTRL.LIF_EN = 1), set 0 to ROT [2:0].
15	SPYCS	B'0	R/W	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H'47). When the output format is YVYU, set this bit and the SPUVS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.
14	SPUVS	B'0	R/W	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H'41). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H'42). When the output format is YVYU, set this bit and the SPYCS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
13, 12	DITH [1:0]	B’00	R/W	Ordered Dither (mode B) Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (260000 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. And when VI6_WPFn_OUTFMT.CSC is set to 1, specify 0 in these bits even in the case that the output format specified through the WRFMT bits is RGB. B’00: Dithering (mode B) is disabled B’11: Dithering (mode B) is enabled B’01, B’10: Setting prohibited When ODE bit in the register is 1, set this bit to 0.
11 to 9	WRTM [2:0]	B’000	R/W	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is YCbCr, or YCbCr to RGB when the format specified in the WRFMT bits is RGB. B’000: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] B’001: BT.601 YCbCr [0,255] ↔ RGB [0,255] B’010: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] B’011: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] B’100 to B’111: Setting prohibited
8	CSC	B’0	R/W	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPFn. The characteristics of color space conversion are determined by the WRTM setting. There are some points to be noted about the relationship between the CSC setting and output format (WRFMT). For details refer to (*1) in section 33.2.6.3, RPFn Input Format Registers (VI6_RPFn_INFMT). 0: Color space is not converted. 1: Color space is converted.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	WRFMT [6:0]	All 0	R/W	WPF Output Image Format Setting These bits select the format of the image output from the WPFn to the external memory from among those listed in Table 33.18 and Table 33.19. [Note 1] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. Specify an appropriate data flow of the source RPF → DPR → target WPF so that the size of the image input to the target WPF satisfies the above restrictions. In particular, when the data flow includes a module or a function that modifies (up-scales, down-scales, or clips) the image size, take special care about the module or function settings. In addition, note the rotation function of the WPF shown in Figure 33.10. When 90° or 270° rotation is used (bit 2 in the ROT bits has a value of 1), the horizontal size of the WPF output image is equal to the vertical size of the WPF input image, and the vertical size of the output image is equal to the horizontal size of the input image; that is, the horizontal and vertical sizes are switched between the input and output. For example, because of the above restriction on YCbCr4:2:2 that the horizontal output size should be a multiple of 2 pixels, the vertical size of the WPF input should be a multiple of 2 pixels. [Note 2] Output lines in YCbCr4:2:0 In the YCbCr4:2:0 output format, the number of chrominance lines in the vertical direction is one-half the number of luminance lines. For this reason, the WPF outputs only even-numbered chrominance lines (lines 0, 2, 4, 6, ...) (conversion from (A) to (B) in. When vertical flipping is also specified through the ROT bits, the flipping processing is executed last and the chrominance line locations are inverted (lines 1, 3, 5, 7, …) in the output image ((C) in Figure 33.28). [Note 3] Down sampling of CbCr in horizontal direction in YCbCr4:2:0 or YCbCr4:2:2 In the YCbCr4:2:2 or YCbCr4:2:0 output format, method of down sample of Cb/Cr in horizontal direction is average of neighbor two pixels.

Table 33.19 Packed YCbCr Formats for WPF Output

WRFMT [6:0]	Packed YCbCr Output Format	Reference
H'40	YCbCr4:4:4 semi-planar	Figure 33.15*4
H'41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 33.16*4
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	YCbCr4:2:0 interleaved *5	
H'4A	YCbCr4:4:4 planar	Figure 33.17*4
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, I420)	
H'4D to H'7F	Reserved	—

Notes: 1. When the output format is NV61 or NV21, set SPUVS (bit 14) to 1.
2. When the output format is YUY2, set SPYCS (bit 15) to 1.
3. When the output format is YVYU, set SPUVS (bit 14) to 1 and SPYCS (bit 15) to 1.
4. Figure 33.18 shows the definition of memory address for each pixel in Figure 33.15 to Figure 33.17.
5. Each line of plane is written twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

For details of each YCbCr format, refer to Figure 33.15, Figure 33.16, Figure 33.17, and Figure 33.18. In these figures, registers for the RPF are indicated; read them as registers for the WPF as follows.

(RPF registers in the figures) → (Corresponding WPF registers)

VI6_RPFn_SRCM_ADDR_Y.SRCM_ADDR_Y → VI6_WPFn_DSTM_ADDR_Y.DSTM_ADDR_Y

VI6_RPFn_SRCM_ADDR_C0.SRCM_ADDR_C0 → VI6_WPFn_DSTM_ADDR_C0.DSTM_ADDR_C0

VI6_RPFn_SRCM_ADDR_C1.SRCM_ADDR_C1 → VI6_WPFn_DSTM_ADDR_C1.DSTM_ADDR_C1

33.2.7.5 WPFn Data Swapping Registers (VI6_WPFn_DSWAP)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	P_LLS	P_LWS	P_WDS	P_BTS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	P_LLS	B'0	R/W	WPF Output Data Swapping in LONG LWORD Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 33.13. 0: Data swapping in LONG LWORD (64-bit) units is disabled 1: Data swapping in LONG LWORD (64-bit) units is enabled
2	P_LWS	B'0	R/W	WPF Output Data Swapping in long word Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 33.13. 0: Data swapping in long word (32-bit) units is disabled 1: Data swapping in long word (32-bit) units is enabled
1	P_WDS	B'0	R/W	WPF Output Data Swapping in Word Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 33.13. 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	P_BTS	B'0	R/W	WPF Output Data Swapping in Byte Units The effect of this bit setting is the same as data swapping in the RPF; refer to Table 33.13. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

Table 33.13 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as in Table 33.18 for RGB format and Figure 33.15 to Figure 33.17 for YCbCr format, set 4'b1111 to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in Table 33.13.

Note: When writing data is FCNL compressed data, follow section 35 FCP User's Manual about setting this swap register.

33.2.7.6 WPFn Rounding Control Registers (VI6_WPFn_RNDCTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBRM	—	—	ABRM [1:0]		ATHRESH [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CLMD [1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27, 26, 15,14, 11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	CBRM	B'0	R/W	Bit Count Reduction Method Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in Table 33.18 and the target bit fields are not 8 bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
25, 24	ABRM [1:0]	B'00	R/W	Bit Count Reduction Method Selection for Data Storage in PAD These bits specify the method for reducing the number of bits when the data selected through VI6_WPFn_OUTFMT.PXA is stored in the bit fields indicated as PAD or P in Table 33.18 and the target bit field is four bits or one bit. A value of B'10 can be specified only when the packed RGB format specified through VI6_WPFn_OUTFMT.WRFMT includes a 1-bit P field. In this case, when the data selected through VI6_WPFn_OUTFMT.PXA is greater than the ATHRESH value, 1 is stored in the P field; when the selected data is not greater than the ATHRESH value, 0 is stored. B'00: Bit count conversion: The lower-order bits are truncated B'01: Bit count conversion: Rounding (rounding off) B'10: Bit count conversion: Comparison with the threshold value (this setting is allowed only when the storage field is one bit) B'11: Setting prohibited
23 to 16	ATHRESH [7:0]	All 0	R/W	Threshold for Conversion to 1-Bit α Data These bits specify the threshold value used for conversion from 8-bit α data to one bit when the ABRM bits are set to B'10. When the 8-bit α value before bit count reduction is equal to or smaller than the ATHRESH value, 0 is stored as the reduced 1-bit α data. In other cases, 1 is stored as the 1-bit α data. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
13, 12	CLMD [1:0]	B’00	R/W	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. B’00: Output value is not clipped (0-255) B’01: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) B’10: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) B’11: Setting prohibited

33.2.7.7 WPF0 Rotation Control Registers (VI6_WPF0_ROT_CTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
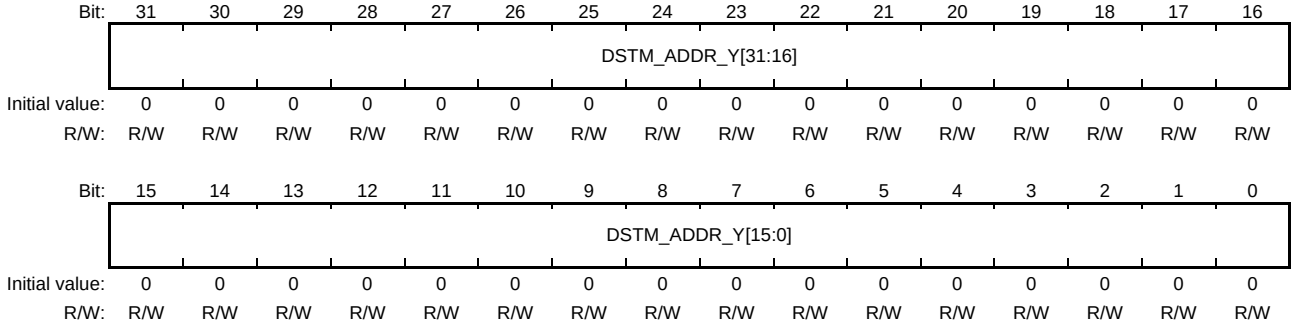
15 to 0	PICT_STRD_C [15:0]	All 0	R/W	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPFn as shown in Figure 33.29. When the WPFn outputs images in an RGB format, this setting is not used. When the WPFn outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from H'0000 to H'FFFF can be specified.

33.2.7.10 WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ ADDR_Y [31:0]	All 0	R/W	Destination Image Y/RGB Plane Storing Address These bits specify in 1-byte units the address for storing the destination-image Y plane or packed RGB plane to be written to by the WPFn in the method described later. A value from H'0000_0000 to H'FFFF_FFFF can be specified.

(Destination Address Specification Method)

When rotation/flipping is not used, the start address of a frame (address FHA shown in Figure 33.30) should be specified as the destination address. When flipping/rotation is used, the destination address is not the frame start address (FHA); one of addresses A_0 to A_3 shown in Figure 33.30 should be selected according to the combination of desired rotation and flipping (VI6_WPFn_OUTFMT.ROT setting).

To strictly define locations A_0 to A_3, let the horizontal size of the output image after rotation be H, the vertical size of the output image after rotation be V, and the memory stride (VI6_WPFn_DSTM_STRIDE_Y/C setting) be S as shown in Figure 33.30. Calculate the destination address (one of A_0 to A_3) using the formula shown in Table 33.20 and specify it in the destination address storing register.

The values of variables N, P, and L in Table 33.20 depend on the other register settings and luminance and chrominance components. These values should be obtained by referring to Table 33.21 to Table 33.23 when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_Y, or Table 33.21 and Table 33.24 to Table 33.25 when calculating the address to be specified in VI6_WPFn_DSTM_ADDR_C0 or VI6_WPFn_DSTM_ADDR_C1.

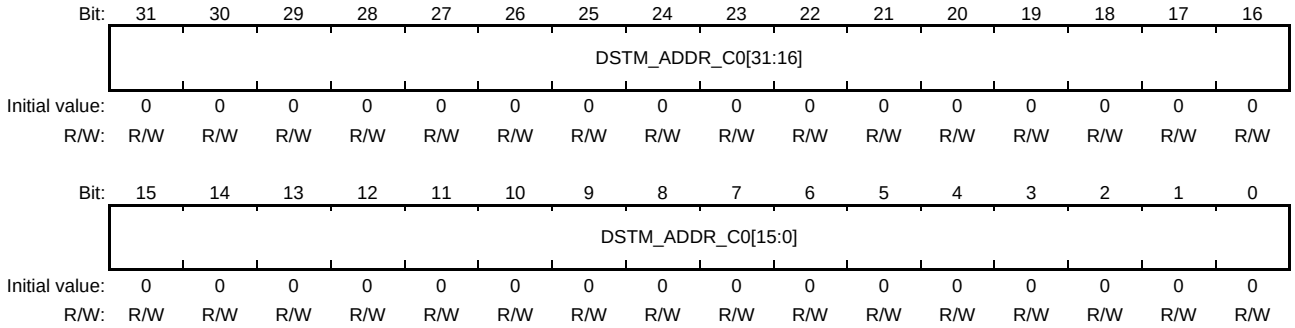
33.2.7.11 WPFn Destination Chroma Address Registers 0 (VI6_WPFn_DSTM_ADDR_C0)

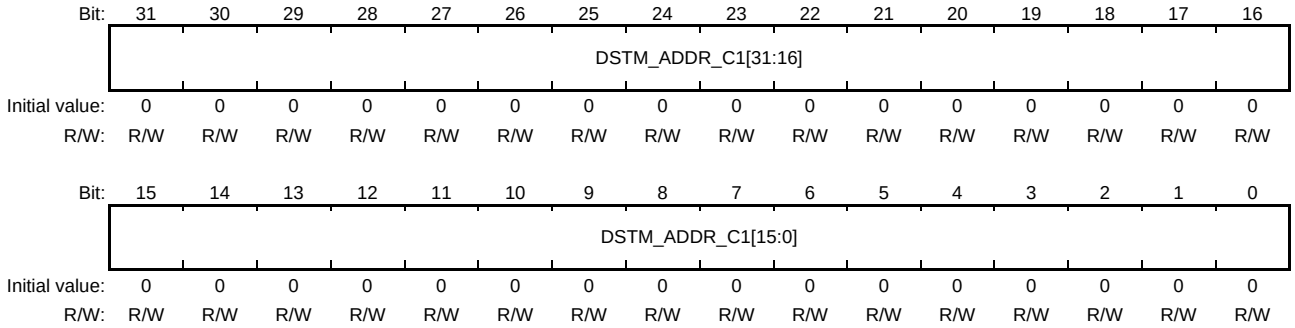
RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ ADDR_C0 [31:0]	All 0	R/W	Destination Image C Plane Storing Address 0 These bits specify in 1-byte units the address for storing the destination-image C plane to be written to by the WPFn. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in Table 33.19 or the Cb plane when a planar format is selected. When an interleaved format is selected or the output is in an RGB format, this setting is not used. A value from H'0000_0000 to H'FFFF_FFFF can be specified. Refer to Figure 33.30 in section 33.2.7.10 for settings.

33.2.7.12 WPFn Destination Chroma Address Registers 1 (VI6_WPFn_DSTM_ADDR_C1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DSTM_ ADDR_C1 [31:0]	All 0	R/W	Destination Image C Plane Storing Address 1 These bits specify in 1-byte units the address for storing the Cr plane when the WPFn outputs images to the external memory in YCbCr planar format shown in Table 33.19. Refer to the description of VI6_WPFn_DSTM_ADDR_Y for settings. This setting is not used when the WPF outputs in YCbCr format that is not a planar format or in an RGB format. A value from H'0000_0000 to H'FFFF_FFFF can be specified. Refer to Figure 33.30 in section 33.2.7.10 for settings.

33.2.7.13 WPFn LIF Write Back Control Registers (VI6_WPFn_WRBCK_CTRL: n = 0, 1)

1, 0	WBMD[1:0]	B'00	R/W	Display Data Write Back Control This bit is used for selecting the write back mode when the value of VI6_LIFn_CTRL.LIF_EN bit is set to 1. 0: Write Back Disabled 1: Write Back Enabled

33.2.8 DPR Control Registers

33.2.8.1 Concept of DPR Settings

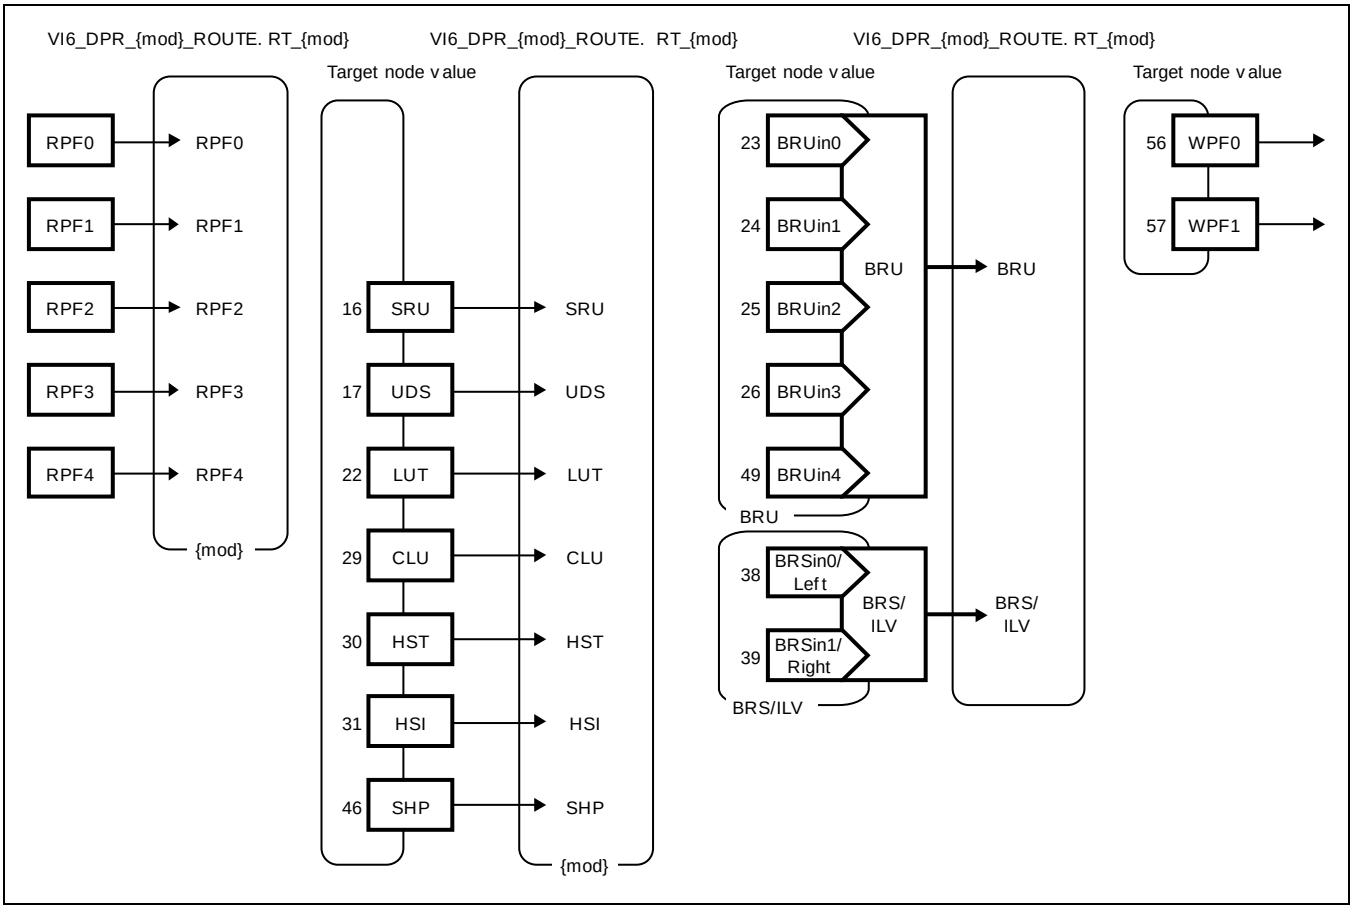

Figure 33.31 Node Register Names and Target Node Values on Data Path Router [RZ/G2H, RZ/G2N]

Note: * Figure 33.31 shows node value of all sub modules implemented in all VSPs of RZ/G2H, RZ/G2N.

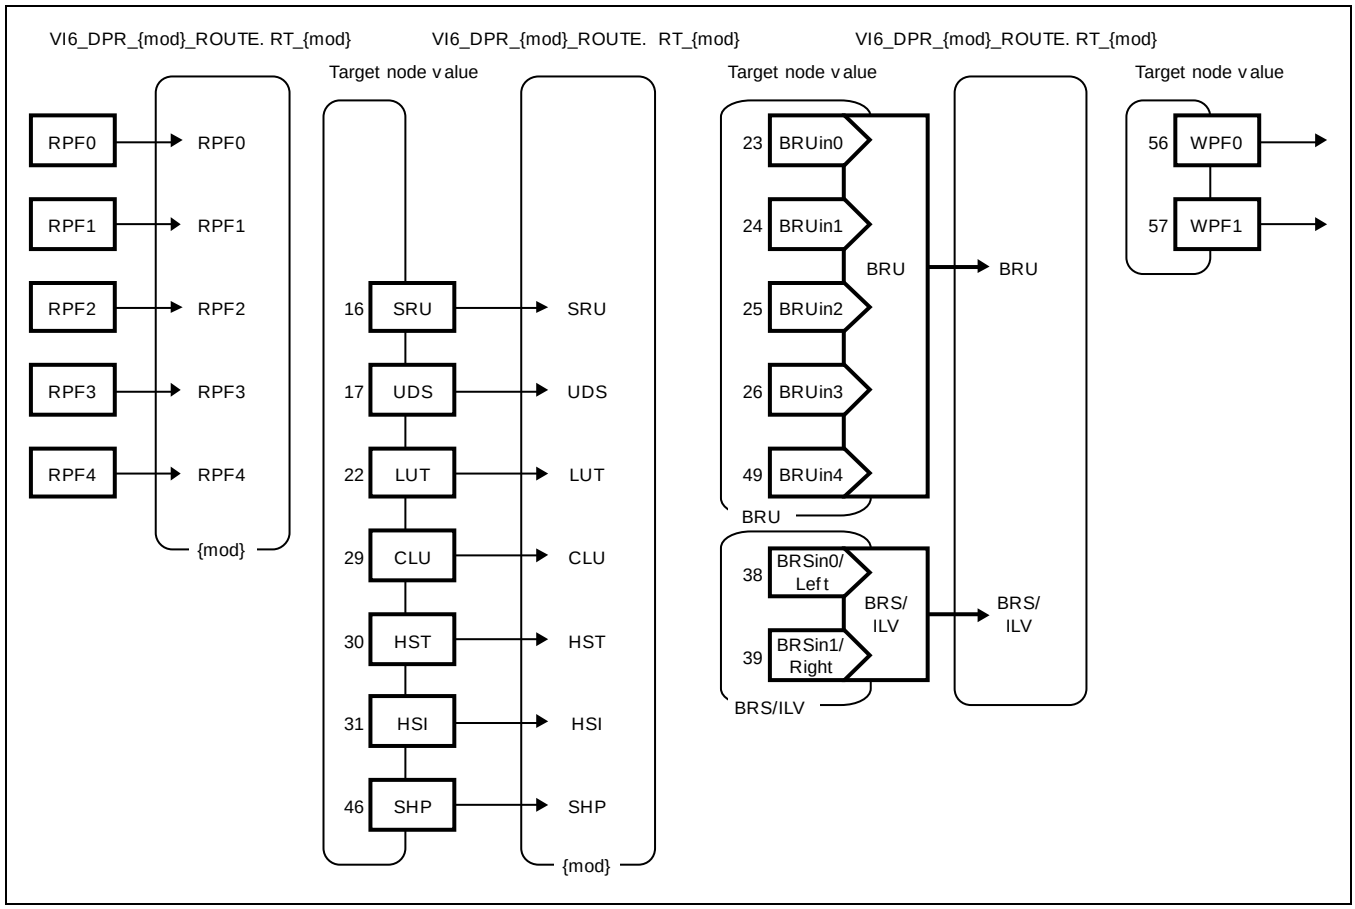

Figure 33.32 Node Register Names and Target Node Values on Data Path Router [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E]

Note: * Figure 33.32 shows node value of all sub modules implemented in all VSPs of RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E.

In the VSP2 internal data path, the order of processes can be specified as desired. The module for performing each process has a unique node value. Set each bit field in VI6_DPR_*_ROUTE to an appropriate node value shown in Figure 33.31 (RZ/G2H, RZ/G2N), Figure 33.32 (RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E) to specify the target node to be connected behind each module.

For DPR settings, all of the following restrictions should be observed. If any of them is violated, even the WPF paths operating correctly at that time will be affected as well as the WPF paths connected through the DPR, and correct operation will not be guaranteed (for example, if a restriction is violated for the DPR setting related to WPF1, even WPF0 that are operating correctly will be affected).

1. Specify 63 for the output node values of all RPFs and processing modules that are not used in the DPR. Here, make sure that no module is connected to a module for which 63 is specified as the node value.

Note: VI6_DPR_{mod}_ROUTE and VI6_DPR_{mod}_SMPPT corresponding to {mod} are not implemented in VSP which doesn't have {mod}. VI6_DPR_RPFn_ROUTE (n = 1 to 4) corresponding to RPFn is not implemented in VSP which doesn't have RPFn (n = 1 to 4). See Figure 33.1 to Figure 33.6 about module configuration of each VSP.

2. When specifying a value other than 63 for an output node value in the DPR, make sure that valid inputs (RPF0 to RPF4 or virtual RPF) and a target WPF are determined.
3. Only one module can be connected to each module; specifying the same target node value for two or more modules is prohibited.

4. Desired modules can be connected between each RPF and BRU input port, but all RPFs specified as the sources for a BRU input port should have the same target WPF. Same manner must be applied for ILV and BRS.
5. Make appropriate routing or RPF register settings so that the color space formats (RGB/YCbCr) for all BRU input ports are the same. Same manner must be applied for ILV and BRS.
6. Do not connect the output of any module as the input to the same module (in the BRU case, any input port) even when there is another module between the output and input (creating a loop is prohibited).
7. Each node can be used only once throughout all paths from RPFn to WPFn. When a module shown in Figure 33.31 is assigned in one RPF → WPF path, it cannot be used in another RPF → WPF path.
8. While a WPF is operating, modifying the DPR connection settings in VI6_DPR_*_ROUTE is prohibited for modules used by the WPF but allowed for modules not used by the WPF. Be careful not to accidentally modify the settings of the modules included in the WPF path that is operating.
9. Be careful to do the following setting when ILV or BRS is used.
   VI6_DPR_ILV_BRS_ROUTE.BRSSEL = 0 (ILV is sued)
   VI6_DPR_ILV_BRS_ROUTE.BRSSEL = 1 (BRS is used)
   BRS and ILV can be used exclusively.

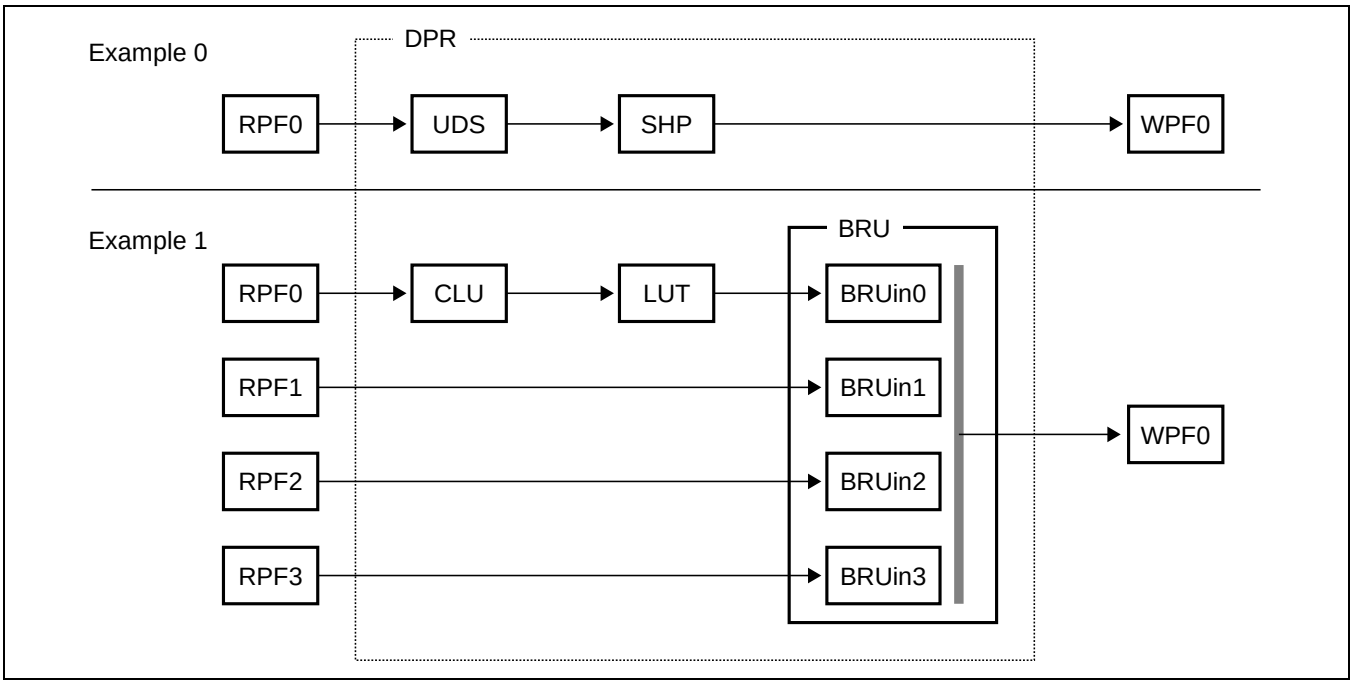

Figure 33.33 Examples of Internal Data Path Routing

Figure 33.33 shows examples of internal data path routing. Example 0 is WPF0 processing (RPF0 is the source RPF), and example 1 is also WPF0 (RPF0 to RPF3 are the source RPFs). Each example has the configuration shown in Figure 33.33. Example 0 performs UDS (up/down scaling) and SHP (sharpness) processing. Example 1 performs CLU and LUT processing (e.g. γ correction), for input 0 (RPF0) and then applies blending or raster operation between the resultant data and input data 1 to 3 (RPF1 to RPF3). The VI6_ DPR_*_ROUTE settings for these examples are shown in table 33.26. The bit fields for the modules that are not used in the examples should be set to 63.

Table 33.26 VI6_DPR_*_ROUTE Register Settings in Connection Examples Shown in Figure 33.33

	Register Name	Setting	
Example 0	VI6_DPR_RPF0_ROUTE.RT_RPF0	17	(To UDS)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	63	(UNUSED)
	VI6_DPR_RPF2_ROUTE.RT_RPF2	63	(UNUSED)
	VI6_DPR_RPF3_ROUTE.RT_RPF3	63	(UNUSED)
	VI6_DPR_RPF4_ROUTE.RT_RPF4	63	(UNUSED)
	VI6_DPR_SRU_ROUTE.RT	63	(UNUSED)
	VI6_DPR_UDS_ROUTE.RT	46	(To SHP)
	VI6_DPR_UIF4_ROUTE.RT	63	(UNUSED)
	VI6_DPR_SHP_ROUTE.RT	56	(To WPF0)
	VI6_DPR_LUT_ROUTE.RT	63	(UNUSED)
	VI6_DPR_CLU_ROUTE.RT	63	(UNUSED)
	VI6_DPR_HST_ROUTE.RT	63	(UNUSED)
	VI6_DPR_HSI_ROUTE.RT	63	(UNUSED)
	VI6_DPR_ILV_BRS_ROUTE.RT	63	(UNUSED)
	VI6_DPR_BRU_ROUTE.RT	63	(UNUSED)
Example 1	VI6_DPR_RPF0_ROUTE.RT_RPF0	29	(To CLU)
	VI6_DPR_RPF1_ROUTE.RT_RPF1	24	(To BRUin1)
	VI6_DPR_RPF2_ROUTE.RT_RPF2	25	(To BRUin2)
	VI6_DPR_RPF3_ROUTE.RT_RPF3	26	(To BRUin3)
	VI6_DPR_RPF4_ROUTE.RT_RPF4	63	(UNUSED)
	VI6_DPR_SRU_ROUTE.RT	63	(UNUSED)
	VI6_DPR_UDS_ROUTE.RT	63	(UNUSED)
	VI6_DPR_UIF4_ROUTE.RT	63	(UNUSED)
	VI6_DPR_SHP_ROUTE.RT	63	(UNUSED)
	VI6_DPR_LUT_ROUTE.RT	56	(To WPF0)
	VI6_DPR_CLU_ROUTE.RT	22	(To LUT)
	VI6_DPR_HST_ROUTE.RT	63	(UNUSED)
	VI6_DPR_HSI_ROUTE.RT	63	(UNUSED)
	VI6_DPR_ILV_BRS_ROUTE.RT	63	(UNUSED)
	VI6_DPR_BRU_ROUTE.RT	63	(UNUSED)

Although both examples shown in figure 33.33 include operation in image processing modules, connect the RPF to the WPF directly when only image format conversion or packed format conversion is required.

33.2.8.2 RPFn Routing Register (VI6_DPR_RPFn_ROUTE : n = 0, 1, 2, 3, 4)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

33.2.9 SRU Control Registers

33.2.9.1 Super Resolution Control Register 0 (VI6_SRU_CTRL0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SRU_PARAM0[8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SRU_PARAM1[4:0]					—	SRU_MODE [2:0]			SRU_PARAM2	SRU_PARAM3	SRU_PARAM4	SRU_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25, 15 to 13, 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SRU_PARAM0 [8:0]	All 0	R/W	Super Resolution Parameter 0 Specify an appropriate value shown in Table 33.28; do not specify any other value.
12 to 8	SRU_PARAM1 [4:0]	All 0	R/W	Super Resolution Parameter 1 Specify an appropriate value shown in Table 33.28; do not specify any other value.
6 to 4	SRU_MODE [2:0]	B’000	R/W	Super Resolution Mode Setting These bits specify a super resolution mode. In super resolution without scaling, the output size is the same as the input size. In super resolution with double scale-up, the output size is twice the input size. B’000: Super resolution without scaling B’100: Super resolution with double scale-up Other settings are prohibited.
3	SRU_PARAM2	B’0	R/W	Super Resolution Parameter 2 This parameter setting depends on the color space of the image input to the SRU. Specify an appropriate value shown in Table 33.29; do not specify any other value.
2	SRU_PARAM3	B’0	R/W	Super Resolution Parameter 3 Specify an appropriate value shown in Table 33.29; do not specify any other value.
1	SRU_PARAM4	B’0	R/W	Super Resolution Parameter 4 This parameter setting depends on the color space of the image input to the SRU. Specify an appropriate value shown in Table 33.29; do not specify any other value.

Bit	Bit Name	Initial Value	R/W	Description
0	SRU_EN	B'0	R/W	Super Resolution Processing Enable/Disable Enables or disables super resolution processing. This setting has the highest priority over all other SRU registers. 0: Super resolution processing is disabled (input goes through the SRU without change) 1: Super resolution processing is enabled

YCbCr format is recommended for the super resolution processing. If the super resolution processing is applied to an RGB-format image, adverse effects such as color blur may be generated; when using an RGB format, evaluate the image quality carefully before applying the processing to practical use.

To execute the super resolution processing in YCbCr format, set up the RPF and DPR appropriately so that YCbCr-format image data is input to the SRU. Specifically, make the RPFn output YCbCr-format image data and send the output data to the SRU through the DPR. For details of RPFn input/output settings, refer to section 33.2.6.3. For DPR settings, refer to section 33.2.8.1 to 33.2.8.4.

Table 33.28 Super Resolution Parameter Setting 1

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31, 27, 26, 23 to 21, 15 to 3, 0	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	AMD	B'0	R/W	Pixel Count at Scale-Up Specifies the number of pixels generated through scale-up in the UDS. This bit setting is ignored for scale-down. 0: Pixel count after scale-up is 1 + ⟨(n − 1) × scale-up factor⟩ 1: Pixel count after scale-up is ⟨n × scale-up factor⟩ *n: Number of pixels input to UDS
29	FMD	B'0	R/W	Padding for Insufficient Clipping Size When the scaling filter outputs an image that is smaller than the clipping size (VI6_UDS_CLIP_SIZE), pixels are interpolated to match the clipping size. This bit specifies the pixel filling method. 0: Pixels are filled by copying pixels at the right edge and the bottom edge 1: Pixels are filled with the color specified by VI6_UDS_FILL_COLOR
28	BLADV	B'0	R/W	Bilinear or Nearest Neighbor Interpolation Characteristic Control Controls the characteristics of bilinear or nearest neighbor interpolation. Setting this bit to 1 improves the aliasing characteristics at ×1/2 to 1/8 scaling (VI6_UDS_SCALE.VMANT/HMANT = 2 to 8). Note that the apparent resolution around edges may deteriorate. In multi-tap mode, this control is not available; to use this control, set the BC bit to 0.
25	AON	B'0	R/W	Scale-Up/Down of α Plane These bits specify whether to enable or disable scale-up/-down of the α plane when scaling up/down in the RGB format. When the AON bit is set to 0, the UDS outputs the value of the VI6_UDS_ALPVAL. ALPH_VAL0 bits as a fixed α value. 0: α scale-up/-down is not performed 1: α scale-up/-down is performed

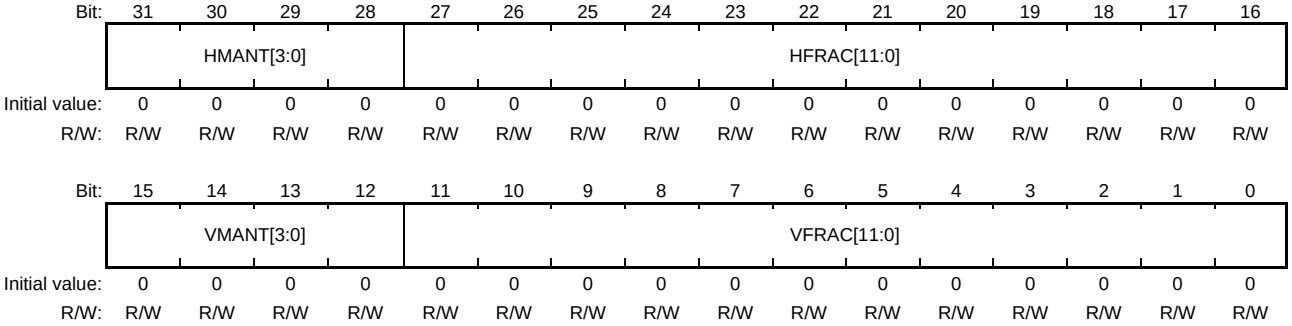
Bit	Bit Name	Initial Value	R/W	Description
24	ATHON	B'0	R/W	α Output Data Threshold Comparison Enable/Disable Enables or disables comparison with the α output data threshold. When this bit is 1, the output α value is replaced according to the VI6_UDS_ALPTH and VI6_UDS_ALPVAL values. When the AON bit is 0 (scale-up/-down of the α plane is disabled), this bit setting has no effect. 0: α output data threshold comparison is disabled 1: α output data threshold comparison is enabled
20	BC	B'0	R/W	Pixel Component Interpolation Method at Scale-Up/Down Specifies the method for interpolating pixel components at scale-up/-down. 0: Bilinear or nearest neighbor interpolation method is used 1: Interpolation method equivalent to 4 to 17 taps in accordance with the scaling factor is used (multi-tap mode) Setting 1 to BC bit (Multi tap mode) is recommended. Note that the α component is interpolated by the method specified in the NE_A bit instead of the multi-tap method. When the BC and AON bits are both set to 1, the scaling shall be scale-up, no scaling, or scale-down with scaling factor 1/1 to 1/2.
19	NE_A	B'0	R/W	α Interpolation Method Specifies the interpolation method of the α plane. When the AON bit is 0 (scale-up/-down of the α plane is disabled), this bit setting has no effect. 0: Bilinear method 1: Nearest neighbor method*
18	NE_RCR	B'0	R/W	R/Cr Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the R/Cr component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
17	NE_GY	B'0	R/W	G/Y Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the G/Y component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
16	NE_BCB	B'0	R/W	B/Cb Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the B/Cb component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
2	AMDSLH	B'0	R/W	Horizontal Filter Phase 0: The horizontal start and end phase is automatically determined by the setting of AMD. In this case, the value of VI6_UDS_HPHASE.HSTP/HEDP is not valid. 1: The horizontal start and end phase is determined by the value of VI6_UDS_HPHASE.HSTP/HEDP.

Bit	Bit Name	Initial Value	R/W	Description
1	EXT (TDIPC)	B'0	R/W	Extended UDS function Enable/Disable Select 0: Extended UDS function Disable 1: 2D IPC function or low pass filter Enable UDS execute 2D IPC function based on this bit and the setting of VI6_UDS_IPC register. UDS execute low pass filter based on this bit and the setting of VI6_UDS_IPC register. See section 33.2.10.7, 2D IPC Setting Register (VI6_UDS_IPC) for more details.

Note: * This method can be used only when the scale-up/-down factor is 1/1 to 1/4.

33.2.10.2 Scaling Factor Registers (VI6_UDS_SCALE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	HMANT [3:0]	All 0	R/W	Multiplier (Integral Part) of Horizontal Scaling Factor These bits specify the integral part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 33.30.
27 to 16	HFRAC [11:0]	All 0	R/W	Multiplier (Fractional Part) of Horizontal Scaling Factor These bits specify the fractional part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'100 to H'FFF can be specified when an image is up-scaled (the HMANT value is 0) in the horizontal direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the HMANT value is not 0) in the horizontal direction. Select a value within the range shown in Table 33.30.
15 to 12	VMANT [3:0]	H'0	R/W	Multiplier (Integral Part) of Vertical Scaling Factor These bits specify the integral part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 33.30.
11 to 0	VFRAC [11:0]	All 0	R/W	Multiplier (Fractional Part) of Vertical Scaling Factor These bits specify the fractional part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'100 to H'FFF can be specified when an image is up-scaled (the VMANT value is 0) in the vertical direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the VMANT value is not 0) in the vertical direction. Select a value within the range shown in Table 33.30.

The HMANT and HFRAC bits set the scale-up/-down factor for an image in the horizontal direction, and the VMANT and VFRAC bits set the scale-up/-down factor for an image in the vertical direction. The UDS operation switches between horizontal scale-up and horizontal scale-down according to the HMANT and HFRAC bit settings, as shown in Table 33.30. (Setting a value outside the ranges of Table 33.30 in UDS operation is prohibited). Table 33.30 is for the horizontal direction, but it is similar for the vertical direction. In this case, replace HMANT with VMANT and HFRAC with VFRAC when reading.

Note that settings for scaling in the horizontal direction and settings for scaling in the vertical direction can be made independently. Therefore, a setting for scale-up in the horizontal direction and scale-down in the vertical direction is possible. In such a case, because the formula (described later) for obtaining the image size after scale-up/-down is different between scale-up and scale-down, a formula matching the scale-up or scale-down operation should be selected independently for the horizontal direction and vertical direction.

Table 33.30 Switching of Horizontal Scale-Up/Down Operation According to HMANT and HFRAC Bit Settings

HMANT	HFRAC	UDS Operation
H'0	H'100 to H'FFF	Scale-up
H'1	H'000	Same size (no scale-up/-down)
	H'001 to H'FFF	Scale-down
H'2 to H'F	H'000 to H'FFF	

Described here is the method for calculating the size of the up-scaled/downscaled image that was obtained based on this register setting. First, define the variables necessary for calculating the horizontal size of the up-scaled/downscaled image, as shown below.

$$hscale = \frac{4096}{4096 \times m_h + f_h}$$

m_h is the value of VI6_UDS_SCALE.HMANT, and f_h is the value of VI6_UDS_SCALE.HFRAC. This formula expresses the estimate of the scale-up/-down factor processed by the UDS. If the horizontal size of the image before scale-up/-down is set as $hsize_{org}$, the horizontal size of the image after scale-up/-down can be roughly obtained through $hsize_{org} \times hscale$.

Similarly, define the variables necessary for calculating the vertical size of the up-scaled/down-scaled image.

$$vscale = \frac{4096}{4096 \times m_v + f_v}$$

When setting m_v as the value of VI6_UDS_SCALE.VMANT, f_v as the value of VI6_UDS_SCALE.VFRAC, and $vsize_{org}$ as the vertical size of the image before scale-up/-down, the vertical size of the image after scale-up/-down can be roughly obtained through $vsize_{org} \times vscale$.

When the UDS performs scale-down with the settings of Table 33.30, using the variables defined so far, the horizontal size of the downscaled image $hsize_{down\_scaled}$ and the vertical size of the downscaled image $vsize_{down\_scaled}$ become as follows:

$$hsize_{down\_scaled} = \left\langle 1 + \left(\left(\left\langle 1 + \frac{\langle hsize_{org} - 1 \rangle}{m_h'} \right\rangle - 1 \right) \times m_h' \times 4096 + hstp + hedp \right) \middle/ \left(4096 \times m_h + f_h \right) \right\rangle$$

$$vsize_{down\_scaled} = \left\langle 1 + \left(\left(\left\langle 1 + \frac{\langle vsize_{org} - 1 \rangle}{m_v'} \right\rangle - 1 \right) \times m_v' \times 4096 \right) \Big/ (4096 \times m_v + f_v) \right\rangle$$

hstp is the value of VI6_UDS_HPHASE.HSTP, *hedp* is the value of VI6_UDS_HPHASE.HEDP.

The value of m_h' or m_v', which is shown in Table 33.31, changes according to the setting of VI6_UDS_SCALE.HMANT or VI6_UDS_SCALE.VMANT and VI6_UDS_CTRL.BLADV.

Table 33.31 m_h' or m_v' Setting

VI6_UDS_SCALE.HMANT Setting (VI6_UDS_SCALE.VMANT Setting)	VI6_UDS_CTRL.BLADV	m_h' (m_v')
0 to 3	0	1
4 to 7	0	2
8 to 15	0	4
2 to 3	1	2
4 to 7	1	4
0, 1, 8 to 15	1	Forbidden

When the UDS performs scale-up with the settings of Table 33.30 and VI6_UDS_CTRL.AMD is 0, the horizontal size of the up-scaled image $hsize_{up\_scaled}$ and the vertical size of the up-scaled image $vsize_{up\_scaled}$ become as follows:

$$hsize_{up\_scaled} = \langle 1 + ((hsize_{org} - 1) \times 4096 + hstp + hedp) / (4096 \times m_h + f_h) \rangle$$

$$vsize_{up\_scaled} = \langle 1 + ((vsize_{org} - 1) \times 4096) / (4096 \times m_v + f_v) \rangle$$

When VI6_UDS_CTRL.AMD is 1, the horizontal size of the up-scaled image $hsize_{up\_scaled}$ and the vertical size of the up-scaled image $vsize_{up\_scaled}$ become as follows:

$$hsize_{up\_scaled} = \langle hsize_{org} \times hscale \rangle$$

$$vsize_{up\_scaled} = \langle vsize_{org} \times vscale \rangle$$

After considering the division of hscale and vscale, the formulas become as follows:

$$hsize_{up\_scaled} = \langle (hsize_{org} \times 4096) / (4096 \times m_h + f_h) \rangle$$

$$vsize_{up\_scaled} = \langle (vsize_{org} \times 4096) / (4096 \times m_v + f_v) \rangle$$

33.2.10.3 α Data Threshold Setting Registers (VI6_UDS_ALPTH)

R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23, 15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 16	BWIDTH_H [6:0]	All 0	R/W	Horizontal Signal Passband at Image Scale-Up/Down Set these bits following the method described later.
6 to 0	BWIDTH_V [6:0]	All 0	R/W	Vertical Signal Passband at Image Scale-Up/Down Set these bits following the method described later.

The method for setting the passband in the horizontal direction of an image is described. When the VI6_UDS_SCALE.HMANT bits for horizontal scale-up/-down factor setting are not 0, set the BWIDTH_H bits according to the following formula. When the VI6_UDS_SCALE.HMANT bits are 0, set 64 in the BWIDTH_H bits.

$$BWIDTH\_H = \left\langle 64 \times \frac{4096 \times m_h'}{4096 \times m_h + f_h} \right\rangle \quad \text{(VI6\_UDS\_SCALE.HMANT} \neq 0\text{)}$$

$$BWIDTH\_H = 64 \quad \text{(VI6\_UDS\_SCALE.HMANT = 0)}$$

m_h is the value of VI6_UDS_SCALE.HMANT, and f_h is the value of VI6_UDS_SCALE.HFRAC. For the m_h' value, see Table 33.31. The method for setting the passband in the vertical direction of an image is similar to that for the horizontal direction described earlier. Since only the correspondence relationship of the registers is changed as shown below, replace the variables in the previous explanation as shown below when reading.

BWIDTH_H → BWIDTH_V

$m_h' \rightarrow m_v'$

$m_h \rightarrow m_v$

$f_h \rightarrow f_v$

VI6_UDS_SCALE.HMANT → VI6_UDS_SCALE.VMANT

VI6_UDS_SCALE.HFRAC → VI6_UDS_SCALE.VFRAC

33.2.10.6 Scaling Filter Horizontal Phase Registers (VI6_UDS_HPHASE)

31 to 28, 26 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	FIELD	B'0	R/W	Top/Bottom Field Select Select Top/Bottom Field of image data when 2D IPC function is enabled (VI6_UDSn_CTRL.EXT = 1). 0: Top Field 1: Bottom Field
0	LPFE	B'0	R/W	Low Pass Filter Enable 0: low pass filter disable 1: low pass filter enable

IPC setting is shown below.

1. Set 1 to VI6_UDSn_CTRL.EXT.
2. Set UDS register as double up-scale in vertical direction and no scaling in horizontal direction.
3. Set appropriate setting of processing image.
   Top Field: H'0000_0000
   Bottom Field: H'0800 0000
4. Set 0 to VI6_UDS_CTRL.FMD
5. Set 1 to VI6_UDS_CTRL.BC

Low pass filter setting is show in below

1. Set 1 to VI6_UDS0_CTRL.EXT and set 1 to VI6_UDS0_CTRL.BC
2. Set equal setting (x1) to VI6_UDS_SCALE
3. Set 0 - 64 to VI6_UDS_PASS_BWIDTH. BWIDTH_H for low pass filter in horizontal direction.
4. Set 0 - 64 to VI6_UDS_PASS_BWIDTH. BWIDTH_V for low pass filter in vertical direction.

Strength of low pass filter can be set by VI6_UDS_PASS_BWIDTH.

When UDS is used for IPC processing, low pass filter cannot be enabled.

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	CL_HSIZE [12:0]	All 0	R/W	Clipping Size of Horizontal Pixel Count after Scale-Up/-Down The horizontal width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_HSIZE bits. The setting range is 4 to 2048 in a scale-down operation (see Table 33.30) and 4 to 8190 in a scale-up operation. These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VI6_UDS_SCALE register.
12 to 0	CL_VSIZE [12:0]	All 0	R/W	Clipping Size of Vertical Pixel Count after Scale-Up/-Down The vertical width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_VSIZE bits. The setting range is 4 to 2048 in a scale-down operation (see Table 33.30) and 4 to 8190 in a scale-up operation. These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VI6_UDS_SCALE register.

Figure 33.36 shows the configuration of the UDS. The UDS consists of a scaling filter and clipping circuit, such as the configuration shown in Figure 33.36. The scaling filter and clipping circuit are independent of each other.

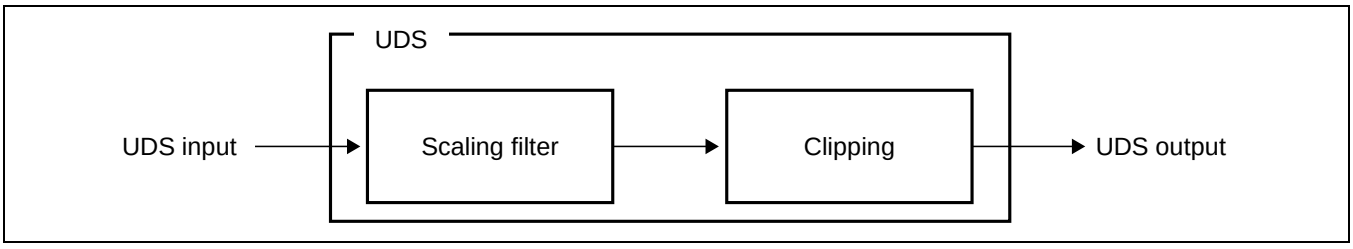

Figure 33.36 UDS Configuration

The size of the image actually output by the scaling filter (refer to section 33.2.10.2 for calculation) is determined from the size of the image input to the scaling filter and the VI6_UDS_SCALE setting; that is, three types of image are output by the UDS according to the relationship between the size of the image actually output from the scaling filter ($hsize_{scaled}$ and $vsize_{scaled}$) and this register setting as shown in Figure 33.37.

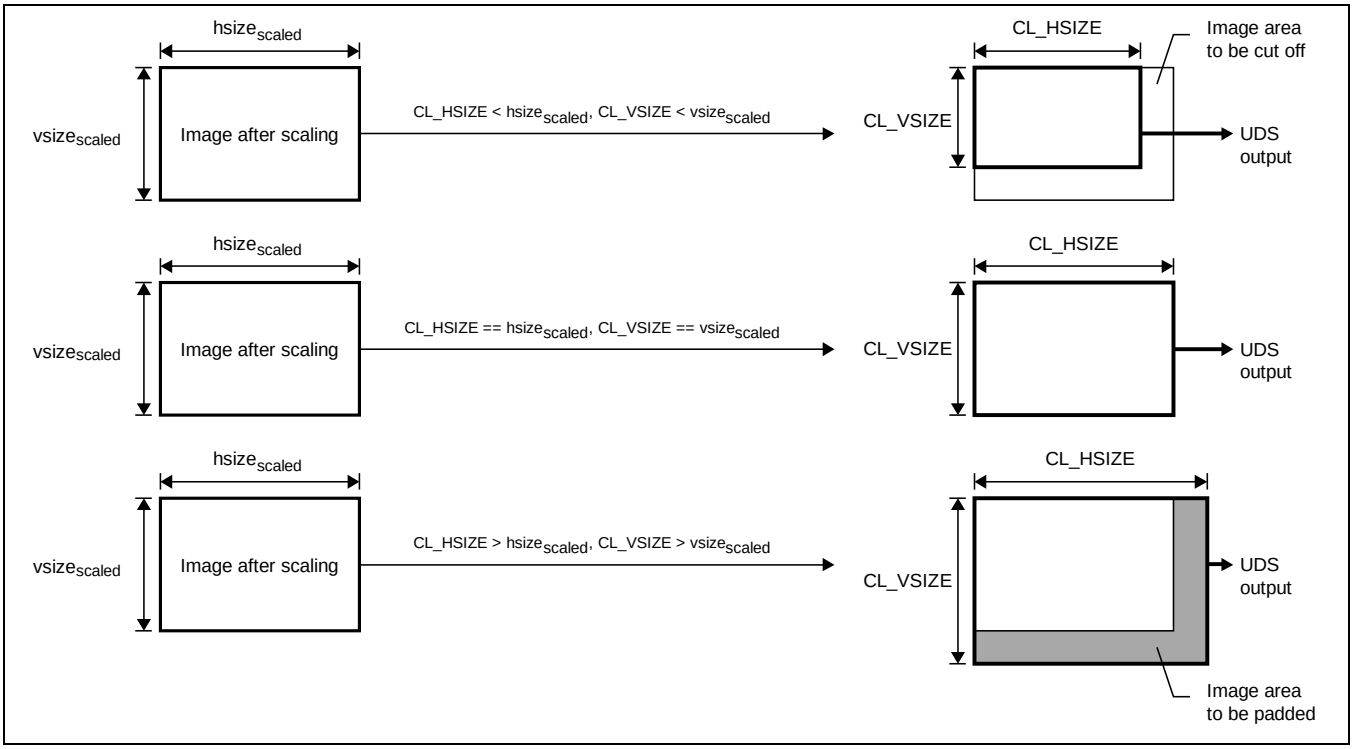

Figure 33.37 UDS Output Image for Each CL_HSIZE/VSIZE Setting

When the settings of the CL_HSIZE and CL_VSIZE bits are smaller than the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the up-scaled/down-scaled image is clipped to become the UDS output image.

When the settings of the CL_HSIZE and CL_VSIZE bits are equal to the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the image actually output by the scaling filter becomes the UDS output image without change.

When the settings of the CL_HSIZE and CL_VSIZE bits are greater than the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, in order to obtain the UDS output image, the image is padded in the mode set by VI6_UDS_CTRL.FMD for the area in which the settings of the CL_HSIZE and CL_VSIZE bits have exceeded the number of pixels actually output by the scaling filter.

7 to 0	BFILC [7:0]	All 0	R/W	B/Cb Component of Fill Color A value from H'00 to H'FF can be specified.

The scaling filter creates an up-scaled/down-scaled image based on the scaling factor settings of the VI6_UDS_SCALE register. If the size of the up-scaled/down-scaled image created by the scaling filter smaller than the clipping size set in the VI6_UDS_CLIP_SIZE register (lowest case in Figure 33.37) while VI6_UDS_CTRL.FMD is set to 1, the color specified by this register is used to fill the space until the clipping size is reached.

The α value of the area to be padded by this register is dependent on VI6_UDS_CTRL.FMD setting. When VI6_UDS_CTRL.FMD is 0 (repetition), the pixel value at the right edge (bottom edge) of the image is repeated as the α value. When VI6_UDS_CTRL.FMD is 1 (color information of this register is used), the α value is 0.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LUT_EN	B'0	R/W	1D-LUT Enable/Disable Enables or disables the 1D-LUT function by the LUT. When the 1D-LUT is used, the color component curve information needs to be set separately in the LUT table. For the LUT table settings, refer to section 33.3.5.1. 0: 1D-LUT function is disabled 1: 1D-LUT function is enabled

In the LUT, various image processing, such as curves with high operation load (e.g., γ correction), negative-positive conversion, and gain adjustment of images, can be achieved by the data replacement processing by the 1D-LUT. As shown in Figure 33.38, the LUT replaces each component of the input pixel data using the set replacement table of 256 entries. For example, if the LUT is set as in Figure 33.39, when there is an input of 150, the data stored in address 150 of the 1D-LUT is read and output as the LUT output. Figure 33.39 shows a case in which the input and output become equal for convenience in explaining.

In the LUT settings shown in Figure 33.40, the input bits are reversed. This has the effect of negative-positive flipping. In Figure 33.41, γ correction (γ = 1.8 is shown as an example) is possible. As described above, information to be set in the LUT indicates LUT processing characteristics. If the same value is set for each component in the LUT, an equal effect can be obtained for each component of the input image when it is processed. If the LUT is set with different characteristics for each component, the processing characteristics can be changed for each component.

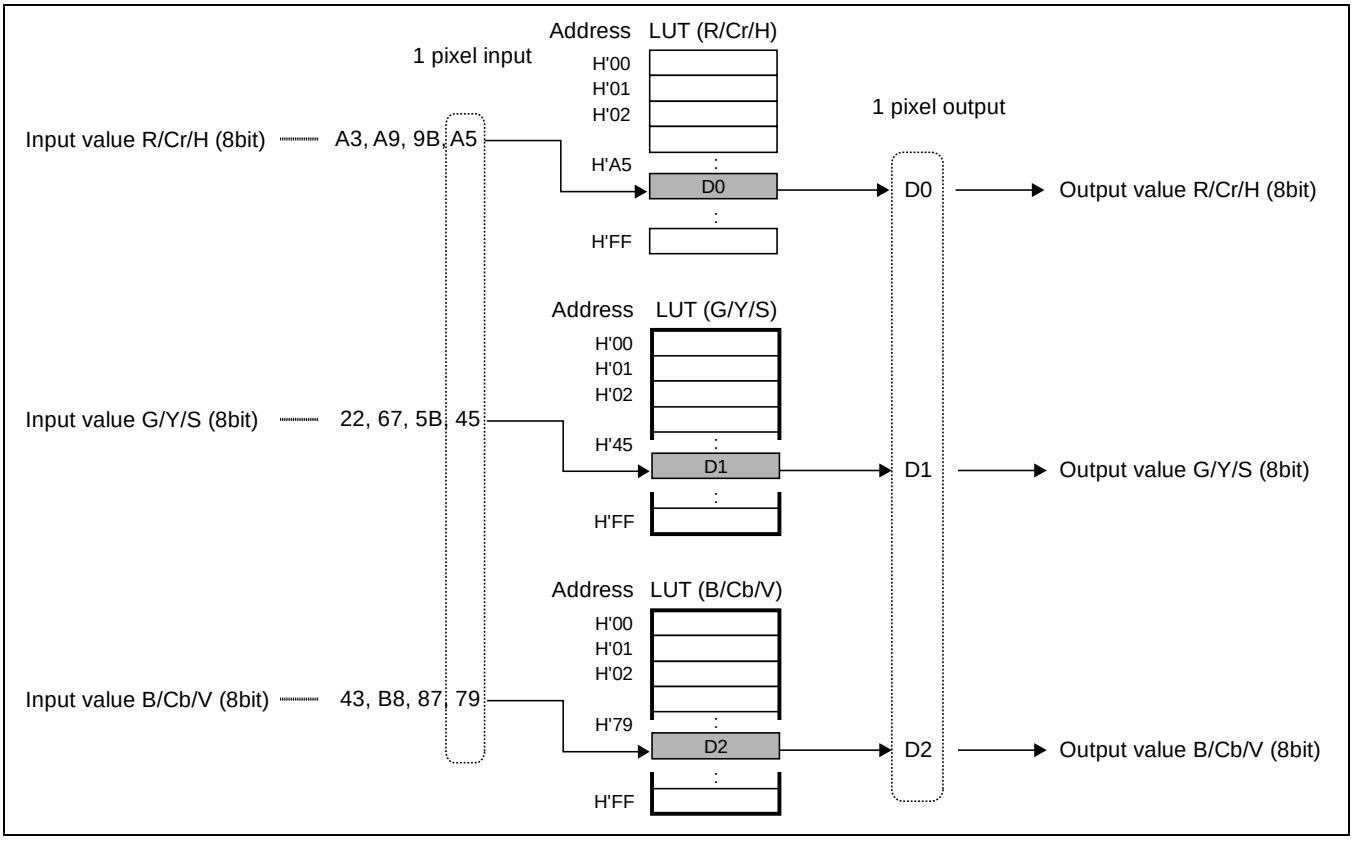

Figure 33.38 Relationship between Input and Output for 1D-LUT Table

Bit	Bit Name	Initial Value	R/W	Description
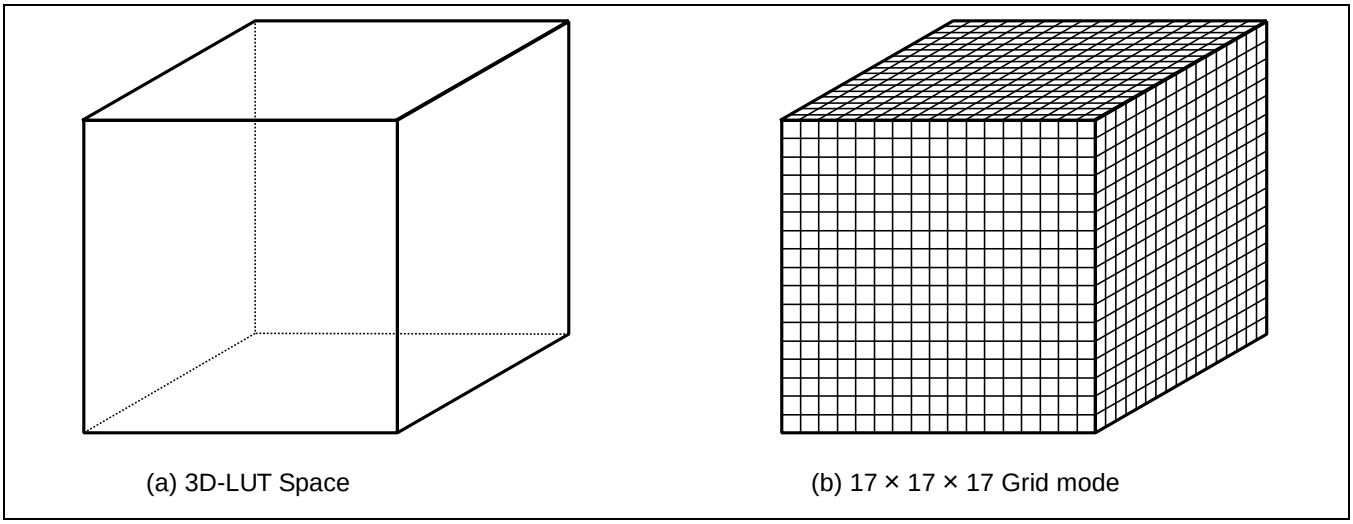
1	M2D	B'0	R/W	LUT Dimension Number Specifies the number of LUT dimensions. The details of each mode will be described later. 2D mode can be used only when the CLU input color space is YCbCr. 0: Operates in 3D mode 1: Operates in 2D mode
0	CLU_EN	B'0	R/W	CLU Processing Enable/Disable Enables or disables the 3D/2D color correction function by the CLU. When the CLU is used, the color component information needs to be set in the CLU table. For how to set data in the CLU table, see section 33.3.5.2. 0: CLU color correction is disabled 1: CLU color correction is enabled

The CLU handles three-dimensional or two-dimensional LUTs. A three-dimensional LUT is called a 3D-LUT and a two-dimensional LUT is called a 2D-LUT. The 3D or 2D operating mode of the CLU is selected by the M2D bit.

In 3D mode, a three-dimensional space such as that shown in Figure 33.42(a) is considered. The total number of coordinate points that can exist in this three-dimensional space is the total number of combinations of input data. For the CLU, this becomes the cube of each 8-bit component (= 16777216 points). Since it is impractical to have table values (= table memory) for the same number of these coordinate points, the CLU divides the three-dimensional space of Figure 33.42 (a) into grids as shown in Figure 33.42 (b) in 3D mode. The apex in each divided grid is defined as the coordinate point in the three-dimensional space, and a table value with three component values is set for all of these coordinate points. The total number of coordinate points in Figure 33.42 (b) is $17^3 = 4913$. For the method of setting the table value for these 4913 points, refer to section 33.3.5.2.



(a) 3D-LUT Space (b) 17 × 17 × 17 Grid mode

Figure 33.42 Concept and Division Count of a 3-Dimensional LUT

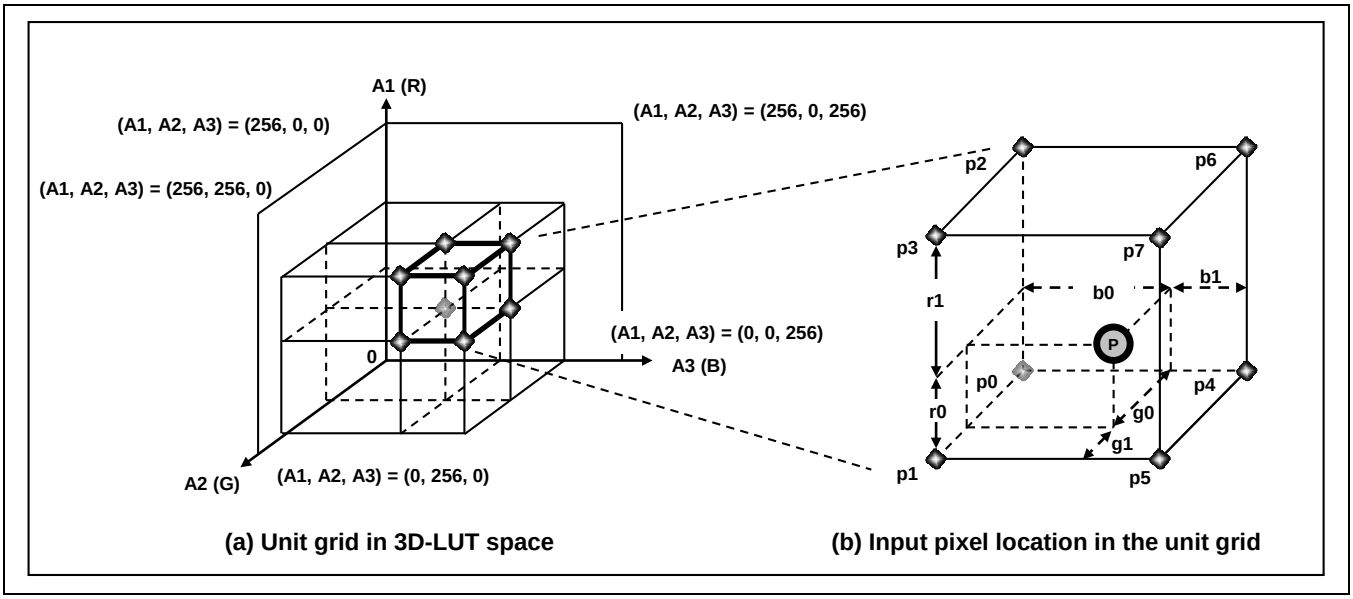


Figure 33.43 Conceptual Diagram of LUT Space When CLU Is in 3D Mode

To express a three-dimensional space such as that shown in Figure 33.42, consider the three-dimensional coordinates and axes shown in Figure 33.43 and define the minimum value and maximum value of each axis as 0 and 256, respectively. In 3D-LUT operation, the CLU forcibly assigns the four components of input data (α, R/Cr/H, G/Y/S, and B/Cb/V) to axes: R, Cr, and H components to the first axis (A1), G, Y, and S components to the second axis (A2), and B, Cb, and V components to the third axis (A3). (The case of 2D mode is described later.) Among multiple components assigned to each axis (e.g., R, Cr, and H components for the first axis), one component is selected according to the format of the data input to the CLU. For example, when the color space of the data input to the CLU is RGB, the first axis (A1) shows the R component, the second axis (A2) shows the G component, and the third axis (A3) shows the B component. In a YCbCr color space, the first axis (A1) shows the Cr component, the second axis (A2) shows the Y component, and the third axis (A3) shows the Cb component.

Each component value of the CLU input data becomes a value on each axis. Since the input data ranges from 0 to 255, the maximum value of 256 is handled as a virtual point in a grid space like that shown in Figure 33.42. In a case where the coordinates obtained by plotting the values of the input three components on axes are exactly on a grid point (e.g., p0 in Figure 33.43 (b)), the 3-component value of the table value (p0) set to that location becomes the CLU output. If the input value of the three components result in an intermediate location between grid points and not on a grid point, such as position P in Figure 33.43 (b), value P of the three components is interpolated from the table values (p0 to p7 in Figure 33.43 (b)) for the eight surrounding grid points and this is used as the CLU output.

By setting arbitrary table value for a three-dimensional LUT space (three-dimensional color space) such as that shown in Figure 33.42 using the processing described above, not only color conversion or color correction for the entire color space, but color conversion or color correction (memory color correction, skin smoothing, etc.) for a particular color area can be achieved.

Next, a 2D-LUT that is used when the CLU is operating in 2D mode is described (M2D bit should be set to 1 for operation in 2D mode). 2D-LUT mode is similar to 3D-LUT mode. However, since the axes for selecting the LUT become two-dimensional, the concept of a 3D-LUT space illustrated in Figure 33.43 changes to a 2D-LUT space like that shown in Figure 33.44.

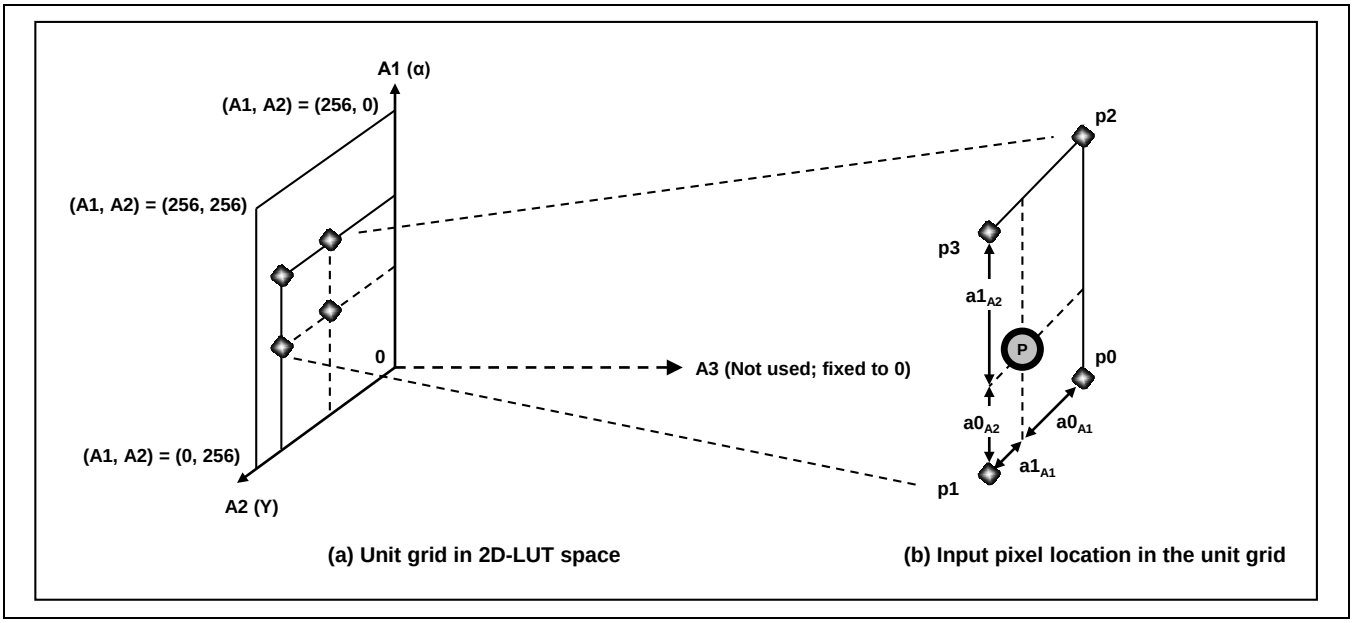

Figure 33.44 Conceptual Diagram of LUT Space When CLU Is in 2D Mode

As shown in Figure 33.44 (a), the first axis (A1) and second axis (A2) are used, and the A1-A2 plane becomes the LUT space in 2D mode. Because the third axis (A3) is not used, the CLU always handles the value on the A3 axis as 0.

2D mode can be used only when the CLU input is in the YCbCr color space. The input value of axis A1 is the input α value of the CLU, and the input value of axis A2 is the input luminance Y of the CLU. If the coordinates in the 2D-LUT space which were determined by the input values are exactly on a grid point (e.g., p2 in Figure 33.44 (b)), the table value (p2) set to that location becomes the output value of the 2D-LUT. If the input 2-component value exists at an intermediate location between grid points and not on a grid point, such as position P in Figure 33.44 (b), value P is interpolated from the table values (p0 to p3 in Figure 33.44 (b)) for the four surrounding grid points and this is used as the 2D-LUT output. The interpolated component of the second axis of the 2D-LUT output acquired in this manner becomes the Y component output of the CLU. In 2D mode, the Cb/Cr component is a pass-through output.

For the CLU table values in Figure 33.44 in 2D mode, set a value for only the component value of the second axis, and set 0 for the component values of the first and third axes. For details on the setting method, see section 33.3.5.2.

33.2.13 HST Control Register

33.2.13.1 HST Control Register (VI6_HST_CTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HST_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	HST_EN	B'0	R/W	HSV Conversion (RGB → HSV) Enable/Disable Enables or disables RGB → HSV conversion. H indicates hue, S indicates saturation, and V indicates a value (brightness). 0: RGB → HSV conversion is disabled 1: RGB → HSV conversion is enabled

Various color correction processing can be applied to HSV-format images by combining the 1D-LUT and 3D-LUT. For details on the 1D-LUT and 3D-LUT, see sections 33.2.11.1 and 33.2.12.1.

To return HSV-converted data to RGB data, HSV → RGB conversion is used (see section 33.2.14.1). RGB ↔ HSV conversion causes an operation error. Therefore, even when only just performing conversion of RGB → HSV → RGB, the original RGB value and converted RGB value will not completely match.

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	NRM	B'0	R/W	Color Data Normalization Enables or disables division by the α value of the color data in BRU blending operation. This is used when converting the RGB color data format to which the α value is multiplied (pre-multiplied color) into the RGB color data format to which the α value is not multiplied (non pre-multiplied color). Do not use this for the YCbCr format. 0: Divider (DIV unit in Figure 33.45) does not divide the color value by α 1: Divider (DIV unit in Figure 33.45)) divides the color value by α
27	ODE4	B'0	R/W	Ordered Dither (mode A) of CH4 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin4 is disabled. 1: Ordered dither (mode A) of BRUin4 is enabled. Ordered dither is available only for 18bpp. So, when ODE4 bit is equal to 1, set DITH4 = 1. When ODE4 bit is equal to 0, BRUin4 dither method is specified by D4ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
26 to 24	DITH4[2:0]	B'000	R/W	Dithering of CH4 Input to BRU These bits specify how to perform dithering of the CH4 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin4 and D4ON replacing BRUin4 and D4ON, respectively.
20	D4ON	B'0	R/W	Ordered dither (mode B) Enable of BRU Input 4 Enables or disables dithering (color reduction) of BRU input 4 (BRUin4 in Figure 33.45)). 0: Dithering (mode B) of BRUin4 is disabled 1: Dithering (mode B) of BRUin4 is enabled When ODE4 in this bit is set to 1, set 0 to this bit.

Bit	Bit Name	Initial Value	R/W	Description
19	D3ON	B’0	R/W	Ordered dither (mode B) Enable of BRU Input 3 Enables or disables dithering (color reduction) of BRU input 3 (BRUin3 in Figure 33.45)). 0: Dithering (mode B) of BRUin3 is disabled 1: Dithering (mode B) of BRUin3 is enabled When ODE3 in this bit is set to 1, set 0 to this bit.
18	D2ON	B’0	R/W	Ordered dither (mode B) Enable of BRU Input 2 Enables or disables dithering (color reduction) of BRU input 2 (BRUin2 in Figure 33.45). 0: Dithering (mode B) of BRUin2 is disabled 1: Dithering (mode B) of BRUin2 is enabled When ODE2 in this bit is set to 1, set 0 to this bit.
17	D1ON	B’0	R/W	Ordered dither (mode B) Enable of BRU Input 1 Enables or disables dithering (color reduction) of BRU input 1 (BRUin1 in Figure 33.45). 0: Dithering (mode B) of BRUin1 is disabled 1: Dithering (mode B) of BRUin1 is enabled When ODE1 in this bit is set to 1, set 0 to this bit.
16	D0ON	B’0	R/W	Ordered dither (mode B) Enable of BRU Input 0 Enables or disables dithering (color reduction) of BRU input 0 (BRUin0 in Figure 33.45). 0: Dithering (mode B) of BRUin0 is disabled 1: Dithering (mode B) of BRUin0 is enabled When ODE0 in this bit is set to 1, set 0 to this bit.
15	ODE3	B’0	R/W	Ordered Dither (mode A) of CH3 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin3 is disabled. 1: Ordered dither (mode A) of BRUin3 is enabled. Ordered dither is available only for 18bpp. So, when ODE3 bit is equal to 1, set DITH3 = 1. When ODE3 bit is equal to 0, BRUin3 dither method is specified by D3ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
14 to 12	DITH3[2:0]	B’000	R/W	Dithering of CH3 Input to BRU These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D3ON bit. When dithering (color reduction) for pixel information is disabled, specify 0 in these bits. B'000: Dithering of BRUin3 input image is disabled B'001: Dithering of BRUin3 input image at 18 bpp (RGB666: 260000 colors) B'010: Dithering of BRUin3 input image at 16 bpp (RGB565: 65535 colors) B'011: Dithering of BRUin3 input image at 15 bpp (RGB555: 32768 colors) B'100: Dithering of BRUin3 input image at 12 bpp (RGB444: 4096 colors) B'101: Dithering of BRUin3 input image at 8 bpp (RGB332: 256 colors) B'110, B'111: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
11	ODE2	B'0	R/W	Ordered Dither (mode A) of CH2 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin2 is disabled. 1: Ordered dither (mode A) of BRUin2 is enabled. Ordered dither is available only for 18bpp. So, when ODE2 bit is equal to 1, set DITH2 = 1. When ODE2 bit is equal to 0, BRUin2 dither method is specified by D2ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
10 to 8	DITH2 [2:0]	B'000	R/W	Dithering of CH2 Input to BRU These bits specify how to perform dithering of the CH2 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin2 and D2ON replacing BRUin3 and D3ON, respectively.
7	ODE1	B'0	R/W	Ordered Dither (mode A) of CH1 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin1 is disabled. 1: Ordered dither (mode A) of BRUin1 is enabled. Ordered dither is available only for 18bpp. So, when ODE1 bit is equal to 1, set DITH1 = 1. When ODE1 bit is equal to 0, BRUin1 dither method is specified by D1ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
6 to 4	DITH1 [2:0]	B'000	R/W	Dithering of CH1 Input to BRU These bits specify how to perform dithering of the CH1 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin1 and D1ON replacing BRUin3 and D3ON, respectively.
3	ODE0	B'0	R/W	Ordered Dither (mode A) of CH0 Input to BRU Enable/Disable 0: Ordered dither (mode A) of BRUin0 is disabled. 1: Ordered dither (mode A) of BRUin0 is enabled. Ordered dither is available only for 18bpp. So, when ODE0 bit is equal to 1, set DITH0 = 1. When ODE0 bit is equal to 0, BRUin0 dither method is specified by D0ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
2 to 0	DITH0 [2:0]	B'000	R/W	Dithering of CH0 Input to BRU These bits specify how to perform dithering of the CH0 input to the BRU. The setting method is the same as that for the DITH3 bits. Read the description of the DITH3 bits with BRUin0 and D0ON replacing BRUin3 and D3ON, respectively.

Figure 33.45 shows the configuration of the BRU. For the BRU inputs, there are five inputs from the DPR and one internal input as a virtual RPF. BRUin0 to BRUin4 are input ports that have the target node values shown in Figure 33.31 to Figure 33.32, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the five inputs from the DPR to the BRU.

The virtual RPF inside the BRU is an input unit not connected to the DPR. It is called the "virtual RPF" because it outputs images internally created by the BRU. Starting of the virtual RPF is controlled by VI6_WPFn_SRCRPF.VIR_ACT, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the

other input units BRUin0 to BRUin4. The color space for the single color to be set for the virtual RPF needs to match the color space of the five inputs from the DPR to the BRU. For this setting method, see section 33.2.15.4.

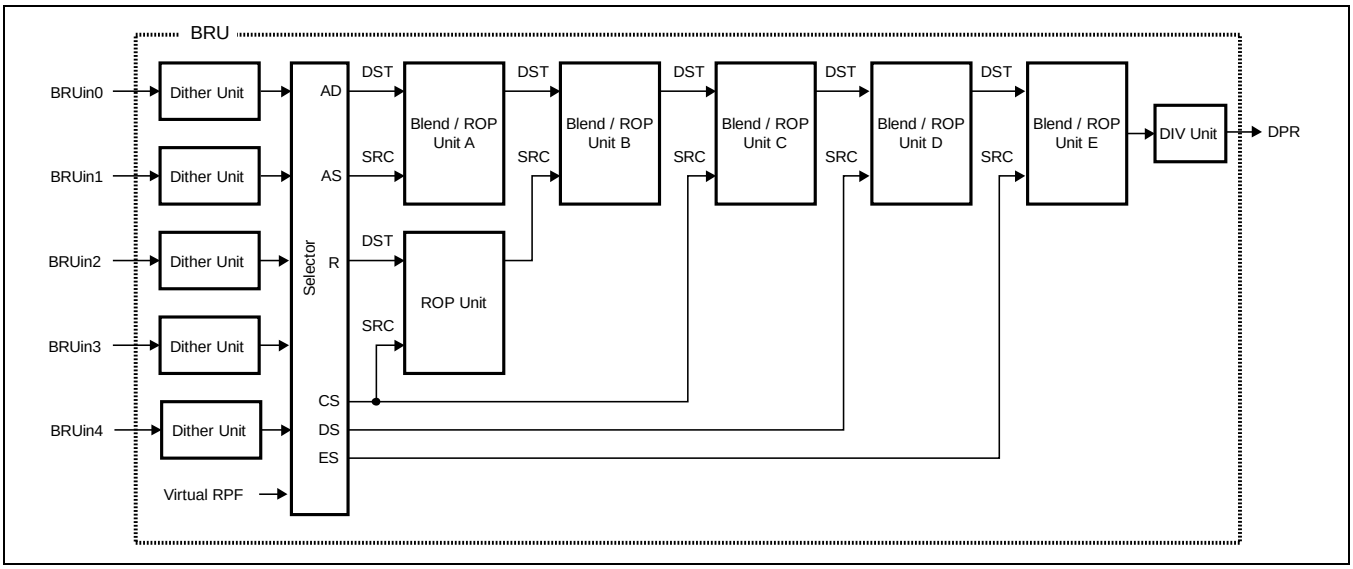

Figure 33.45 BRU Configuration

The selector in Figure 33.45 is used to select the SRC and DST inputs to blending/ROP units A to E and the ROP unit from BRUin0 to BRUin4 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to E and the ROP unit are either uniquely determined based on the configuration shown in Figure 33.45 (Table 33.32) or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS, R, CS, DS and ES, which correspond to the registers shown in Table 33.33.

Table 33.32 SRC and DST with Unique Input Sources

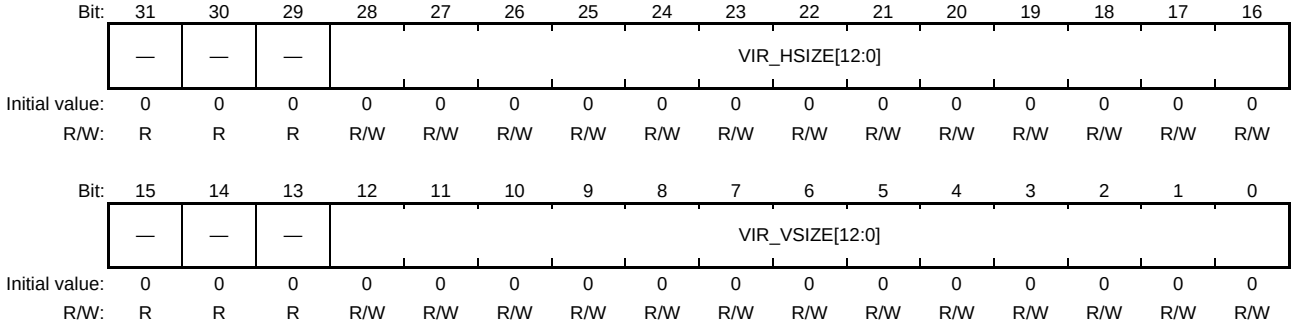
Input	Input Source	Register Bits
Blending/ROP unit B - DST	Output from blending/ROP unit A	—
Blending/ROP unit B - SRC	Output from ROP unit	—
Blending/ROP unit C - DST	Output from blending/ROP unit B	—
Blending/ROP unit D - DST	Output from blending/ROP unit C	—
Blending/ROP unit E - DST	Output from blending/ROP unit D	—
ROP unit - SRC	CS which is a selector output	VI6_BRUC_CTRL.SRCSEL

Table 33.33 Correspondence between Selector Output Destinations and Register Bits

Selector Output	Output Destination	Register Bits
AD	Blending/ROP unit A - DST	VI6_BRUA_CTRL.DSTSEL
AS	Blending/ROP unit A - SRC	VI6_BRUA_CTRL.SRCSEL
R	ROP unit - DST	VI6_BRU_ROP.DSTSEL
CS	Blending/ROP unit C - SRC	VI6_BRUC_CTRL.SRCSEL
DS	Blending/ROP unit D - SRC	VI6_BRUD_CTRL.SRCSEL
ES	Blending/ROP unit E - SRC	VI6_BRUE_CTRL.SRCSEL

33.2.15.2 Size Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_SIZE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	VIR_HSIZE [12:0]	All 0	R/W	Virtual RPF Horizontal Size These bits set the horizontal size of an image from the virtual RPF shown in Figure 33.45. A value from 1 to 8190 can be specified.
12 to 0	VIR_VSIZE [12:0]	All 0	R/W	Virtual RPF Vertical Size These bits set the vertical size of an image from the virtual RPF shown in Figure 33.45. A value from 1 to 8190 can be specified.

The virtual RPF has only a function to output a fixed α value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRU input ports, a sublayer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sublayer, it can be drawn on the master layer as a window.

Note that the virtual RPF is fixed to input port 5 of the BRU, and the data path route cannot be changed by the DPR.

33.2.15.3 Display Location Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_LOC)

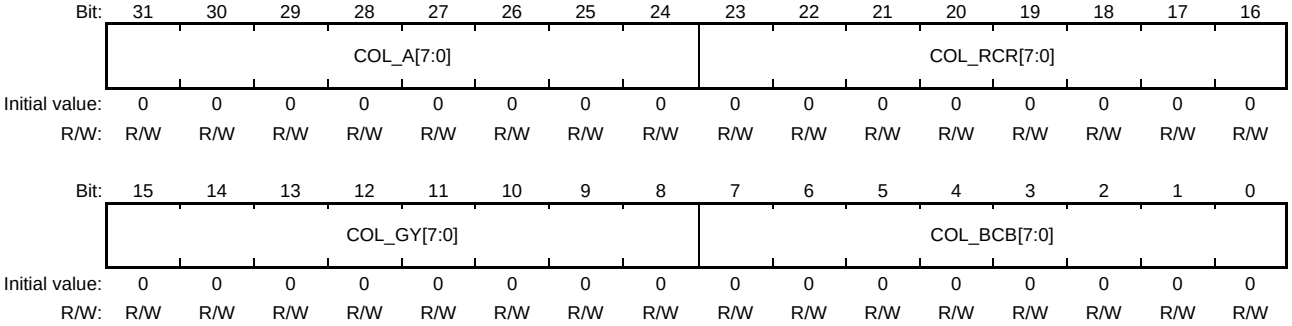
Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Virtual RPF Location on Master Layer These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT, set these bits to 0.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Virtual RPF Location on Master Layer These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT, set these bits to 0.

33.2.15.4 Color Information Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_COL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	COL_A [7:0]	All 0	R/W	Fixed α of Virtual RPF These bits set the fixed α value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
23 to 16	COL_RCR [7:0]	All 0	R/W	Fixed R/Cr of Virtual RPF These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
15 to 8	COL_GY [7:0]	All 0	R/W	Fixed G/Y of Virtual RPF These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
7 to 0	COL_BCB [7:0]	All 0	R/W	Fixed B/Cb of Virtual RPF These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.

The transparency information and color information of the single color that is created by the virtual RPF are set in the bits of this register. As described earlier, the color information is set for the YCbCr or RGB color space. The color space to be set in this register depends on the register settings of the environment and other modules to which the BRU is connected by the DPR. Two cases can be considered. Since the α value (COL_A) is transparency information and irrelevant to the concept of color space, the same setting is made for either the YCbCr or RGB color space.

(Case 1: When an input other than the virtual RPF is used)

When the source RPF is connected to any one of the BRU input ports (BRUin0 to BRUin4) other than the virtual RPF and valid data is being supplied, the same color space data as the color space for the BRU inputs should be set in this register as the color space for the virtual RPF's color information. This is based on the restriction of "all BRU inputs must have the same color space", as described in section 33.2.8.1 or 33.2.15.1.

(Case 2: When only the virtual RPF is used)

When only the virtual RPF is used as the source RPF of WPFn, RPFn is not connected to the BRU, as shown in Figure 33.46. Thus, there is no color space for another input that the color space for the virtual RPF has to follow, as in case 1. This means that the color space of the data output by the BRU is determined by the WPF setting.

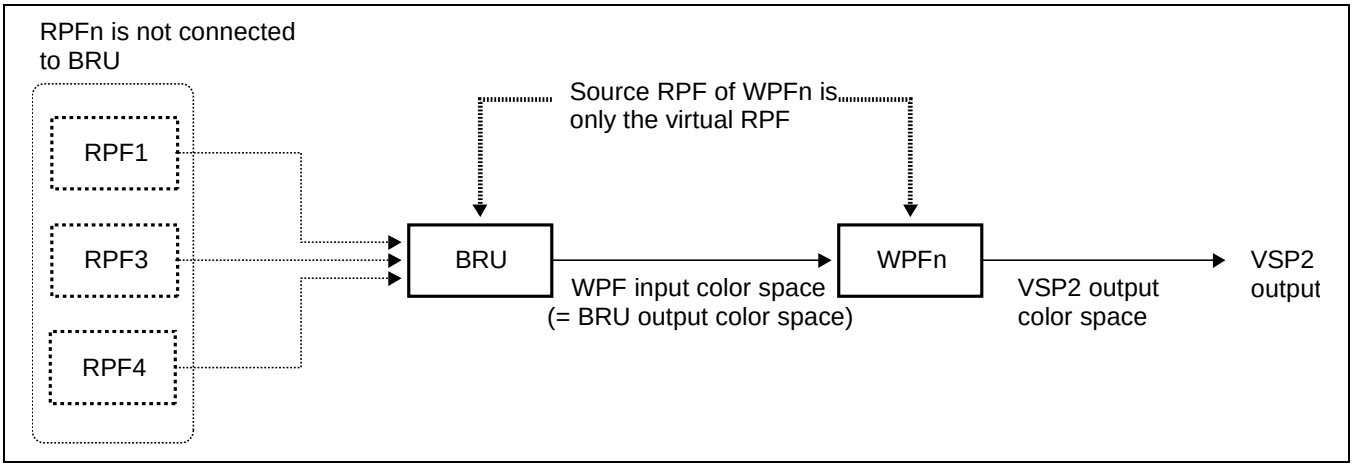


Figure 33.46 Relationship between DPR Connection and Color Space When Only Virtual RPF is Used

Figure 33.46, the output color space of the VSP2 (= output color space of WPFn) is determined by VI6_WPFn_OUTFMT.WRFMT. When bit 6 in VI6_WPFn_OUTFMT.WRFMT (WRFMT [6]) is 0, the color space is RGB, while when it is 1, the color space is YCbCr. Next, the WPF input color space (= BRU output color space) is determined by the relationship between the WPF output color space and VI6_WPFn_OUTFMT.CSC. When VI6_WPFn_OUTFMT.CSC is 0, the WPF output color space and WPF input color space (= BRU output color space) are the same. When VI6_WPFn_OUTFMT.CSC is 1, the WPF output color space and WPF input color space (= BRU output color space) are the opposite. This relationship is summarized in Table 33.34.

The color space for the virtual RPF's color information should be set in this register according to the "BRU output color space" shown in Table 33.34.

Table 33.34 Relationship between WPF Output Color Space and BRU Output Color Space

VI6_WPFn_OUTFMT Register Bit Settings				BRU Output Color Space (= WPF Input Color Space)
Bit 6 in WRFMT		CSC		
0	(WPF output is RGB)	0	(YCbCr → RGB conversion is disabled)	RGB
0	(WPF output is RGB)	1	(YCbCr → RGB conversion is enabled)	YCbCr
1	(WPF output is YCbCr)	0	(RGB → YCbCr conversion is disabled)	YCbCr
1	(WPF output is YCbCr)	1	(RGB → YCbCr conversion is enabled)	RGB

33.2.15.5 BRU Control Registers (VI6_BRUm_CTRL: m = A, B, C, D, E)

Bit	Bit Name	Initial Value	R/W	Description
31	RBC	B’0	R/W	Operation Type of Blending/ROP Unit m (m = A, B, C, D, E) Specifies the operation type for blending/ROP unit m (m = A, B, C, D, E) shown in Figure 33.45. 0: ROP (raster operation) 1: Blending operation
30 to 23, 19, 15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 20	DSTSEL [2:0]	B’000	R/W	Input Selection for DST Side of Blending/ROP Unit A These bits select the input for the DST side of blending/ROP unit A shown in Figure 33.45. These bits specify the connection between the BRU input port and the DST separately from the setting of connections between other modules and the BRU input port through the DPR. B'000: BRU input 0 (BRUin0) is input to DST B'001: BRU input 1 (BRUin1) is input to DST B'010: BRU input 2 (BRUin2) is input to DST B'011: BRU input 3 (BRUin3) is input to DST B'100: Virtual RPF is input to DST B’101: BRU input 4 (BRUin4) is input to DST B'110 to B'111: Setting prohibited [Note] The DSTSEL bits for blending/ROP unit m (m = B, C, D, E) are reserved according to Table 33.32. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	SRCSEL [2:0]	B’000	R/W	Input Selection for SRC Side of Blending/ROP Unit m (m = A, C, D, E) These bits select the input for the SRC side of blending/ROP unit m (m = A, C, D, E) shown in Figure 33.45. These bits specify the connection between the BRU input port and the SRC separately from the setting of connections between other modules and the BRU input port through the DPR. B'000: BRU input 0 (BRUin0) is input to SRC B'001: BRU input 1 (BRUin1) is input to SRC B'010: BRU input 2 (BRUin2) is input to SRC B'011: BRU input 3 (BRUin3) is input to SRC B'100: Virtual RPF is input to SRC B'101: BRU input 4 (BRUin4) is input to SRC B'110 to B'111: Setting prohibited [Note] The SRCSEL bits for blending/ROP unit B are reserved according to Table 33.32. The write value should always be 0.
7 to 4	CROP [3:0]	H’0	R/W	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit m (m = A, B, C, D, E). Select the opcode for ROP operation from Table 33.35.
3 to 0	AROP [3:0]	H’0	R/W	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit m (m = A, B, C, D, E). Select the opcode for ROP operation from Table 33.35.

Table 33.35 ROP Operator of Blending/ROP Unit m (m = A, B, C, D)

Opcode	Operator
B’0000	NOP(D)
B’0001	AND(S & D)
B’0010	AND_REVERSE(S & ~D)
B’0011	COPY(S)
B’0100	AND_INVERTED(~S & D)
B’0101	CLEAR(0)
B’0110	XOR(S ^ D)
B’0111	OR(S | D)
B’1000	NOR(~(S | D))
B’1001	EQUIV(~(S ^ D))
B’1010	INVERT(~D)
B’1011	OR_REVERSE(S | ~D)
B’1100	COPY_INVERTED(~S)
B’1101	OR_INVERTED(~S | D)
B’1110	NAND(~(S & D))
B’1111	SET(all1)

33.2.15.6 BRU Blend Control Registers (VI6_BRUm_BLD: m = A, B, C, D, E)

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	B’0	R/W	Blending Expression Selection Selects the blending expression of the color data in the BRU (VI6_BRUm_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits. 0: CCMDX * (DST color data) + CCMDY * (SRC color data) 1: CCMDX * (DST color data) – CCMDY * (SRC color data)
30 to 28	CCMDX [2:0]	B’000	R/W	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. B’000: DST α data is used as blending coefficient X B’001: 255 – (DST α data) is used as blending coefficient X B’010: SRC α data is used as blending coefficient X B’011: 255 – (SRC α data) is used as blending coefficient X B’100: Fixed α value 0 (COEFX setting)
27, 19	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	CCMDY [2:0]	B’000	R/W	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. B’000: DST α data is used as blending coefficient Y B’001: 255 – (DST α data) is used as blending coefficient Y B’010: SRC α data is used as blending coefficient Y B’011: 255 – (SRC α data) is used as blending coefficient Y B’100: Fixed α value 1 (COEFY setting)
23	ABES	B’0	R/W	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B, C, D, E). α creation coefficients are specified by the ACMDX and ACMDY bits. 0: ACMDX * (DST α data) + ACMDY * (SRC α data) 1: ACMDX * (DST α data) – ACMDY * (SRC α data)

Bit	Bit Name	Initial Value	R/W	Description
22 to 20	ACMDX [2:0]	B’000	R/W	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. B’000: (α creation coefficient X) = (DST α data) B’001: (α creation coefficient X) = 255 – (DST α data) B’010: (α creation coefficient X) = (SRC α data) B’011: (α creation coefficient X) = 255 – (SRC α data) B’100: (α creation coefficient X) = Fixed α value 0 (COEFX setting) B’101 to B’111: Setting prohibited
18 to 16	ACMDY [2:0]	B’000	R/W	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. B’000: (α creation coefficient Y) = (DST α data) B’001: (α creation coefficient Y) = 255 – (DST α data) B’010: (α creation coefficient Y) = (SRC α data) B’011: (α creation coefficient Y) = 255 – (SRC α data) B’100: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) B’101 to B’111: Setting prohibited
15 to 8	COEFX [7:0]	All 0	R/W	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to B’100. A value from H’00 to H’FF can be specified.
7 to 0	COEFY [7:0]	All 0	R/W	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to B’100. A value from H’00 to H’FF can be specified.

Bit	Bit Name	Initial Value	R/W	Description
31, 30, 15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	HOFFSET[13:0]	All 0	R/W	Horizontal Offset of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (Figure 33.47). In these bits, specify the value of horizontal offset (hoffset shown in Figure 33.47) in pixel units. A value from 0 to 8189 can be specified. The value of HOFFSET shall be smaller than that of the input image size of HGO.
13 to 0	VOFFSET[13:0]	All 0	R/W	Vertical Offset of Histogram Detection Window The HGO creates a histogram for the detection window in the input image (Figure 33.47). In these bits, specify the value of vertical offset (voffset shown in Figure 33.47) in pixel units. A value from 0 to 8189 can be specified. The value of VOFFSET shall be smaller than that of the input image size of HGO.

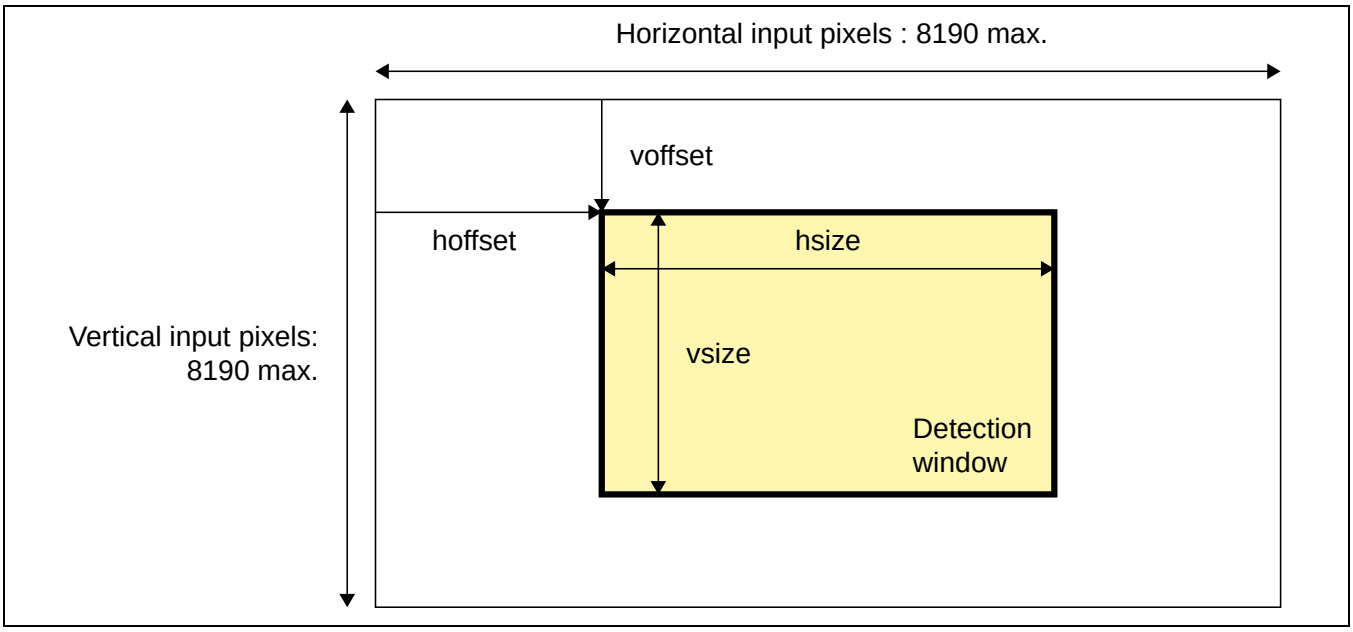

Figure 33.47 Histogram Detection Window of HGO

33.2.16.2 HGO Detection Window Size Register (VI6_HGO_SIZE)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	AUTOW	—	STEP	—	—	MAXRGB	OFSB_R	OFSB_G	OFSB_B	HRATIO[1:0]		VRATIO[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13, 11, 9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	AUTOW	B'0	R/W	HGO automatically histogram write. [RZ/G2H/RZ/G2N, RZ/G2E] 0: Histogram is not dumped to external memory automatically. S/W needs to dump histogram from histogram registers to external memory. 1: Histogram is dumped to SDRAM automatically. Dump format is shown in Figure 33.48. HGO histogram swapping register in section 33.2.16.16 specifies data order in 4byte unit as Table 33.36.
10	STEP	B'0	R/W	Histogram step of Y/MaxRGB. 0: 64 step mode. 1: 256 step mode for Y/MaxRGB histogram. Restriction of color format is shown in Table 33.37 about 64 step mode and Table 33.38 about 256 step mode.
7	MAXRGB	B'0	R/W	Histogram Source Component Setting 0: The histogram is generated from 3 color components independently. 1: The histogram is generated from the maximum value of input R, G and B data.
6	OFSB_R	B'0	R/W	Offset Binary Mode for R/Cr/H Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.

Bit	Bit Name	Initial Value	R/W	Description
5	OFSB_G	B'0	R/W	Offset Binary Mode for G/Y/S Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.
4	OFSB_B	B'0	R/W	Offset Binary Mode for B/Cb/V Component 0: Straight binary 1: Offset binary In offset binary mode, values are converted to absolute values before they are used to detect the maximum value, minimum value, sum, and black band. Note that values without conversion are always used for histogram creation regardless of this mode setting.
3, 2	HRATIO[1:0]	B'00	R/W	Horizontal Pixel Skipping Mode for Histogram Detection B'00: No skipping for horizontal pixels. B'01: Horizontal 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created. B'10: Horizontal 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created. B'11: Setting prohibited. The first pixel in the horizontal direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.
1, 0	VRATIO[1:0]	B'00	R/W	Vertical Pixel Skipping Mode for Histogram Detection B'00: No skipping for vertical pixels. B'01: Vertical 1/2 skipping. One pixel is discarded from every two pixels before a histogram is created. B'10: Vertical 1/4 skipping. Three pixels are discarded from every four pixels before a histogram is created. B'11: Setting prohibited. The first pixel in the vertical direction is not discarded but subsequent pixels are discarded (regardless of the histogram detection window). Among the pixels that have not been discarded, only the pixels within the detection window are used to create a histogram.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HISTOGRAM_n[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	HISTOGRAM_n [23:0]	All 0	R	Frequency of Component-m in the value range-n From these bits, the count of the pixels whose component-m value (val) satisfies the following condition within the histogram detection window (Figure 33.47) is read (after pixel skipping is applied when skipping mode is selected). $4*n \leq val < 4*(n + 1)$ Counting starts after the HGO is activated. To read the histogram, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again. These bits are available when VI6_HGO_MODE.step is 0 (64 step mode). When VI6_HGO_MODE.step is 1 (256 step mode), read Y/MaxRGB histogram from the VI6_HGO_EXT_HIST_DATA after setting histogram address in the VI6_HGO_EXT_HIST_ADDR.

The component-m in a color space is determined by the following table in case of VI6_HGO_MODE.step = 0 (64 step mode)

Table 33.37 The component of index-m for each color space in 64 step mode.

	Color Space			
	RGB		YCbCr	HSV
Index-m	VI6_HGO_MODE. MAXRGB = 0	VI6_HGO_MODE. MAXRGB = 1	VI6_HGO_MODE MAXRGB = 0 (*1)	VI6_HGO_MODE. MAXRGB = 0(*1)
R	R	n/a (*2)	Cr	H
G	G	max(R, G, B) (*3)	Y	S
B	B	n/a (*2)	Cb	V

Notes: 1. When color space of input data is in YCbCr or HSV, set VI6_HGO_MODE.MAXRGB = 0
2. When VI6_HGO_MODE.MAXRGB = 1, the histogram of index-R / index-B are not ensured.
3. max(R, G, B) indicates maximum value of input R, G and B data.

33.2.16.8 HGO Component-m Min/Max Value Register (VI6_HGO_m_MAXMIN: m = R, G, B)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24, 15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	MAXVAL[7:0]	All 0	R	Maximum Value of Component-m From these bits, the maximum value of the component-m of the pixels within the histogram detection window (Figure 33.47) is read (after pixel skipping is applied when skipping mode is selected). Maximum value detection starts after the HGO is activated. To read the maximum value, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.
7 to 0	MINVAL[7:0]	All 0	R	Minimum Value of Component-m From these bits, the minimum value of the component-m of the pixels within the histogram detection window (Figure 33.47) is read (after pixel skipping is applied when skipping mode is selected). Minimum value detection starts after the HGO is activated. To read the minimum value, read these bits after the HGO has completed processing of one screen of data and before the HGO is activated again.

33.2.16.9 HGO Component-m Sum Register (VI6_HGO_m_SUM: m = R, G, B)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

	—	—	—	—	—	—	—	—	—	—	—	—	—	LTRBOX1	LTRBOX2	SIDE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	LTRBOX1	B'0	R	Letter Box Detection Result #1 of Zone-0/1 for Component-m This bit is set to 1 when none of the component-m of the pixels on the lines of zone-0/vpos0 and zone-1/vpos1 (two lines in total) in Figure 33.49 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.
1	LTRBOX2	B'0	R	Letter Box Detection Result #2 of Zone-0/1 for Component-m This bit is set to 1 when none of the component-m of the pixels on the four lines of zone-0 and 1 in Figure 33.49 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.
0	SIDE	B'0	R	Letter Box Detection Result of Zone-2/3 for Component-m This bit is set to 1 when none of the component-m of the pixels on the two lines of zone-2 and 3 in Figure 33.49 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGO has completed processing of one screen of data and before the HGO is activated again. The value read during processing is not guaranteed to be correct.

33.2.16.11 HGO Y/MaxRGB Extended Histogram Address Register (VI6_HGO_EXT_HIST_ADDR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	EXT_HIST_ADDR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	EXT_HIST_ADDR [7:0]	All 0	R/W	Histogram address in case of 256 step histogram mode. Set value-m when user wants to read frequency of Y or MaxRGB pixel value-m. After setting VI6_HGO_EXT_HIST_ADDR, read VI6_HGO_EXT_HIST_DATA to read frequency of Y or MaxRGB pixel value-m. This is in-direct addressing way. This in-direct addressing way is available in case of VI6_HGO_MODE.STEP=1(256 step histogram mode).

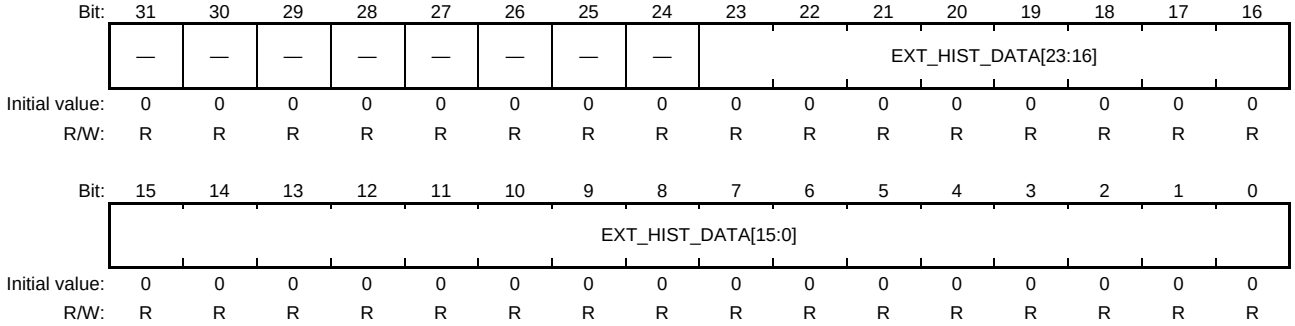
Table 33.38 Restriction in case of 256 step mode (VI6_HGO_MODE.STEP = 1)

Color Space			
RGB		**YCbCr**	**HSV**
VI6_HGO_MODE. MAXRGB = 0	**VI6_HGO_MODE. MAXRGB = 1**	**VI6_HGO_MODE MAXRGB = 0 (*1)**	**VI6_HGO_MODE. MAXRGB = 0(*1)**
N/A	max(R, G, B) (*2)	Y	N/A

Notes: 1. When color space of input data is in YCbCr or HSV, set VI6_HGO_MODE.MAXRGB = 0
2. max(R, G, B) indicates maximum value of input R, G and B data.

33.2.16.12 HGO Y/MaxRGB Extended Histogram Data Register (VI6_HGO_EXT_HIST_DATA)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	EXT_HIST_DATA [23:0]	All 0	R	Histogram data in case of 256 step histogram mode. See VI6_HGO_EXT_HIST_ADDR register's explanation. This in-direct addressing way is available in case of VI6_HGO_MODE.STEP = 1 (256 step histogram mode).

33.2.16.13 HGO Write Buffer Side (VI6_HGO_WBUFS)

Bit	Bit Name	Initial Value	R/W	Description
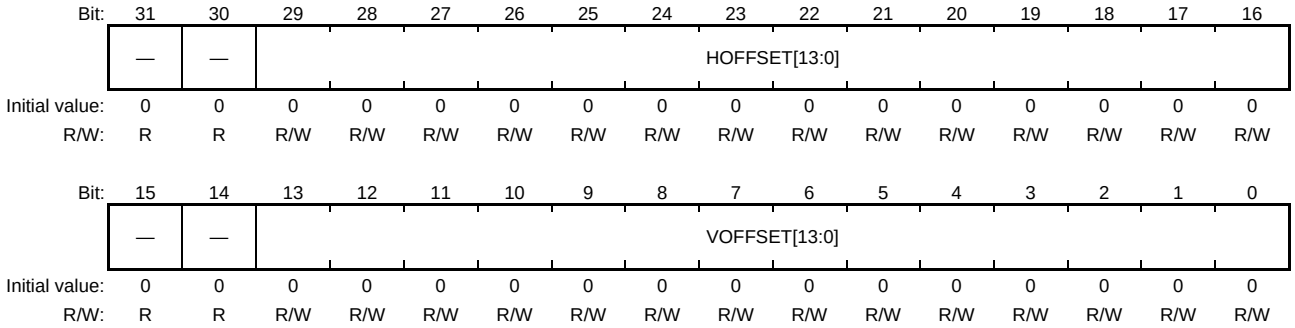
31 to 5, 3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	RCPART	B'0	W	Status Reset Writing 1 to this bit resets counter bits in HGO.
0	RCLEA	B'0	W	Register Reset Writing 1 to this bit resets all read-only registers (33.2.16.7 to 33.2.16.10) to their initial values. This register is write-only and is always read as 0. Note that R/W registers (33.2.16.1 to 33.2.16.6) are not affected by write access to this register.

When image partition is used, refer to section 33.3.7.7.

33.2.17 HGT Control Registers

33.2.17.1 HGT Detection Window Offset Register (VI6_HGT_OFFSET)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31, 30, 15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	HOFFSET [13:0]	All 0	R/W	Horizontal Offset of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (Figure 33.50). In these bits, specify the value of horizontal offset (hoffset shown Figure 33.50) in pixel units. A value from 0 to 8189 can be specified. The value of HOFFSET shall be smaller than that of the input image size of HGT.
13 to 0	VOFFSET [13:0]	All 0	R/W	Vertical Offset of Histogram Detection Window The HGT creates a histogram for the detection window in the input image (Figure 33.50). In these bits, specify the value of vertical offset (voffset shown in Figure 33.50) in pixel units. A value from 0 to 8189 can be specified. The value of VOFFSET shall be smaller than that of the input image size of HGT.

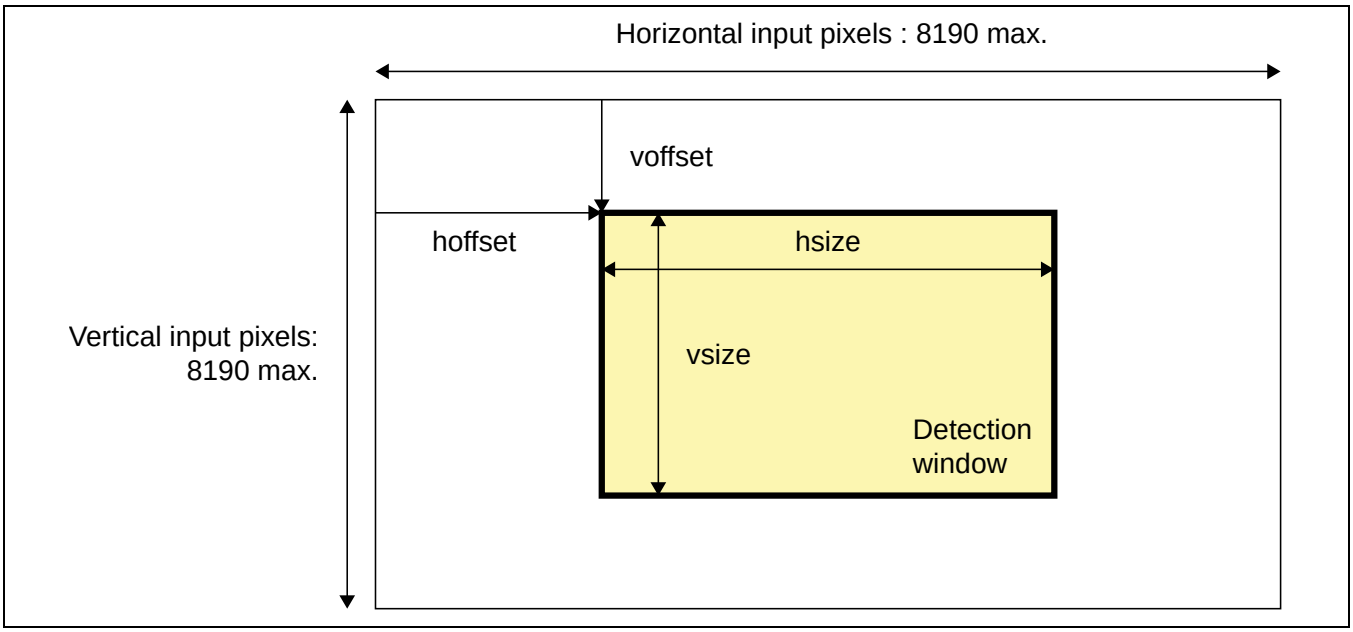


Figure 33.50 Histogram Detection Window of HGT

33.2.17.2 HGT Detection Window Size Register (VI6_HGT_SIZE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

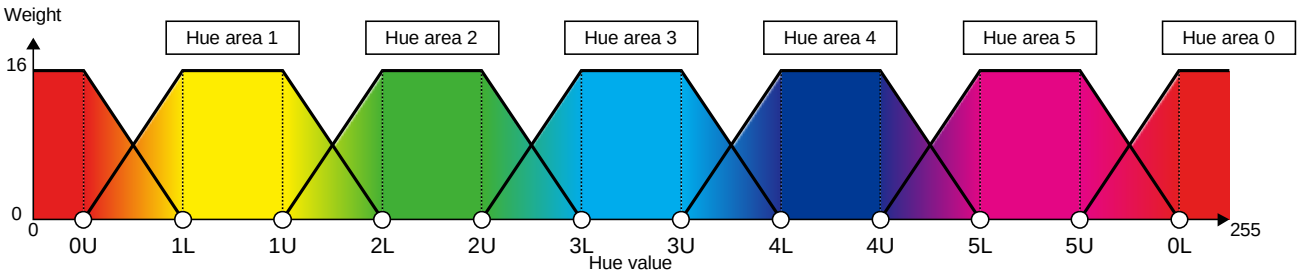
33.2.17.4 HGT Hue Area Register (VI6_HGT_HUE_AREA_n: n = 0 to 5)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	HUE_LOWER_n[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	HUE_UPPER_n[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24, 15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	HUE_LOWER_n [7:0]	All 0	R/W	Lower Boundary Value for Hue Area - n The HGT creates a two-dimensional histogram of H (hue) and S (saturation) components. Division of hue areas and overlapping of adjacent hue areas can be specified through these bits. In these bits, specify the value of n L (hue_lower n) shown in Figure 33.52. A value from 0 to 255 can be specified. The specified value should satisfy the restrictions shown in Figure 33.52.
7 to 0	HUE_UPPER_n [7:0]	All 0	R/W	Upper Boundary Value for Hue Area - n The HGT creates a two-dimensional histogram of H (hue) and S (saturation) components. Division of hue areas and overlapping of adjacent hue areas can be specified through these bits. In these bits, specify the value of n U (hue_upper n) shown in Figure 33.52. A value from 0 to 255 can be specified. The specified value should satisfy the restrictions shown in Figure 33.52.



Restrictions: 0U ≤ 1L ≤ 1U ≤ 2L ≤ 2U ≤ 3L ≤ 3U ≤ 4L ≤ 4U ≤ 5L ≤ 5U, 0L ≤ 0U, or 5U ≤ 0L

- Values are rounded down in the diagonal-line sections.
- When overlapped areas are not specified, the boundary value is included in the lower-value area.

0L = HUE_LOWER_0 register setting	0U = HUE_UPPER_0 register setting
1L = HUE_LOWER_1 register setting	1U = HUE_UPPER_1 register setting
2L = HUE_LOWER_2 register setting	2U = HUE_UPPER_2 register setting
3L = HUE_LOWER_3 register setting	3U = HUE_UPPER_3 register setting
4L = HUE_LOWER_4 register setting	4U = HUE_UPPER_4 register setting
5L = HUE_LOWER_5 register setting	5U = HUE_UPPER_5 register setting

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	HISTOGRAM_m_n[25:0]	All 0	R	Weighted Frequency of Hue Area-m and Saturation Area-n From these bits, the count of weighting for the pixels whose H component value is in hue area m (Figure 33.52) and whose S component value (val) satisfies the following condition within the histogram detection window (Figure 33.50) is read (after pixel skipping is applied when skipping mode is selected). $8*n \leq val < 8*(n + 1)$ The weight is determined by the H component value as shown in Figure 33.52 and the maximum weight is 16. Counting starts after the HGT is activated. To read the histogram, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

33.2.17.9 HGT Max/Min Value Register (VI6_HGT_MAXMIN)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24, 15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	MAXVAL[7:0]	All 0	R	Maximum Value of S Components From these bits, the maximum value of the S components of the pixels within the histogram detection window (Figure 33.50) is read (after pixel skipping is applied when skipping mode is selected). Maximum value detection starts after the HGT is activated. To read the maximum value, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.
7 to 0	MINVAL[7:0]	All 0	R	Minimum Value of S Components From these bits, the minimum value of the S components of the pixels within the histogram detection window (Figure 33.50) is read (after pixel skipping is applied when skipping mode is selected). Minimum value detection starts after the HGT is activated. To read the minimum value, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

33.2.17.10 HGT Sum Register (VI6_HGT_SUM)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 0	SUMVAL[29:0]	All 0	R	Sum of S Components From these bits, the sum of the S components of the pixels within the histogram detection window (Figure 33.50) is read (after pixel skipping is applied when skipping mode is selected). Accumulation starts after the HGT is activated. To read the sum, read these bits after the HGT has completed processing of one screen of data and before the HGT is activated again.

33.2.17.11 HGT LB Detection Result Register (VI6_HGT_LB_DET)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	LTRBOX1	B'0	R	Letter Box Detection Result #1 of Zone-0/1 for V Component This bit is set to 1 when none of the V components of the pixels on the lines of zone-0/vpos0 and zone-1/vpos1 (two lines in total) in Figure 33.53 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.
1	LTRBOX2	B'0	R	Letter Box Detection Result #2 of Zone-0/1 for V Component This bit is set to 1 when none of the V components of the pixels on the four lines of zone-0 and 1 in Figure 33.53 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.
0	SIDE	B'0	R	Letter Box Detection Result of Zone-2/3 for V Component This bit is set to 1 when none of the V components of the pixels on the two lines of zone-2 and 3 in Figure 33.53 exceeds the threshold (BLACK_TH). If any pixel is greater than the threshold, this bit is set to 0. Read this bit after the HGT has completed processing of one screen of data and before the HGT is activated again. The value read during processing is not guaranteed to be correct.

33.2.17.12 HGT Parameter Register Reset (VI6_HGT_REGRST)

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	H_LWS	B'0	R/W	HGT histogram Swapping in Longword Units 0: Data swapping in longword (32-bit) units is disabled 1: Data swapping in longword (32-bit) units is enabled
1	H_WDS	B'0	R/W	HGT histogram Swapping in Word Units 0: Data swapping in word (16-bit) units is disabled 1: Data swapping in word (16-bit) units is enabled
0	H_BTS	B'0	R/W	HGT histogram Swapping in Byte Units 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

See Figure 33.51 and Table 33.39 for setting HGT histogram swap.

33.2.18 ILV Control Register

33.2.18.1 ILV Control Register (VI6_ILV_CTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILV_MODE [1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ILV_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18, 15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	ILV_MODE [1:0]	B’0	R/W	Format Setting for 3D-Format Conversion These bits specify the format for 3D-format conversion. B’00: Side by side (output is enlarged twice in horizontal direction) B’01: Line by line (output is enlarged twice in vertical direction) B’10: Pixel by pixel (output is enlarged twice in horizontal direction) B’11: Doubler (output is enlarged twice in horizontal and vertical directions)
0	ILV_EN	B’0	R/W	3D-Format Conversion Enable/Disable Enables or disables 3D-format conversion by the ILV. Before setting this bit to 1, make appropriate connections with the DPR so that valid image data is sent to two input lines of the ILV. When this bit is set to 0, the input to the ILVL passes through the ILV and the output size becomes the same as the input size. 0: 3D-format conversion is disabled. 1: 3D-format conversion is enabled.

Interleave method of ILVL and ILVR is shown in Figure 33.54. "ILVL" or "L" in the figure is output image from module that target node setting is 38. "ILVR" or "R" in the figure is output image from module that target node setting is 39. See section 33.2.8.1 about target node.

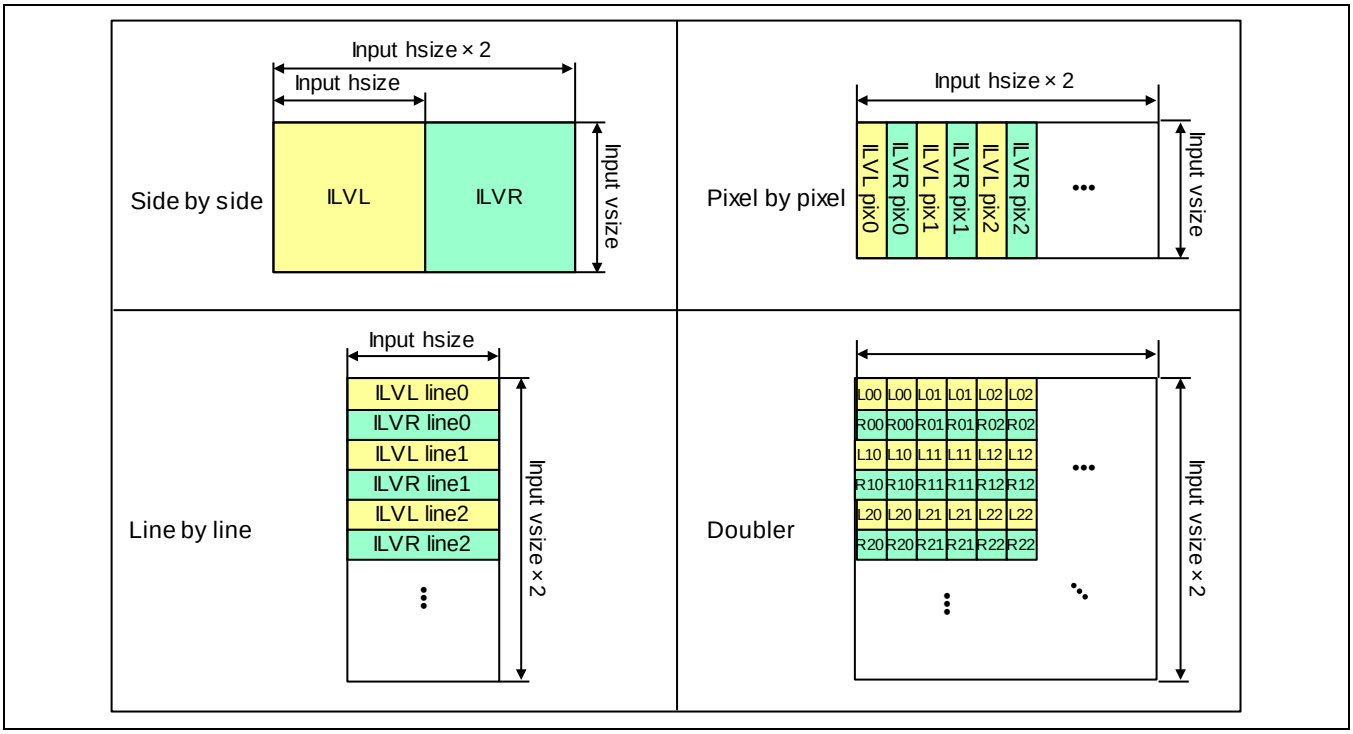

Figure 33.54 Interleave method of ILVL and ILVR

33.2.19 BRS Control Registers

33.2.19.1 BRS Input Control Register (VI6_BRS_INCTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	—	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	NRM	—	—	—	—	—	—	—	—	—	—	D1ON	D0ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ODE1	DITH1[2:0]			ODE0	DITH0[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 18, 15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	NRM	B'0	R/W	Color Data Normalization Enables or disables division by the α value of the color data in BRS blending operation. This is used when converting the RGB color data format to which the α value is multiplied (pre-multiplied color) into the RGB color data format to which the α value is not multiplied (non pre-multiplied color). Do not use this for the YCbCr format. 0: Divider (DIV unit in Figure 33.55) does not divide the color value by α 1: Divider (DIV unit in Figure 33.55) divides the color value by α
17	D1ON	B'0	R/W	Ordered dither (mode B) Enable of BRS Input 1 Enables or disables dithering (color reduction) of BRS input 1 (BRSin1 in Figure 33.55). 0: Dithering (mode B) of BRSin1 is disabled 1: Dithering (mode B) of BRSin1 is enabled When ODE1 in this bit is set to 1, set 0 to this bit.
16	D0ON	B'0	R/W	Ordered dither (mode B) Enable of BRS Input 0 Enables or disables dithering (color reduction) of BRS input 0 (BRSin0 in Figure 33.55). 0: Dithering (mode B) of BRSin0 is disabled 1: Dithering (mode B) of BRSin0 is enabled When ODE0 in this bit is set to 1, set 0 to this bit.

Bit	Bit Name	Initial Value	R/W	Description
7	ODE1	B'0	R/W	Ordered Dither (mode A) of CH1 Input to BRS Enable/Disable 0: Ordered dither (mode A) of BRSin1 is disabled. 1: Ordered dither (mode A) of BRSin1 is enabled. Ordered dither is available only for 18bpp. So, when ODE1 bit is equal to 1, set DITH1 = 1. When ODE1 bit is equal to 0, BRSin1 dither method is specified by D1ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
6 to 4	DITH1 [2:0]	B'000	R/W	Dithering of CH1 Input to BRS These bits specify the number of colors for pixels after dithering (color reduction) when dithering (color reduction) for pixel information is enabled through the D1ON bit. When dithering (color reduction) for pixel information is disabled, specify 0 in these bits. B'000: Dithering of BRSin1 input image is disabled B'001: Dithering of BRSin1 input image at 18 bpp (RGB666: 260000 colors) B'010: Dithering of BRSin1 input image at 16 bpp (RGB565: 65535 colors) B'011: Dithering of BRSin1 input image at 15 bpp (RGB555: 32768 colors) B'100: Dithering of BRSin1 input image at 12 bpp (RGB444: 4096 colors) B'101: Dithering of BRSin1 input image at 8 bpp (RGB332: 256 colors) B'110, B'111: Setting prohibited
3	ODE0	B'0	R/W	Ordered Dither (mode A) of CH0 Input to BRS Enable/Disable 0: Ordered dither (mode A) of BRSin0 is disabled. 1: Ordered dither (mode A) of BRSin0 is enabled. Ordered dither is available only for 18bpp. So, when ODE0 bit is equal to 1, set DITH0 = 1. When ODE0 bit is equal to 0, BRSin0 dither method is specified by D0ON in the register Ordered dither (mode A) is recommended rather than ordered dither (mode B) in case of 18bpp.
2 to 0	DITH0 [2:0]	B'000	R/W	Dithering of CH0 Input to BRS These bits specify how to perform dithering of the CH0 input to the BRS. The setting method is the same as that for the DITH1 bits. Read the description of the DITH1 bits with BRSin0 and D0ON replacing BRSin1 and D1ON, respectively.

Figure 33.55 shows the configuration of the BRS. For the BRS inputs, there are two inputs from the DPR and one internal input as a virtual RPF. BRSin0 to BRSin1 are input ports that have the target node values shown in Figure 33.31, and they can be connected to any module on the DPR. The same color space (YCbCr or RGB) has to be used for the two inputs from the DPR to the BRS.

The virtual RPF inside the BRS is an input unit not connected to the DPR. It is called the "virtual RPF" because it outputs images internally created by the BRS. Starting of the virtual RPF is controlled by VI6_WPFn_SRCRPF.VIR_ACT2, and the single-color data created at the virtual RPF can be used for blending or raster operation (ROP) with data from the other input units BRSin0 to BRSin1. The color space for the single color to be set for the virtual RPF needs to match the color space of the two inputs from the DPR to the BRS. For this setting method, see section 33.2.19.4.

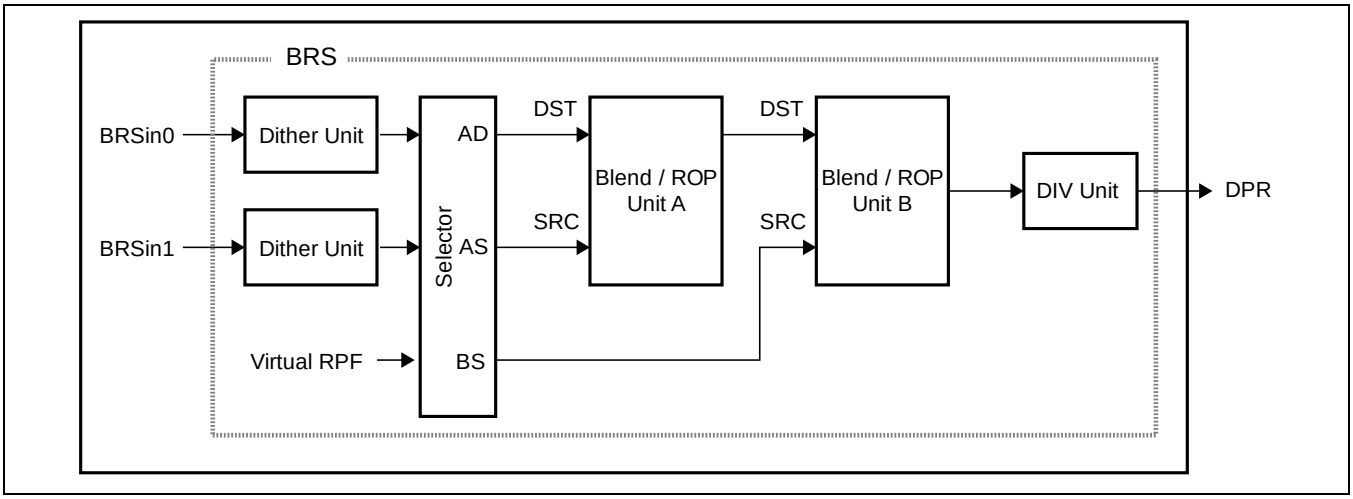

Figure 33.55 BRS Configuration

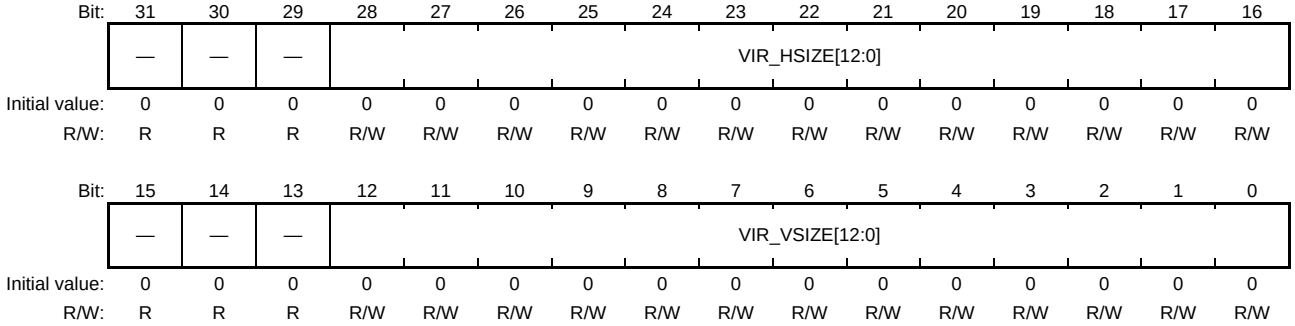
The selector in Figure 33.55 is used to select the SRC and DST inputs to blending/ROP units A to B from BRSin0 to BRSin1 which are inputs from the DPR and the virtual RPF. The SRC and DST input sources for blending/ROP units A to B are either uniquely determined based on the configuration shown in Figure 33.55 or selected as desired by registers. The input sources that can be arbitrarily selected by registers are AD, AS and BS, which correspond to the registers shown in Table 33.40.

Table 33.40 Correspondence between Selector Output Destinations and Register Bits for BRS

Selector Output	Output Destination	Register Bits
AD	Blending/ROP unit A - DST	VI6_BRSA_CTRL.DSTSEL
AS	Blending/ROP unit A - SRC	VI6_BRSA_CTRL.SRCSEL
BS	Blending/ROP unit B - SRC	VI6_BRSB_CTRL.SRCSEL

33.2.19.2 Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	—	√	—



Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	VIR_ HSIZE [12:0]	All 0	R/W	Virtual RPF Horizontal Size These bits set the horizontal size of an image from the virtual RPF shown in Figure 33.55. A value from 1 to 8190 can be specified.
12 to 0	VIR_ VSIZE [12:0]	All 0	R/W	Virtual RPF Vertical Size These bits set the vertical size of an image from the virtual RPF shown in Figure 33.55. A value from 1 to 8190 can be specified.

The virtual RPF has only a function to output a fixed α value and a fixed pixel value. The virtual RPF can internally create a single-color image without accessing external memory via the MAU. Same as images from the other BRS input ports, a sublayer can be blended on an image created in this manner with the image used as the background (master layer). In turn, when using the image as a sublayer, it can be drawn on the master layer as a window.

33.2.19.3 Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	—	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

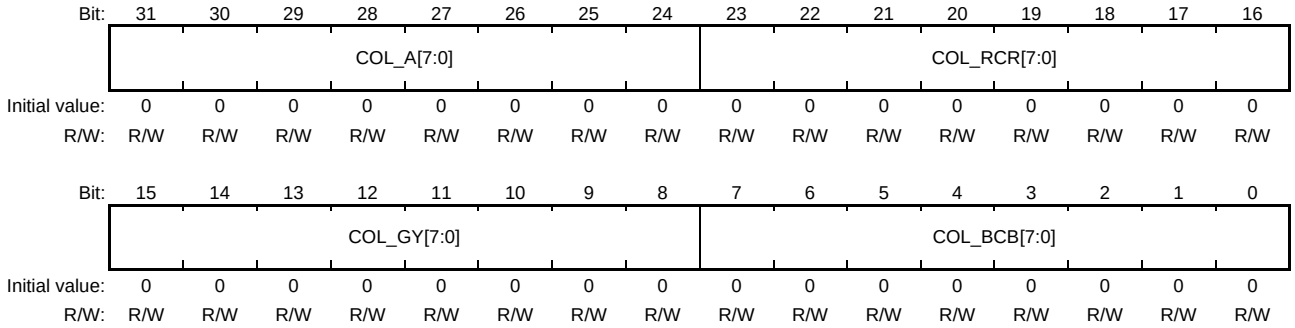
Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Virtual RPF Location on Master Layer These bits specify the horizontal coordinate of where to locate the left-edge pixel of the virtual RPF's layer, with the left-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Virtual RPF Location on Master Layer These bits specify the vertical coordinate of where to locate the top-edge pixel of the virtual RPF's layer, with the top-edge pixel of the master layer set at coordinate 0. This setting should be made in pixel units. A value from 0 to 8189 can be specified. When the virtual RPF is specified as the master layer by VI6_WPFn_SRCRPF.VIR_ACT2, set these bits to 0.

33.2.19.4 Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	—	√	—



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	COL_A [7:0]	All 0	R/W	Fixed α of Virtual RPF These bits set the fixed α value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
23 to 16	COL_RCR [7:0]	All 0	R/W	Fixed R/Cr of Virtual RPF These bits set the fixed R/Cr value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
15 to 8	COL_GY [7:0]	All 0	R/W	Fixed G/Y of Virtual RPF These bits set the fixed G/Y value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.
7 to 0	COL_BCB [7:0]	All 0	R/W	Fixed B/Cb of Virtual RPF These bits set the fixed B/Cb value when the virtual RPF creates a virtual plane. A value from 0 to 255 can be specified.

The way to set this register is same as BRU virtual RPF shown in section 33.2.15.4. See section 33.2.15.4 for more detail explanation.

33.2.19.5 BRS Control Registers (VI6_BRSm_CTRL: m = A, B)

Bit	Bit Name	Initial Value	R/W	Description
31	RBC	B’0	R/W	Operation Type of Blending/ROP Unit m (m = A, B) Specifies the operation type for blending/ROP unit m (m = A, B) shown in Figure 33.55. 0: ROP (raster operation) 1: Blending operation
30 to 23, 19, 15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 20	DSTSEL [2:0]	B’000	R/W	Input Selection for DST Side of Blending/ROP Unit A These bits select the input for the DST side of blending/ROP unit A shown in Figure 33.55. These bits specify the connection between the BRS input port and the DST separately from the setting of connections between other modules and the BRS input port through the DPR. B’000: BRS input 0 (BRSin0) is input to DST B’001: BRS input 1 (BRSin1) is input to DST B’100: Virtual RPF is input to DST B’010, B’011, B’101 to B’111: Setting prohibited [Note] The DSTSEL bits for blending/ROP unit B is reserved. The write value should always be 0.
18 to 16	SRCSEL [2:0]	B’000	R/W	Input Selection for SRC Side of Blending/ROP Unit m (m = A, B) These bits select the input for the SRC side of blending/ROP unit m (m = A, B) shown in Figure 33.55. These bits specify the connection between the BRS input port and the SRC separately from the setting of connections between other modules and the BRS input port through the DPR. B’000: BRS input 0 (BRSin0) is input to SRC B’001: BRS input 1 (BRSin1) is input to SRC B’100: Virtual RPF is input to SRC B’010, B’011, B’101 to B’111: Setting prohibited [Note] The SRCSEL bits for blending/ROP unit B are reserved. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	CROP [3:0]	H'0	R/W	Color Data ROP Operator These bits select the ROP operator of the color data in blending/ROP unit m (m = A, B). Select the opcode for ROP operation from Table 33.35.
3 to 0	AROP [3:0]	H'0	R/W	α Data ROP Operator These bits select the ROP operator of the α data in blending/ROP unit m (m = A, B). Select the opcode for ROP operation from Table 33.35.

Bit	Bit Name	Initial Value	R/W	Description
31	CBES	B’0	R/W	Blending Expression Selection Selects the blending expression of the color data in the BRS (VI6_BRSm_CTRL.RBC = 1). Blending coefficients are specified by the CCMDX and CCMDY bits. 0: CCMDX * (DST color data) + CCMDY * (SRC color data) 1: CCMDX * (DST color data) – CCMDY * (SRC color data)
30 to 28	CCMDX [2:0]	B’000	R/W	Blending Coefficient X Selection These bits specify coefficient X used in the blending expression determined by the CBES bit. B’000: DST α data is used as blending coefficient X B’001: 255 – (DST α data) is used as blending coefficient X B’010: SRC α data is used as blending coefficient X B’011: 255 – (SRC α data) is used as blending coefficient X B’100: Fixed α value 0 (COEFX setting)
27, 19	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	CCMDY [2:0]	B’000	R/W	Blending Coefficient Y Selection These bits specify coefficient Y used in the blending expression determined by the CBES bit. B’000: DST α data is used as blending coefficient Y B’001: 255 – (DST α data) is used as blending coefficient Y B’010: SRC α data is used as blending coefficient Y B’011: 255 – (SRC α data) is used as blending coefficient Y B’100: Fixed α value 1 (COEFY setting)
23	ABES	B’0	R/W	Blending α Creation Expression Specifies the expression for creating α data after blending by blending/ROP unit m (m = A, B, C, D, E). α creation coefficients are specified by the ACMDX and ACMDY bits. 0: ACMDX * (DST α data) + ACMDY * (SRC α data) 1: ACMDX * (DST α data) – ACMDY * (SRC α data)

Bit	Bit Name	Initial Value	R/W	Description
22 to 20	ACMDX [2:0]	B’000	R/W	α Creation Coefficient X These bits specify α creation coefficient X used in the α creation expression determined by the ABES bit. B’000: (α creation coefficient X) = (DST α data) B’001: (α creation coefficient X) = 255 – (DST α data) B’010: (α creation coefficient X) = (SRC α data) B’011: (α creation coefficient X) = 255 – (SRC α data) B’100: (α creation coefficient X) = Fixed α value 0 (COEFX setting) B’101 to B’111: Setting prohibited
18 to 16	ACMDY [2:0]	B’000	R/W	α Creation Coefficient Y These bits specify α creation coefficient Y used in the α creation expression determined by the ABES bit. B’000: (α creation coefficient Y) = (DST α data) B’001: (α creation coefficient Y) = 255 – (DST α data) B’010: (α creation coefficient Y) = (SRC α data) B’011: (α creation coefficient Y) = 255 – (SRC α data) B’100: (α creation coefficient Y) = Fixed α value 1 (COEFY setting) B’101 to B’111: Setting prohibited
15 to 8	COEFX [7:0]	All 0	R/W	Fixed α Value 0 These bits specify fixed α value 0 used when the CCMDX or ACMDX bits are set to B’100. A value from H’00 to H’FF can be specified.
7 to 0	COEFY [7:0]	All 0	R/W	Fixed α Value 1 These bits specify fixed α value 1 used when the CCMDY or ACMDY bits are set to B’100. A value from H’00 to H’FF can be specified.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28, 15 to 5, 3 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	OBTH [11:0]	All 0	R/W	Buffer Threshold for Start Ready Notification to Display Module [For VSPD] Always specify 3000, when LIF_EN is set to 1. [For VSPDL] RZ/G2H, RZ/G2N: Always specify 1500, when LIF_EN is set to 1.
4	CFMT	B'0	R/W	Chroma Format This bit selects the output format from the LIF module to the display module. When RGB format is used, this bit shall be set to 0. 0: YCbCr444 or RGB Format 1: YCbCr422 Format [Note] The DU cannot receive YCbCr422 format. Therefore, when CFMT is 1, YCbCr444 data which information contents is equal to YCbCr422 is output to DU as shown in Figure 33.56. Set 1 to DEF10Rm.YCDF{0,1} (DU register) for DU to perform simple down sample for Cb/Cr.
1	REQSEL	B'0	R/W	External Display Module Selection 0: This value is setting prohibited when 1 is set to LIF_EN 1: DU is selected as the destination external display module.
0	LIF_EN	B'0	R/W	Enable/Disable of Data Output to External Display Module Enables or disables data output from the LIF to the external display module (DU). 0: Data output to the external display module is disabled. 1: Data output to the external display module is enabled.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
31 to 24	Limit0	All 0	R/W	Sharpness Parameter Limit0 There are 24 types of setting value to apply sharpness as shown in Table 33.41 and 24 types of setting value to apply blurring as shown in Table 33.42. Specify an appropriate value from among its combination.
23 to 16	Gain0	All 0	R/W	Sharpness Parameter Gain0 There are 24 types of setting value to apply sharpness as shown in Table 33.41 and 24 types of setting value to apply blurring as shown in Table 33.42. Specify an appropriate value from among its combination.
1	SIGN	B’0	R/W	Sharpness Parameter SIGN There are 24 types of setting value to apply sharpness as shown in Table 33.41 and 24 types of setting value to apply blurring as shown in Table 33.42. Specify an appropriate value from among its combination.
0	SHP_EN	B’0	R/W	Sharpness Processing Enable/Disable 0: Sharpness processing is disabled (input goes through the SHP without change) 1: Sharpness processing is enabled When this bit is set to 1, input format to the SHP module should be YCbCr format. Effect of sharpness is applied to Y component, not applied to Cb, Cr component. Effect of sharpness is applied to horizontal direction, not applied to vertical direction.

To execute sharpness processing in YCbCr format, set up the RPF and DPR appropriately so that YCbCr-format image data is input to the SHP. Refer to section 33.2.6.3. For DPR settings, refer to section 33.2.8.1 to 33.2.8.4. Refer to Table 33.41 to apply sharpness. The SHP also has a function of blurring. Refer to Table 33.42 to apply blurring.

33.3.1 Registers to set fixed value

Set fixed value to following registers in any case.

[1] Always set H'0000 0808 to VI6_CLK_DCSWT

[2] Always set D'256 to VI6_DL_CTRL.AR_WAIT [7:0] in case of using display list.

[3] Always set D'2 to VI6_DL_EXT_CTRLn.POLINT [5:0] in case of using extended display list of WPFn.

[4] Always set D'1 to VI6_DL_EXT_CTRLn.DLPRI in case of using extended display list of WPFn.

[5] Always set D'0 to VI6_DL_EXT_CTRLn.EXPRI in case of using extended display list of WPFn.

[6] Always set D'256 to VI6_WPF0_ROT_CTRL.LMEM_WD [12:0] in case of using rotation.

[7] Always set H'0000 0500 toVI6_DPR_WPFn_FPORCH (n = 0, 1) in case of using WPFn.

[8] For VSPD, always set D'3000 to VI6_LIF0_CTRL.OBTH[11:0] for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N or RZ/G2E in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

For VSPDL, always set D'1500 to VI6_LIFn_CTRL.OBTH[11:0] for RZ/G2H or RZ/G2N in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[9] Always set H' 0000_0000 to VI6_LIF0_LBA for RZ/G2M V1.3, RZ/G2M V3.0 in case of using LIF0 (VI6_LIF0_CTRL.LIF_EN = 1).

[10] Always set D'1 to VI6_LIFn_CTRL.REQSEL in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

[11] Always set D'0 to VI6_LIFn_CSBTH in case of using LIFn (VI6_LIFn_CTRL.LIF_EN = 1).

33.3.2 Concept of VSP2 Operation Starting and Stopping

The VSP2 provides two channels of image processing. Each channel is started by setting the corresponding start register. Here, starting a processing channel means starting one of WPF0 to WPF1, which are output modules of the VSP2. Use the start registers shown in Table 33.43 to start WPF modules.

After a WPF module is started and specified processing is completed, the corresponding channel stops operation and notifies the end of processing through an end interrupt. End interrupts are generated through the end interrupt source registers shown in Table 33.43; clearing a source register cancels the corresponding interrupt signal (for details of interrupt processing, refer to section 33.3.4, Interrupt Processing). Each of the operating status registers shown in the table indicates the busy state after the corresponding channel is started through the start register until processing is completed and operation stops. Figure 33.57 shows these operation timings.

Table 33.43 Target Module and Corresponding Registers for Starting and Stopping Operation

Target Module	Start Register	End Interrupt Source Register	Operating Status Register
WPF0	VI6_CMD0.STRCMD	VI6_WPF0_IRQ_STA. FRE	VI6_STATUS.SYS0_ACT
WPF1	VI6_CMD1.STRCMD	VI6_WPF1_IRQ_STA. FRE	VI6_STATUS.SYS1_ACT

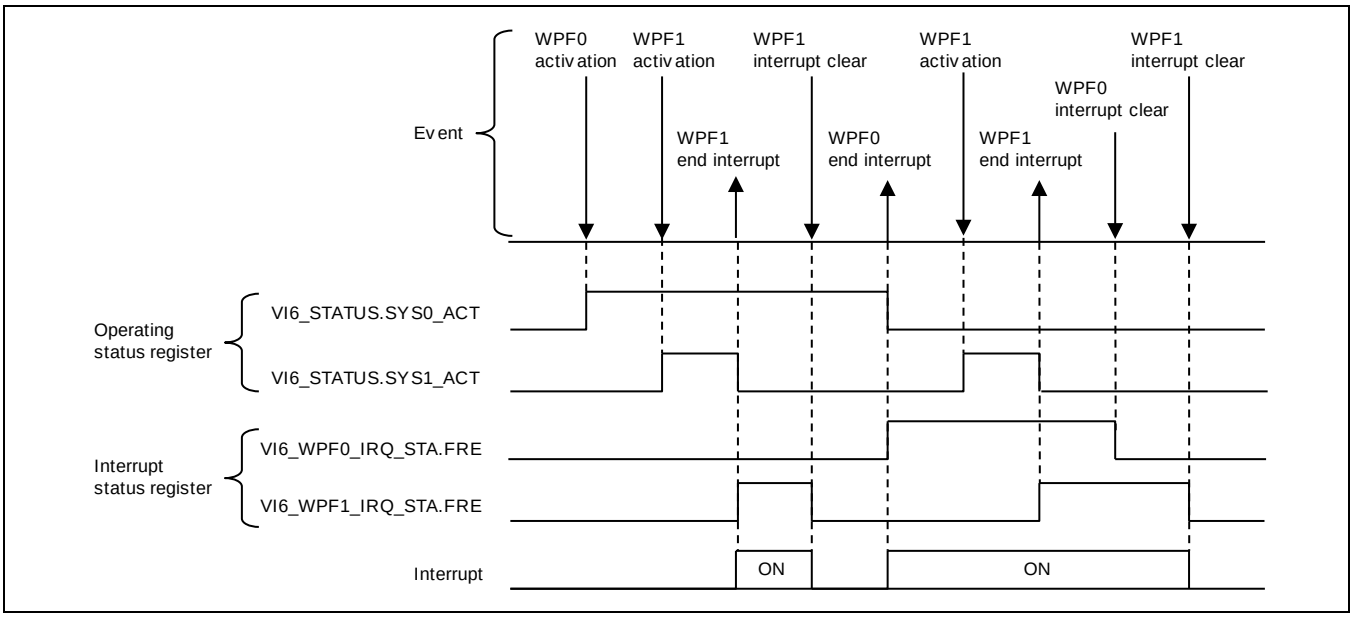

Figure 33.57 VSP2 Startup and Status of Each Register and Interrupt

The following describes the operating states (operating or stopped) of VSP2 internal modules. As described in section 33.1.2, the VSP2 has several image processing modules and the connections between modules are determined by the DPR. Accordingly, the operating state of a module is the same as that of the target WPF for that module. For example, when the target WPF for the BRU is WPF0, the BRU operating state is the same as that of WPF0; that is, the BRU operating state is indicated by the VI6_STATUS.SYS0_ACT as shown in Table 33.43 and the status change timing is shown as VI6_STATUS. SYS0_ACT in Figure 33.57. Likewise, the operating states of all modules connected to WPF0 is indicated by VI6_STATUS. SYS0_ACT.

After connections through the DPR are changed and the target WPF for a module is changed, refer to the correct register for the new target WPF to check the operating state of that module. In the above example, after the target WPF for the BRU is changed from WPF0 to WPF1, the BRU operating state is indicated by VI6_STATUS. SYS1_ACT.

Connections should be changed through the DPR-related registers (described later) while all modules to be affected by any change in connections are stopped. If connections through the DPR are changed during operation, the VSP2 will hang.

Figure 33.58 shows relation between start reservation and operating status. When start is reserved while VSP2 is operating, the reservation is accepted after VSP2 status is moved from "operating" into "idle" as shown in Figure 33.58. Therefore, when start reservation is used for VSPI and VSPB as shown in section 33.3.7.3 and section 33.3.8, take following procedure to confirm VSP2 isn't operating.

<1> Check VI6_CMD0.STRCMD is zero (Start is not reserved)

<2> Check VI6_STATUS.SYS0_ACT is zero (VSP2 is IDLE status)

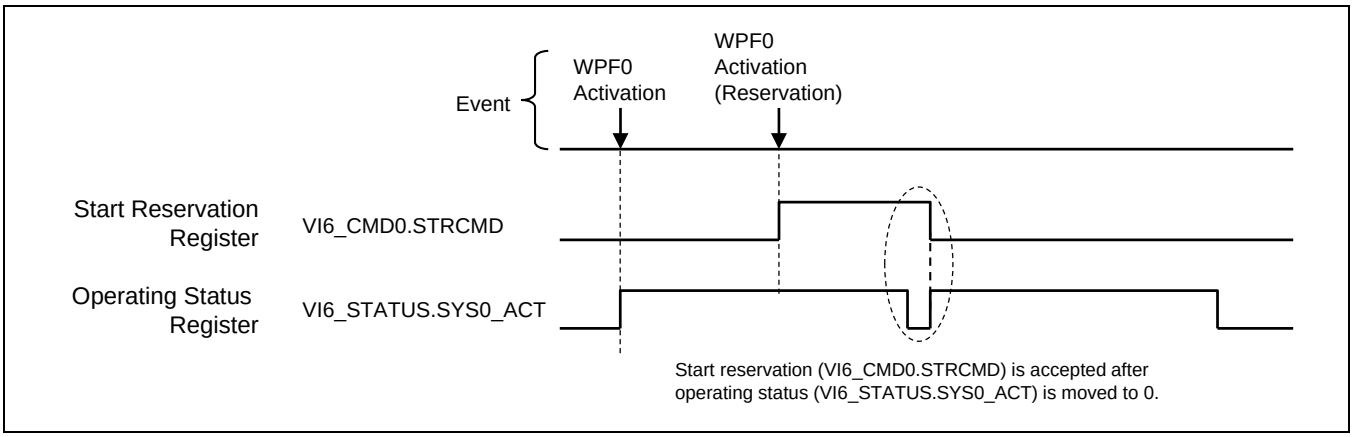

Figure 33.58 VSP2 Start reservation and Operating status

Note: WPF0 and WPF1 cannot be executed at same time for VSPD

33.3.3 Display List

33.3.3.1 Functional Description

The VSP2 provides the display list function. As a display list, the VSP2 automatically downloads the register settings except for the control registers (section 33.2.4 and 33.2.5) from external memory and stores the settings in the VSP2 registers. This function is advantageous in that the interrupt processing or register setting modification processing can be executed without CPU intervention during multiple-frame processing because the register settings used for VSP2 processing are prepared in advance in external memory such as SDRAM.

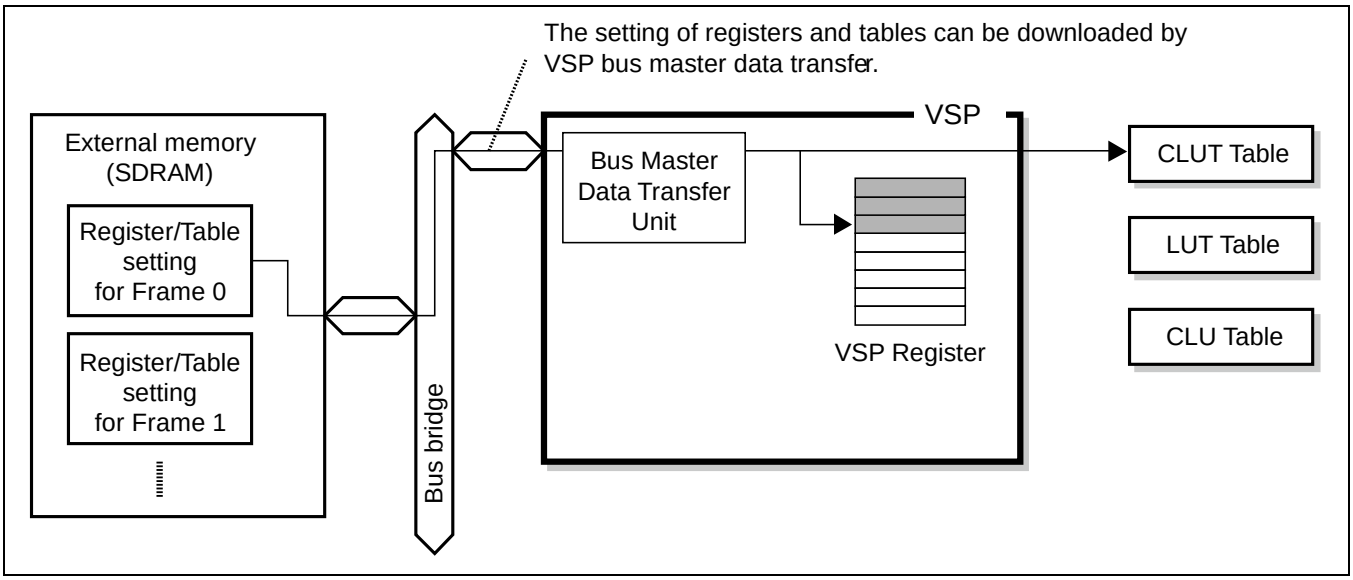

Figure 33.59 Concept of Display List

To use display lists, specify the external memory addresses to the display list control registers described in section 33.2.5. The register settings or various types of information should be stored in external memory in the format described in section 33.3.3.2. Figure 33.60 shows the difference between VSP2 operation through normal register settings and through display lists.

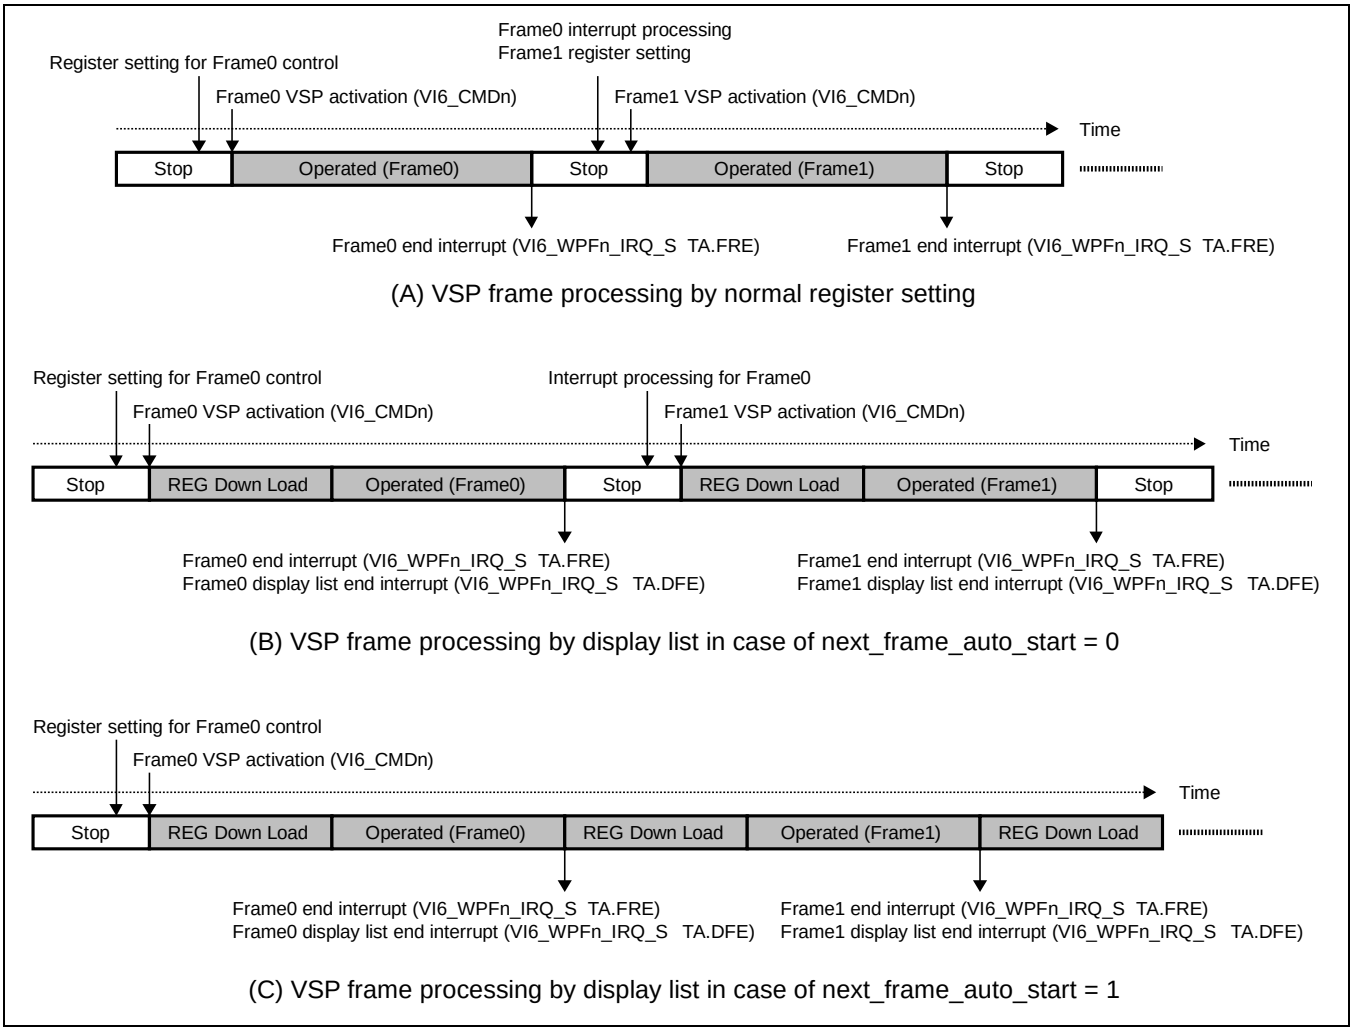

Figure 33.60 Comparison of VSP2 Operation between Normal Register Settings and Display Lists

As shown in Figure 33.60 (A), in the VSP2 processing through normal register settings, all registers should be set up before the VSP2 is started for each frame. After the VSP2 processing is completed, the VSP2 outputs a frame end interrupt (VI6_WPFn_IRQ_STA.FRE). This method requires a certain amount of time for register settings or interrupt processing by the CPU between frames. In contrast, when display lists are used, the VSP2 automatically downloads register settings from external memory as shown in Figure 33.60 (B) and (C), which reduces the load on the CPU between frames.

Figure 33.60 (B) shows the display list usage where the VSP2 stops at the end of every frame; only the VSP2 start processing for each frame is done by the CPU. This is suitable for the cases when the CPU controls synchronization of frame processing in frame buffer management or when the amount of register values or table data to be set in the VSP2 is large. In the case shown in Figure 33.60 (C), as soon as the frame processing ends, the VSP2 automatically begins next frame operation and starts downloading new register settings. This is the fastest operation using display lists.

Table 33.44 shows the modes of the display list and the supported functions for each mode. The detail of each mode is described in the following sections.

Table 33.44 Display list mode and supported functions

Mode	Extended Display List	Continuous Frames
Normal Display List Mode	Supported	Controlled by “next frame auto start” in the header of the display list.
Header-less Display List Mode	Not Supported	Controlled by VI6_DL_CTRL.CFM0 bit.

33.3.3.2 Normal Display List Mode

The VSP2 display lists include control information as well as simple register settings in order to control multiple-frame processing in an optimum way for each application. Figure 33.61 shows the display list structure.

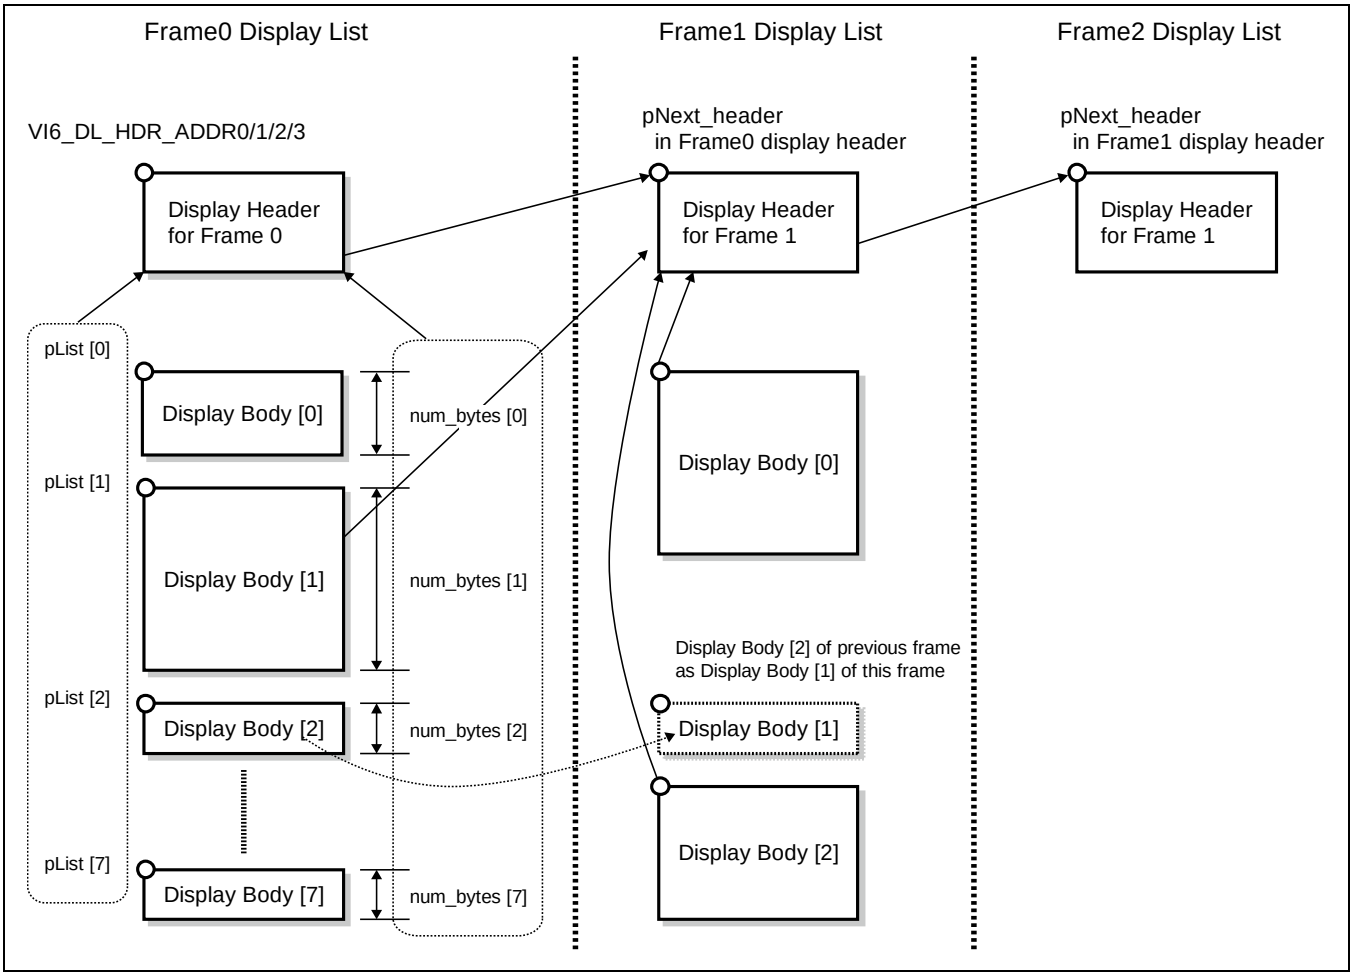

Figure 33.61 Structure and Concept of VSP2 Display List

A VSP2 display list consists of two sections; a header section for storing various information and control flags and a body section for storing register and table settings. A combination of these two sections is defined as a display list for a frame. The register and table settings can be divided and stored in up to eight separate bodies allocated in memory. Therefore, the separate bodies storing the register settings for one frame (for example, frame 0) can have non-sequential start addresses; that is, the bodies for one frame can be allocated to areas distant from each other in memory. To gather these bodies and configure the register settings for one frame, a header is used. A display header stores the number of bodies linked with the header and the start address and size of each body.

The VSP2 analyzes the header to gather register and table settings stored in separate memory areas and reconfigures the complete register settings.

The addresses of display headers should be specified in the VSP2 registers described in section 33.2.5. When activated in a mode that uses display lists, the VSP2 downloads display headers from the addresses specified in VI6_DL_HDR_ADDR0/1/2/3 (numbers 0 to 3 correspond to the WPF channel index numbers), analyzes the numbers of bodies and the address and data size of each body, downloads the bodies, and completes register and table settings. After display list downloading is completed, the VSP2 becomes ready for frame image processing; the VSP2 then starts the actual frame processing.

After processing of a frame ends, the VSP2 proceeds to the next frame processing. Here, there are two modes for starting the next frame processing as shown in Figure 33.60. In one mode, the VSP2 stops operation and waits for the next

activation by the CPU in the same way as when display lists are not used. In this mode, the address used for downloading the display header of the next frame is kept by the internal hardware. Therefore, if valid address information is not stored in the display header for the previous frame, a correct value should be specified in VI6_DL_HDR_ADDR0/1/2/3 while the VSP2 is stopped. When the VSP2 is started after a correct value is specified, the VSP2 starts next frame processing with the same procedure for the previous frame. In contrast to this mode, which stops the VSP2 after the end of one-frame processing, there is another mode for automatically starting next frame processing. In automatic start mode, the VSP2 downloads the next display header as soon as the previous frame processing ends. After downloading ends, the VSP2 starts image processing. The information regarding mode selection, that is, whether to automatically start next frame processing, should be stored in the display header downloaded for the previous frame.

In the automatic start mode, the VSP2 continues processing until the display header for a frame specifies that the next frame should not be started automatically. To stop processing during automatic execution, use a software reset (VI6_SRESET).

To strictly define the display list format described above, the following shows the grammatical structure of a display list using pseudo-code. First, to simplify the description of the display list format in the following pages, Table 33.45 defines a function. Function zero bits (num bits) generates a string of one-bit 0s for the number of bits specified by the parameter for the function. By using this function, Table 33.46 defines the header section format of a display list and Table 33.47 defines the body section format and Table 33.48 defines the extended display list body section format.

Data order of Display List Header Section, Display List Body Section and Extended Display List Body Section are assumed as the data is stored in SDRAM by big endian. Table 33.49 shows an example of data order. If data order is not same as the definition, data order within 8byte unit can be adjusted by setting VI6_DL_SWAP (33.2.5.3).

Table 33.45 Definition of a Function for Simple Description

Syntax	Bit Count
zero_bits (num_bits)	
{	
for (i=0; i<num_bits; i++) {	
zero_bit	1
}	
}	

Bit String	Contents
zero_bit	zero_bit indicates a 1-bit integer having a value of 0.

Table 33.46 Format of Display List Header Section

Syntax	Bit Count
display_header () /* Fixed length */	
{	
zero_bits (29)	
num_list_minus1	3
for (i = 0; i<8; i++)	
zero_bits (15)	
num_bytes [i]	17
pList [i]	32
}	
pNext_header	32
zero_bits (30)	
current_frame_int_enable	1
next_frame_auto_start /* 76 bytes from the beginning of this header*/	1
if (VI6_DL_EXT_CTRL.EXT) {	
zero_bits (32) /* padding zero 4 bytes for alignment */	
zero_bits (6)	
pre_ext_dl_exec	1
post_ext_dl_exec	1
zero_bits (8)	
pre_ext_dl_num_cmd	16
pre_ext_dl_pList	32
zero_bits (16)	
post_ext_dl_num_cmd	16
post_ext_dl_pList /* 96 bytes from the beginning of this header*/	32
}	
}	

Bit String	Contents
num_list_minus1	Specifies the value obtained by subtracting 1 from the total number of display list bodies linked with the display header. For example, when this bit field is set to 0, this display list uses one body.
num_bytes [i]	Specifies the number of bytes in the i-th display list body (indicated by index i). Be sure to specify a multiple of eight bytes. For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pList [i]	Specifies the start address of the i-th display list body (indicated by index i). Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0). For the bodies that are not defined in num_list_minus1 (for example, i = 5 to 7 when num_list_minus1 is set to 4), specify 0.
pNext_header	Specifies the address of the display list header for the next frame. After display list downloading ends, the VSP2 keeps its value in the internal memory and uses it in the next display list header downloading. Be sure to specify an address aligned with an 8-byte boundary (the lower-order three bits are 0).
current_frame_int_enable	This is a flag that indicates whether to set the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) to 1 when the current frame processing ends. If this flag is set to 0, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is not set to 1 when one-frame processing by this display header ends. In this state, even if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), no interrupt will be generated. If this flag is set to 1, the display list end interrupt source (VI6_WPFn_IRQ_STA.DFE) is set to 1 when one-frame processing by this display header ends. In this state, if the display list end interrupt is enabled (VI6_WPFn_IRQ_ENB.DFEE is set to 1), the VSP2 generates an interrupt.
Next_frame_auto_start	Enables or disables automatic start of next frame processing when one-frame processing by this display header ends. If this bit is set to 1, the VSP2 starts next frame processing as soon as one-frame processing by this display header ends, and starts downloading the next frame display header from the pNext_header address specified in this display header. If this bit is set to 0, the VSP2 stops operation when one-frame processing by this display header ends. In this case, start the VSP2 through VI6_CMDn to process the next frame.
pre_ext_dl_exec	Enables execution of the extended display list for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. If this bit is set to 1, the VSP2 executes the extended display list for frame preprocessing. The VSP2 does not execute it if this bit is set to 0. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_exec	Set 0 to this bit.
pre_ext_dl_num_cmd	Specifies the number of commands in the extended display list body section for frame preprocessing when VI6_DL_EXT_CTRL.EXT is 1. The number of commands that can be specified is 1, and a command is 16 bytes. When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
pre_ext_dl_pList	Specifies the start address of the area where the extended display list body section for frame preprocessing is stored when VI6_DL_EXT_CTRL.EXT is 1. Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0). When pre_ext_dl_exec is set to 0, the extended display list for frame preprocessing is not executed; specify 0 in this bit. This bit setting is ignored when VI6_DL_EXT_CTRL.EXT is 0.
post_ext_dl_num_cmd	Set 0 to this bit.
post_ext_dl_pList	Set 0 to this bit.

Table 33.47 Format of Display List Body Section

Syntax	Bit Count
display_list (num_bytes) /* Variable length (num_bytes) */	
for (i = 0; i<num_bytes; i+ = 8) {	
set_address	32
set_data	32
}	
}	

Bit String	Contents
set_address	Specifies the address where the value specified by set_data is to be stored. Specify a register address. Note: Register space of VSP is 32Kbyte (H'0000 - H'7FFC). So, set 0 to upper 17bit of set_address in Display List Body Section.
set_data	Specifies the value to be stored in the address specified by set_address. Specify a value to be set in a register.

Table 33.48 Format of Extended Display List Body Section

Syntax	Bit width
ext_dl_display_list (num_llw) /* Variable length (pre/post_ext_dl_num_bytes) */	
for (i = 0; i<num_llw; i+ = 2) {

~~	~~~

33.3.3.3 Header-less Display List Mode

The header-less display list does not have the display header listed in Table 33.46, and it has the simplest structure that has only single body. The extended display list function is not available in case of the header-less display list mode. Set the value 1 to VI6_DL_CTRL.NH0 (see the section 33.2.5.1) to use the header-less display list. The start address downloaded by the header-less display list should be set to VI6_DL_HDR_ADDR0. And the size of the display body which is originally defined in the display header should be set to VI6_DL_BODY_SIZE0. The header-less display list is available only in WPF0.

33.3.3.4 Restrictions on Display List Usage

Access to the general control registers and display list control registers through a display list is prohibited. When using display lists, be sure to observe the following restrictions on register access by the CPU.

1. Do not execute write access to the same register (same address) from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSP2 is not guaranteed.
2. Do not execute write access to the same OSD-CLUT, CLU, or LUT lookup table from the CPU and through a display list at the same time. If such a conflict occurs, correct operation of the VSP2 is not guaranteed. Here, the same lookup table means the address space having the same space name shown in Table 33.50 or Table 33.51.
3. When read access by the CPU and write access through a display list to the same register (same address) occur at the same time, the read value returned to the CPU is not guaranteed.
4. When read access by the CPU and write access through a display list to the same OSD-CLUT, CLU, or LUT lookup table occur at the same time, the read value returned to the CPU is not guaranteed. Here, the same lookup table means the address space having the same space name shown in Table 33.50 or Table 33.51.
5. For other restrictions on values and timing of register setting through display lists, refer to the restrictions on normal register settings described in section 33.2.3.
6. Manipulation and setting of the registers described in section 33.2.4 and 33.2.5 through a display list is prohibited.
7. The extended display list function enabled by VI6_DL_EXT_CTRL.EXT is to control the registers of the ICB connected with the VSP2. Do not use extended display lists for any other purpose.

33.3.4 Interrupt Processing

The VSP2 provides multiple image processing channels (WPF0 to WPF1) and they can operate simultaneously in parallel. When a WPF module generates an internal source that should be notified, an interrupt signal is output. As internal sources are generated in each WPF independently, the VSP2 has the following registers to control interrupts in each WPF.

WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0, 1) (refer to section 33.2.4.12)

WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0, 1) (refer to section 33.2.4.13)

While multiple WPF modules operate in parallel, they may output interrupt requests at the same time (this is called a multiple interrupt state). Read the WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0, 1) in sequence and execute the interrupt response processing for each interrupt source.

(Note1)

To use interrupts, enable them through WPF interrupt enable registers. If an interrupt source register has already been set to 1 for some reason, an unintended interrupt will occur as soon as the corresponding interrupt enable register is set as enabled. To avoid this, before enabling interrupts through WPF interrupt enable registers, be sure to clear all WPF interrupt sources to be enabled to 0. Be careful about this procedure when setting up registers before starting the VSP2.

(Note2)

WPF0 and WPF1 cannot be executed at same time for VSPD.

33.3.5 Lookup Table Settings

33.3.5.1 OSD-CLUT or LUT

For a single entry to the OSD-CLUT space (see Table 33.50) or LUT space (see Table 33.50) of the VSP2, the OSD-CLUT or LUT data is set by a write access in the format shown in Figure 33.62.

The entry address of each space is (start address of the space) + (entry number counting from the base point 0 × 4). For example, the address of entry 7 to the LUT space is (offset address) + H'7000 + 7 × 4 = (offset address) + H'701C.

Table 33.50 shows the spaces for which entries can be made. Note that if the module that references that space is operating, write accesses to the relevant space are prohibited. For example, while RPF2 is operating, accesses to the entire space of VI6_CLUT2_TBL are prohibited. When a read access is made to the relevant space during operation of the referencing module, undefined values will be read out.

The operating/stopped state of each module in Table 33.50 is the operating state of the WPF to which each module is connected. Determine whether the module is operating or stopped using each WPF operating status bit in the VI6_STATUS register.

Table 33.50 OSD-CLUT Space and LUT Space Addresses

Space Name	Space Addresses	Entry Count	Module that References the Space in the Left Column
VI6_CLUT0_TBL	(offset address) + H'4000 to (offset address) + H'43FC	256	RPF0
VI6_CLUT1_TBL	(offset address) + H'4400 to (offset address) + H'47FC	256	RPF1
VI6_CLUT2_TBL	(offset address) + H'4800 to (offset address) + H'4BFC	256	RPF2
VI6_LUT_TBL	(offset address) + H'7000 to (offset address) + H'73FC	256	LUT

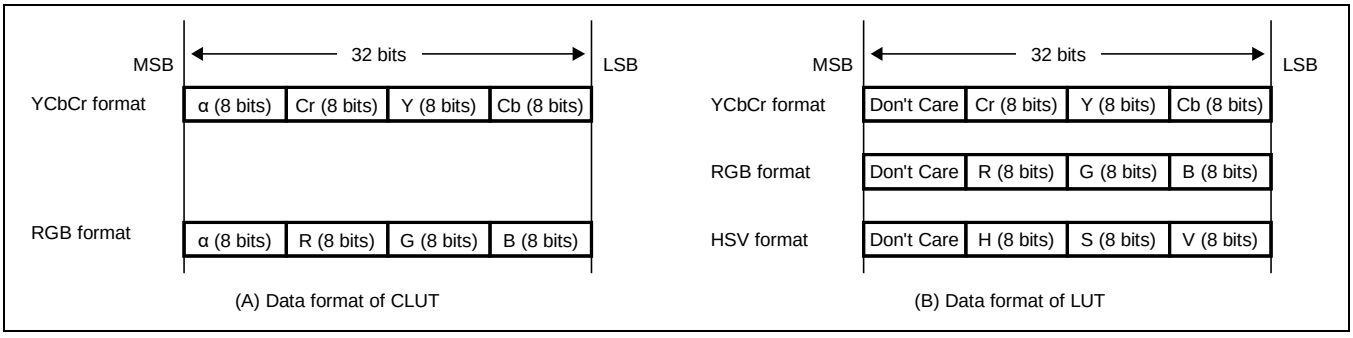

Figure 33.62 VI6_CLUT_TBL and VI6_LUT_TBL Formats

33.3.5.2 CLU Table

Data is set in the CLU table in the space shown in Table 33.51 through indirect addressing.

Table 33.51 CLU Space Addresses

Space Name	Space Addresses	Module that References the Space in the Left Column
VI6_CLU_TBL	(offset address) + H'7400 to (offset address) + H'7407	CLU

The addresses used in indirect addressing (VI6_CLU_ADDR, VI6_CLU_DATA) are shown in Table 33.52. The CLU table can be accessed by setting the VI6_CLU_ADDR register and then reading from or writing to the VI6_CLU_DATA register. To write-access the CLU table continuously, such as when setting data to the CLU table, perform the following.

(1) Set the first CLU table coordinates in VI6_CLU_ADDR.
(2) Write the first data to be set in VI6_CLU_DATA.
(3) Set the next CLU table coordinates in VI6_CLU_ADDR.
(4) Write the next data to be set in VI6_CLU_DATA.
Execute these processes in a similar manner.

Accesses to VI6_CLU_ADDR and VI6_CLU_DATA registers are repeated in this way. The location where to access the CLU table to write the VI6_CLU_DATA contents immediately takes effect after a value is set in the VI6_CLU_ADDR register.

To read-access the CLU table continuously, change the write-access operation to the read-access operation in the sequence of processes of (1) to (4) above.

The following describes how to specify VI6_CLU_ADDR.

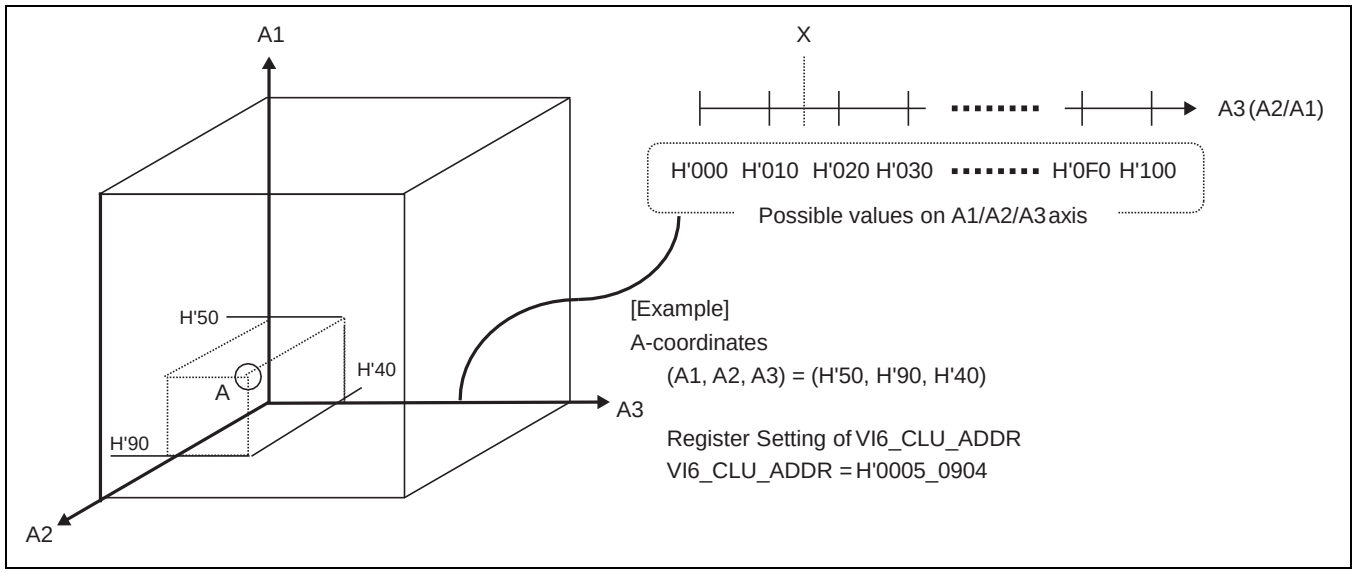

Figure 33.63 VI6_CLU_ADDR Setting

In the CLU table, a table value should be specified for every increase by H'10 along each of the axes and for every intersection between two axes. For a certain axis, as shown in the top right of Figure 33.63, a value to be set in the table corresponds to a scale mark at an interval of H'10. The location of a point between two scale marks (for example, point X in Figure 33.63) is calculated through interpolation by the CLU (refer to section 33.2.12.1). Accordingly, the lower four bits of table settings for each axis has no meaning; only the upper-order five bits of the desired coordinate for each component should be specified in VI6_CLU_ADDR (which should be shifted to the right by four bits) as shown in Figure 33.63.

Table 33.52 Address Spaces Used in Indirect Addressing to CLU Table

Address (Name)	Bit	Initial Value	R/W	Description
(offset address) + H'7400 (VI6_CLU_ADDR)	31 to 24	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
	23 to 16	All 0	R/W	Coordinate Value of First Axis These bits set the coordinate value of the first axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified.
	15 to 8	All 0	R/W	Coordinate Value of Second Axis These bits set the coordinate value of the second axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified.
	7 to 0	All 0	R/W	Coordinate Value of Third Axis These bits set the coordinate value of the third axis on the three-dimensional space coordinates of the CLU table. A value from 0 to 16 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.
(offset address) + H'7404 (VI6_CLU_DATA)	31 to 24	Undefined	R	Reserved These bits are always read as 0. The write value should always be 0.
	23 to 16	Undefined	R/W	Component Value of First Axis These bits set the component value of the first axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register. A value from 0 to 255 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.
	15 to 8	Undefined	R/W	Component Value of Second Axis These bits set the component value of the second axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register. A value from 0 to 255 can be specified.
	7 to 0	Undefined	R/W	Component Value of Third Axis These bits set the component value of the third axis on the three-dimensional space coordinates of the CLU table, which is defined by the VI6_CLU_ADDR register. A value from 0 to 255 can be specified when the CLU is in 3D mode. In 2D mode, these bits must be set to 0.

Accessing way of “Automatic Table Address Increment (VI6_CLU_CTRL.AAI = 1)” is shown below.

(1) Set 1 in VI6_CLU_CTRL.AAI
(2) Set H’0000_0000 in VI6_CLU_ADDR (initial coordinate)
(3) Write the data in VI6_CLU_DATA by following order (pseudo-code).

```
for (ax3 = 0; ax3 < 17; ax3 ++) {
    for (ax2 = 0; ax2 < 17; ax2 ++) {
        for (ax1 = 0; ax1 < 17; ax1 ++) {
            Write the data in VI6_CLU_DATA
            for the coordinate of "VI6_CLU_ADDR = (ax1 << 16) + (ax2 << 8) + ax3".
        }
    }
}
```

33.3.6 Linked with DU

33.3.6.1 Operation flow of VSPD and DU

This section shows operation flow of VSPD and VSPDL by using Normal Display List Mode. For details of Normal Display List Mode, refer to section 33.3.3.2.

Figure 33.64 to Figure 33.66 shows a procedure (register setting flow) to display image data to display panel. Setting not only VSPD or VSPDL registers, but also FCPV/ DU registers are needed. So, see section 35 FCP User's Manual / section 36 DU User's Manual to know the contents of FCPV/ DU registers mentioned in Figure 33.64 and Figure 33.66.

Figure 33.64 shows setting flow to start VSPD/LIF0 linked with DU. Figure 33.65 shows setting flow to update display image. Figure 33.66 shows setting flow to stop VSPD/LIF0 linked with DU.

Using display list with enabling next_frame_auto_start shown in section 33.3.3 is required to take the flow from Figure 33.64 to Figure 33.66.

Same flow can be applied for VSPDL/LIF0 and VSPDL/LIF1. Correspondence between ch number of VSPD/LIF and ch number of DU is shown in Table 33.6. VSPDL/LIF0 and VSPDL/LIF1 can be operated in parallel.

Note: If display sync operation ([1-8] step in Figure 33.64) is set before activating the VSPD/VSPDL, background color specified in DU register (BPORn or DOORn) is displayed until image data read from external memory is ready to be transferred to DU. In this case, image data from external memory is displayed late by one vsync or more.

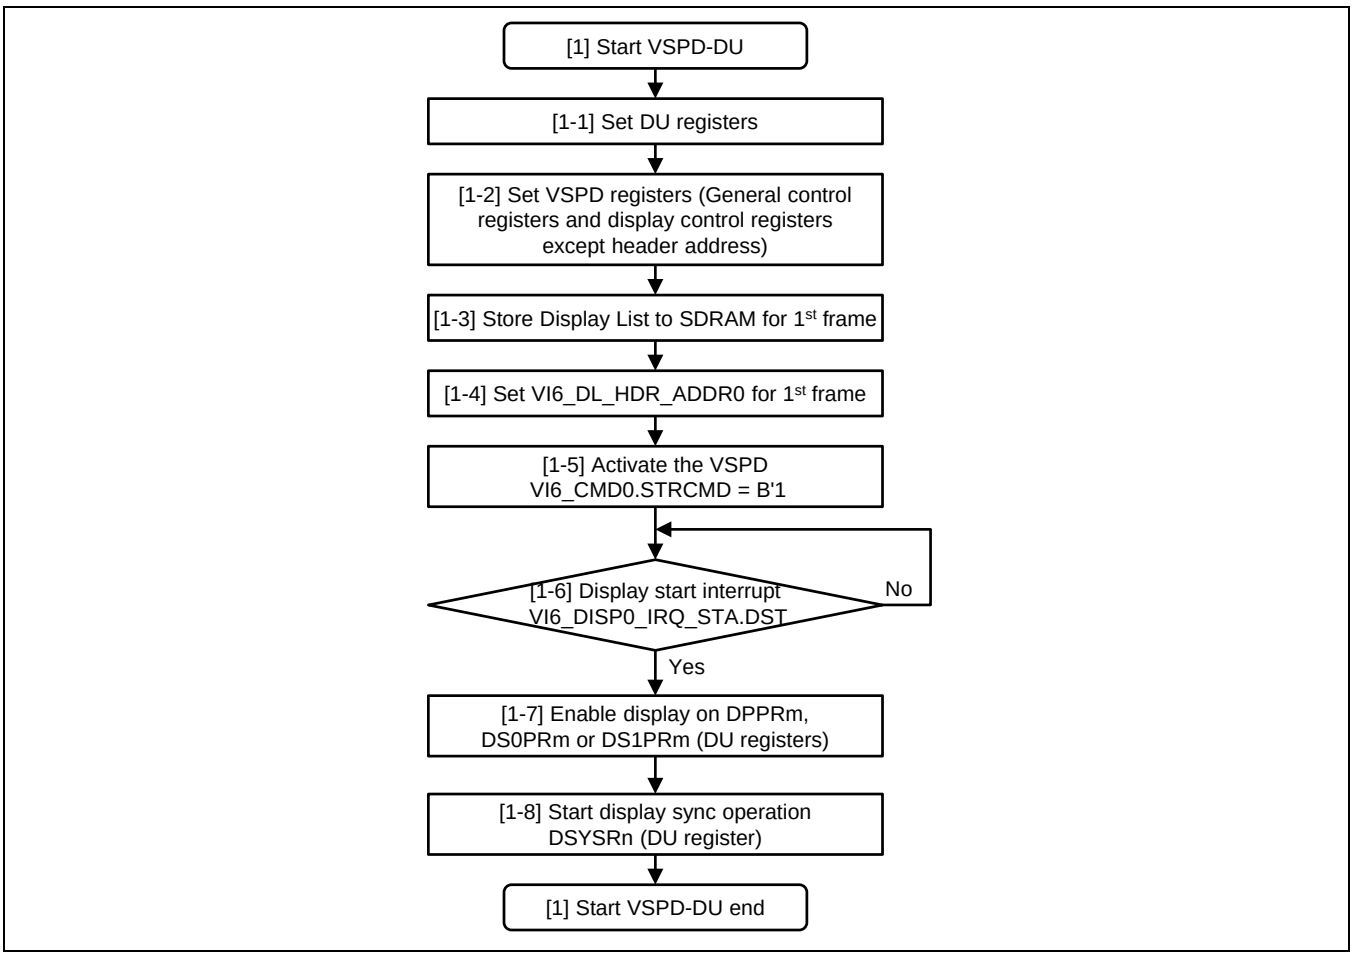

Figure 33.64 Setting flow to start VSPD linked with DU

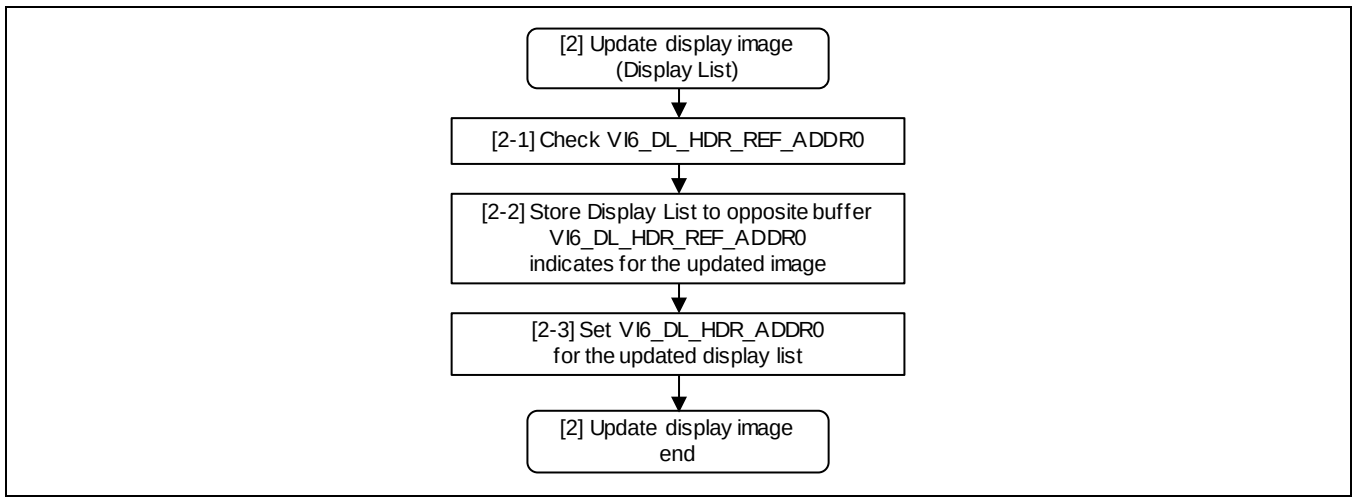

Figure 33.65 Setting flow to update display image

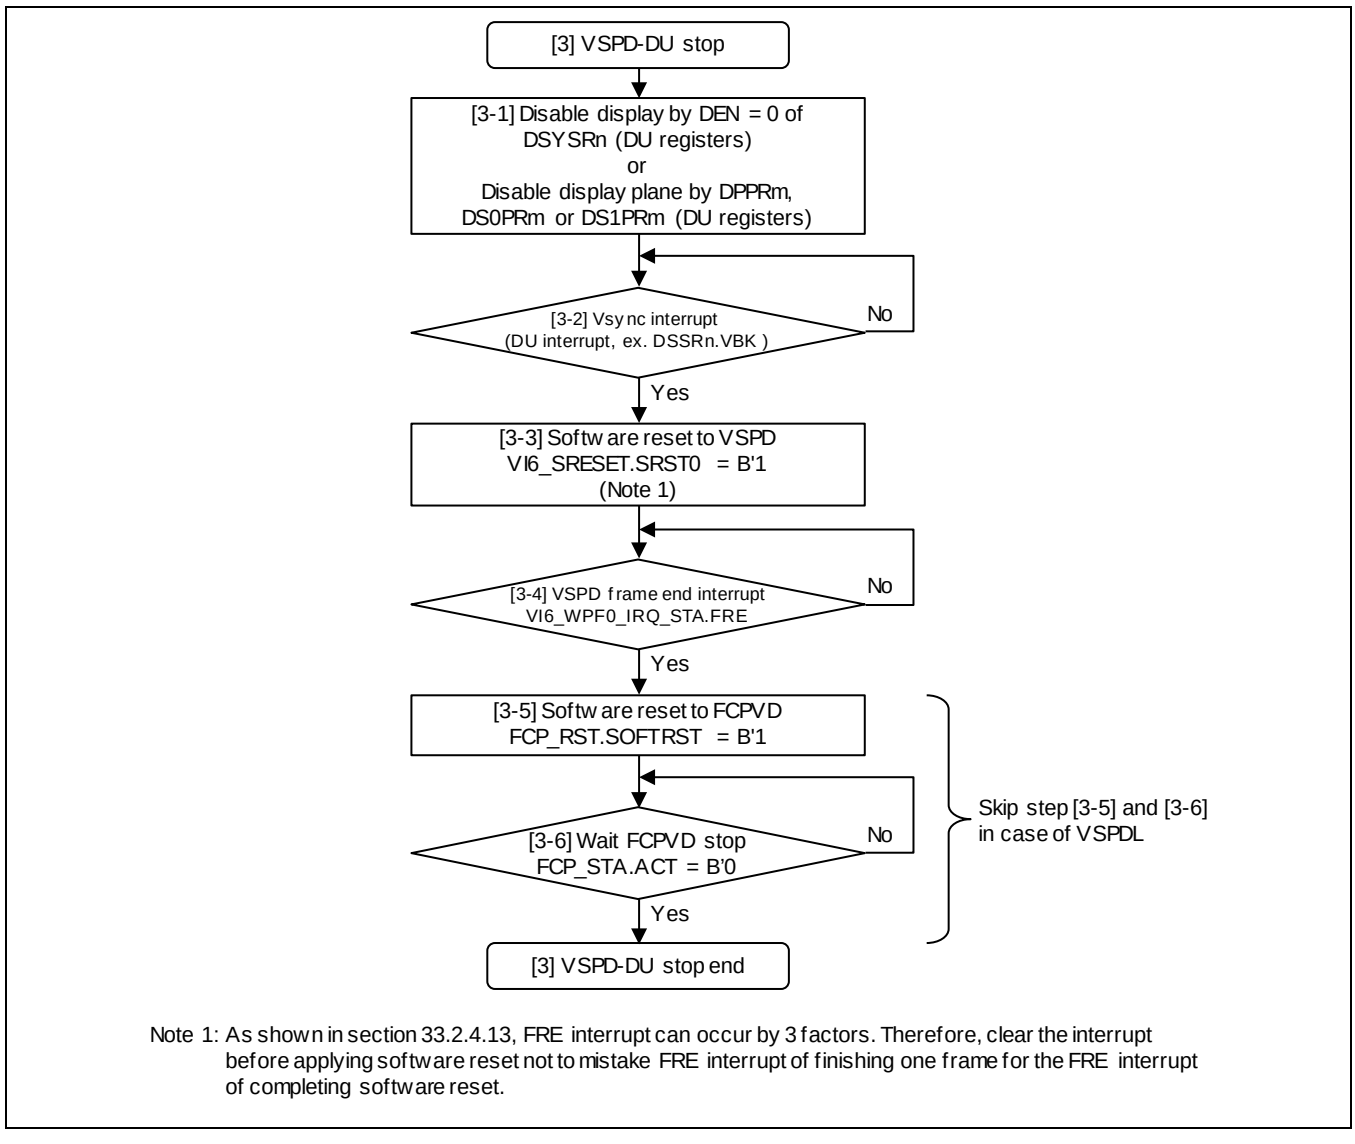

Note 1: As shown in section 33.2.4.13, FRE interrupt can occur by 3 factors. Therefore, clear the interrupt before applying software reset not to mistake FRE interrupt of finishing one frame for the FRE interrupt of completing software reset.

Figure 33.66 Setting flow to stop VSPD linked with DU

Note1: As shown in section 33.2.4.13, FRE interrupt can occur by 3 factors. Therefore, clear the interrupt before applying software reset not to mistake FRE interrupt of finishing one frame for the FRE interrupt of completing software reset.

It is possible to update display list at any time (arbitrary timing) as shown in Figure 33.65. Don't overwrite display list in external memory pointed by VI6_DL_HDR_REF_ADDR. It is because VSP2 is reading the display list pointed by VI6_DL_HDR_REF_ADDR or will be reading the display list soon.

Detail explanation is shown below.

As shown in section 33.2.5.6, when VSP2 is reading display list from external memory (Period [A] in Figure 33.67), VI6_DL_HDR_REF_ADDRn indicates header address of the display list referred by VSP2. When VSP2 is not reading display list from external memory (Period [B] in Figure 33.67), VI6_DL_HDR_REF_ADDRn indicates the value of VI6_DL_HDR_ADDRn, and there is possibility that the display list is being read soon by VSP2 at next frame start timing. Therefore, keep display list in external memory pointed by VI6_DL_HDR_REF_ADDR. Detail software sequence to update display list and VSP2-H/W behavior are shown below.

[1] Store latest display list in external memory area different from the area pointed by VI6_DL_HDR_REF_ADDR, because the area pointed by VI6_DL_HDR_REF_ADDR is being read or is being read soon by VSP2.

[2] Set header address of new display list into VI6_DL_HDR_ADDRn.

[3] VSP2 reads display list from the external memory area pointed by VI6_DL_HDR_ADDRn at frame start timing.

Refer also to section 33.2.5.2 and section 33.2.5.6.

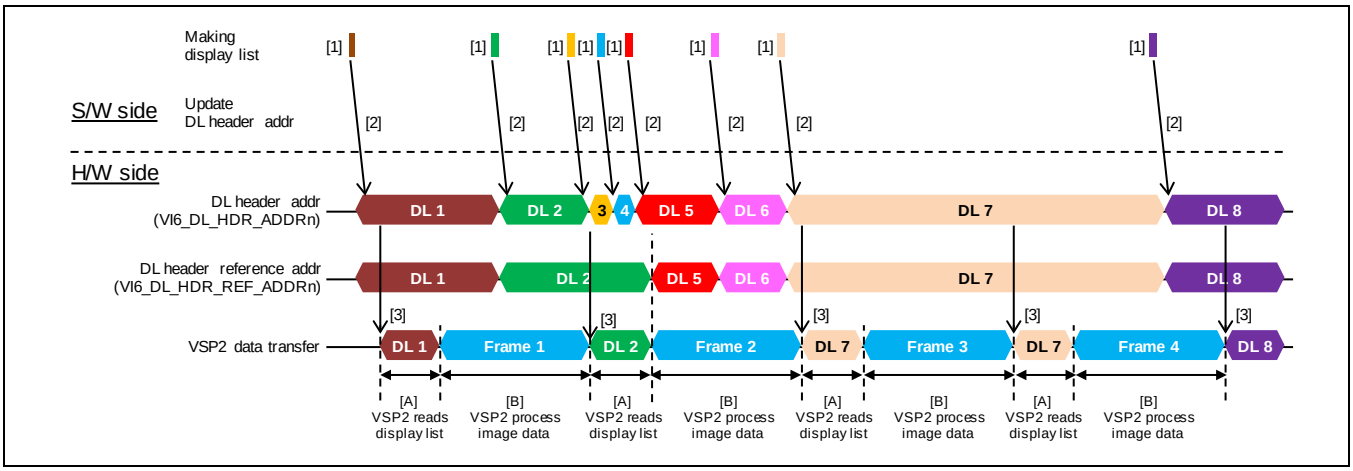

Figure 33.67 Updating display list at arbitrary timing

33.3.6.2 Controlling Two Register Planes Using Display Lists

This section shows operation flow of VSPD and VSPDL (*) by using Header-less Display List Mode. Start procedure and stop procedure are same with Normal Display List Mode in section 33.3.6.1 except for the point that VI6_DL_BODY_SIZE0 should be set before step [1-5] in start procedure shown in Figure 33.64. The procedure to update display list is different with Normal Display List Mode, and is described later. Figure 33.68 shows the control of two register planes using header-less display lists (see section 33.3.3.3) and its timing. In the description hereafter, the use of header-less display lists is always assumed and they are simply called display lists.

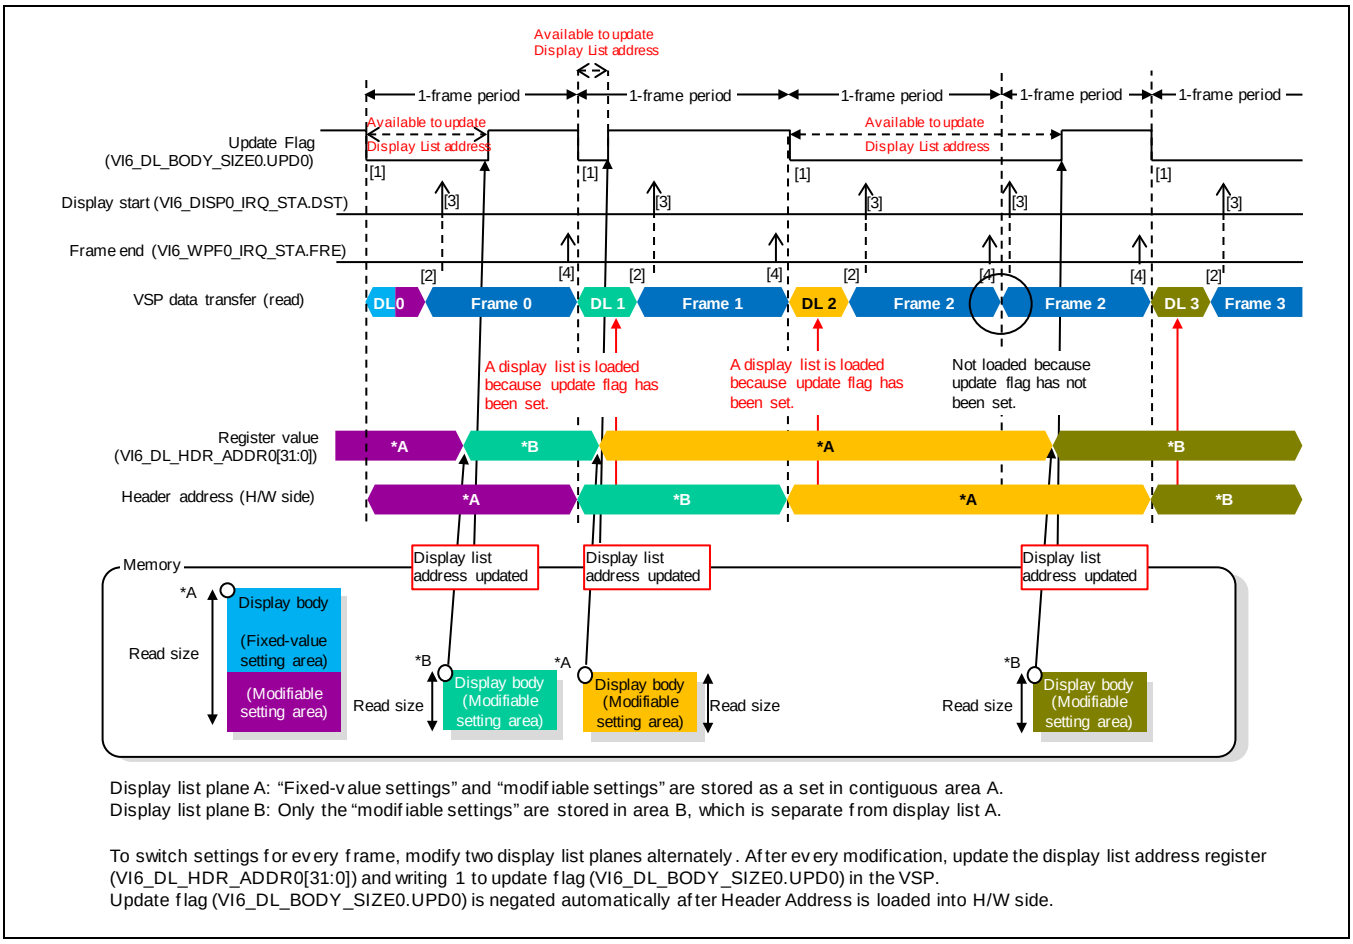

Figure 33.68 Controlling Two Register Planes Using a Display List

The VSP2 downloads a display list immediately after activation. In the start frame, download the display list that contains all necessary settings. From the next frame on, only the necessary register or table values should be specified in a display list.

When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 1, VSP2 downloads a new display list at the start of the next frame. When the update flag of VI6_DL_BODY_SIZE0.UPD0 is set to 0, the register settings acquired from the display list previously downloaded are retained and used for the next operation without downloading a new display list.

Order of each VSP2-H/W Events mentioned as [1], [2], [3] and [4] in Figure 33.68 are shown below.

[1] VI6_DL_BODY_SIZE0.BS0 and VI6_DL_HDR_ADDR0 are downloaded in H/W side. And Update Flag (VI6_DL_BODY_SIZE0.UPD0) is negated automatically.

[2] Reading DisplayList from external memory into VSP2-H/W is finished through master access.

[3] Display start interrupt status (VI6_DISP0_IRQ_STA.DST) asserts.

[4] Frame end interrupt status (VI6_WPF0_IRQ_STA.FRE) asserts.

Don’t overwrite the display list in external memory for a period from "[4] VI6_WPF0_IRQ_STA.FRE" to next "[3] VI6_DISP0_IRQ_STA.DST", because VSP is reading the display list for the period.

Note: * Header-less Display List Mode is supported only in LIF0 and is not supported in LIF1. Use Normal Display List Mode for VSPDL/LIF1.

33.3.6.3 Auto display function (AUTO-DISP)

VSPD and VSPDL have AUTO-DISP function. This function allows VSPD/VSPDL to display latest image in triple buffer output from VIN without S/W control of triple buffer. And VSPD/VSPDL selects the field which should be read from TOP or BOTTOM automatically without S/W control. Outline of this function is shown in

Figure 33.69. VSPD/VSPDL replaces source address registers with source address information stored in pre extended display list according to latest buffer information from VIN and field information from DU.

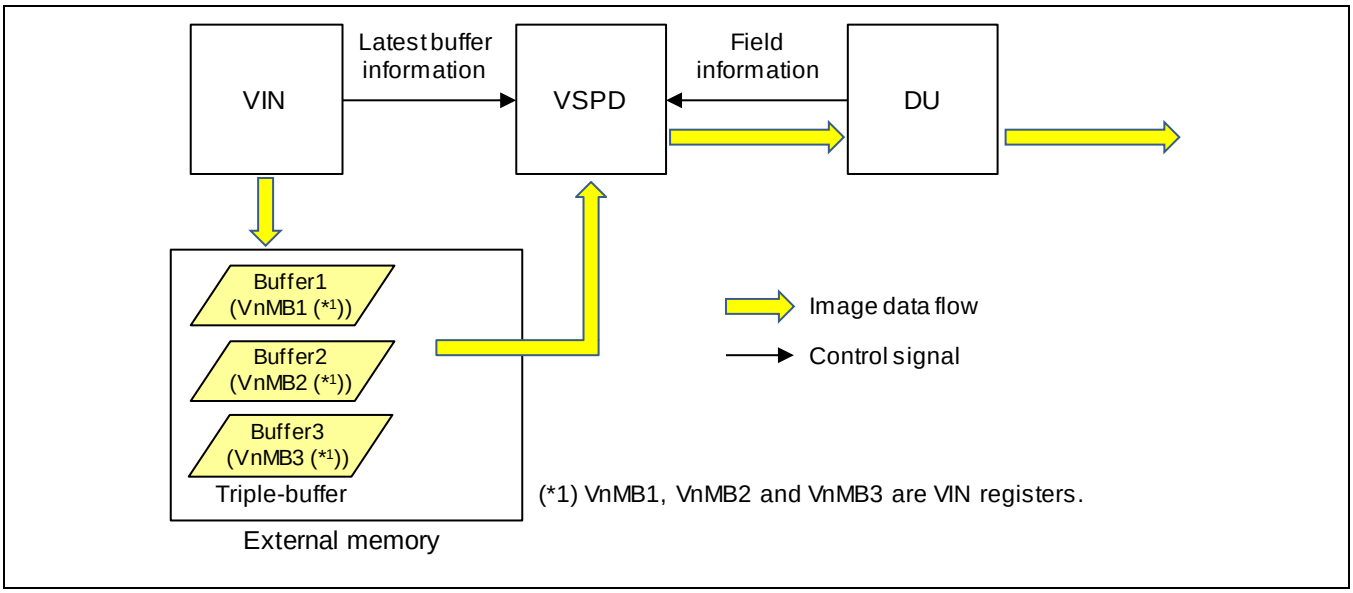

Figure 33.69 Outline of AUTO-DISP

Method to realize this function is shown below.

[1] Use Display List (Normal Display List Mode)

Register setting about display list in case of LIFn AUTO-DISP is shown below.

VI6_DL_CTRL.DLEn = 1

VI6_DL_CTRL.NH0 = 0 [Only for LIF0]

VI6_DL_CTRL.CFM0 = 0 [Only for LIF0]

VI6_DL_CTRL.RLM0 = 0 [Only for LIF0]

VI6_DL_HDR_ADDRn = <Set start address of Display list header>

[2] Use extended display list.

Register setting about extended display list in case of LIFn AUTO-DISP is shown below.

VI6_DL_EXT_CTRLn = H'0000_0221

[3] Contents of display list

Structure of display list to realize AUTO-DISP function is shown in Figure 33.70. Contents of each display list is shown below.

— Display List Header: Table 33.53

— Display List Body: Prepare it in the same way with the case which AUTO-DISP is not used.

— Pre Extended Display List Body: Table 33.54

— Pre Extended Display List Source Address Set: Table 33.55

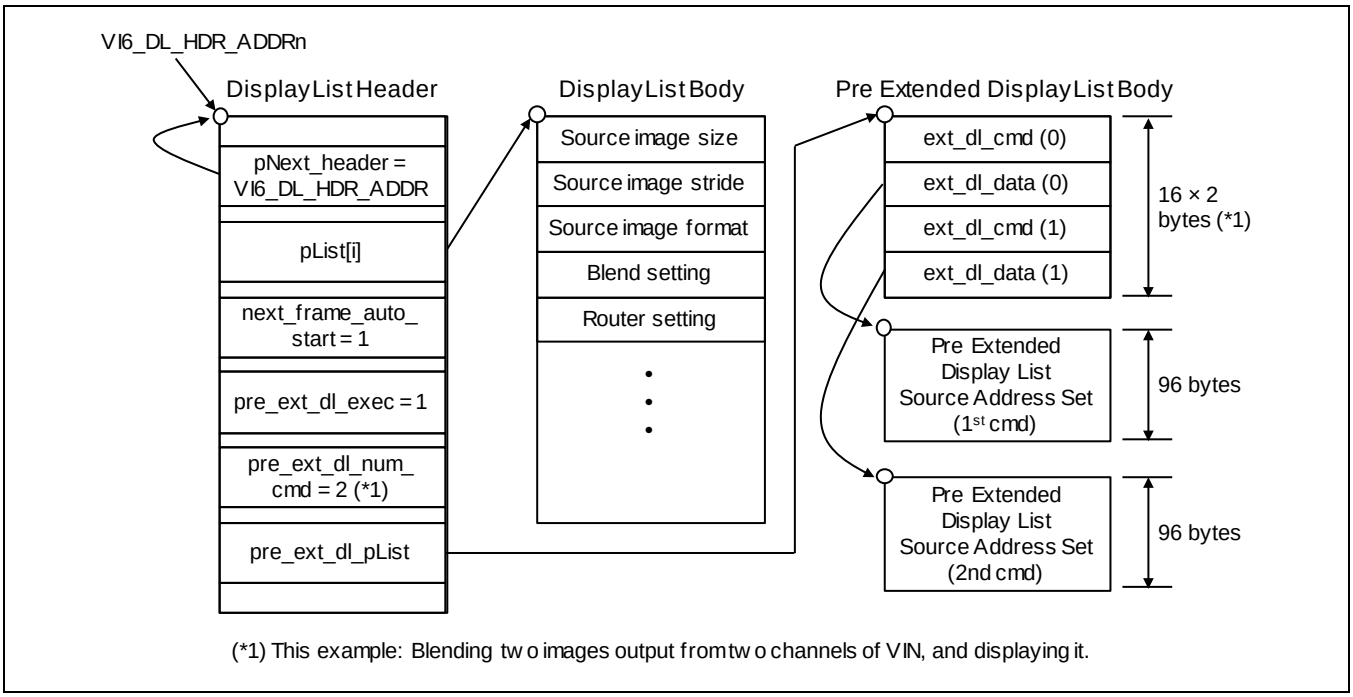

Figure 33.70 Structure of DisplayList of AUTO-DISP

Table 33.53 Display List Header for AUTO-DISP

Syntax	Value
num_list_minus1	Set these bits in the same way with the case which AUTO-DISP is not used.
num_bytes [i]	Set these bits in the same way with the case which AUTO-DISP is not used.
pList [i]	Set these bits in the same way with the case which AUTO-DISP is not used.
pNext_header	Set same address of VI6_DL_HDR_ADDRn for progressive display. See Figure 33.72 and Figure 33.73 for interlace display. Be sure to specify an address aligned with a 8-byte boundary (lower-order three bits are 0).
current_frame_int_enable	0
next_frame_auto_start	1
pre_ext_dl_exec	1
post_ext_dl_exec	0
pre_ext_dl_num_cmd	Set the number of connected VIN channels <1 to 5>
pre_ext_dl_pList	Set start address of extended display list body Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0).
post_ext_dl_num_cmd	0
post_ext_dl_pList	0

Table 33.54 Pre Extended Display List Body for AUTO-DISP

Bit String	bits	Symbol	value
ext_dl_cmd	63 to 40	—	0
	39 to 32	Opcode	2 (AUTO_DISP is selected)
	31 to 14	—	0
	13 to 11	VIN ch no	Set VIN channel number <0 ~ 7>
	10 to 8	RPF ch no	Set RPF channel number <0 ~ 4>
	7 to 3	—	0
	2	1st field	0: TOP field first (DSMRn.ODEV = 1) 1: BOT field first (DSMRn.ODEV = 0)
	1	Correction	Set 0 for progressive display. See Figure 33.72 and Figure 33.73 for interlace display.
	0	Int	0: Progressive display 1: Interlace display
ext_dl_data	63 to 32	pAddres_set	Set start address of Source Address Set Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0).
	31 to 0	Reserved	0

Note: Don't specify RPF channels which are not connected to the LIF in ext_dl_cmd [10:8]. Otherwise, operation of the WPF causes wrong on the other WPF in case of VSPDL.

Table 33.55 Pre Extended Display List Source Address Set for AUTO-DISP

Address	Contents
ext_dl_data [63:32] + 0	Buffer1 TOP field address of Y/RGB
ext_dl_data [63:32] + 4	Buffer1 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 8	Buffer1 TOP field address of C0
ext_dl_data [63:32] + 12	Buffer1 BOTTOM field address of C0
ext_dl_data [63:32] + 16	0
ext_dl_data [63:32] + 20	0
ext_dl_data [63:32] + 24	0
ext_dl_data [63:32] + 28	0
ext_dl_data [63:32] + 32	buffer2 TOP field address of Y/RGB
ext_dl_data [63:32] + 36	buffer2 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 40	buffer2 TOP field address of C0
ext_dl_data [63:32] + 44	buffer2 BOTTOM field address of C0
ext_dl_data [63:32] + 48	0
ext_dl_data [63:32] + 52	0
ext_dl_data [63:32] + 56	0
ext_dl_data [63:32] + 60	0
ext_dl_data [63:32] + 64	buffer3 TOP field address of Y/RGB
ext_dl_data [63:32] + 68	buffer3 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 72	buffer3 TOP field address of C0
ext_dl_data [63:32] + 76	buffer3 BOTTOM field address of C0
ext_dl_data [63:32] + 80	0
ext_dl_data [63:32] + 84	0
ext_dl_data [63:32] + 88	0
ext_dl_data [63:32] + 92	0

How VSPD/VSPDL replaces source address registers is described as below. VSP reads extended display list body specified in Table 33.54 and source address set specified in Table 33.55 during the term of “Ext-DL” specified in Figure 33.71. And VSPD/VSPDL replaces source address registers by step 1 to step 7 as below.

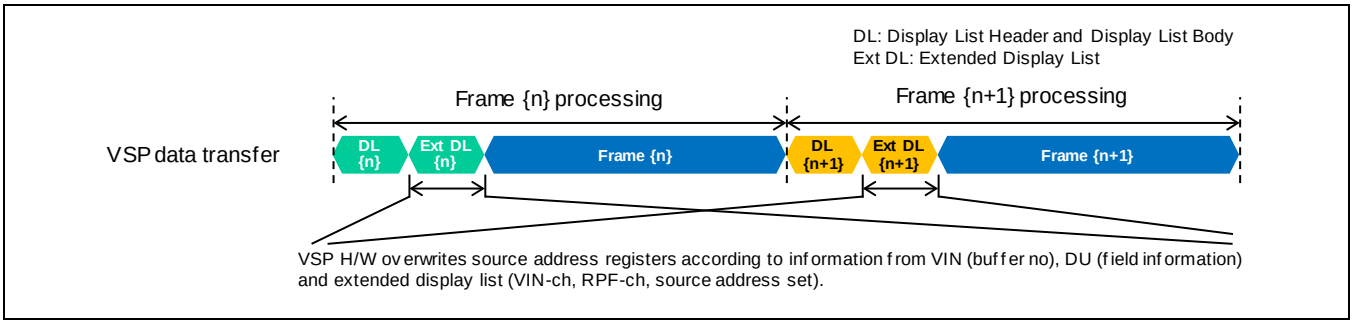

Figure 33.71 Timing to read extended display list

1. VSP reads extended display list body from external memory
2. VSP gets latest buffer information from VINs.
   Note: information is updated at only 1st field in case of interlace.
3. VSP gets field information from DU.
4. VSP reads address information of the latest buffer of the VIN ext_dl_cmd [13:11] indicates from source address set specified in Table 33.55.
5. VSP selects source address from TOP (*) address or BOTTOM (*) address in source address set according to ext_dl_cmd [2:0].
   Note: Set start address of progressive image in both TOP address bits and BOTTOM address bits in extended display list source address set in case of progressive display.
6. VSP overwrites source address registers for the RPF specified in ext_dl_cmd [10:8] at source address read from external memory.
   Note: C1 address and Alpha address registers for the RPF are overwritten by 0 value for the RPF specified in ext_dl_cmd [10:8].
7. VSP repeats step 4 to step 6 for number of times of pre_ext_dl_num_cmd.

Note: * In this document, TOP field is used as field image including 0th, 2nd, 4th … line. BOTTOM field is used as field image including 1st, 2nd, 5th … line.

[4] Progressive and Interlace

There are restrictions about combination of interlace and progressive for input/output as shown in Table 33.56. When VIN captures interlace image, DU should display image in interlace method. When VIN captures progressive image, DU should display image in progressive method.

[4-1] Particular restriction for VIN registers

- Set full interlace mode in VIN register (VnMC.IM[1:0] = 3) in case of interlace display.
- No particular restriction is required in case of progressive display.

[4-2] Particular restriction for DU registers

- No particular restriction is required

[4-3] Particular setting and status of VSP

- Set <2 x source stride> to source stride register (VI6_RPFn_SRCM_PSTRIDE) in case of interlace display.
- VI6_STATUS.FLDSTn in section 33.2.4.11 indicates field information of last displayed frame.

[4-4] The number of Display List Header and Pre Extended Display List body

One display list header and one pre extended display list body is needed for progressive display as shown in Figure 33.70. All frames can be controlled by one display list. Set same value of VI6_DL_HDR_ADDRn to pNext_haeder.

Field signal from DU is not stable in first two fields. Therefore, to display first two fields by appropriate field (TOP or BOTTOM), set bit1 in ext_dl_cmd as shown in Figure 33.72 for TOP field first and Figure 33.73 for BOTTOM field first. Three display list headers and three pre extended display list bodies are needed to adjust first two fields for interlace display.

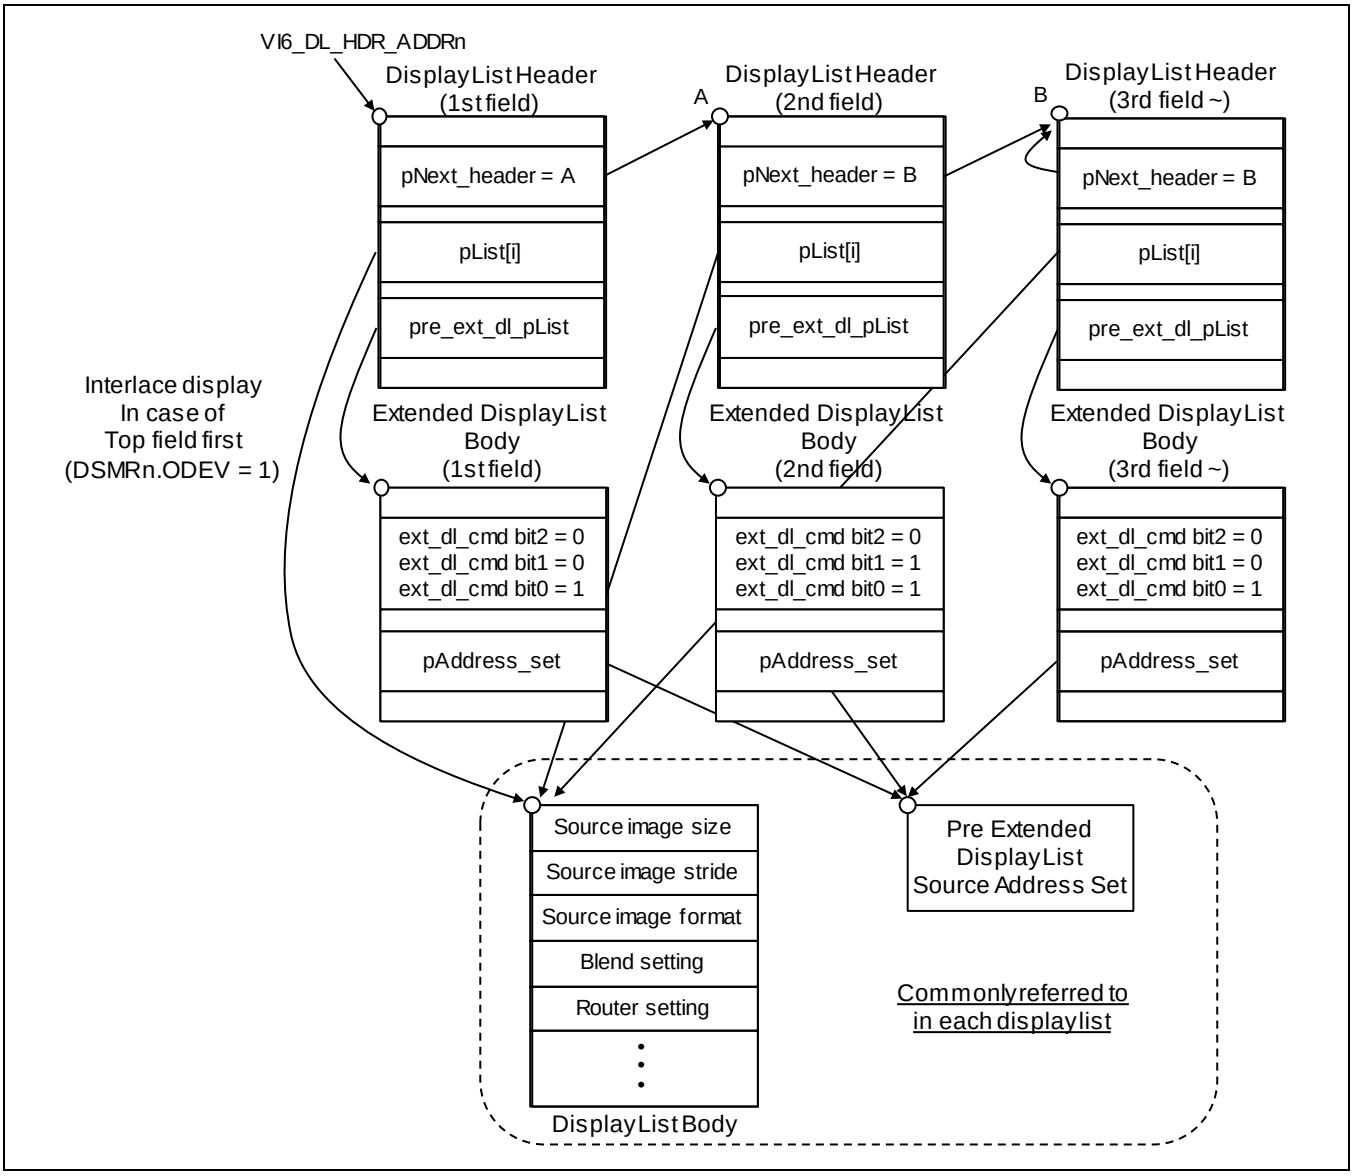

Figure 33.72 Correcting first two fields in case of TOP field first

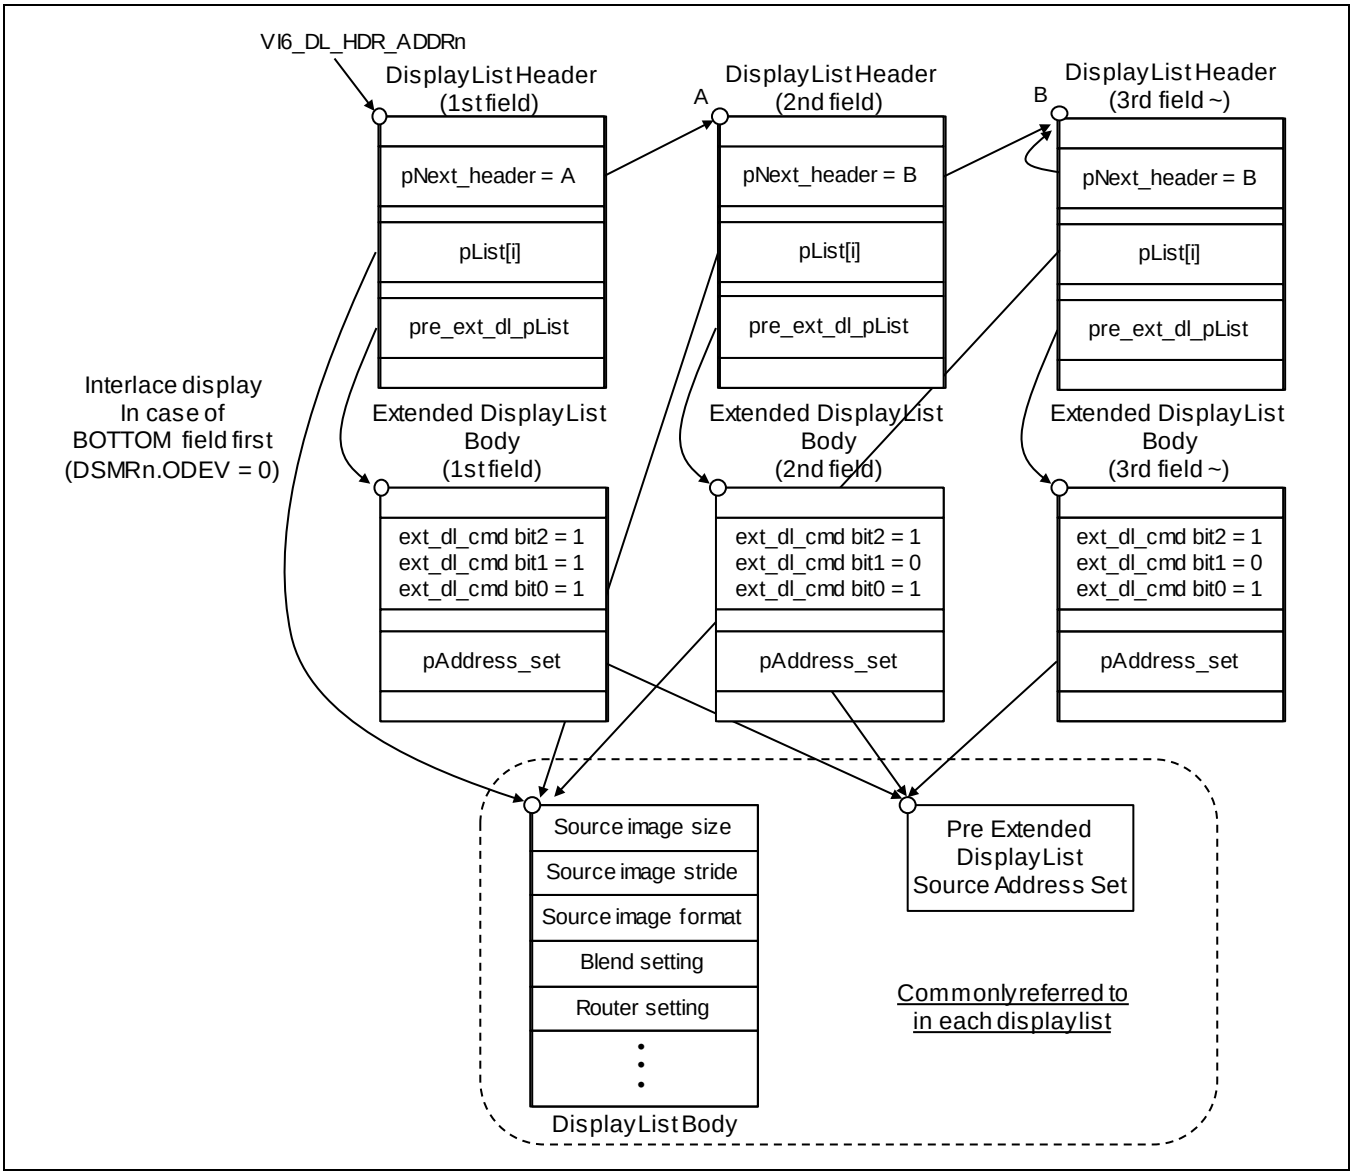

Figure 33.73 Correcting first two fields in case of BOTTOM field first

[5] Startup image before first image is output from VIN

VSP reads image data in buffer3 address specified in extended display list source address set until VIN completes writing first frame's image into buffer1. Therefore, prepare startup image in buffer3. This image is overwritten after VIN is activated.

[6] Procedure of activation

Activate VIN with continuous frame capture mode (VnFC.CC = 1). After that, activate VSPD and DU by procedure of Figure 33.64

[7] Restrictions

There are several restrictions as shown below.

[7-1] Restriction about combination of interlace and progressive for input/output

There are restriction about combination of interlace and progressive for input/output as shown in Table 33.56.

Table 33.56 Restriction about combination of interlace and progressive for input/output

Video IN	Display	Support
Progressive	Progressive	√
Progressive	Interlace	
Interlace	Progressive	
Interlace	Interlace	√

[7-2] Restriction about frame rate of input and output

Frame rate of VIN should be equal to or smaller than frame rate of display.

[7-3] Restriction about selecting VIN channel.

(a) For RZ/G2M V1.3, RZ/G2M V3.0, there are following restrictions about connection between VIN and VSPD.

VSPD0 can read only VIN0 output image when this function is used.

VSPD1 can read only VIN2 output image when this function is used.

VSPD2 can read only VIN4 output image when this function is used.

(b) For RZ/G2H, RZ/G2N and RZ/G2E, there is no restriction about selecting VIN channel.

33.3.6.4 Auto field function (AUTO-FLD)

VSPD and VSPDL have AUTO-FLD function. VSPD/VSPDL selects the field which should be read from TOP or BOTTOM automatically without S/W control. Outline of this function is shown in Figure 33.74. VSPD/VSPDL replaces source address registers with source address information stored in pre extended display list according to field information from DU.

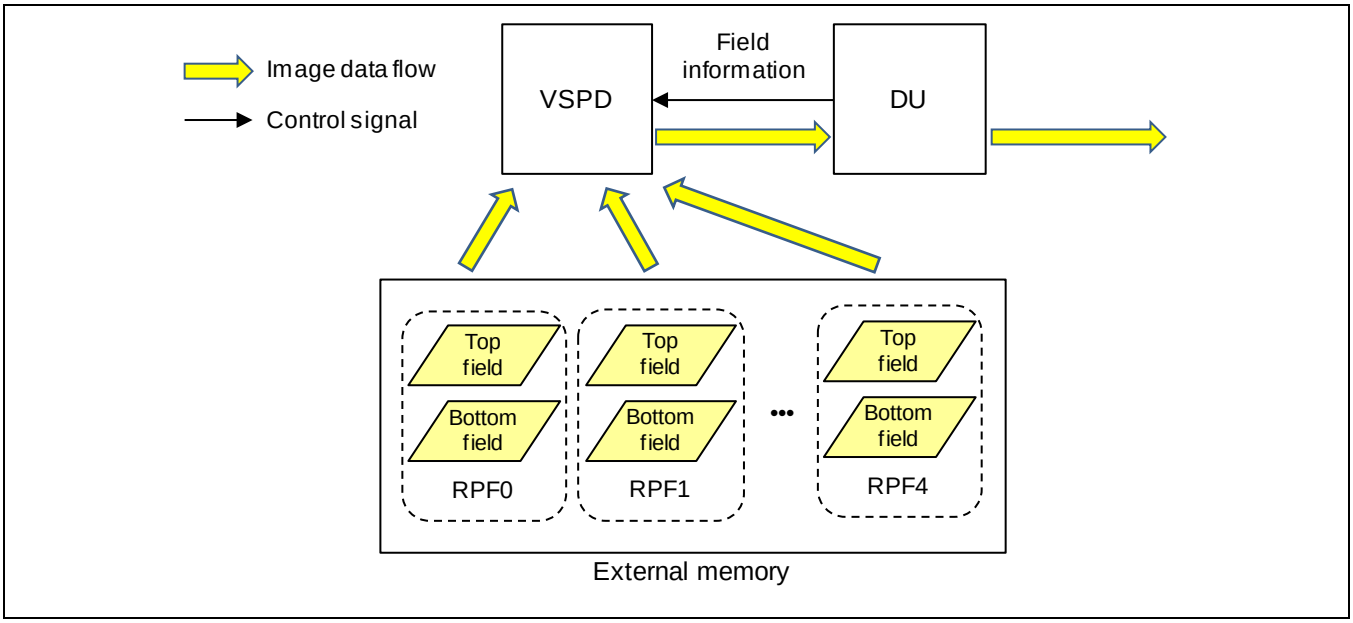

Figure 33.74 Outline of AUTO-FLD

Method to realize this function is shown below.

[1] Use Display List (Normal Display List Mode)

Take same setting with AUTO-DISP shown in 33.3.6.3.

[2] Use extended display list.

Take same setting with AUTO-DISP shown in 33.3.6.3.

[3] Contents of display list for AUTO-FLD

Structure of display list to realize AUTO-FLD function is shown in Figure 33.75. Contents of each display list is shown below.

— Display List Header: Table 33.57
— Display List Body: Prepare it in the same way with the case which AUTO-FLD is not used.
— Pre Extended Display List Body: Table 33.58
— Pre Extended Display List Source Address Set: Table 33.59

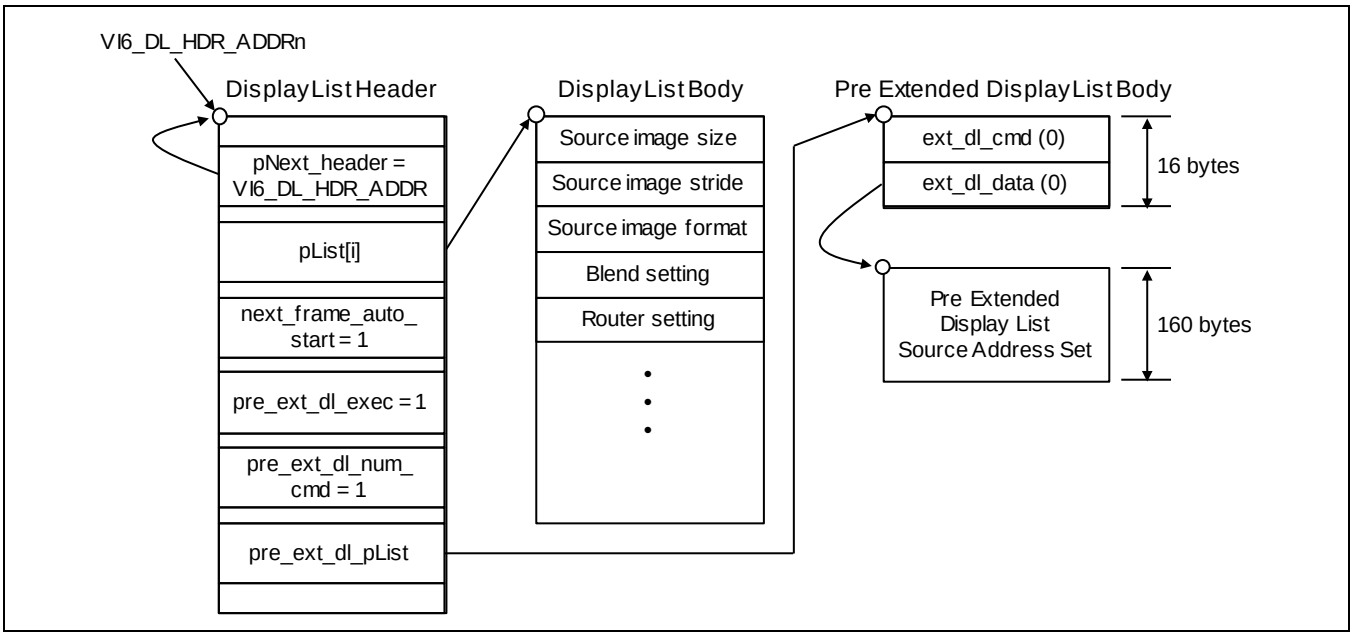

Figure 33.75 Structure of DisplayList of AUTO-FLD

Table 33.57 Display List Header for AUTO-FLD

Syntax	Value
num_list_minus1	Set these bits in the same way with the case which AUTO-FLD is not used.
num_bytes [i]	Set these bits in the same way with the case which AUTO-FLD is not used.
pList [i]	Set this bits in the same way with the case which AUTO-FLD is not used.
pNext_header	Set same address of VI6_DL_HDR_ADDRn for progressive display. See Figure 33.72 and Figure 33.73 for interlace display. Be sure to specify an address aligned with a 8-byte boundary (lower-order three bits are 0).
current_frame_int_enable	0
next_frame_auto_start	1
pre_ext_dl_exec	1
post_ext_dl_exec	0
pre_ext_dl_num_cmd	1
pre_ext_dl_pList	Set start address of extended display list body Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0).
post_ext_dl_num_cmd	0
post_ext_dl_pList	0

Table 33.58 Pre Extended Display List Body for AUTO-FLD

Bit String	bits	Symbol	value
ext_dl_cmd	63 to 40	—	0
	39 to 32	Opcode	3 (AUTO_FLD is selected)
	31 to 21	—	0
	20	RPF4 enable	0: Not replace RPF4 source address registers. 1: Replace RPF4 source address registers.
	19	RPF3 enable	0: Not replace RPF3 source address registers. 1: Replace RPF3 source address registers.
	18	RPF2 enable	0: Not replace RPF2 source address registers. 1: Replace RPF2 source address registers.
	17	RPF1 enable	0: Not replace RPF1 source address registers. 1: Replace RPF1 source address registers.
	16	RPF0 enable	0: Not replace RPF0 source address registers. 1: Replace RPF0 source address registers.
	15 to 2	—	0
	1	Correction	Set 0 for progressive display. See Figure 33.72 and Figure 33.73 for interlace display.
	0	Int	1
ext_dl_data	63 to 32	pAddres_set	Set start address of Source Address Set Be sure to specify an address aligned with a 16-byte boundary (lower-order four bits are 0).
	31 to 0	Reserved	0

Note: For RPFn enable in pre extended display list body shown in Table 33.58, don't enable RPF channels which are not connected to the LIF. Otherwise, operation of the WPF causes wrong on the other WPF in case of VSPDL.

Example. When RPF0, RPF1 and RPF2 are connected to WPF0/LIF0, and RPF3 and RPF4 are connected to WPF1/LIF1,
- Disable RPF3 and RPF4 (ext_dl_cmd [20:16] = 5'b00111) for WPF0 display list.
- Disable RPF0, RPF1 and RPF2 (ext_dl_cmd [20:16] = 5'b11000) for WPF1 display list.

Table 33.59 Pre Extended Display List Source Address Set for AUTO-FLD

Address	Contents
ext_dl_data [63:32] + 0	RPF0 TOP field address of Y/RGB
ext_dl_data [63:32] + 4	RPF0 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 8	RPF0 TOP field address of C0
ext_dl_data [63:32] + 12	RPF0 BOTTOM field address of C0
ext_dl_data [63:32] + 16	RPF0 TOP field address of C1
ext_dl_data [63:32] + 20	RPF0 BOTTOM field address of C1
ext_dl_data [63:32] + 24	0
ext_dl_data [63:32] + 28	0
ext_dl_data [63:32] + 32	RPF1 TOP field address of Y/RGB
ext_dl_data [63:32] + 36	RPF1 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 40	RPF1 TOP field address of C0
ext_dl_data [63:32] + 44	RPF1 BOTTOM field address of C0
ext_dl_data [63:32] + 48	RPF1 TOP field address of C1
ext_dl_data [63:32] + 52	RPF1 BOTTOM field address of C1
ext_dl_data [63:32] + 56	0
ext_dl_data [63:32] + 60	0
ext_dl_data [63:32] + 64	RPF2 TOP field address of Y/RGB
ext_dl_data [63:32] + 68	RPF2 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 72	RPF2 TOP field address of C0
ext_dl_data [63:32] + 76	RPF2 BOTTOM field address of C0
ext_dl_data [63:32] + 80	RPF2 TOP field address of C1
ext_dl_data [63:32] + 84	RPF2 BOTTOM field address of C1
ext_dl_data [63:32] + 88	0
ext_dl_data [63:32] + 92	0
ext_dl_data [63:32] + 96	RPF3 TOP field address of Y/RGB
ext_dl_data [63:32] + 100	RPF3 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 104	RPF3 TOP field address of C0
ext_dl_data [63:32] + 108	RPF3 BOTTOM field address of C0
ext_dl_data [63:32] + 112	RPF3 TOP field address of C1
ext_dl_data [63:32] + 116	RPF3 BOTTOM field address of C1
ext_dl_data [63:32] + 120	0
ext_dl_data [63:32] + 124	0
ext_dl_data [63:32] + 128	RPF4 TOP field address of Y/RGB
ext_dl_data [63:32] + 132	RPF4 BOTTOM field address of Y/RGB
ext_dl_data [63:32] + 136	RPF4 TOP field address of C0
ext_dl_data [63:32] + 140	RPF4 BOTTOM field address of C0
ext_dl_data [63:32] + 144	RPF4 TOP field address of C1
ext_dl_data [63:32] + 148	RPF4 BOTTOM field address of C1
ext_dl_data [63:32] + 152	0
ext_dl_data [63:32] + 156	0

How VSPD/VSPDL replaces source address registers is described as below. VSP reads extended display list body specified in Table 33.58 and source address set specified in Table 33.59 during the term of “Ext-DL” specified in Figure 33.71. And VSPD/VSPDL replaces source address registers by step 1 to step 5 as below.

1. VSP reads extended display list body from external memory.
2. VSP gets field information from DU.
3. VSP reads address information of RPFs which ext_dl_cmd [20:16] indicates from source address set.
4. VSP selects source address from TOP address or BOTTOM address in source address set according to ext_dl_cmd [2:0]
5. VSP overwrites source address registers for the RPF specified in ext_dl_cmd [20:16] at source address read from external memory.

Note: Alpha address registers for the RPF are overwritten by 0 value for the RPF specified in ext_dl_cmd [20:16].

[4] Interlace

[4-1] Status of VSP

- VI6_STATUS.FLDSTn in section 33.2.4.11 indicates field information of last displayed frame.

[4-2] The number of Display List Header and Pre Extended Display List body

Field signal from DU is not stable in first two fields. Therefore, to display first two fields by appropriate field (TOP or BOTTOM), set bit1 in ext_dl_cmd as shown in Figure 33.72 for TOP field first and Figure 33.73 for BOTTOM field first. Three display list headers and three pre extended display list bodies are needed to adjust first two fields for interlace display.

Note: For AUTO_FLD, set 0 to ext_dl_cmd bit2 regardless of that first field is TOP or BOTTOM.

[5] Procedure of activation

Activate VSPD and DU by procedure of Figure 33.64

[6] Restrictions

There is no restriction about AUTO-FLD.

33.3.7 Image partition for VSPI processing

33.3.7.1 Necessity of image partition

Because SRU, UDS and WPF/Rotation (VI6_WPF0_OUTFMT.ROT > 1) need to satisfy horizontal size restriction as shown in Table 33.60. Several executions of VSPI by partitioning one frame's image is needed to realize larger size in horizontal direction. In the chapter, the method is called as image partition. This section shows how to realize image partition for VSPI.

When either restriction shown in Table 33.60 applies, image partition method is needed.

Table 33.60 Condition of necessity to take image partition

Location of restriction	Max horizontal size	Condition of necessity to take the restriction.
Input to UDS after clipping horizontal size by VI6_UDS_HSZCLIP register	304 pixels	UDS is used by up-scaling in horizontal direction.
Output from UDS after clipping horizontal size by VI6_UDS_CLIP_SIZE	304 pixels	UDS is used by down-scaling or no scaling in horizontal direction.
Input to SRU	288 pixels	SRU is used.
Input to WPF after clipping horizontal size by VI6_WPF0_HSZCLIP	256 pixels	WPF/rotation (VI6_WPF0_OUTFMT.ROT > 1) is used.

To realize image partition, see five items below.

(1) Auto execution of VSPI by using automatic start of next frame processing (next_frame_auto_start) of DisplayList is recommended. See section 33.3.7.2 for more detail.

(2) Start reservation is available to reduce overhead of interrupt response. See section 33.3.7.3 to use start reservation.

(3) Discontinuous line is generated by VSPI end processing at partition boundary. So, reading overlapped pixels with neighbor partition and clipping discontinuous line at partition boundary is needed. Figure 33.76 shows example of overlap pixel and clipping in case of 3 partition. See section 33.3.7.4 for more detail.

(4) The number of taps for each function's filter in horizontal direction is shown in section 33.3.7.5 for user to realize how many overlapped pixels to be read and how many pixels to be clipped.

(5) Horizontal size clipping registers are explained in section 33.3.7.6.

(6) How to set HGO and HGT registers related to image partition is shown in section 33.3.7.7.

(7) There are some restrictions when VSPI image partition is used. See section 33.3.7.8.

src_d0: input partition position 0
src_d1: input partition position 1

P0 horizontal input size = $src\_h_0 + m_0$
P1 horizontal input size = $src\_h_1 + m_1 + m_2$
P2 horizontal input size = $src\_h_2 + m_3$

$src\_h_0 = src\_d_0 + 1$
$src\_h_1 = src\_d_1 - src\_d_0$
$src\_h_2 = src\_h - src\_d_1 - 1$

Gray hatching is discontinuous region.

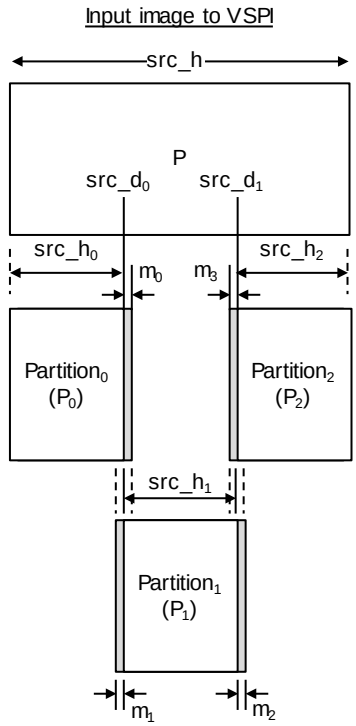

Figure 33.76 Example of overlap pixel and clipping in case of 3 partitions

33.3.7.2 Auto execution by using display list

Because partitioning one frame image into several partitioned images, several activations of VSPI for one frame processing are needed. So, using display list and auto execution by next frame auto start is recommended. Detail way is shown below.

(1) Store all partitions' display list in SDRAM as shown in Figure 33.77.

(2) In order to get better performance, don't set registers which are not updated per partition in display body from 2nd partition to last partition as shown in Figure 33.77. Registers which need to be updated per partition is listed in Table 33.61.

(3) Set 1 to next_frame_auto_start in display list header from 1st partition to 2nd partition from the last. Then S/W has to activate VSPI only once for 1st partition.

(4) Set 1 to current_frame_int_enable in display list header for only last partition. Set H'0000_0002 to VI6_WPF0_IRQ_ENB to enable Display List Frame End (DFE) interrupt and to disable Frame End (FRE) interrupt. Then DFE interrupt occurs after all partitions' processing is finished by VSPI-H/W.

(5) Set below to VI6_DL_CTRL

- VI6_DL_CTRL.DLE0 = 1 (Use display list)
- VI6_DL_CTRL.NH0 = 0 (Use Header Mode)
- VI6_DL_CTRL.RLM0 = 1 (Registers with two planes are not downloaded into H/W side at partition boundary)

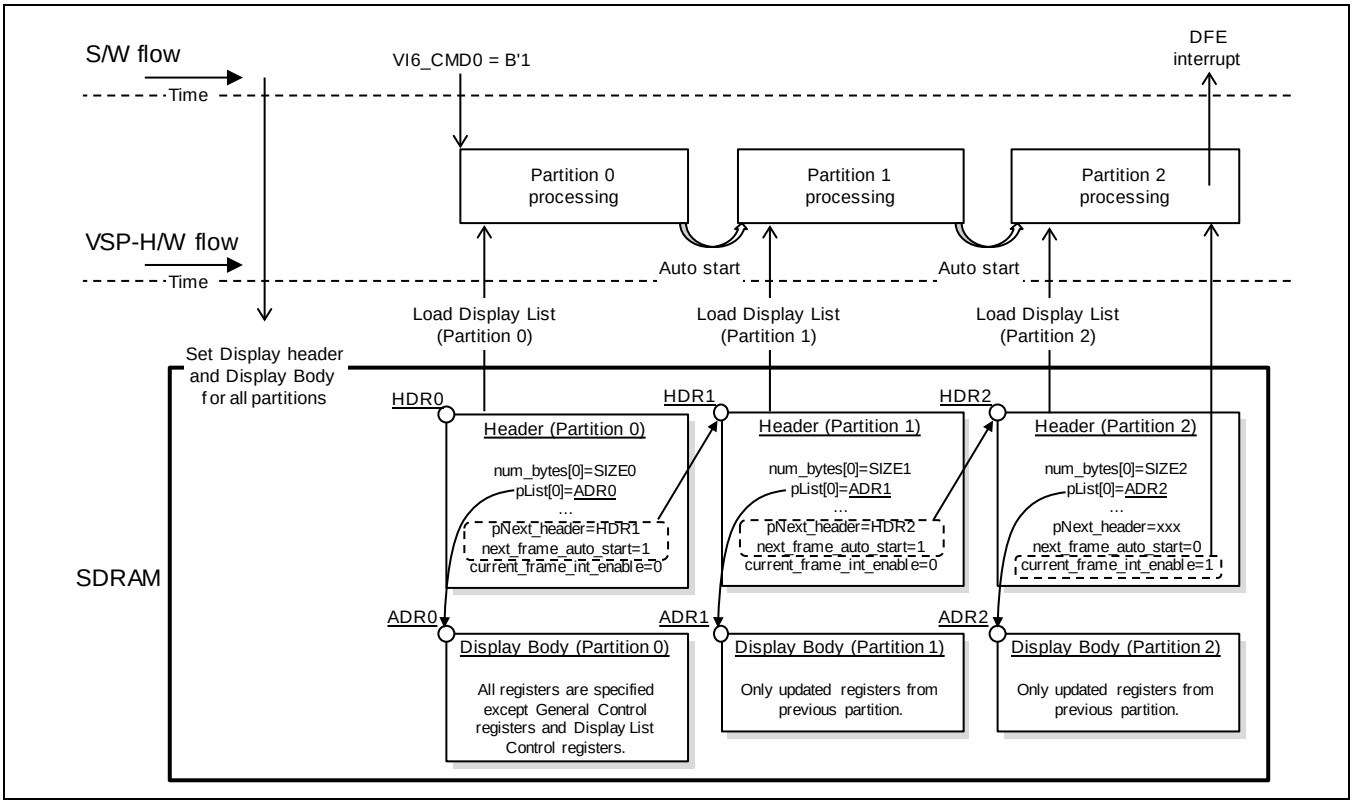

Figure 33.77 Flow of image partition process (Example of 3 partitions case)

Table 33.61 Registers which need to be updated per partition

1	VI6_RPF0_SRC_BSIZE
2	VI6_RPF0_SRC_ESIZE
3	VI6_RPF0_SRCM_ADDR_Y
4	VI6_RPF0_SRCM_ADDR_C0
5	VI6_RPF0_SRCM_ADDR_C1
6	VI6_RPF0_SRCM_ADDR_AI
7	VI6_WPF0_HSZCLIP

33.3.7.3 Start Reservation for VSPI

This section shows sequence of software when start reservation is used. Software can reserve starting VSPI before VSPI processing of one frame is completed. Start reservation can remove interrupt response time and software overhead by reserving execution of VSPI before completion of previous frame.

(a) below shows software sequence of start reservation.

(b) below shows software sequence to manage the number of interrupt generation.

Note: Follow section 33.3.7.2 about the setting of display list and VI6_WPF0_IRQ_ENB.

(a) Software sequence of start reservation

[1] ~ [9] shown in Figure 33.78 and Figure 33.79 shows S/W flow to set registers for start reservation of VSPI

[1] Wait until 0 is read from VI6_CMD0.STRCMD to confirm that starting WPF0 is not reserved.

[2] Wait until 0 is read from VI6_STATUS.SYS0_ACT to confirm WPF0 is IDLE.

[3] Set registers with two planes for frame 0 (1st frame) except DLH (Display List Header) address. Vi6_DL_HDR_ADDR0, VI6_HGO_WBUFS and VI6_HGT_WBUFS has two planes.

[4] Set header address of display list for frame 0 to VI6_DL_HDR_ADDR0. Then VI6_CMD0.UPDHDR is asserted automatically by VSP2 to indicate downloading registers with two planes is reserved.

[5] Activate WPF0 for frame 0 (1st frame) by writing H'0000_0001 to VI6_CMD0.
If next frame's execution of VSPI is needed, go to step [6].

[6] Wait until start reservation is accepted and registers with two planes are downloaded into H/W side. If 0 is read from VI6_CMD0, it means that starting WPF0 is accepted and register with two planes are downloaded into internal registers H/W side refers.

[7] Set registers with two planes for next frame (fr{m}) except DLH (Display List Header) address.

[8] Set header address of display list for next frame (fr{m}) to VI6_DL_HDR_ADDR0. Then VI6_CMD0.UPDHDR is asserted automatically by VSP2 to indicate downloading registers with two planes is reserved.

[9] Reserve activating WPF0 for next frame (fr{m}) by writing H'0000_0001 to VI6_CMD0.
If next frame's execution of VSPI is needed, go to step [6].

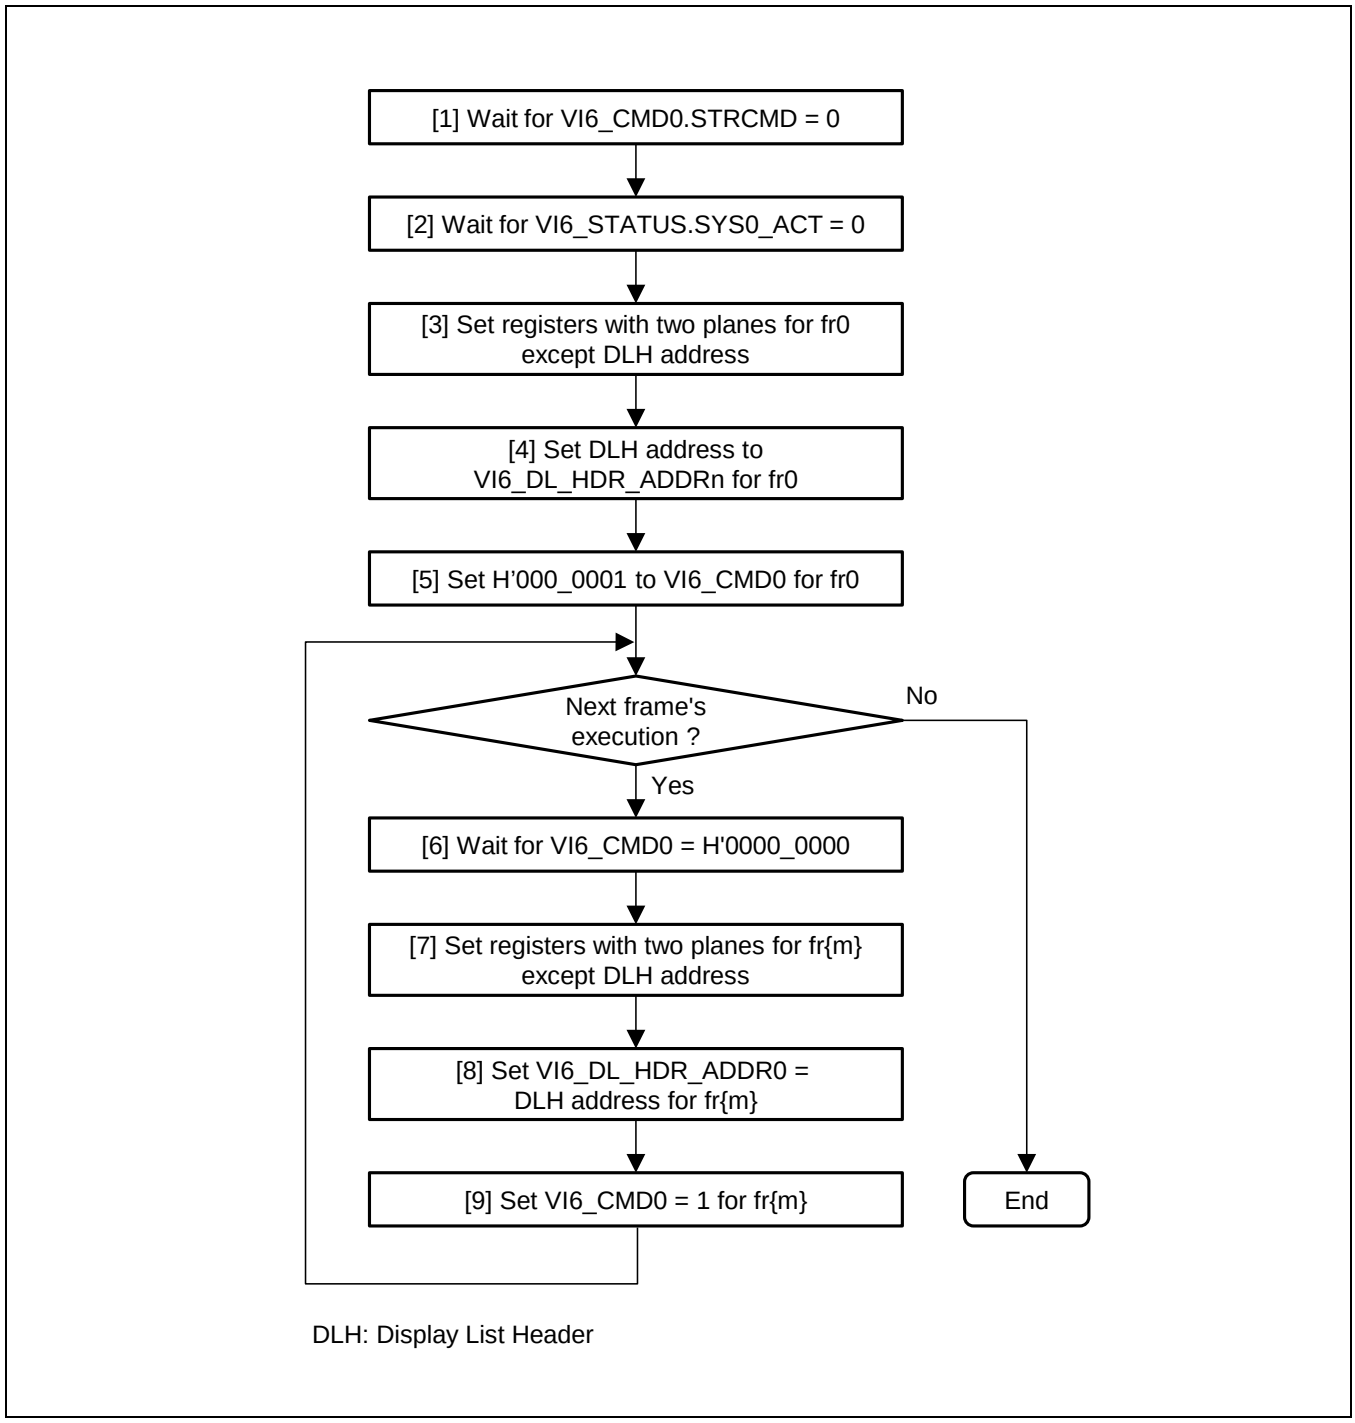

Figure 33.78 Flow chart of setting registers by S/W in case of VSPI start reservation

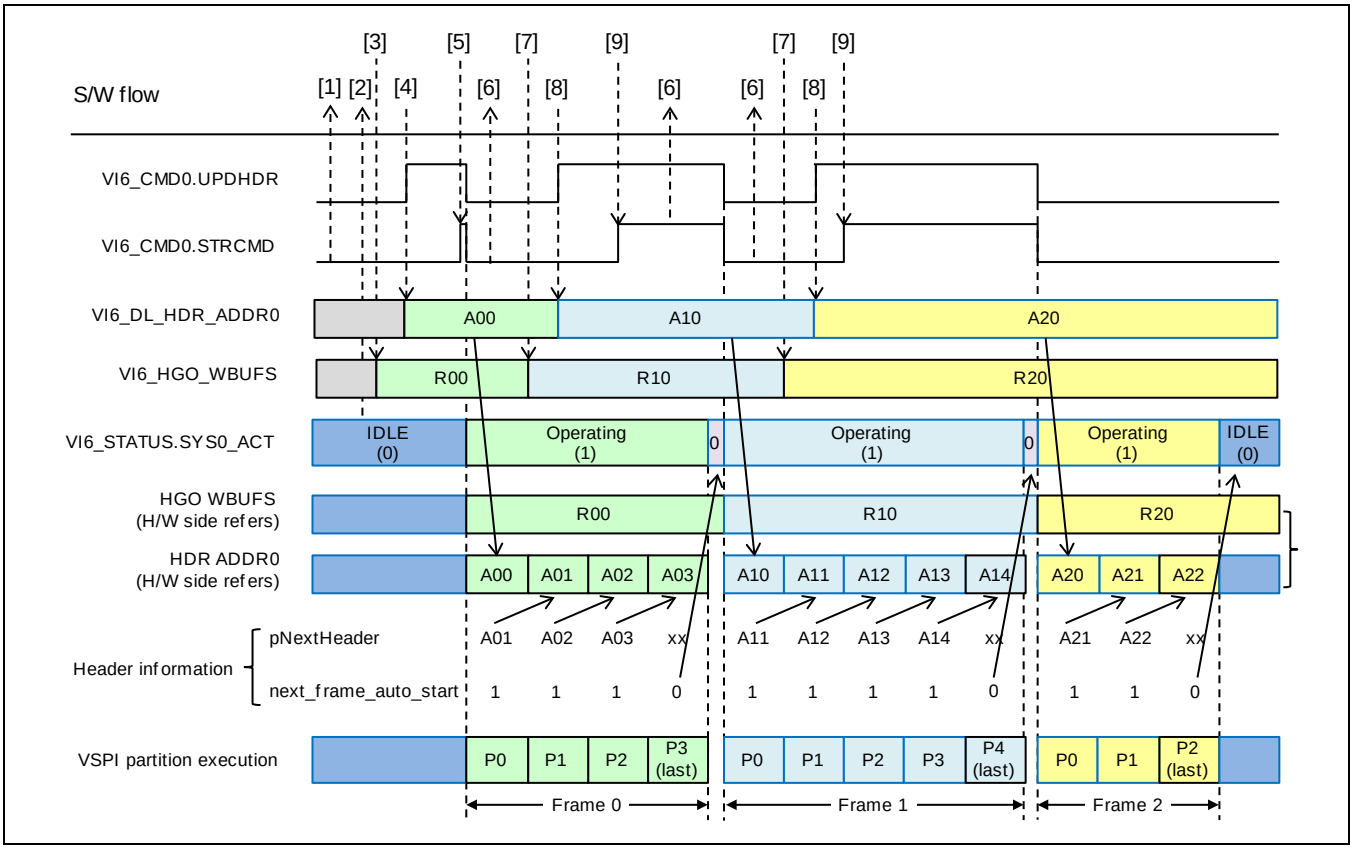

Figure 33.79 Timing of setting registers by S/W in case of VSPI start reservation

(b) Software sequence to manage the number of interrupt generation.

The way of using interrupt is shown below.

[1] Set 1 to the VI6_WPF0_IRQ_ENB.DFEE to use frame end interrupt (VI6_WPF0_IRQ_STA.DFE)

[2] Write 0 to VI6_WPF0_IRQ_STA.DFE to clear status after interrupt processing as shown in **Figure 33.80**.

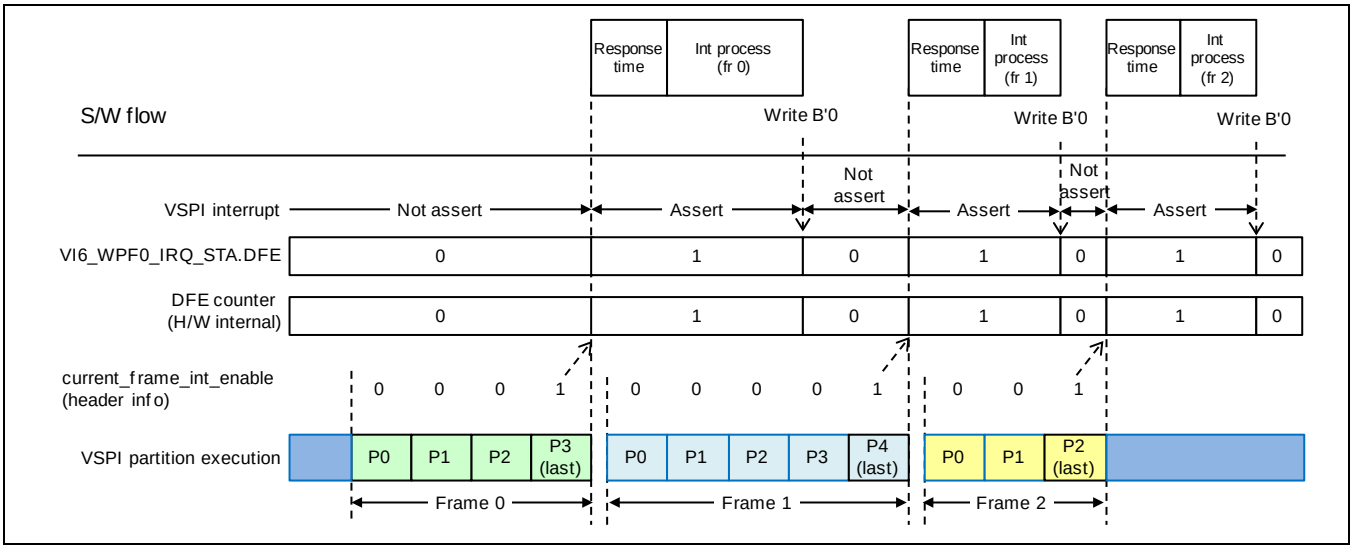

Figure 33.80 Timing of interrupt processing by S/W in case of VSPI start reservation (Case1)

Be careful following points as shown in Figure 33.81.

[1] Set 0 to VI6_WPF0_IRQ_STA.DFE for the number of interrupt generation to clear VI6_WPF0_IRQ_STA.DFE.

[2] The VSPI H/W can count at most two of interrupt generation. If three times of interrupts occur before clearing the interrupt factor, interrupt counter overflows. Therefore, wait to reserve starting VSPI of frame {n+2} until interrupt factor of the frame {n} is cleared.

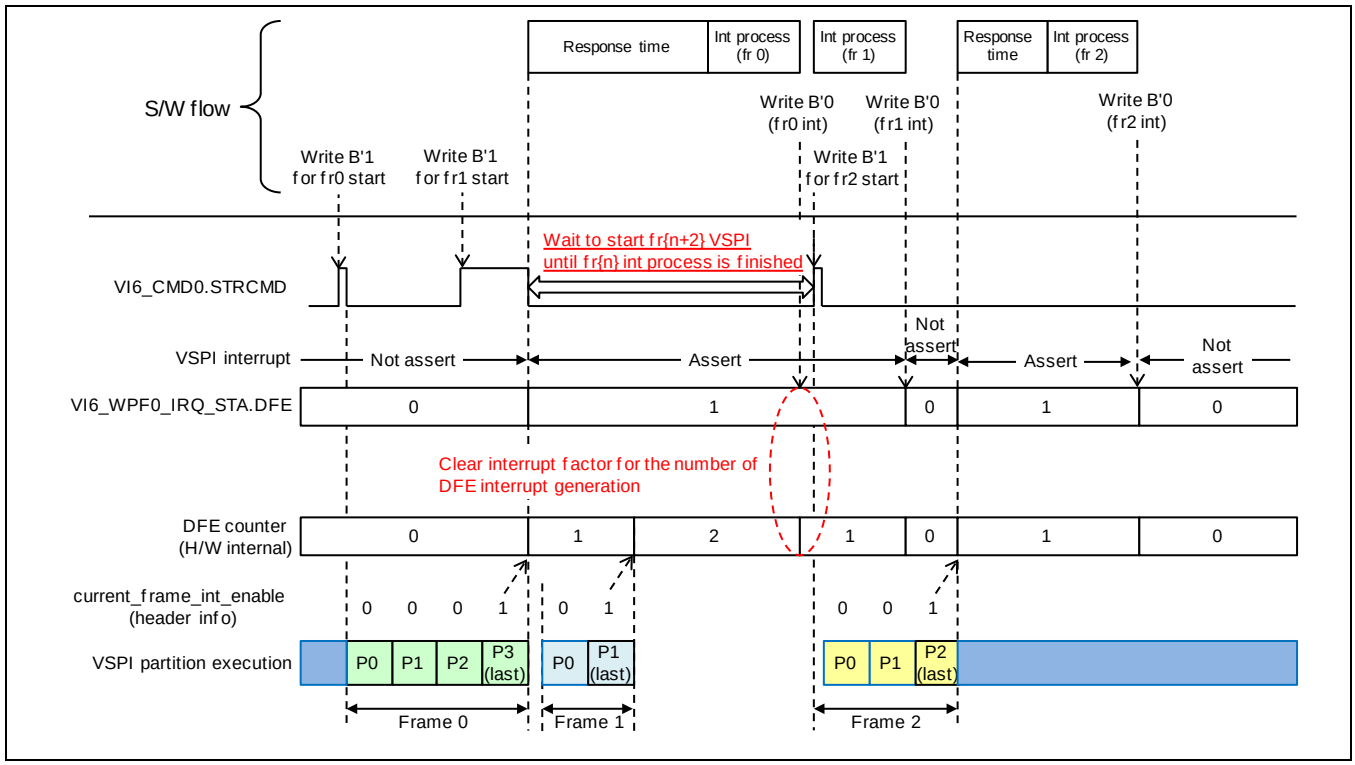

Figure 33.81 Timing of interrupt processing by S/W in case of VSPI start reservation (Case2)

33.3.7.4 Reading overlapped pixels and clipping discontinuous line

The VSPI processes partition boundary as end processing, and discontinuous line is generated at partition boundary. Figure 33.82 shows why reading overlapped pixels and clipping discontinuous line are needed. As example that 3 tap filter is used inside VSPI, right neighbor pixel and left neighbor pixel are referred to generate output pixel. (a), (b) and (c) pixels are referred to generate (b') in left partition. But if the VSPI doesn't read (c), right end pixel (b) is copied inside VSPI. And (b) is referred instead of (c) to generate (b'). And (b') is recognized as discontinuous line. So reading overlapped pixels and clipping discontinuous line are needed.

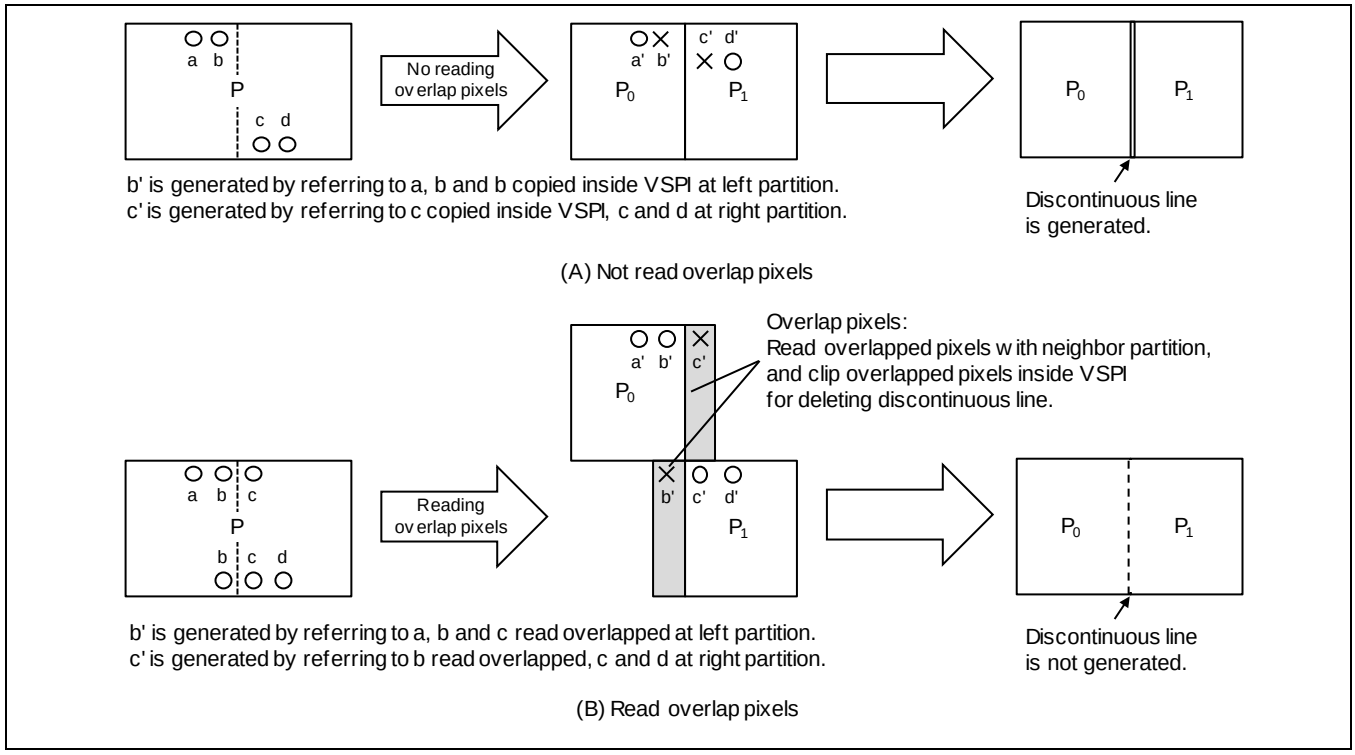

Figure 33.82 Discontinuous line at partition boundary (The example is 3 tap filter)

33.3.7.5 The number of taps for each function's filter in horizontal direction

SRU, SHP, UDS and RPF have filter function which refer to not only current position's pixel but also several neighbor pixels to generate current position's output pixel. The number of taps for each function's filter are shown in this section to realize how many overlapped pixels to be read and how many pixels to be clipped.

(1) RPF (YCbCr42x -> YCbCr444 up sampling for Chroma)

Treatment of Cb and Cr is same as up sampling method. So C is used as Cb or Cr in the explanation.

(1-1) In case of VI6_RPF0_INFMT.CIPM = 0 for YCbCr42x input format

- Duplicate C component twice in horizontal direction.
- Horizontal size setting is restricted as 2-pixels units as shown in Table 33.65

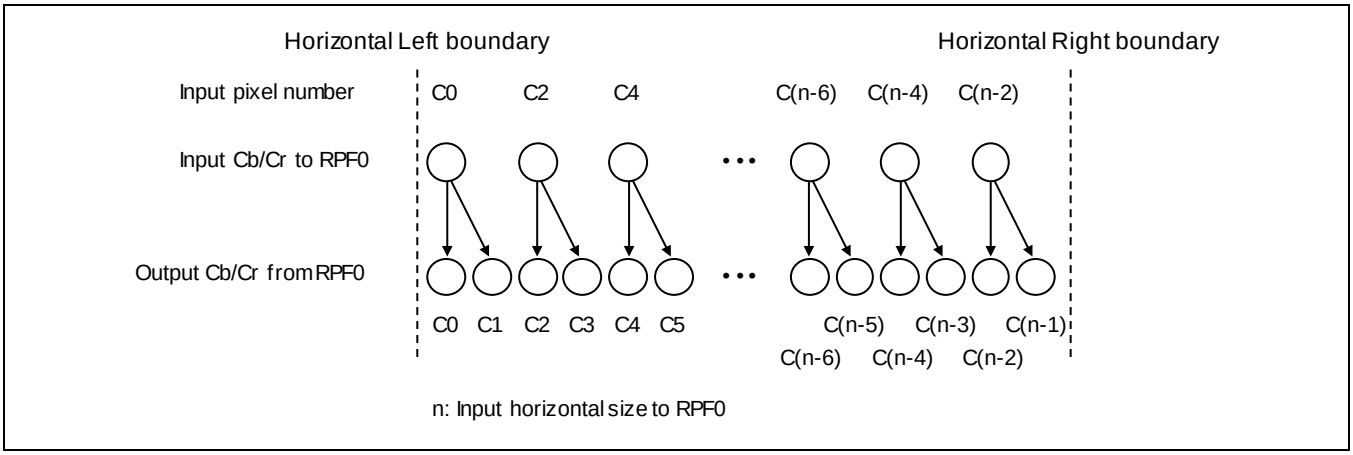

Figure 33.83 Chroma (Cb, Cr) interpolation way in RPF0 (VI6_RPF0_INFMT.CIPM = 0)

(1-2) In case of VI6_RPF0_INFMT.CIPM = 1 for YCbCr42x input format

- Even (0, 2, 4 …) output pixel of C is generated as copy of input pixel.
- Odd (1, 3, 5 …) output pixel of C is generated as 2 taps filter.
- Output pixel at right boundary is influenced by copied pixel C (n-2) of input pixel as shown in Figure 33.84. So it needs to clip C (n-1) output pixel for deleting discontinuous line when horizontal partition's right boundary is not frame boundary.
- Horizontal size setting is restricted as 2-pixels units as shown in Table 33.65.

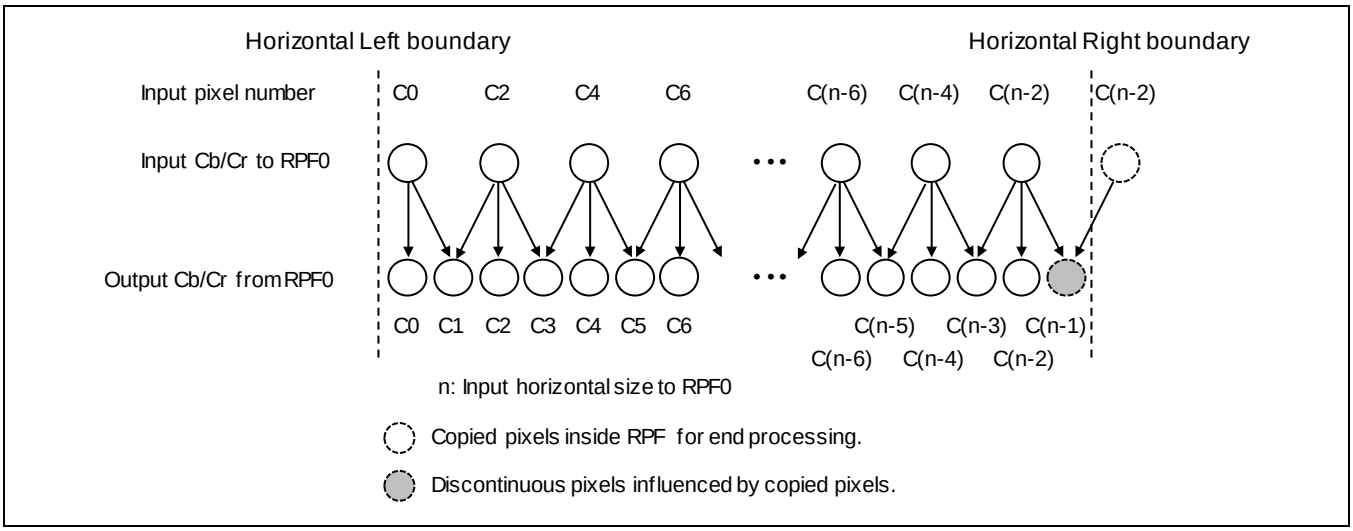

Figure 33.84 Chroma (Cb, Cr) interpolation way in RPF0 (VI6_RPF0_INFMT.CIPM = 1)

(2) SHP

- 9 taps filter
- From n-4 to n-1 output pixels are influenced by copied pixel of n-1 input pixel as shown in Figure 33.85. So it needs to clip from n-4 to n-1 output pixel for deleting discontinuous line when horizontal partition's right boundary is not frame boundary.
- From 0 to 3 output pixels are influenced by copied pixel of 0 input pixel as shown in Figure 33.85. So it needs to clip from 0 to 3 output pixels for deleting discontinuous line when horizontal partition's left boundary is not frame boundary.

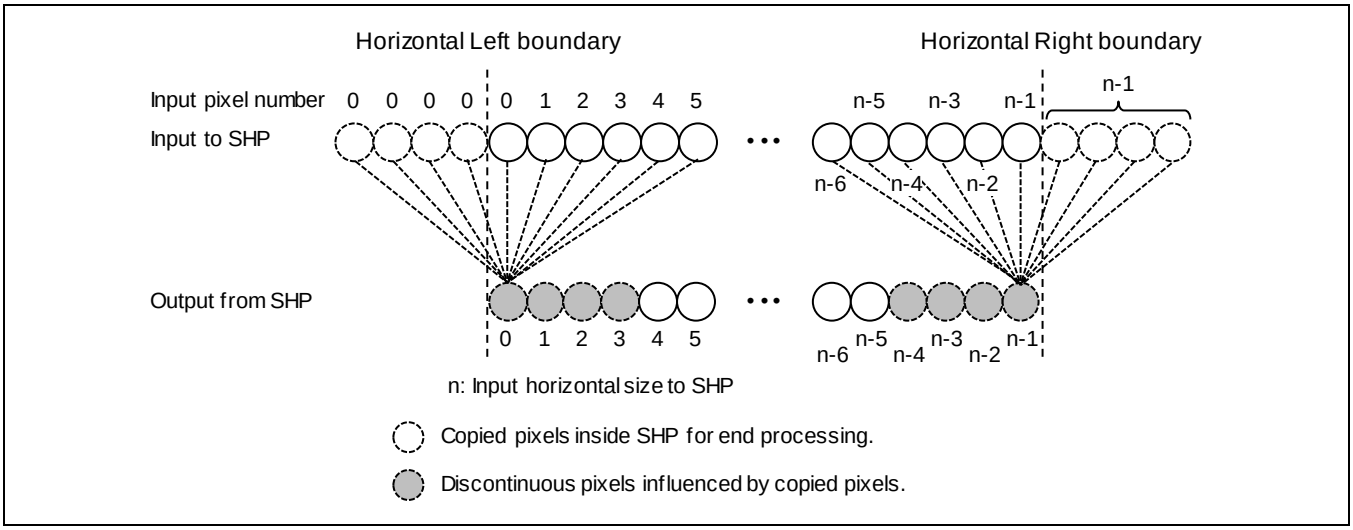

Figure 33.85 The way of applying tap in SHP filter

(3) SRU

SRU filter processing is composed of pre filter and post filter as shown in Figure 33.86.

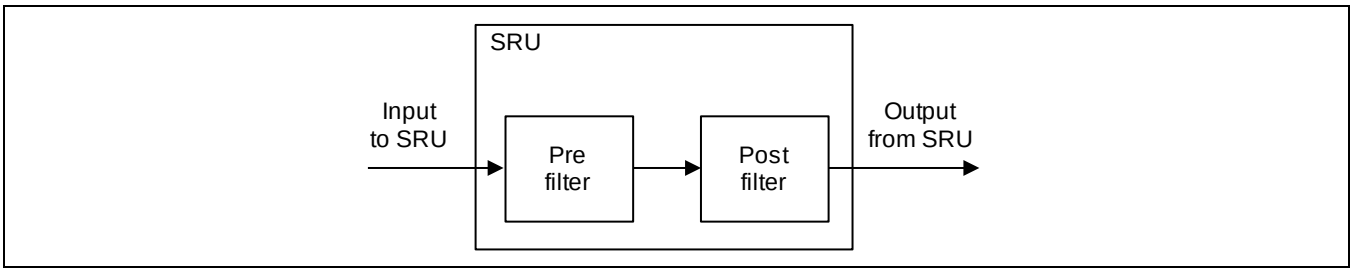

Figure 33.86 Structure of SRU filter processing

(3-1) In case of super resolution without scaling (VI6_SRU_CTRL0.SRU_MODE= B'000)

- Pre filter is 3 taps filter and go through post filter
- N-1 output pixel is influenced by copied pixel of n-1 input pixel as shown in Figure 33.87. So it needs to clip from n-1 output pixel for deleting discontinuous line when horizontal partition's right boundary is not frame boundary.
- 0 output pixel is influenced by copied pixel of 0 input pixel as shown in Figure 33.87. So it needs to clip 0 output pixel for deleting discontinuous line when horizontal partition's left boundary is not frame boundary.

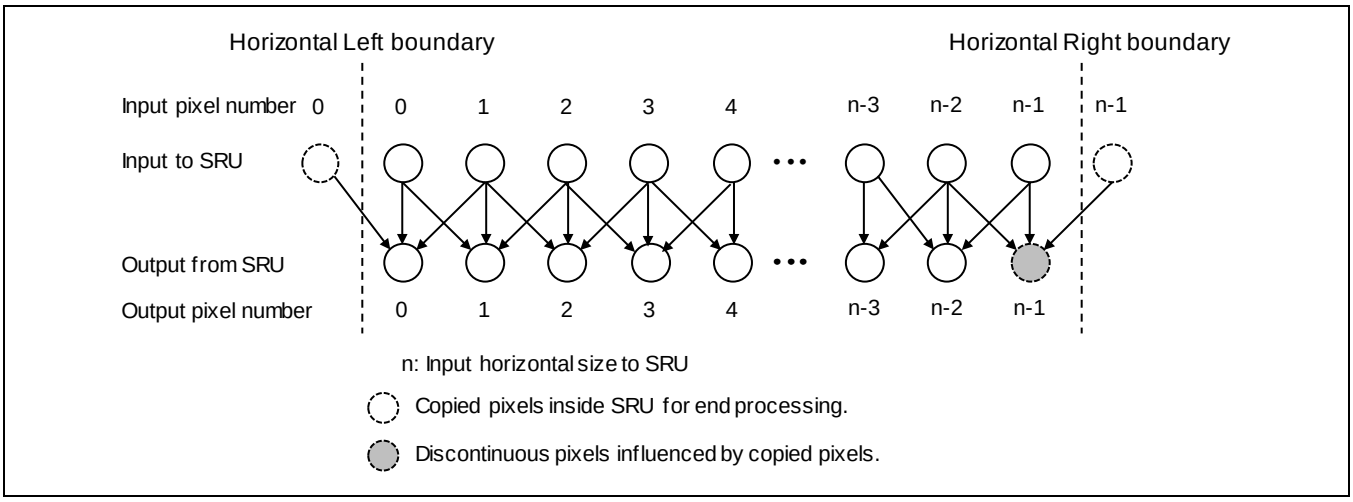

Figure 33.87 The way of applying tap in SRU filter (VI6_SRU_CTRL0.SRU_MODE = B'000)

(3-2) In case of super resolution with double scale-up (VI6_SRU_CTRL0.SRU_MODE = B'100)

- Pre filter is 3 taps filter and post filter is 2 taps filter.
- Even (0, 2, 4 …) output pixel is generated by 3 pixels (3 taps).
- Odd (1, 3, 5 …) output pixel is generated by 4 pixels (4 taps).
- From m-3 to m-1 output pixels are influenced by copied pixel of n-1 input pixel as shown in Figure 33.88. So it needs to clip from m-3 to m-1 output pixels for deleting discontinuous line when horizontal partition's right boundary is not frame boundary.
- From 0 to 1 output pixels are influenced by copied pixel of 0 input pixel as shown in Figure 33.88. So it needs to clip from 0 to 1 output pixels for deleting discontinuous line when horizontal partition's left boundary is not frame boundary.

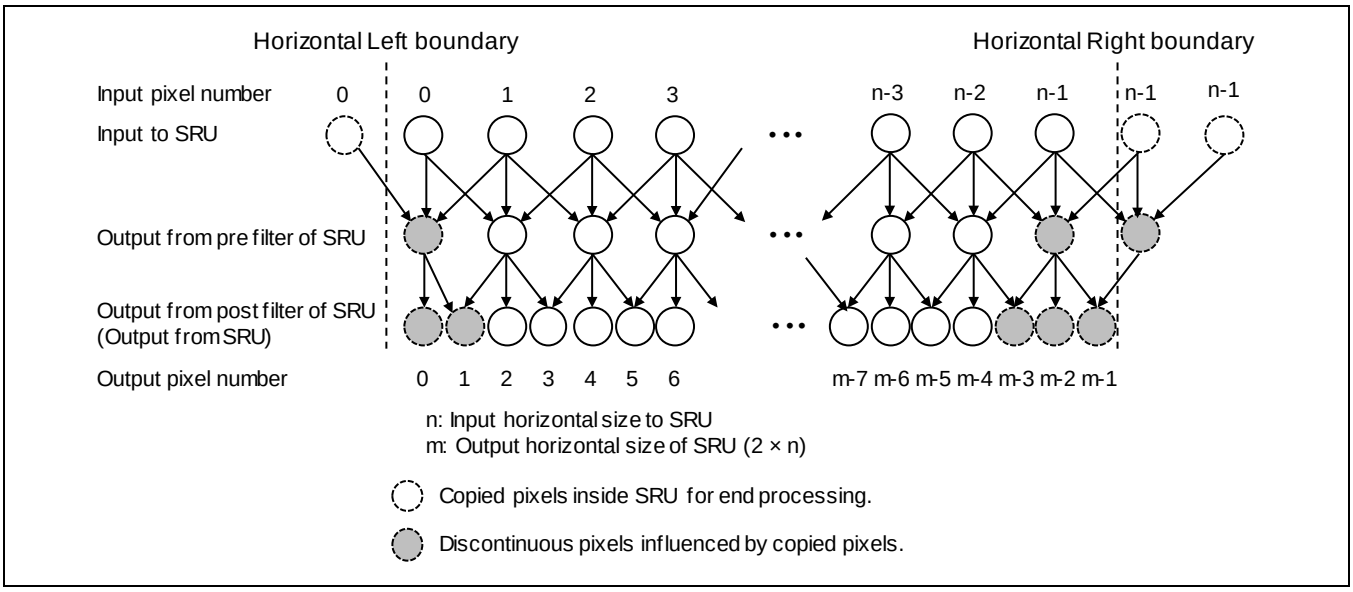

Figure 33.88 The way of applying tap in SRU filter (VI6_SRU_CTRL0.SRU_MODE = B'100)

(4) UDS

This section shows the way to calculate necessary input pixels of UDS (from src_pos0 position to src_pos1 position shown in Figure 33.89), discontinuous pixels generated by UDS (left position of discontinuous pixels is dst_pos0_pb as shown in Figure 33.89), necessary setting of horizontal start phase (hstp) and necessary setting of horizontal end phase (hedp) for UDS in order to generate valid output pixels from dst_pos0 position to dst_pos1 position as shown in Figure 33.89. Each parameter's definition is shown in (a) and (b) below. The way to calculate each parameter is shown in (c) below.

(a) Input parameters decided by user

- dst_pos0: Left position of desired valid pixels output from UDS.
- dst_pos1: Right position of desired valid pixels output from UDS.

(b) Parameters calculated in this section

- dst_pos0_pb: Left position of discontinuous pixels output from UDS.
- src_pos0: Left position of input pixels to UDS to generate valid pixels from dst_pos0 position.
- src_pos1: Right position of input pixels to UDS to generate valid pixels to dst_pos1 position.
- hstp: Horizontal start phase corresponding to dst_pos0_pb position.
- hedp: Horizontal end phase.

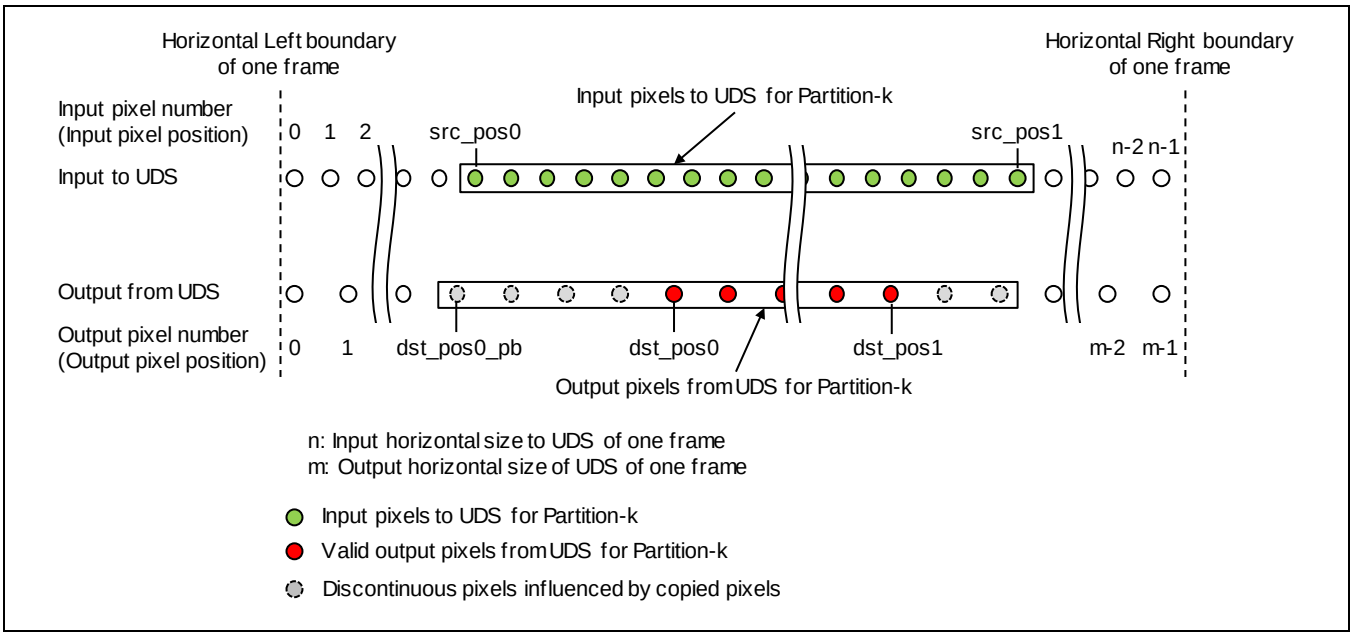

Figure 33.89 Relation between valid output pixels' position and necessary input pixels' position of UDS

(c) The way to calculate each parameter.

<procedure1> Calculate temporary src_pos0 position

For 1st partition (left end partition of source image)

src_pos0 (temporal) = 0

For from 2nd partition to last partition (except left end partition of source image)

src_pos0 (temporal) = (rdown ((dst_pos0 x alpha - phase_edge x m_h') / (4096 x m_h')) – sub_src) x m_h'

m_h is the value of VI6_UDS_SCALE.HMANT, and f_h is the value of VI6_UDS_SCALE.HFRAC. m_h' is defined in Table 33.31. phase_edge is defined in Table 33.62. rdown is defined in section 33.4.7. sub_src is 1 in case of m_h' = 1, sub_src is 2 in case of m_h' = 2 or 4. alpha can be expressed as below.

alpha = 4096 x m_h + f_h

Table 33.62 Value of phase_edge referenced in above calculation

VI6_UDS_SCALE.HMANT	VI6_UDS_CTRL.AMD	phase_edge
0	0	0
	1	rdown ((4096-VI6_UDS_SCALE.HFRAC)/2)
1 to 15	0 to 1	0

<procedure2> Calculate temporary dst_pos0_pb position

For 1st partition (left end partition of source image)

dst_pos0_pb (temporal) = 0

For from 2nd partition to last partition (except left end partition of source image)

dst_pos0_pb (temporal) = rdown ((src_pos0 (temporal) x 4096 + phase_edge x m_h') / alpha)

<procedure3> Decide dst_pos0_pb position from temporal dst_pos0_pb

There is a restriction about the left position which UDS outputs including discontinuous pixels. So it's necessary to shift the position of dst_pos0_pb (temporal) to the left so that the restrictions may be satisfied. dst_pos0_pb can be expressed as below.

dst_pos0_pb = dst_pos0_pb (temporal) - dst_pos0_pb_shift

Here, dst_pos0_pb_shift means the number of pixels by which dst_pos0_pb (temporal) is shifted to the left. Decide dst_pos0_pb_shift as satisfying restriction of [(dst_pos0_pb x alpha) should be multiple of m_h']. The restriction can be expressed as below in other word.

There is no restriction in case of m_h' = 1

- (dst_pos0_pb x alpha) must be multiple of 2 in case of m_h' = 2
- (dst_pos0_pb x alpha) must be multiple of 4 in case of m_h' = 4

Because clip register of UDS output (VI6_UDS_CLIP_SIZE) doesn't have clip offset setting, set the number of pixels of sum of valid output pixels and left discontinuous pixels to VI6_UDS_CLIP_SIZE.CL_HSIZE as shown in Figure 33.90. The number of sum of valid output pixels and left discontinuous pixels is (dst_pos1 - dst_pos0_pb + 1) in the case. Left discontinuous pixels output from UDS should be clipped by offset register of WPF input clip (VI6_WPF0_HSZCLIP.HCL_OFST) as shown in Figure 33.90. The number of left discontinuous pixels is (dst_pos0 - dst_pos0_pb) in the case. When modules which output discontinuous pixels such as SRU and/or SHP are connected after UDS as shown in Figure 33.91, discontinuous pixels are generated by also those modules. Add the number of pixels to the offset setting in the case.

The number of valid pixels from UDS should be set in size setting of WPF input clip register (VI6_WPF0_HSZCLIP.HCL_SIZE) as shown in Figure 33.90. The number of valid pixels is (dst_pos1 - dst_pos0 + 1) in the case. When modules which output discontinuous pixels such as SRU and/or SHP is connected after UDS as shown in Figure 33.91, subtract the number of the discontinuous pixels from the size setting.

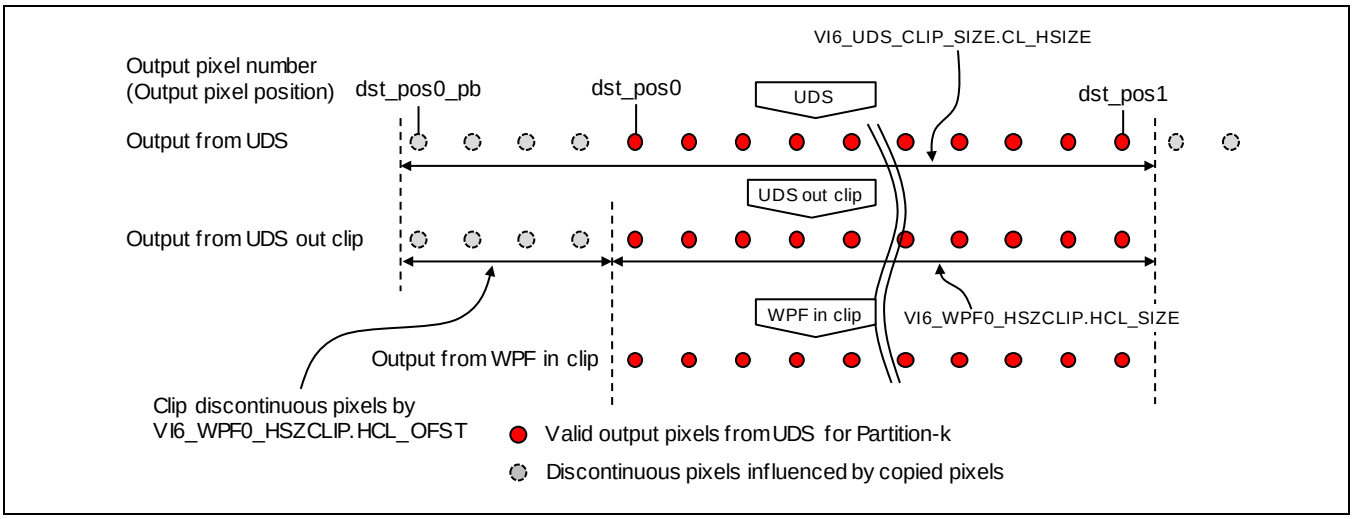

Figure 33.90 UDS output pixels and clip register's setting (Case 1)

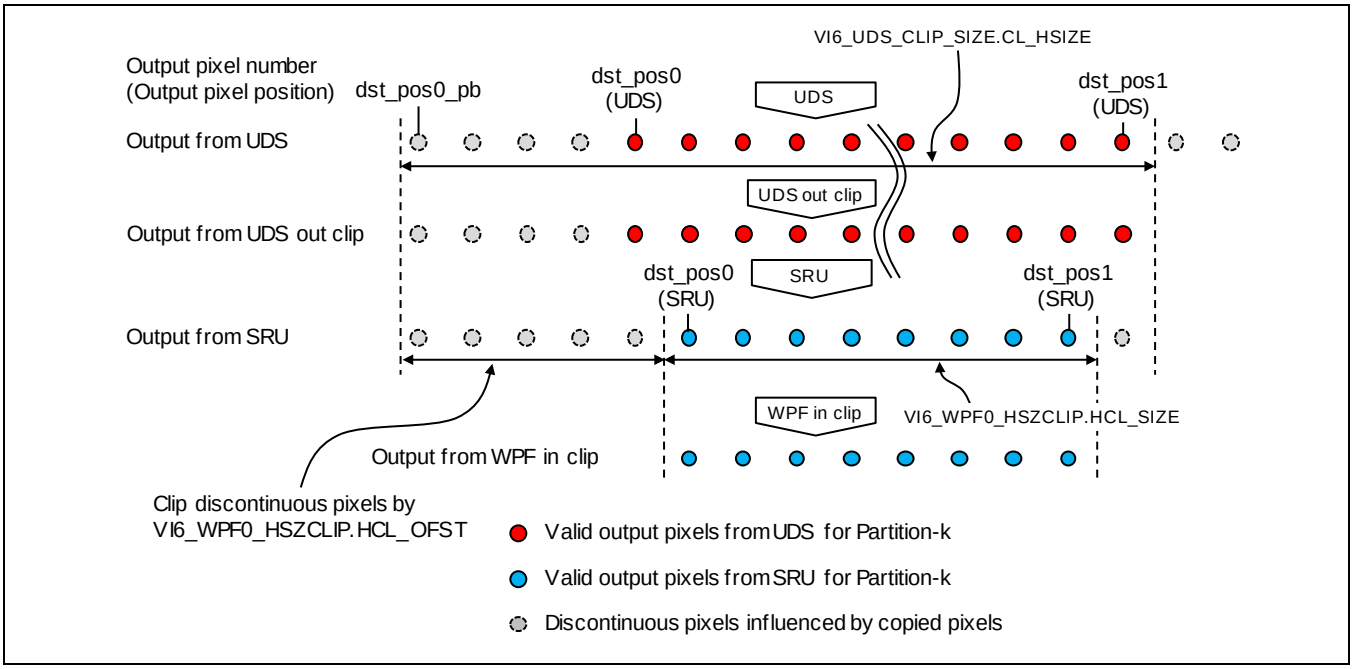

Figure 33.91 UDS output pixels and clip register's setting (Case 2)

<procedure4> Calculate src_pos0 position from dst_pos0_pb

For 1st partition (left end partition of source image)

src_pos0 = 0

For from 2nd partition to last partition (except left end partition of source image)

src_pos0 = rdown ((dst_pos0_pb x alpha - phase_edge x m_h') / (4096 x m_h') + add_src} x m_h'

add_src is 0 in case that phase_residual expressed below is 0, add_src is 1 in case that phase_residual expressed below is not 0. phase_residual can be expressed as below.

phase_residual = rdown ((alpha x dst_pos0_pb – phase_edge x m_h') % (4096 x m_h'))

<procedure5> Calculate src_pos1 position from dst_pos1

For from 1st partition to 2nd last partition (except right end partition of source image)

src_pos1 = (rdown ((dst_pos1 x alpha - phase_edge x m_h') / (4096 x m_h')) + 2) x m_h' + rdown (m_h'/2)

For last partition (right end partition of source image)

src_pos1 = n - 1

n is horizontal input size of UDS of one frame as shown in Figure 33.89

<procedure6> Calculate hstp

For 1st partition (left end partition of source image)

hstp = phase_edge

For from 2nd partition to last partition (except left end partition of source image)

hstp = 4096 – rdown (phase_residual/ m_h') in case that phase_residual is not 0

hstp = 0 in case that phase_residual is 0

Set the value of hstp to VI6_UDS_HPHASE.HSTP. To enable VI6_UDS_HPHASE, set 1 to VI6_UDS_CTRL.AMDSLH.

<procedure7> Calculate hedp

For from 1st partition to 2nd last partition (except right end partition of source image)

hedp = 0

For last partition (right end partition of source image)

hedp = phase_edge

Set the value of hedp to VI6_UDS_HPHASE.HEDP. To enable VI6_UDS_HPHASE, set 1 to VI6_UDS_CTRL.AMDSLH.

33.3.7.6 Horizontal size clipping registers for image partition

As explained in section 33.3.7.1 and section 33.3.7.4, discontinuous line is generated at partition boundary. So clipping discontinuous line is needed at boundary of image partition.

Horizontal input size clipping can be realized at input point of UDS module, input point of WPF0 module, input point of HGO module, input point of HGT module and output point of UDS module as shown in Figure 33.92. Table 33.63 shows horizontal size clipping registers of each modules.

Other than an output point of UDS, arbitrary horizontal size can be specified from arbitrary horizontal offset position.

For an output point of UDS, arbitrary horizontal size can be specified from the left edge.

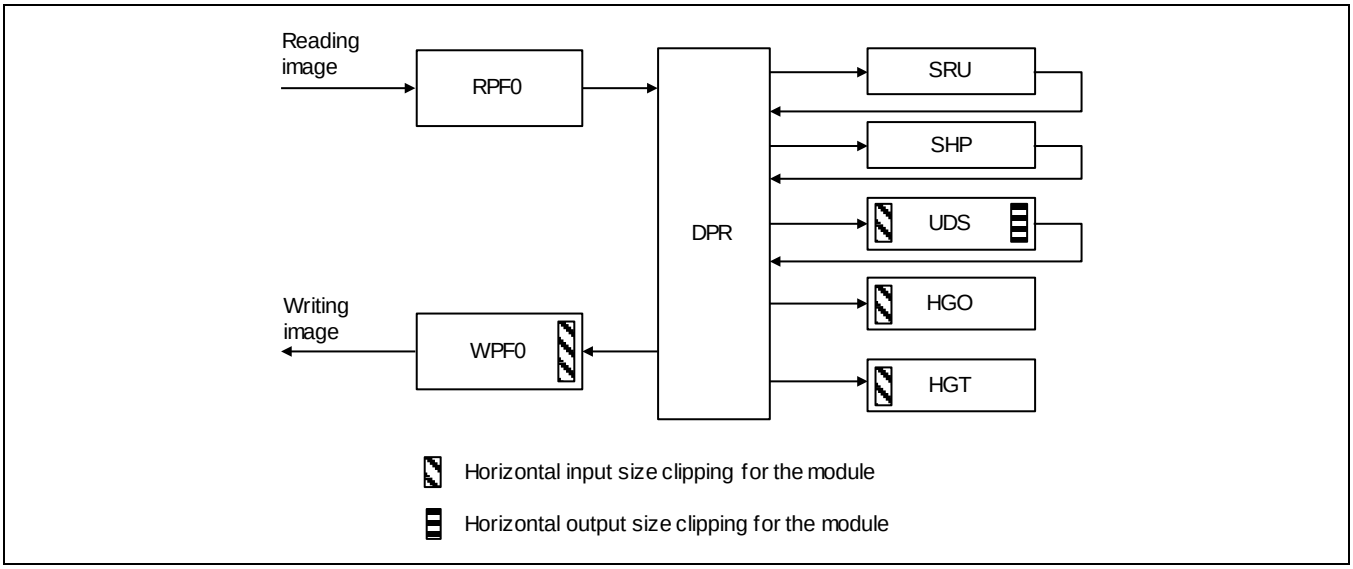

Figure 33.92 Horizontal input size clipping in VSPI

Table 33.63 Horizontal size clipping registers of each modules

Point	Size or offset	Registers
UDS input (*1)	Horizontal offset	VI6_UDS_HSZCLIP.HCL_OFST [7:0]
	Horizontal size	VI6_UDS_HSZCLIP.HCL_SIZE [12:0]
UDS output (*2)	Horizontal size	VI6_UDS_CLIP_SIZE.CL_HSIZE [12:0]
WPF input (*3)	Horizontal offset	VI6_WPF0_HSZCLIP.HCL_OFST [7:0]
	Horizontal size	VI6_WPF0_HSZCLIP.HCL_SIZE [12:0]
HGO input	Horizontal offset	VI6_HGO_OFFSET.HOFFSET [13:0]
	Horizontal size	VI6_HGO_SIZE.HSIZE [13:0]
HGT input	Horizontal offset	VI6_HGT_OFFSET.HOFFSET [13:0]
	Horizontal size	VI6_HGT_SIZE.HSIZE [13:0]

Notes: 1. Set 1 to VI6_UDS_HSZCLIP.HCEN to enable clipping horizontal size at input to UDS
2. Horizontal offset at the UDS output point cannot be specified
3. Set 1 to VI6_WPF0_HSZCLIP.HCEN to enable clipping horizontal size at input to WPF0

33.3.7.7 Histogram of HGO/HGT

This section shows the setting value of registers about histogram detection of HGO and HGT. Figure 33.93 shows the example of getting HGO histogram for UDS output. Those registers shown in Figure 33.93 can be set by display list.

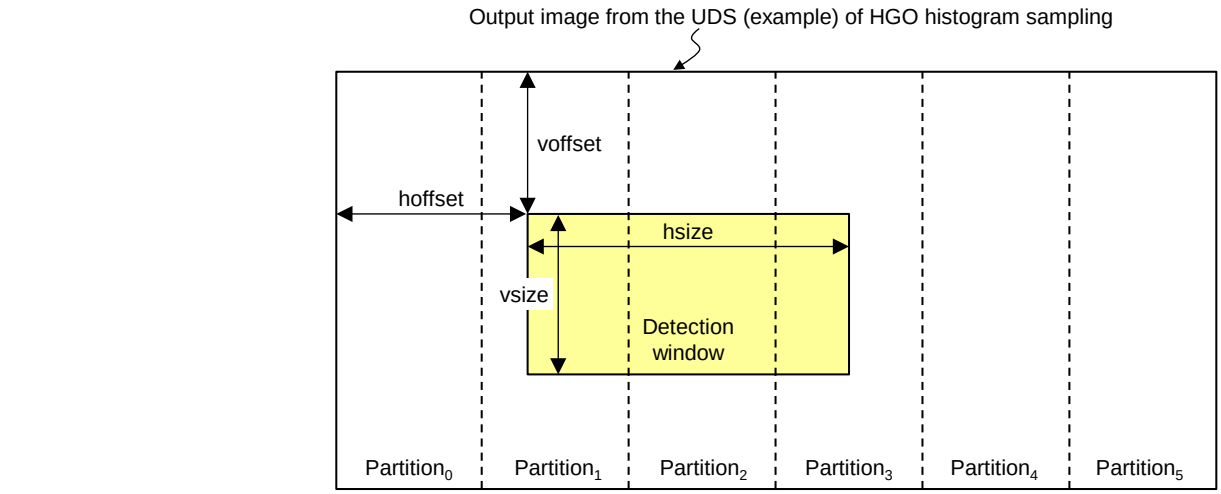
If user wants to get histogram for partial window (like Figure 33.93), set H'0000_073F to VI6_DPR_HGO_SMPPT/VI6_DPR_HGT_SMPPT for partitions without detection window of histogram.

Set 1 to VI6_HGO_REGRST.RCLEA (VI6_HGT_REGRST.RCLEA) to initialize histogram counter for 1st partition including detection window of histogram (Partition1 in case of Figure 33.93). Then histogram counter is initialized before starting processing of the partition. To accumulate counting histogram for all partitions to get one frame's histogram, don't set 1 to VI6_HGO_REGRST.RCLEA (VI6_HGT_REGRST.RCLEA) after the partition.

Set 1 to VI6_HGO_REGRST.RCPART (VI6_HGT_REGRST.RCPART) for all partitions to initialize HGO (HGT) except histogram counter.

If user wants to dump histogram to external memory automatically [RZ/G2H, RZ/G2N, RZ/G2E], set 1 to VI6_HGO_MODE.AUTOW (VI6_HGT_MODE.AUTOW) for last partition with detection window (partition3 in case of Figure 33.93). Then histogram is dumped to external memory after processing the partition with VI6_HGO_MODE.AUTOW =1 (VI6_HGT_MODE.AUTOW =1).

hsize and hoffset in Figure 33.93 means horizontal size and horizontal offset as one frame. Set hsize and hoffset as each partition to VI6_HGO_SIZE.HSIZE, VI6_HGT_SIZE.HSIZE, VI6_HGO_OFFSET.HOFFSET and VI6_HGT_OFFSET.HOFFSET. If target node of histogram sampling generates discontinuous pixels, consider the number of discontinuous pixels and set offset register (VI6_HGO_OFFSET.HOFFSET, VI6_HGT_OFFSET.HOFFSET) as clipping also discontinuous pixels.



Register (display list setting)	Partition 0	Partition 1	Partition 2	Partition 3	Partition 4	Partition 5
VI6_HGO_REGRST.RCPART	1	1	1	1	1	1
VI6_HGO_REGRST.RCLEA	0	1	0	0	0	0
VI6_HGO_MODE.AUTOW	0	0	0	1	0	0
VI6_DPR_HGO_SMPPT	H'0000_073F	H'0000_0011			H'0000_073F	

Figure 33.93 Example of histogram detection for image partition

33.3.7.8 Restriction when VSPI image partition is used

When VSPI image partition is used, there are some restrictions below.

Note: SRU (x1) means SRU without scaling. SRU (x2) means SRU with double scale-up.

- RPF
  - Tiling (VI6_RPF0_SRC_BSIZE.BHSIZE != VI6_RPF0_SRC_ESIZE.EHSIZE) is prohibited.
  - Reading 1bit/pixel alpha plane is prohibited.
- SRU and UDS
  - There are restriction when SRU and UDS are used in a VSP execution. The restriction depends on SRU resolution mode, UDS horizontal scaling factor, the order of UDS and SRU and usage of SHP. The restriction is shown in Table 33.64.

    Example1. RPF0 -> UDS -> LUT -> SRU (x2) -> WPF0 is prohibited.

    Example2. RPF0 -> SRU (x2) -> LUT -> UDS (hscale=2) -> WPF0 can be used.

    Example3. RPF0 -> SRU (x1) -> LUT -> UDS (hscale=4) -> WPF0 can be used.

    Example4. RPF0 -> SRU (x1) -> UDS (hscale=1/2) -> WPF0 is prohibited.

Table 33.64 Restriction in case of connecting SRU and UDS

Order	SRU	UDS (*)	VSP2 supports	Note
UDS -> SRU (x1)	x1	1/16 < hscale <= 16	√	
SRU (x1) -> UDS	x1	hscale < 1	N.A	
		1 <= hscale	√	
UDS -> SRU (x2)	x2	1/16 < hscale <= 16	N.A	
SRU (x2) -> UDS	x2	hscale =< 1/4	N.A	
		1/4 < hscale	√	SHP cannot be used in this case

Note: * hscale is defined in section 33.2.10.2

- HGO/HGT
  - HGO/HGT sampling points should not be specified at modules before UDS or SRU(x2).

    Ex. In case of RPF0 -> SHP -> UDS -> SRU(x1) -> CLU -> LUT -> WPF0 connection

    UDS, SRU, CLU or LUT can be specified as HGO/HGT sampling points

    RPF0 or SHP cannot be specified as HGO/HGT sampling points.

    Ex. In case of RPF0 -> SHP -> SRU(x2) -> CLU -> LUT -> WPF0 connection

    SRU, CLU or LUT can be specified as HGO/HGT sampling points

    RPF0 or SHP cannot be specified as HGO/HGT sampling points.
  - Letter box detection (VI6_HGO_m_LB_DET: m = R, G, B and VI6_HGT_LB_DET) cannot be available.
  - Horizontal Pixel Skipping Mode cannot be used. Fix 0 to VI6_HGO_MODE.HRATIO [1:0], Fix 0 to VI6_HGT_MODE.HRATIO [1:0].
- WPF
  - Mode B dither cannot be used.

33.3.8 Start Reservation for VSPBD, VSPBC, VSPBS or VSPB

This section shows sequence of software when start reservation is used. The way of start reservation is common in VSPBD, VSPBC, VSPBS and VSPB, so we call VSPB* in this section. Software can reserve starting VSPB* before VSPB* processing of one frame is completed. Start reservation can remove interrupt response time and software overhead by reserving execution of VSPB* before completion of previous frame. Use frame end interrupt (VI6_WPF0_IRQ_ENB.FRE) for VSPB*.

(a) below shows software sequence of start reservation.

(b) below shows software sequence to manage the number of interrupt generation.

(a) Software sequence of start reservation

Same step of [1] ~ [9] shown in Figure 33.78 (Flow chart of setting registers by S/W in case of VSPI start reservation) can be applied for start reservation of VSPB*. Figure 33.94 shows timing chart of S/W flow to set registers for start reservation of VSPB*.

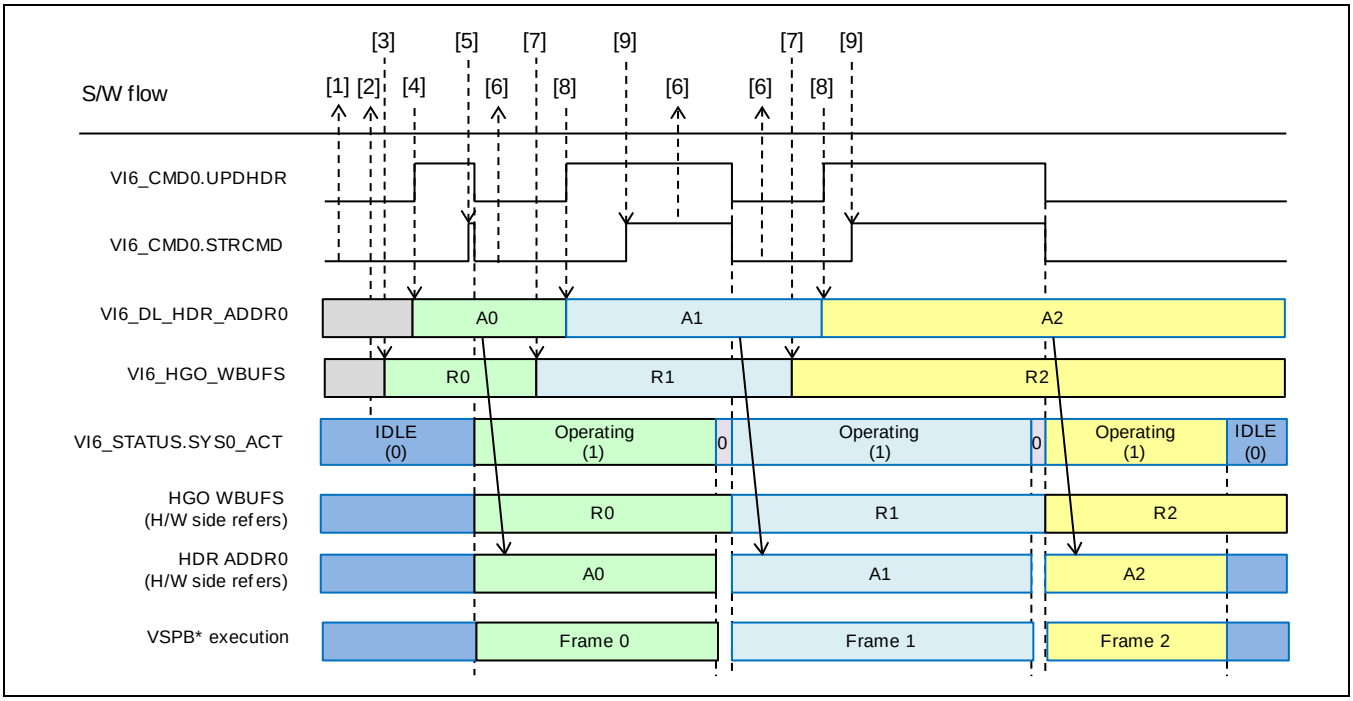


Figure 33.94 Timing of setting registers by S/W in case of VSPB* start reservation

(b) Software sequence to manage the number of interrupt generation.

The way of using interrupt is shown below.

[1] Set 1 to the VI6_WPF0_IRQ_ENB.FREE to use frame end interrupt (VI6_WPF0_IRQ_STA.FRE)

[2] Write 0 to VI6_WPF0_IRQ_STA.FRE to clear status after interrupt processing as shown in Figure 33.95.

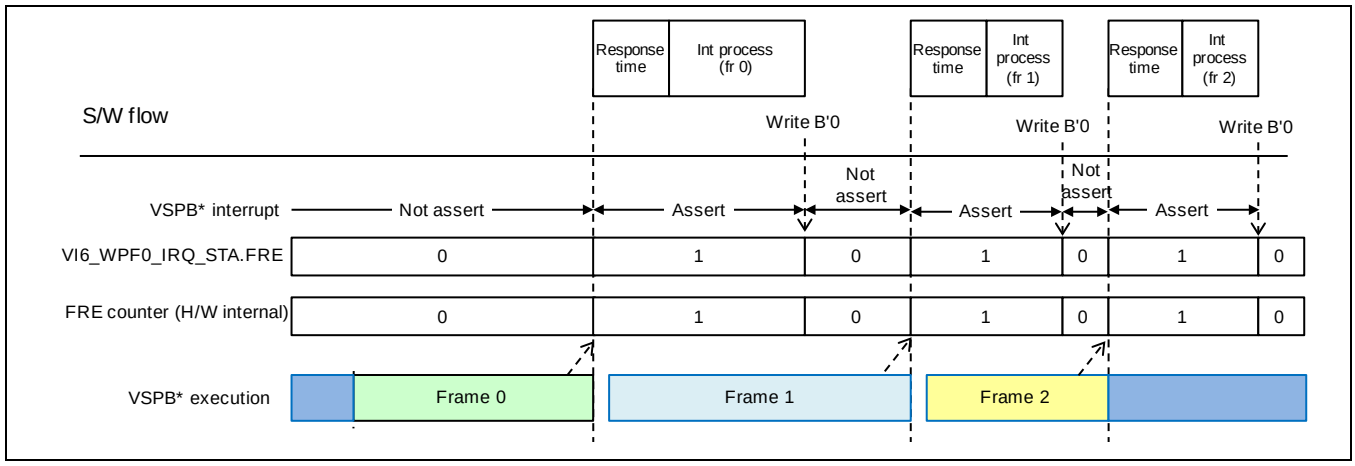

Figure 33.95 Timing of interrupt processing by S/W in case of VSPB* start reservation (Case1)

Be careful following points as shown in Figure 33.96.

[1] Set 0 to VI6_WPF0_IRQ_STA.FRE for the number of interrupt generation to clear VI6_WPF0_IRQ_STA.FRE.

[2] The VSPB* H/W can count at most two of interrupt generation. If three times of interrupts occur before clearing the interrupt factor, interrupt counter overflows. Therefore, wait to reserve starting VSPB* of frame {n+2} until interrupt factor of the frame {n} is cleared.

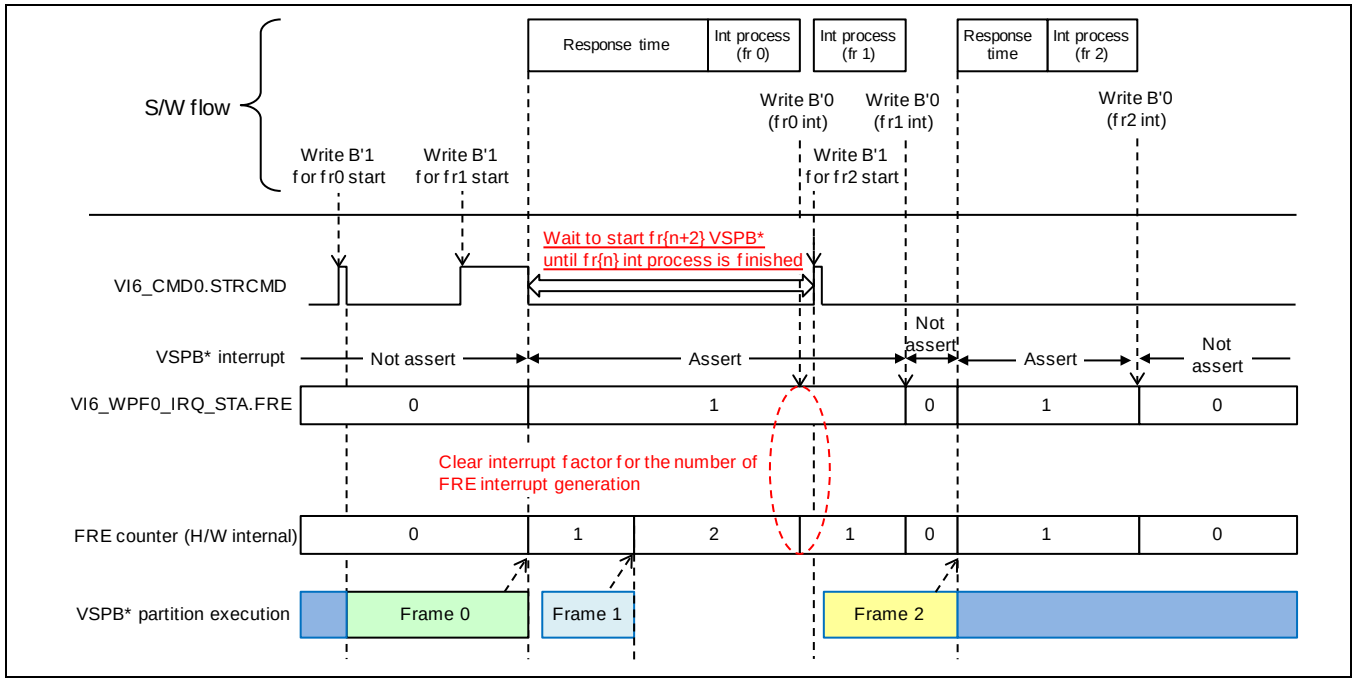

Figure 33.96 Timing of interrupt processing by S/W in case of VSPB start reservation (Case2)

33.3.9 The step to read HGO histogram registers of 256 step mode by indirect addressing

When HGO is used as 256 step mode (VI6_HGO_MODE.STEP = 1) and HGO histogram is not automatically dumped to external memory (VI6_HGO_MODE.AUTOW = 0), read HGO histogram registers by indirect addressing. The step is shown below.

(1) Set VI6_HGO_RBUFS (section 33.2.16.14) to specify buffer side of reading HGO histogram. [RZ/G2M V1.3, RZ/G2M V3.0 only]

(2) Set value-m in VI6_HGO_EXT_HIST_ADDR (section 33.2.16.11). m is frequency of Y or MaxRGB pixel with value-m.

(3) Read VI6_HGO_EXT_HIST_DATA (section 33.2.16.12) to get frequency of Y or MaxRGB pixel with value-m.

Repeat step (2) and step (3) 256 times from m = 0 to m = 255.

33.4 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2N
RZ/G2M V3.0 RZ/G2E

33.4.1 Assignment in Memory Space

Make sure that VSP2 memory space shall be mapped to Non-Cache region.

33.4.2 Limitations on Software Reset and Module Standby

Refer to Usage Notes of section 35 FCP User's Manual

33.4.3 Input Image Size

Table 33.65 is a list of input size specifications.

Table 33.65 List of Input Size Specifications

Module	Min. Input Size	Max. Input Size	Restrictions on Setting Unit
RPF	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. Notes: 1. When the 1-bpp alpha plane*1 is input, the size can always be specified in 8-pixel units both horizontally and vertically regardless of the input format. 2. These restrictions including note 1 are applied to the following. VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
SRU*2	4 (horizontal) × 4 (vertical) pixels	Without scaling (same size): 288 (horizontal) × 8190 (vertical) pixels With double scale-up: 288 (horizontal) × 4095 (vertical) pixels	1-pixel units both horizontally and vertically.
UDS*2	4 (horizontal) × 4 (vertical) pixels	304 (horizontal) *3 × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
SHP	4 (horizontal) × 4(vertical) pixels	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
ILV	1 (horizontal) × 1 (vertical) pixel	Side by Side Mode 4095 (horizontal) × 8190 (vertical) pixels Line by Line Mode 8190 (horizontal) × 4095 (vertical) pixels Pixel by Pixel Mode 4095 (horizontal) × 8190 (vertical) pixels Doubler Mode 4095 (horizontal) × 4095 (vertical) pixels	1-pixel units both horizontally and vertically.
LUT	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
CLU	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
HST	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
HSI	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
BRU	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.

Module	Min. Input Size	Max. Input Size	Restrictions on Setting Unit
BRS	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
HGO	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
HGT	1 (horizontal) × 1 (vertical) pixel	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
LIF	128 (horizontal) × 96 (vertical) pixels	8190 (horizontal) × 8190 (vertical) pixels	1-pixel units both horizontally and vertically.
WPF*2	1 (horizontal) × 1 (vertical) pixel	When VI6_WPF0_OUTFMT.ROT is smaller than 2 8190 (horizontal) × 8190 (vertical) pixels When VI6_WPF0_OUTFMT.ROT is bigger than 1, 256(horizontal) × 8190(vertical) pixels	YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. YCbCr420: 2-pixel units both horizontally and vertically. Other formats: 1-pixel units both horizontally and vertically. Note 1: This restriction on the WPF only applies to the WPF output size. The WPF input size should be specified in 1-pixel units. Note 2: In case of image rotation and flipping, other restrictions are applied. Refer to section 33.2.7.7, which explains LMEM_WD.

Notes: 1. When VI6_RPFn_ALPH_SEL.ASEL is set to B'011.
2. To support horizontal input size is larger than 256 pixels about SRU, UDS and/or WPF/ROT (VI6_WPF0_OUTFMT.ROT>1), the way of image partition is needed. Refer to section 33.3.7 for realizing the way of image partition.
3. The restriction of horizontal size is applied to input size of UDS in case of up-scaling in horizontal direction. The restriction of horizontal size is applied to output size of UDS in case of down-scaling or no-scaling in horizontal direction.

The most important restriction shown in Table 33.65 is the setting unit. Make appropriate register settings so that the size of the image input to each module does comply with setting units and does not exceed the limits shown in Table 33.65. Especially for the register settings of SRU and UDS, where the size can be changed within the modules, be careful not to exceed the input size limit for the module connected behind each of them.

33.4.4 Output Image Size

The size of the output from each WPF is determined by the results of processing in the modules connected with the DPR. As shown in Figure 33.1 to Figure 33.6, the data input to the VSP2 is sent to the WPF output modules through the RPF and the modules connected with the DPR. When there is no processing that changes the image size through this data path, the WPF output size is the same as the RPF input size. Table 33.66 is a list of the processing that changes image size.

Table 33.66 Image Processing that changes image size

Module	Function*1	Related Register	Size of Output from Module
SRU	Super resolution with double scale-up	VI6_SRU_CTRL0	Super resolution without scaling (same size): Input size Super resolution with double scale-up: Input size × 2
UDS	Output size clipping	VI6_UDS_CLIP_SIZE	Horizontal output size: VI6_UDS_CLIP_SIZE.CL_HSIZE setting Vertical output size: VI6_UDS_CLIP_SIZE.CL_VSIZE setting
WPF	Input size clipping	VI6_WPFn_HSZCLIP VI6_WPFn_VSZCLIP	When this function is disabled, the input size and the output size are the same. When this function is enabled, the output is in the following size. Horizontal output size: VI6_WPFn_HSZCLIP.HCL_SIZE *2 setting Vertical output size: VI6_WPFn_VSZCLIP.VCL_SIZE *2 setting
ILV	3D format conversion	VI6_ILV_CTRL	Side by side mode or Pixel by pixel mode Horizontal: Input size × 2, Vertical: Input size Line by line mode Horizontal: Input size, Vertical: Input size × 2 Doubler mode Horizontal: Input size × 2, Vertical: Input size × 2

Notes: 1. For details of each function, refer to the descriptions of the related registers.
2 Refer to Section 33.2.1 "Notational Conventions for Registers and Bit Fields" for explanation of register bit field.

The input image size can be changed only with the modules and functions shown in Table 33.66. With the other modules and functions, the input size and output size are the same. Accordingly, after module connections with the DPR are determined, the VSP2 output size can also be determined through the following steps.

1. The image size (VI6_RPFn_SRC_ESIZE) read from the external memory and sent to the DPR by the RPFn is the initial value.
2. When the module connected with the DPR is not a module (function) shown in Table 33.66, the output size from the module is the same as the input size; the image size does not need to be updated.
3. When a module connected with the DPR is a module (function) shown in Table 33.66, the output image size should be updated to the size shown in the table, which should be used as the input image size for the module connected behind it.
4. When the final image size at the WPFn is determined, this size is the VSP2 output size for that WPFn path.

Figure 33.97 shows how to determine the image size in a sample DPR connection through the above steps. The related conditions that determine the image size are also shown.

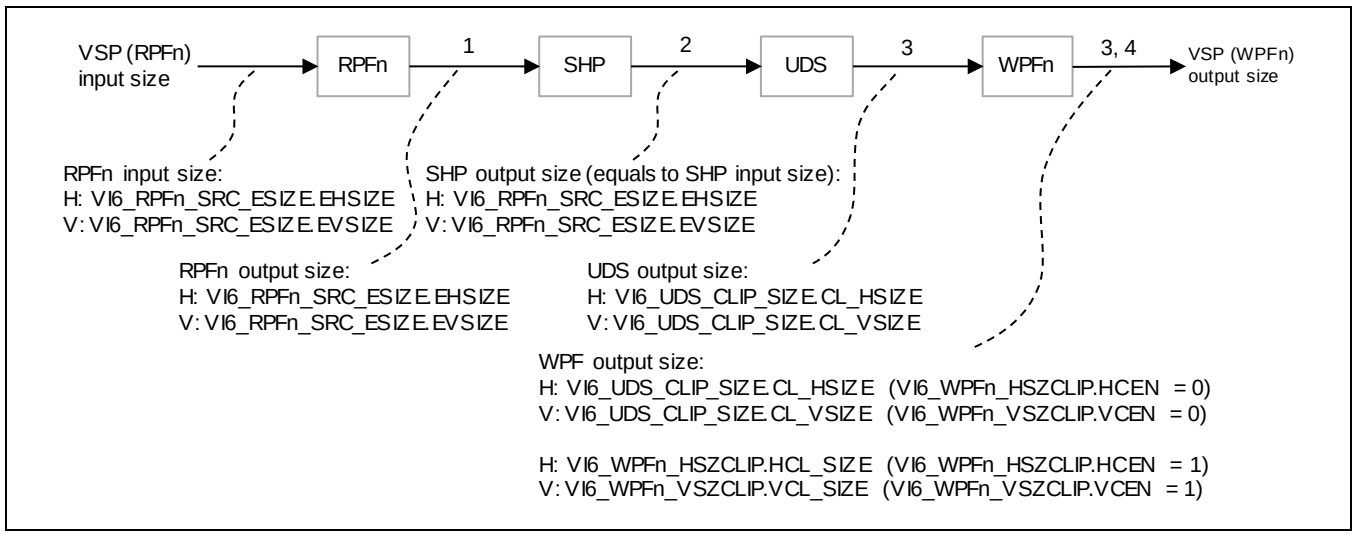

Figure 33.97 Input/output Size for Each Module in a Sample DPR Connection

Make appropriate register settings in each module so that the VSP2 output image size determined as shown in the figure does not violate the restrictions shown in Table 33.66.

33.4.5 Configuration of VSP2

Table 33.67 to Table 33.72 show the configuration of each type of VSP2 unit on this LSI.

All the registers and functions listed in [Module] category of Table 33.67 to Table 33.72 should be treated as un-implemented functions in each VSP2 unit. Do not set any registers related to the un-implemented function without any statement.

Table 33.67 VSPI configuration

Category	Configuration	Restricted contents
Restriction	WPF/format	When FCNL compression is enabled, write format is restricted. See section 35 FCP User's Manual for more detail. Related registers: VI6_WPF0_OUTFMT.ROT, VI6_WPF0_OUTFMT.FCNL, VI6_WPF0_OUTFMT.WRFMT
	WPF/Addr, Stride	When FCNL compression is enabled, destination address and destination memory stride are restricted. See section 35 FCP User's Manual for more detail. Related registers : VI6_WPFn_STRIDE_Y. VI6_WPFn_STRIDE_C VI6_WPFn_DSTM_ADDR_Y VI6_WPFn_DSTM_ADDR_C0 VI6_WPFn_DSTM_ADDR_C1

	WPF/rotation and reflection	Horizontal filliping, vertical flipping and rotation are not available. ROT = 0 is available. ROT = 1, 2, 3, 4, 5, 6 and 7 are not available. Related registers: VI6_WPF0_OUTFMT.ROT
Restriction	WPF/format	FCNL compression cannot be used. Related registers : VI6_WPFn_OUTFMT.FCNL

33.4.6 Performance of VSP2

VSPI, VSPBD, VSPBC, VSPBS, VSPB, VSPD and VSPDL performance is shown in this section. VSP performance shown in below is based on evaluation under the condition that only one IP is operated.

33.4.6.1 Performance of VSPI

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

500 Mpix/s process rate per 1 set of VSPI except following cases. When one of following conditions is true, performance of VSPI is lower than 500 Mpix/s process rate. The execution of the VSPI is up to at most 480 frames per second.

[RZ/G2E]

125 Mpix/s process rate per 1 set of VSPI except following cases. When one of following conditions is true, performance of VSPI is lower than 125 Mpix/s process rate. The execution of the VSPI is up to at most 120 frames per second.

(1) 90 degree or 270 degree rotation (VI6_WPF0_OUTFMT.ROT > 3) is enabled
(2) Horizontal scaling ratio is larger than x4 times and SRU (x1) is used at same time.
(3) At least one RPF has all following conditions.
- RGB32bpp or YCbCr planar or YCbCr444 semi-planar
- Reading alpha plane

33.4.6.2 Performance of VSPBD, VSPBC or VSPB

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

500 Mpix/s process rate per 1 set of VSPBD, VSPBC or VSPB except following cases. If one of following conditions is true, performance of VSPBD/VSPBC/VSPB is lower than 500 Mpix/s process rate. The execution of the VSPBD/VSPBC/VSPB are up to at most 480 frames per second.

[RZ/G2E]

125 Mpix/s process rate per 1 set of VSPB except following cases. If one of following conditions is true, performance of VSPB is lower than 125 Mpix/s process rate. The execution of the VSPB is up to at most 120 frames per second.

(1) At least one RPF has all following conditions.
- RGB32bpp or YCbCr planar or YCbCr444 semi-planar
- Reading alpha plane
- Source stride or start address of either plane is not multiple of 256 bytes.

(2) Two RPFs have RGB32bpp and alpha plane.
(3) At least three RPFs are used, and at least one of the RPF has RGB32bpp and alpha plane.
(4-1) Total amount of byte/pixel of all RPFs is larger than 16 bytes. [for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E]
Following example shows 16 byte/pixel.
- RPF0 = YCbCr420SPL (2 byte/pixel)
- RPF1 = YCbCr420SPL (2 byte/pixel)
- RPF2 = ARGB (4 byte/pixel)
- RPF3 = ARGB (4 byte/pixel)
- RPF4 = ARGB (4 byte/pixel)

(4-2) Total amount of byte/pixel of all RPFs and WPF is larger than 12 bytes. [for RZ/G2N]
Following example shows 12 byte/pixel.
- RPF0 = YCbCr420SPL (2 byte/pixel)

- RPF1 = YCbCr420SPL (2 byte/pixel)
- RPF2 = YCbCr420SPL (2 byte/pixel)
- RPF3 = YCbCr420SPL (2 byte/pixel)
- WPF0 = ARGB (4 byte/pixel)

33.4.6.3 Performance of VSPD or VSPDL

In this section, the maximum dot clock frequency is the one VSPD/VSPDL can support regardless of display type. Therefore, it may be higher than the maximum dot clock frequency specified by an particular display type such as LVDS or DPAD can support. Refer to section 36 DU User's Manual and Electrical Characteristics to grasp the maximum dot clock frequency.

[RZ/G2H, RZ/G2N]

250 Mpix/s process rate (support up to 300MHz in case of DU display) per 1 set of VSPD.

125 Mpix/s process rate (support up to 150MHz in case of DU display) per 1 video path (1WPF) of VSPDL.

[RZ/G2M V1.3, RZ/G2M V3.0]

250 Mpix/s process rate (support up to 300MHz in case of DU display) per 1 set of VSPD.

[RZ/G2E]

125 Mpix/s process rate (support up to 150MHz in case of DU display) per 1 set of VSPD except following cases. If one of following conditions is true, the maximum process rate is 83.3 Mpix/sec (support up to 100MHz in case of DU display).

(1) At least one RPF has all following conditions.
- RGB32bpp or YCbCr planar or YCbCr444 semi-planar
- Reading alpha plane
- Source stride or start address of either plane is not multiple of 256 bytes.

(2) Two RPFs have RGB32bpp and alpha plane.

(3) At least three RPFs are used, and at least one of the RPF has RGB32bpp and alpha plane.

(4) Total amount of byte/pixel of all RPFs is larger than 16 bytes.

Following example shows 16 byte/pixel.
- RPF0 = YCbCr420SPL (2 byte/pixel)
- RPF1 = YCbCr420SPL (2 byte/pixel)
- RPF2 = ARGB (4 byte/pixel)
- RPF3 = ARGB (4 byte/pixel)
- RPF4 = ARGB (4 byte/pixel)

33.4.7 Legend of terms

This section describes the configurations of VSP2 on this LSI. Descriptions in this section show the full-function specifications of the VSP2 IP. Some of the functions described in this section are not available on VSP2 with restrictions written here.

(1) Terminology

This section explains the terminology for VSP2.

Virtual RPF

There is an image compositing sub module named as BRU which can execute image blending or raster operation. The BRU has 5 input ports for compositing multiple images. There must be a RPF module as the start of data processing. Each RPF can be a source of data input to BRU. In addition to these RPF modules, the BRU has a function which generates monochrome color image internally. This functionality is useful because the data access to an external memory is not required. This function is called as virtual RPF.

Refer to section 33.2.7.1, 33.2.15.2, 33.2.15.3 and 33.2.15.4 for virtual RPF.

The BRS has also virtual RPF. Refer to section 33.2.7.1, 33.2.19.2, 33.2.19.3 and 33.2.19.4 for virtual RPF in the BRS.

Target WPF

The VSP2 has five RPFs (RPF 0 to 4) and four WPFs (WPF0 to 1) and execute image processing. One data path consists of more than one RPF, one WPF and other image functional modules if necessary. The WPF which is reached from specific RPF(s) in the data path is called as target WPF for the RPF(s). The number of target WPFs is always one for the data path.

Source RPF

The data source in the data path for the specific WPF is called as source RPF for that WPF. The number of source RPFs is not always one, may be more than one for image blend operation or raster operation.

Layer

In case of image composite operation such as image blending or raster operation for multiple images, there is hierarchical relationship for each image. One layer is assigned to one RPF or one virtual RPF indicating one image in hierarchical relationship.

Master Layer

The master layer is a base layer for image compositing of multiple images, and the size of the master layer equals to that of BRU output. When the image compositing is not applied, there is one layer. This layer is also called as the master layer.

Sub Layer

The Layers except the master layer are called as sub layer.

Alpha

The VSP2 can execute both color data and its transparent data. The alpha is 8-bit data and expresses the transparency of pixel. The value H’FF represents opaque pixel, and the value H’00 represents transparent pixel.

Plane

One layer consists of color components such as R/G/B or Y/Cb/Cr, and alpha data representing its transparency of the pixel. The frame which is one of color components and alpha data is called as a plane.

Picture Plane

The picture plane represents color data in one layer.

Alpha Plane

The alpha plane represents transparent data in one layer.

Blending

The image blending means the image composite operation with alpha data. The composite ratio of image blending depends on the relationship of each layer and alpha values.

Raster Operation (ROP)

The bitwise operation such as AND or OR is called as raster operation (ROP).

(2) Definition of operators and functions

The following operators, notations are defined for explaining the functions of VSP2.

$\langle x \rangle$

Discard decimal places of value x

rdown (*x*)

Discard decimal places of value *x*: Ex, rdown (3.81) = 3

clip0 (*x*)

Clip to 0 value if x is less than 0. [$x = (x < 0)? 0 : x$]

clip3 (*min, max, x*)

The value x shall be clipped so that x shall be $min < x < max$. [$x = (x < min)? min : ((x > max)? max : x)$]

(3) Unit

The unit is defined here for explaining VSP2's functions.

[bpp]: bits per pixel

VSP2 can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows a number of data bits for one pixel. For example, RGB 8bpp means that its format is RGB and the pixel consists of 8 data bits.

34. Fine Display Processor (FDP1)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

34.1 Overview

The FDP1 is the de-interlacing module which converts the interlaced video to progressive video. Require software or the library to RENESAS for operating this module.

The RZ/G2H provides two channels.

The RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N and RZ/G2E provides one channel respectively.

34.1.1 Features

This module has the following features.

- High image quality motion adaptive de-interlacing algorithm (*)
  - Combines the best aspects of both Bob (2D) and Weave (3D)
  - 2D and 3D comparisons are performed to decide whether or not an individual pixel has motion.
  - Diagonal interpolation is supported in 2D compensation.
- Support 8190 x 8190 resolution
- Performance of FDP is as following:
  - Output performance of each channel is 500Mpixs/s for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N.
  - Output performance of each channel is 125Mpixs/s for RZ/G2E.
  - Input performance (interlace mode) per one active RPF of each channel is half of output performance.
  - Input performance (progressive mode) per one active RPF of each channel is equal to output performance.

Note: * This algorithm is applied for luma only. The chroma is de-interlaced by fixed 2D without diagonal interpolation.

Main Function of the FDP1

Read Pixel Formatter (RPF)

Number of channels			**Three channels (RPF0 to RPF2)**
Image Format	Input (*1)	YCbCr	YCbCr444-PL, SP, ILV (*2) YCbCr422-PL, SP, ILV (*2) YCbCr420-PL, SP (*2)
		Maximum size	H8190 x V8190 pixels (Frame) H8190 x V4095 pixels (Field)
		Minimum size	H3 2 x V32 pixels (Frame) H32 x V16 pixels (Field)
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.

Write Pixel Formatter (WPF)

Number of channels			**One channel (WPF)**
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555 α value is fixed.
		YCbCr	YCbCr444-PL, SP, ILV (*2) YCbCr422-PL, SP, ILV (*2) YCbCr420-PL, SP (*2)
		Maximum size	H8190 x V8190 pixels
		Minimum size	H32 x V32 pixel
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color space conversion	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping

Interlace to Progressive Converter (IPC)

De-interlacing	Output frame rate	Per one input field output one frame (Example: 60i to 60p)
	Interpolation mode	2D-3D adaptive (*3) 2D fixed 3D fixed (*3)
	Algorithm	Motion adaptive (luma only)
Diagonal line interpolation		Supported (luma only)

Notes: 1. Chroma component (Cb, Cr or U, V) of RPF0, RPF2 is not read from bus in case of planar or semi-planar format and discarded after reading in package with luma component in case of interleaved format because it is processed in fixed 2D de-interlacing.
2. PL: Planar, SP: Semi-planar, ILV: Interleaved
3. Source picture structures (field-structure or frame-structure) should be the same structure among the all input pictures.

34.1.2 Block Diagram

Figure 34.1 shows the block diagram of FDP1.

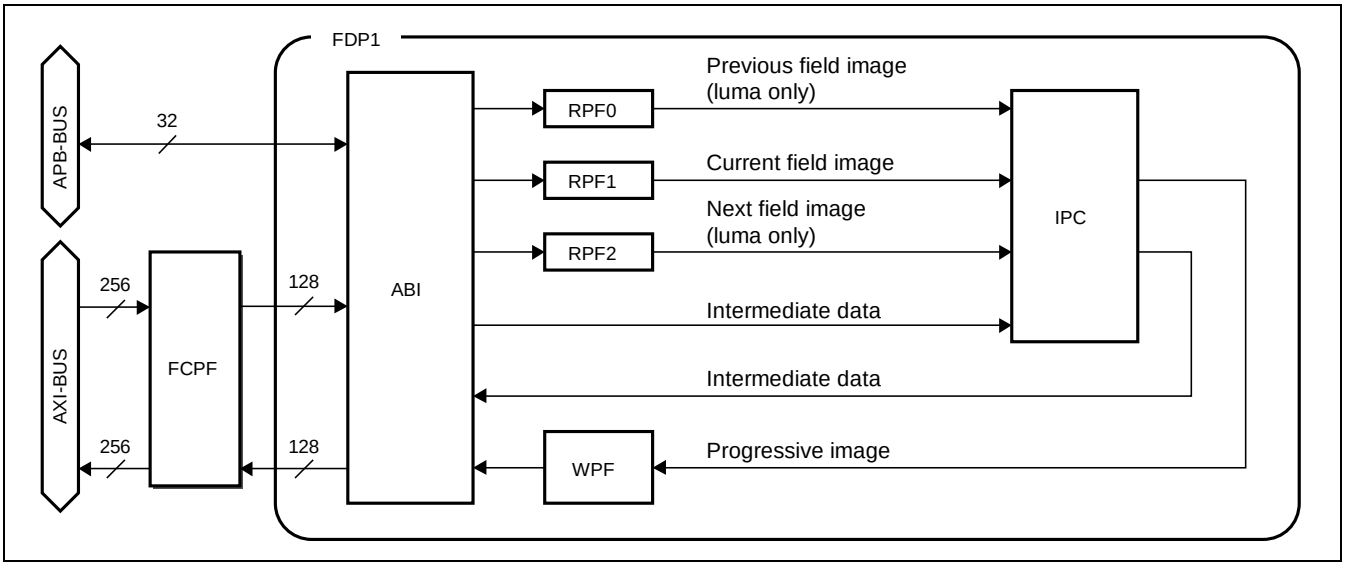

Figure 34.1 FDP1 Block diagram

The following gives an overview of each block function shown in Figure 34.1.

The operation of these functions is determined by the register setting explained in section 34.2. See section 34.2 for the relationship between the register setting and the functional behavior.

34.1.2.1 ABI (AXI Bus Interface)

The FDP1 applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and FDP1 necessary for this operation is done by the ABI, which works as the bus master, according to the register settings. The ABI executes this data transfer between the external memory and FDP1 through FCPF.

34.1.2.2 RPF (Read Pixel Formatter)

The RPF reads image data from the external memory through the ABI, unpacks data according to the specified format, and outputs the resultant data to the IPC. The input format unpacking unit expands the image data input from the ABI into the image format for internal processing.

The FDP1 provides three RPF modules (RPF0 to RPF2). RPF0 reads the previous field, RPF1 reads the current field and RPF2 reads the next field for processing de-interlacing operation.

34.1.2.3 IPC (Interlace to Progressive Converter)

The IPC is the de-interlacing module which reads the field image through RPFn (n = 0, 1, 2) and writes back to the progressive image to the external memory through WPF. The IPC uses the motion adaptive algorithm which enhances the image resolution of still pixels compared with conventional 2D de-interlacing.

Note: the motion adaptive algorithm is applied to only luma component. Conventional 2D de-interlacing is applied to chroma component.

34.1.2.4 WPF (Write Pixel Formatter)

The WPF is an output module that receives image data from the IPC, converts the color space, number of colors, and format of the data, and outputs the results of FDP1 image processing to external memory through the ABI. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The FDP1 provides one WPF.

34.1.2.5 Input/output Data Format

The FDP1 input/output data should be stored in a format where the address is incremented in the direction from the MSB to the LSB as in big endian. For example, the FDP1 reads and writes data to and from the external memory through the dedicated bus interface with a 128-bit width, and the data that should come first should be stored in the MSB side regardless of the unit data size as shown in Figure 34.2.

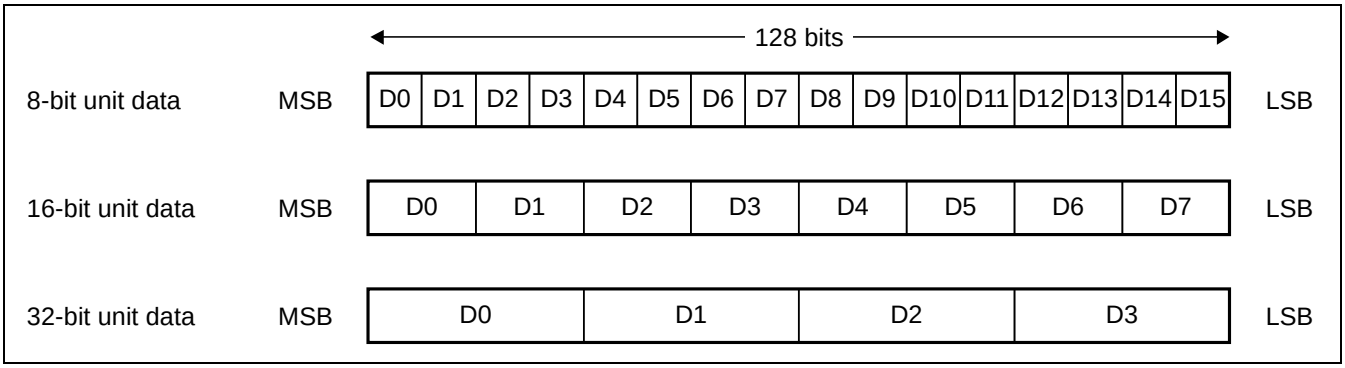

Figure 34.2 FDP1 Input/output Data Format

However, data may be arranged in a way unexpected by the FDP1 depending on the address handling method (such as little endian) of the FDP1 access destination in some cases as in the external memory format shown in Figure 34.3. In such a case, use the data swapping function (Refer to section 34.2.7.6 and 34.2.8.4) in the FDP1 to convert the data format to be suitable for the FDP1.

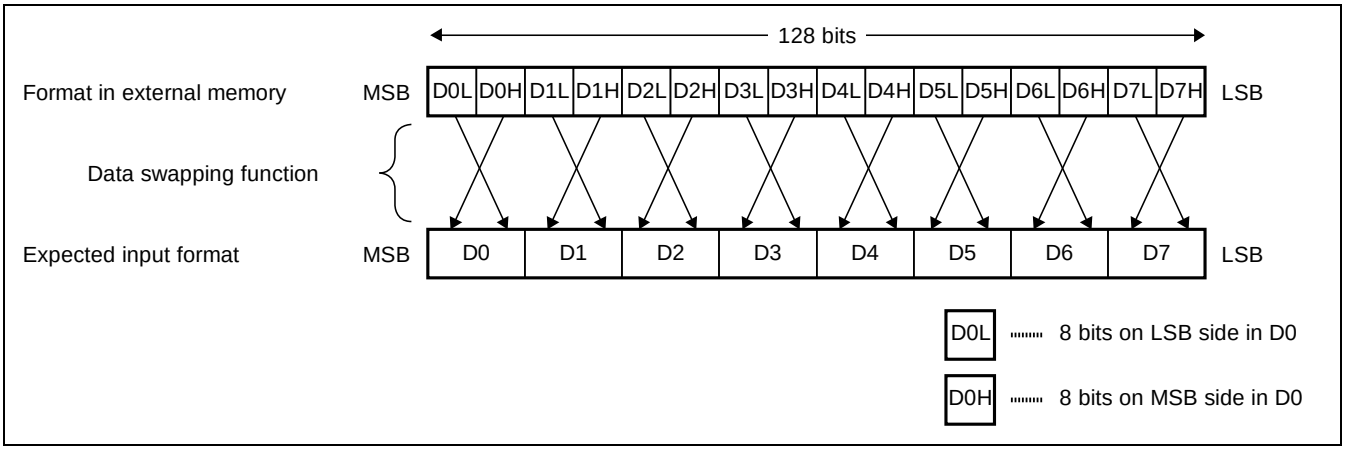

Figure 34.3 Input Data Alignment by Data Swapping Function

34.1.3 Register Configuration

Table 34.1 shows the FDP1 memory map. Immediate registers are specified as “Imm”, the V-update registers are indicated as “Vupdt” and the V-update status registers are indicated as “VupdtSt” in register type column in Table 34.1.

Base address of each FDP1:

Ch0: H'FE94_0000

Ch1: H'FE94_4000 (RZ/G2H only)

34.1.4 Connected Module

Following table shows the modules connected to the FDP1.

Table of connected Module

Module	Connected Module	Description
FDP1	FCPF	FCP for FDP

34.2 Register Description

34.2.1 Access Restrictions

FDP1 supports only 32 bit access to read or write all addresses in FDP1 area. Do not access any of otherwise access units. Therefore, read-modify-write is needed to change partial bits in 32bits register.

34.2.2 Register Type Definitions

There are 3 types of registers in FDP1: immediate register, V-update Register and V-update Status Register. The values of immediate registers are reflected to H/W behavior immediately after the changing its values. Hence, do not change these immediate registers while FDP1 is processing unless this manual allows it explicitly. The values of V-update registers are reflected to H/W behavior at the timing of V-interruption (at the timing of FD1_CTL_IRQSTA.VINT is set to 1). Users can change these V-update registers while FDP1 is processing. To reflect V-update registers to the H/W, users have to set FD1_CTL_REGEND.REGEND to 1 after the all V-update registers which are intended to be changed are completely set. The values of V-update Status Registers are updated at the timing of V-interruption. Therefore, the status (FD1_CTL_STATUS) of de-interlacing process which is conducted before a V-interruption must be referred after that V-interruption.
To confirm the types of registers, refer to Table 34.1.

34.2.3 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the FDP1 registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the FD1_CTL_CMD register is indicated as FD1_CTL_CMD.STRCMD.
3. Lowercase "n" in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For example, FD1_RPFn_ADDR_Y.PSRC_ADDR (n = 0, 1, 2) indicates the PSRC_ADDR bits in three registers FD1_RPF0_ADDR_Y.PSRC_ADDR, FD1_RPF1_ADDR_Y.PSRC_ADDR, and FD1_RPF2_ADDR_Y.PSRC_ADDR. For RPFn when the range of value n is not defined, RPFn (n = 0, 1, 2) are assumed.
4. In each subsection for register description in section 34.2, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are three registers FD1_RPF0_ADDR_Y, FD1_RPF0_ADDR_C0 and FD1_RPF0_ADDR_C1, FD1_RPF0_ADDR_* indicates three registers.

34.2.4 Register Classification

The FDP1 registers are arranged in the following order; the general control registers control the operation of the entire FDP1, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from section 34.2.6.

1. General control registers (FD1_CTL_*)
2. RPF control registers (FD1_RPF_*)
3. WPF control registers (FD1_WPF_*)
4. IPC control registers (FD1_IPC_*)

34.2.5 Restrictions on Access to Registers and Lookup Tables

The FDP1 has control registers and lookup tables. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the FDP1 will not operate correctly.

1. For the read-only bits and reserved bits in all FDP1 registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in section 34.1.3 are reserved areas and write access is prohibited in these areas.
3. For all immediate registers and lookup tables, except FD1_CTL_SGCMD, FD1_CTL_SRESET and FD1_CTL_IRQ*, modifying register values during operation of the module is prohibited. Modify registers while the FDP1 is stopped. For the operating status of the FDP1, refer to section 34.2.6.9.

34.2.6 General Control Registers

34.2.6.1 FDP1 Start Register (FD1_CTL_CMD)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STRCMD
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	STRCMD	B'0	R/W	Start Command FDP1 starts the de-interlacing processing if this bit is set to 1. Set this bit after all relevant registers are surely set except for FD1_CTL_REGEND and FD1_CTL_SGCMD. Set this bit to 1 before the FD1_CTL_REGEND.REGEND and FD1_CTL_SGCMD if FDP1 has to execute process. This bit will keep the value 1 after the set. To clear this bit, write the value 0 to this bit. 0: NOP or stops process at the next timing of V-Interruption. 1: Start FDP1 process at the next timing of V-Interruption. Note that setting of this register is valid if the register FD1_CTL_REGEND.REGEND is set to the value 1 at the timing of next V-Interruption.

34.2.6.2 Sync Generator Register (FD1_CTL_SGCMD)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SGEN

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SGEN	B'0	R/W	V-Interruption Generator Enable This bit controls V-Interruption. This bit should be set to the value 1 after other all registers are set, and only at the first field of the sequence. Set this bit to the value 1 to execute process in all V-Interruption modes described in the section 34.2.6.5. 0: Disable V-Interruption 1: Enable V-Interruption [Important] In case of software reset (FD1_CTL_SRESET.SRST), set this SGEN bit to the value 0. If this bit is cleared during process V-interruption will not occur after FDP1 finished current frame. As a result, FDP1 will not start the next frame because STRCMD is not captured and V-update status registers will not be updated about process information of current frame.

34.2.6.3 Register Set End Register (FD1_CTL_REGEND)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5, 3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PRG	B'0	R/W	Progressive Mode When the register field is set to 1, the de-interlacing processing is not executed, and the incoming image data is passed through IPC module. 0: Interlace Mode 1: Progressive Mode
1, 0	VIMD[1:0]	B'00	R/W	V-Interruption Mode This register field sets V-Sync interrupt mode of FDP1. Refer to Table 34.3 for detail. 0: Interrupt mode 1: Best Effort mode 2: No interrupt mode

Table 34.3 V-Interrupt Mode

	V-Interruption Timing		STRCMD Captured Timing
VIMD[1:0]	**First time**	**Second time or later**	
0 (Interrupt mode)	V-Interruption occurs when changes FD1_CTL_SGCMD.SGEN from 0 to 1 and FDP1 is not doing de-interlacing process.	Fixed period interrupt specified by FD1_CTL_VPERIOD in spite of the de-interlacing processing	Captured at V-Interruption
1 (Best effort)		Fixed period interrupt specified by FD1_CTL_VPERIOD If the de-interlacing processing is not completed at the timing specified by FD1_CTL_VPERIOD, V-Interruption is deferred to the end of the processing.	
2 (No interrupt)		If FD1_CTL_REGEND is set 1 before the end of the processing (frame end interruption FD1_CTL_IRQSTA .FRE is set as 1) V-Interruption occurs right after the end of the processing. If FD1_CTL_REGEND is set 1 after the end of processing (frame end interruption FD1_CTL_IRQSTA .FRE is set as 1) V-Interruption occurs right after FD1_CTL_REGEND is set. If FD1_CTL_REGEND is not set 1 V-Interruption does not occur.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRST	B'0	R/W	FDP1 Software Reset FDP1 stops it operation after this bit is set to 1. FDP1 aborts all processing and quit bus/ memory accesses. Do not start next process by FD1_CTL_CMD until the software processing is completed. When this processing is completed, the FD1_ CTL_IRQSTA.FRE interrupt source bit is set to 1, when the FRE interrupt is enabled. This interrupt notifies the end of the reset processing. The end of software reset processing is notified through the FRE bit, but the software reset issued while FDP1 is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the FDP1 may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the FDP1 completes operation. But even through in this case, not that the output image may be destroyed due to software reset process. This bit is always read as 0. 0: NOP 1: Software Reset [Important] Set FD1_CTL_SGCMD.SGEN to the value 0 before write 1 to this SRST bit.

34.2.6.9 Operating Status Register (FD1_CTL_STATUS)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VINTE	—	—	—	FREE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15 to 5, 3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VERE	B'0	R/W	Interrupt Enable for V-Sync End Error The interrupt of V-Sync end error is asserted at the timing that FDP1 does not complete the de-interlacing processing at the V-Sync.
4	VINTE	B'0	R/W	Interrupt Enable for V-Sync The interrupt of V-Sync is asserted at the timing of V-Sync specified by FD1_CTL_OPMODE.VIMD register field. If VIMD is set to 2, this interrupt is not asserted.
0	FREE	B'0	R/W	Interrupt Enable for Frame End The interrupt of frame end is asserted at the timing that FDP1 completes the de-interlacing processing.

Each bit controls the interrupt enable of the corresponding interrupt source.
0: Interrupt Disabled
1: Interrupt Enabled

Each bit in FD1_CTL_IRQSTA is set to 1 when the corresponding interrupt source is generated. FD1_CTL_IRQENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in FD1_CTL_IRQSTA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in FD1_CTL_IRQSTA is set to 1.

34.2.6.12 Interrupt Status Register (FD1_CTL_IRQSTA)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VER
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VINT	—	—	—	FRE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15 to 5, 3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	VER	B'0	R/W	Interrupt Status and Clear for V-Sync End Error
4	VINT	B'0	R/W	Interrupt Status and Clear for V-Sync
0	FRE	B'0	R/W	Interrupt Status and Clear for Frame End

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt
1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0
1: Hold the interrupt status value

FD1_CTL_IRQSTA indicates the state of the interrupt sources generated in the FDP1. Whether to output a FDP1 interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in FD1_CTL_IRQENB.

While an interrupt is disabled in FD1_CTL_IRQENB, the FDP1 does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FRES	B'0	R/W	This bit is used to issue the dummy frame end interruption. [Read Access] Always 0 value is read. [Write Access] 0: Hold the current interrupt status value 1: The interrupt status of frame end (bit FRE of register FD1_CTL_IRQSTA) is forced to 1. After being forced to 1, the status value 1 of interrupt status bit FRE is hold until it is cleared by being written 0. The bit FRES turns to 0 automatically after being written 1.

34.2.7 RPF Control Registers

34.2.7.1 Source Picture Size Register (FD1_RPF_SIZE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15 to 14, 11 to 9, 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CIPM	B'0	R/W	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside RPF in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in Figure 34.8. This bit specifies the method of up-sampling for this purpose. 0: The nearest-neighbor method is used for horizontal chrominance interpolation. 1: The bilinear method is used for horizontal chrominance interpolation. In the case all following conditions are true set 0 to this bit in order to prevent the image difference between input and output. If set 1 to this bit in this case the output image may be different from the input image, but it is not broken. 1) Operation mode is progressive (FD1_CTL_OPMODE.PRG = 1) 2) Input format is either YCbCr4:2:2 or YCbCr4:2:0 3) Output format is either YCbCr4:2:2 or YCbCr4:2:0
13	RSPYCS	B'0	R/W	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFM T bits to 71 (H'47). When the input format is YVYU, set this bit and the RSPUVS bit to 1 and set the RDFM T bits to 71 (H'47). In other cases, set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
12	RSPUVS	B'0	R/W	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFM T bits to 65 (H'41). When the input format is NV21, set this bit to 1 and set the RDFM T bits to 66 (H'42). When the input format is YVYU, set this bit and the RSPYCS bit to 1 and set the RDFM T bits to 71 (H'47). In other cases, set this bit to 0.
8	CF	B'0	R/W	Current Field This bit specifies current field parity. Note that the Previous or Next field pictures should be the opposite parity of the current field specified by this bit. 0: Current field is top field 1: Current field Bottom field
6 to 0	RDFMT [6:0]	All 0	R/W	RPF Input Image Format Setting These bits select the format of the image input from the external SDRAM to the RPFn (n = 0, 1, 2). Select a value corresponding to the desired format from those shown in Table 34.4. [Note 1] Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. [Note 2] Input chroma horizontal up-sampling When the input format is YCbCr4:2:2 or YCbCr4:2:0 the chroma component is up-sampled horizontally to YCbCr4:4:4 (the format used for image process) with the method specified by the CIPM bit. In the interlace mode (FD1_CTL_OPMODE.PRG = 0) this up-sampling is processed before IP conversion. [Note 3] Input chroma vertical up-sampling When the input format is YCbCr4:2:0 the chroma component is up-sampled vertically to YCbCr4:4:4 (the format used for image process) by copying the neighbor upper input line. In the interlace mode (FD1_CTL_OPMODE.PRG = 0) this up-sampling is processed before IP conversion.

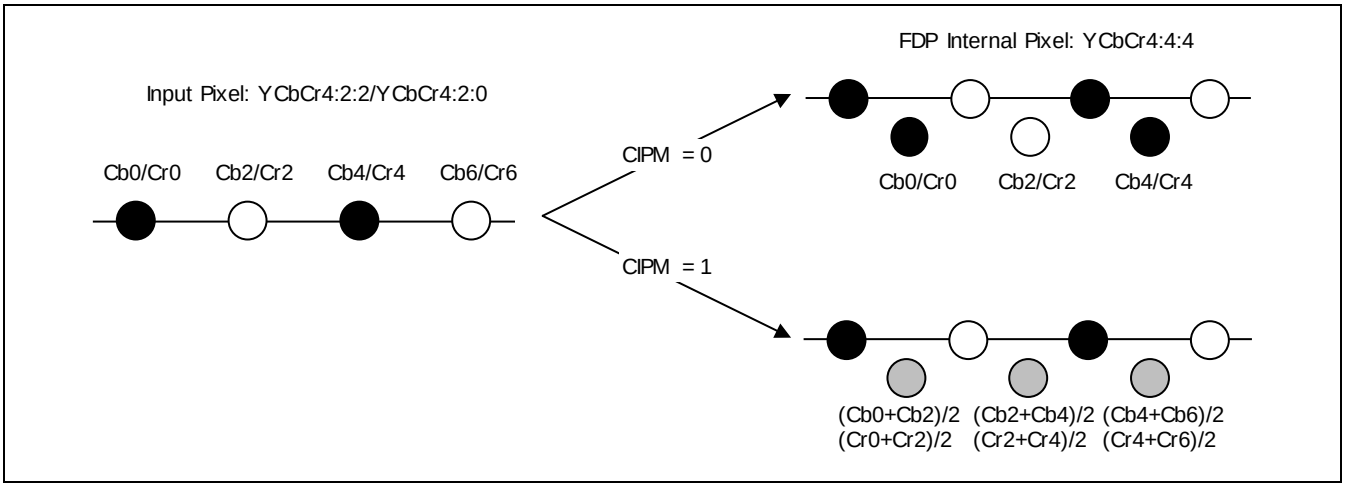

Figure 34.8. Chrominance Interpolation Methods Selectable through CIPM Setting

Table 34.4 YCbCr Formats for RPF Input*4 and WPF Output

RDFMT [6:0], WRFMT[6:0]	Packed YCbCr input/output Format	Reference
H'00 to H'3F	Reserved	—
H'40	YCbCr4:4:4 semi-planar	Figure 34.9
H'41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21*1)	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 34.10
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	Reserved	
H'4A	YCbCr4:4:4 planar	Figure 34.11
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, I420)	
H'4D to H'7F	Reserved	—

Notes: 1. when the input format is NV61 or NV21, set the RSPUVS bit to 1.
2. when the input format is YUY2, set the RSPYCS bit to 1.
3. when the input format is YVYU, set the RSPUVS bit to 1 and RSPYCS bit to 1.
4. Chroma component (Cb, Cr or U, V) of RPF0, RPF2 is not read from bus in case of YCbCr planar, YCbCr semi-planar formats, and discarded after reading in package with luma component in case YCbCr interleaved formats because it is processed in fixed 2D de-interlacing.

In write format case shown in section 34.2.8.1, FD1_WPF_FORMAT.WSPYCS, WSPUVS are corresponds to RSPYCS and RSPUVS, respectively.

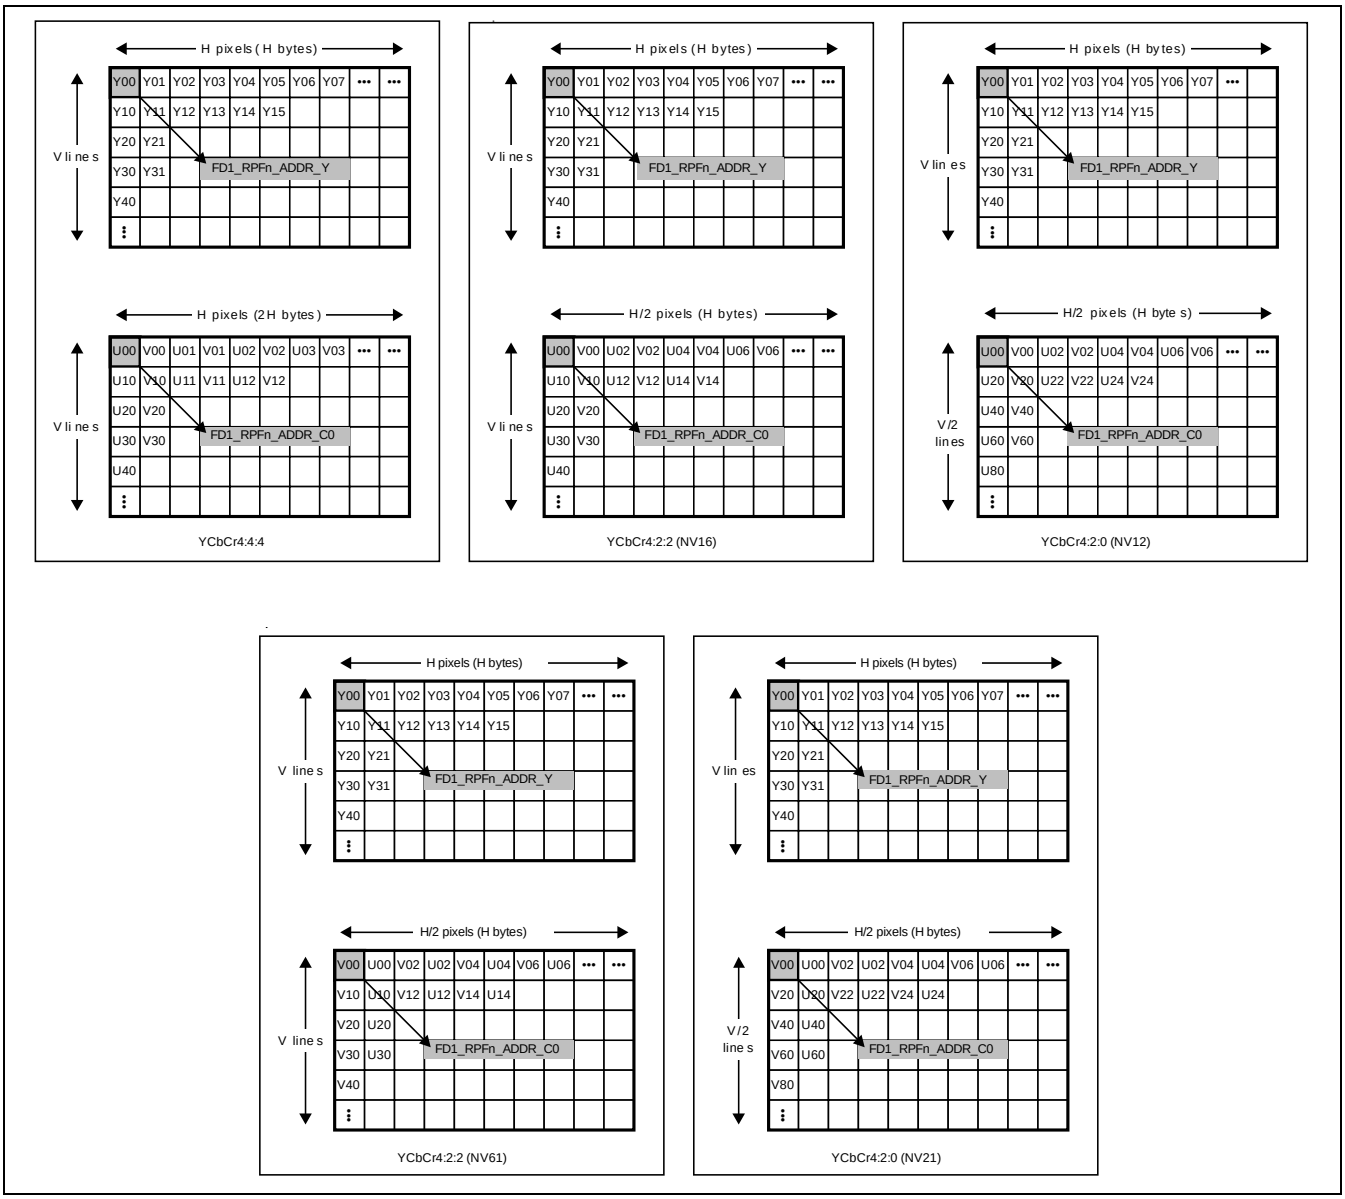

Figure 34.9. YCbCr Semi-Planar Formats

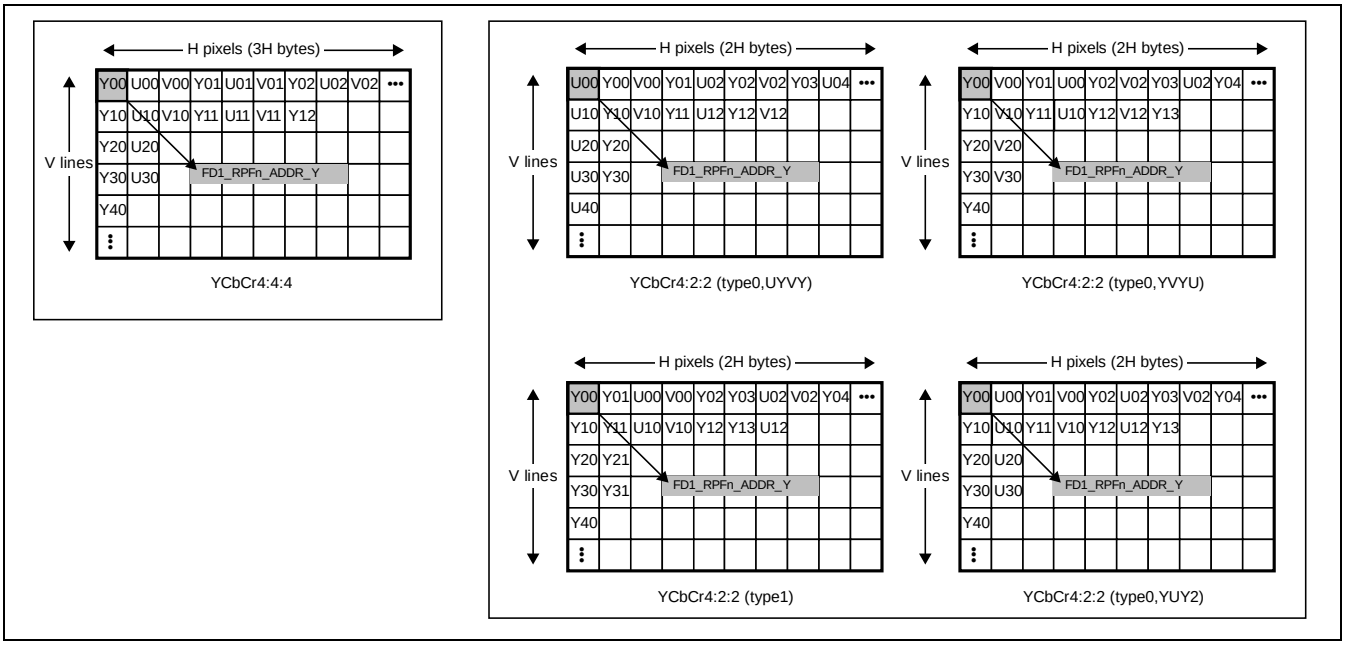

Figure 34.10. YCbCr Interleaved Formats

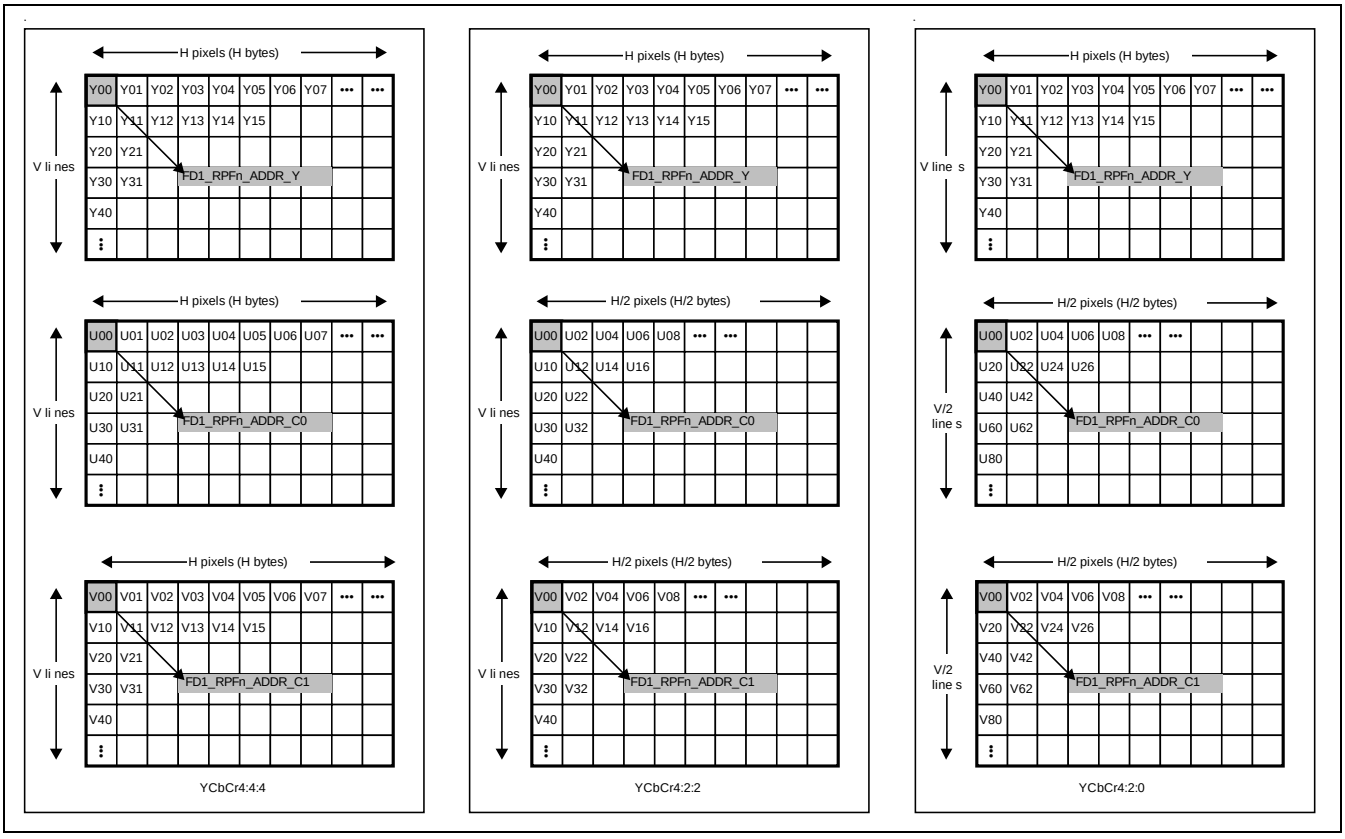

Figure 34.11. YCbCr Planar Formats

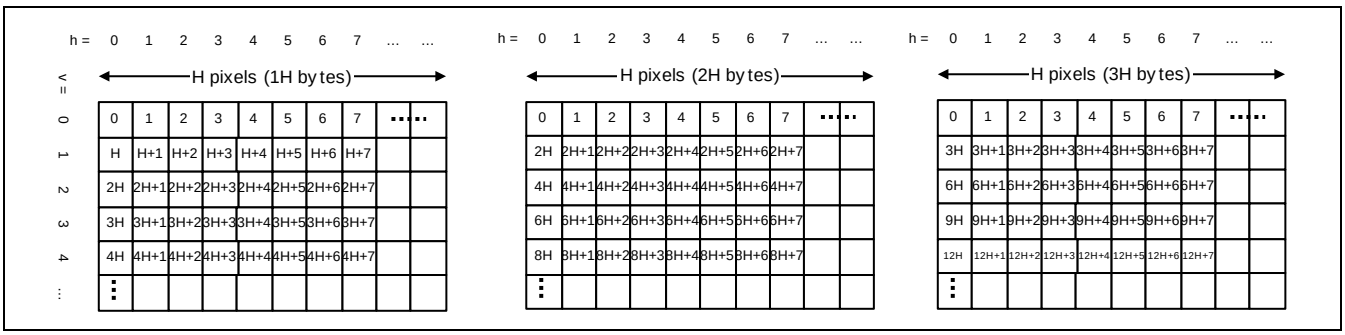

Figure 34.12. Memory address for the corresponding pixel's position

Legend of Figure 34.12, H is horizontal image size in pixel unit. 1H, 2H and 3H is corresponding to the case 1 pixel has 1byte, 2bytes, 3bytes of data respectively.

34.2.7.3 Source Picture Stride Register (FD1_RPF_PSTRIDE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRC_STRD_Y[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRC_STRD_C[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

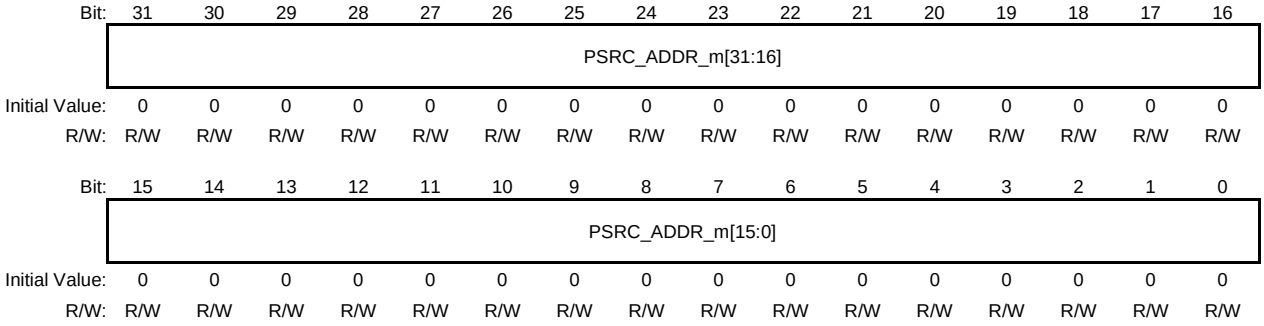
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SRC_STRD_Y [15:0]	All 0	R/W	Memory Stride of Source Picture Y Plane These bits specify in 1-byte units the memory stride of the source picture Y plane read by the RPFn (n = 0, 1, 2). A value from H'0020 to H'1FFE can be specified.
15 to 0	SRC_STRD_C [15:0]	All 0	R/W	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPF1. A value from H'0020 to H'1FFE can be specified. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

[Note]

As described above, stride value of source pictures (past, current, future) are common one. Therefore, frame structures of all input pictures should be the same format. For example, the case that past picture which is supplied to RPF0 is frame-structure, and other input pictures to RPF1 and 2 are field picture, is prohibited.

34.2.7.4 RPFn Source Component-m Address Register (FD1_RPFn_ADDR_m: {n,m} is one of {0,Y},{1,Y},{1,C0},{1,C1},{2,Y})

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PSRC_ADDR_m [31:0]	All 0	R/W	RPFn Source Field Address for Component-m ({n,m} is one of {0,Y},{1,Y},{1,C0},{1,C1},{2,Y}) These bits specify in 1-byte units the start address of the source component-m plane read by the RPFn. A value from H'0000_0000 to H'FFFF_FFFF can be specified. Set same value with LSB 4bit of RPFn source field address of component C0 to LSB 4bit of RPFn source field address of component C1, when input image format is Planar(FD1_RPF_FORMAT.RDFMT = 74,75,76).

34.2.7.5 Still Mask Address Register (FD1_RPF_SMSK_ADDR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SMSK_ADDR[31:16]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SMSK _ADDR[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SMSK_ADDR [31:0]	All 0	R/W	Still Mask Buffer Address. These bits specify the memory address which the still mask data is located. This bit field should take the value in the range of H'0000_0000 to H'FFFF_FFFF. Still mask is intermediate data for IP conversion only when adaptive 2D/3D (FD1_CTL_OPMODE.PRG = 0 and FD1_IPC_MODE.DIM [2:0] = 0). This data is active when one of the two bits FD1_CTL_CHACT.SMW and FD1_CTL_CHACT.SMR is set as 1. This data is generated and re-used by FDP. It should be kept on SDRAM. FDP1 needs two separated buffers of the same size for this data, one is common for all top fields and the other is common for all bottom fields. Therefore, the source address must be different between top and bottom field. When the register bit FD1_RPF_FORMAT.CF is 0 set the address of buffer of top filed to register. Otherwise set the address of buffer of bottom filed to register. The memory stride of each buffer is expressed as the following equation. 2 x {(FD1_RPF_SIZE.HSIZE + 7)/8} [byte] The memory space of each buffer is expressed as below. 2 x {(FD1_RPF_SIZE.HSIZE + 7)/8} x FD1_RPF_SIZE.VSIZE [byte] The Figure 34.13 shows the usage of still mask data buffers and the Table 34.5 shows how to set the register of still mask data buffer address.

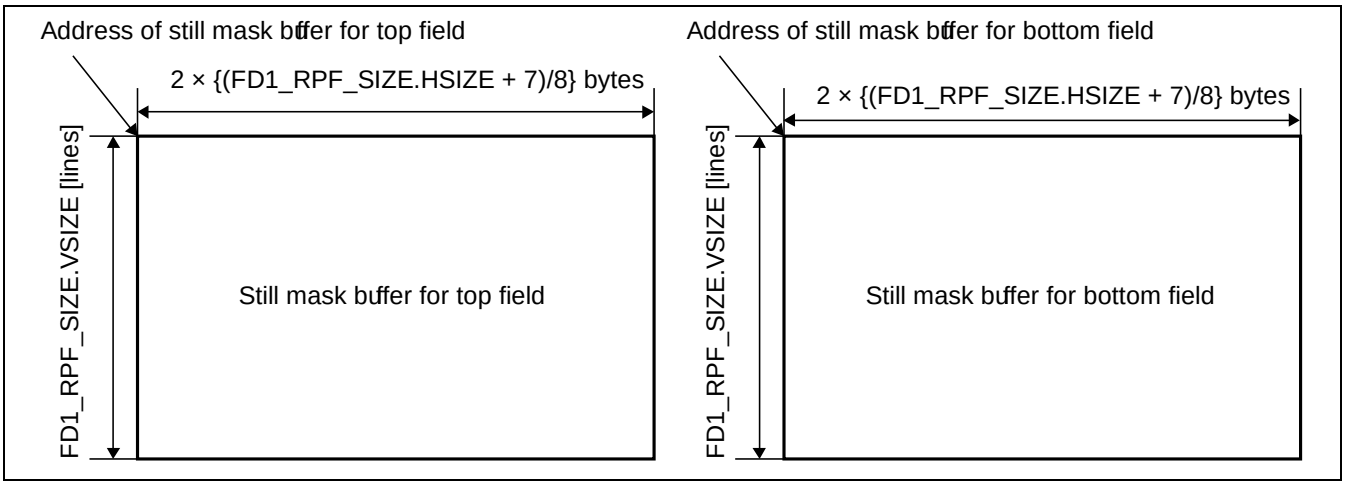


Figure 34.13 Usage of still mask buffers

Table 34.5 Setting of still mask buffer address register

Current Field Parity	FD1_RPF_FORMAT.CF	FD1_RPF_SMSK_ADDR.SMSK_ADDR
Top Field	0	Address of Still Mask buffer for Top Field
Bottom Field	1	Address of Still Mask buffer for Bottom Field

34.2.7.6 RPF Data Swap Register (FD1_RPF_SWAP)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
23 to 21, 19 to 16, 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
31 to 24	PDV[7:0]	All 0	R/W	PAD Value in Output Packed Data These bits specify the value to be stored in the bit field indicated as PAD or P in the output formats shown in Table 34.7. A value from 0 to 255 can be specified.
20	FCNL	B'0	R/W	Frame Compress Near Lossless in FCPF 0: Not compress 1: Compress Although this bit is register of FCPF, the setting timing is same with other bits of FD1_WPF_FORMAT.
15	WSPYCS	B'0	R/W	WPF Output Mode Setting 1 When the output format is YUY2, set this bit to 1 and set the WRFMT bits to 71 (H'47). When the output format is YVYU, set this bit and the WSPUVS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.
14	WSPUVS	B'0	R/W	WPF Output Mode Setting 2 When the output format is NV61, set this bit to 1 and set the WRFMT bits to 65 (H'41). When the output format is NV21, set this bit to 1 and set the WRFMT bits to 66 (H'42). When the output format is YVYU, set this bit and the WSPYCS bit to 1 and set the WRFMT bits to 71 (H'47). In other cases, set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
13 to 12	DITH[1:0]	B'00	R/W	Dithering Enable/Disable When the output format specified through the WRFMT bits is RGB with 18 bpp (262144 colors) or less, the color reduction processing is applied to match the number of colors. The color reduction processing may generate the artifacts of pseudo gradation, which can be suppressed through dithering. The DITH bits enable or disable dithering during color reduction. When the output format specified through the WRFMT bits is YCbCr, specify 0 in these bits. 0: Dithering is disabled 3: Dithering is enabled 1, 2: Setting prohibited
11 to 9	WRTM[2:0]	B'000	R/W	CSC Conversion Expression Setting These bits select the expression for color space conversion. The conversion direction is RGB to YCbCr when the format specified in the WRFMT bits is RGB, or YCbCr to RGB when the format is YCbCr. 0: BT.601 YCbCr [16,235/240] → RGB [0,255] 1: BT.601 YCbCr [0,255] → RGB [0,255] 2: BT.709 YCbCr [16,235/240] → RGB [0,255] 3: BT.709 YCbCr [16,235/240] → RGB [16,235] 4 to 7: Setting prohibited
8	CSC	B'0	R/W	Color Space Conversion Setting Enables or disables YCbCr ↔ RGB color space conversion to be executed in the WPF. The characteristics of color space conversion are determined by the WRTM setting. 0: Color space is not converted. 1: Color space is converted.
6 to 0	WRFMT [6:0]	All 0	R/W	WPF Output Image Format Setting These bits select the format of the image output from the WPF to the external memory from among those listed in Table 34.7 and Table 34.4. [Note 1] Number of output pixels When YCbCr4:2:2 is specified through WRFMT, the horizontal size of the output image should be a multiple of 2 pixels. When YCbCr4:2:0 is specified, the vertical and horizontal sizes of the output image should be multiples of 2 pixels. [Note 2] Output chroma horizontal down-sampling When the output format is YCbCr4:2:2 or YCbCr4:2:0 the chroma component is down-sampled horizontally from YCbCr4:4:4 (the format of image process result) by averaging the values of neighbor two pixels. In the interlace mode (FD1_CTL_OPMODE.PRG = 0) this down-sampling is processed after IP conversion. [Note 3] Output chroma vertical down-sampling When the output format is YCbCr4:2:0 the chroma component is down-sampled vertically from YCbCr4:4:4 (the format of image process result) by outputting only the even number line (line 0, 2, etc). In the interlace mode (FD1_CTL_OPMODE.PRG = 0) this down-sampling is processed after IP conversion.

Table 34.7 Packed RGB Formats for WPF Output

WRFMT [6:0]	Bit per pixel	Phase	upper row - address / bottom row - bit field																													
			n								n+1								n+2								n+3							
			7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0

34.2.8.2 Destination Picture Rounding Control Register (FD1_WPF_RNDCTL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	CBRM	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CLMD[1:0]		—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 14, 11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	CBRM	B’0	R/W	Bit Count Reduction Selection for Data Storage in Packed RGB This bit specifies the method for reducing the number of bits when data is stored in the bit fields indicated as R, G, and B in Table 34.7 and the target bit fields are not eight bits. 0: Bit count conversion: The lower-order bits are truncated 1: Bit count conversion: Rounding (rounding off)
13 to 12	CLMD[1:0]	B’00	R/W	Color Data Clipping These bits specify the method for clipping the YCbCr color data output from the WPF. When RGB color data is output from the WPF, specify 0 in these bits. b'00: Output value is not clipped (0-255) b'01: Output value is clipped: YCbCr mode 1 (16-235 (Y), 16-240 (Cb/Cr)) b'10: Output value is clipped: YCbCr mode 2 (Y/Cb/Cr = 1-254) b'11: Setting prohibited

34.2.8.3 Destination Picture Stride Register (FD1_WPF_PSTRIDE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DST_STRD_Y[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DST_STRD_C[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	DST_STRD_Y [15:0]	All 0	R/W	Memory Stride of Destination Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the destination picture in the external memory to be written to by the WPF. A value from H'0020 to H'1FFE can be specified.
15 to 0	DST_STRD_C [15:0]	All 0	R/W	Memory Stride of Destination Picture C Plane These bits specify in 1-byte units the memory stride for the C plane of the destination picture in the external memory to be written to by the WPF. When the WPF outputs images in an RGB format, this setting is not used. When the WPF outputs images in YCbCr planar format, this setting is applied to both the Cb and Cr planes. A value from H'0020 to H'1FFE can be specified.

34.2.8.4 Destination Component-m Address Register (FD1_WPF_ADDR_m: m = Y, C0, C1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DST_ADDR_m[31:16]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DST_ADDR_m[15:0]															
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DST_ADDR_m [31:0]	All 0	R/W	Destination Address for Component-m (m = Y, C0, C1) These bits specify in 1-byte units the address for storing the destination component-m plane to be written to the external memory by the WPF. A value from H'0000_0000 to H'FFFF_FFFF can be specified.

34.2.8.5 WPF Data Swap Register (FD1_WPF_SWAP)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SSWAP[3:0]				OSWAP[3:0]			
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	SSWAP [3:0]	All 0	R/W	Set the same value with FD1_RPF_SWAP.ISWAP.
3 to 0	OSWAP [3:0]	H'0	R/W	Output Swap Setting for Image Data This bit field specifies the data swapping function. Each bit corresponds to the following data swapping. Bit[3]: Long Long Word (64-bit) Swap Bit[2]: Long Word (32-bit) Swap Bit[1]: Word (16-bit) Swap Bit[0]: Byte (8-bit) Swap

When data order in memory for each format is defined as same as Table 34.7 for RGB format and Figure 34.9 to Figure 34.11 for YCbCr format set 4'b1111 to OSWAP[3:0]. If data order in memory is different from definitions of these table and figures, it can be adjusted to definitions of these table and figures in 16 bytes unit as shown in Table 34.6.

Note: Follow the section "34.4 FCP for FDP (FCPF)" about setting this swap register.

34.2.9 IPC Control Registers

Table 34.8 shows registers categorized in function of IPC.

Table 34.8 IPC registers categorized in function

Function	Registers
IP Conversion Control	FD1_IPC_MODE
3D de-interlace	FD1_IPC_COMB_DET
Adaptive 2D/3D de-interlacing	FD1_IPC_SMSK_THRESH
	FD1_IPC_MOTDEC
Diagonal line interpolation	FD1_IPC_DLI_BLEND
	FD1_IPC_DLI_HGAIN
	FD1_IPC_DLI_SPRS
	FD1_IPC_DLI_ANGLE
	FD1_IPC_DLI_ISOPIX0
	FD1_IPC_DLI_ISOPIX1
Film detection	FD1_SENSOR_m (m = 0, 1, …, 17)
	FD1_SENSOR_CTL0
	FD1_SENSOR_CTL1
	FD1_SENSOR_CTL2
	FD1_SENSOR_CTL3
	FD1_IPC_SENSOR_TH0
	FD1_IPC_SENSOR_TH1
Line memory pixel number	FD1_IPC_LMEM
IP Internal data	FD1_IP_INTDATA

For chroma component, IPC cannot process 3D de-interlace, adaptive 2D/3D de-interlacing, diagonal line interpolation and film detection but can process fixed 2D IP conversion.

34.2.9.1 IPC Mode Register (FD1_IPC_MODE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DLI	—	—	—	—	—	DIM[2:0]		
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9, 7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DLI	B’0	R/W	Set the value 1 to this bit.
2 to 0	DIM[2:0]	B’000	R/W	De-Interlacing Mode These bits specify the de-interlacing mode. B’000: Adaptive 2D/3D de-interlacing B’001: Fixed 2D de-interlacing B’010: Fixed 3D de-interlacing B’011: Select previous field for interpolated lines B’100: Select next field for interpolated lines B’101, B’110, B’111: setting prohibited The de-interlacing process of chroma component is fixed 2D de-interlacing regardless of these bits. In the case of first, second and last frame, DIM [2:0] should take other value than the upper guide. Refer to Table 34.2 for setting this register and FD1_CTL_OPMODE, FD1_CTL_CHACT according to each use case.

34.2.9.2 Still Mask Threshold Register (FD1_IPC_SMSK_THRESH)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FSM0
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SMSK_TH[7:0]

R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	FSM0	B'0	R/W	Set the value 1. Other setting value is used for purpose of h/w debugging. Do not set other value.
7 to 0	SMSK_TH [7:0]	All 0	R/W	Set the value 2 to this bit. Other setting value is used for purpose of h/w debugging. Do not set other value.

34.2.9.3 Comb Detection Parameter Register (FD1_IPC_COMB_DET)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMB_OFST[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMB_MAX[7:0]								CMB_GRAD[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	CMB_OFST [7:0]	All 0	R/W	Set the value H'20 to this bit as default.
15 to 8	CMB_MAX [7:0]	All 0	R/W	Set the value 0 to this bit as default.
7 to 0	CMB_GRAD [7:0]	All 0	R/W	Set the value H'40 to this bit as default.

When combing noise appears obviously it is recommended to set value H'20, H'ff, H'ff to register CMB_OFST, CMB_MAX, CMB_GRAD respectively.

34.2.9.4 Motion Decision Parameter Register (FD1_IPC_MOTDEC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

34.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

34.3.1 Procedure of FDP1 Start and Stop

34.3.1.1 Register usages for FDP1 Start and Stop

Registers FD1_CTL_CMD, FD1_CTL_SGCMD, and FD1_CTL_REGEND must be used correctly in the procedures of FDP1 start and stop as specified in Table 34.9 and Table 34.10.

Table 34.9 Register usages for starting FDP1

Register	Start the first frame (FR[0])	Start the second or later frame (FR[f], f = 1, 2, 3…)
FD1_CTL_SGCMD.SGEN	After all registers have been set completely, it must be set as 1 to generate V-Interruption.	It must be kept as 1 from the previous frame FR [f-1].
FD1_CTL_REGEND.REGEND	After all registers except FD1_CTL_SGCMD.SGEN have been set completely, it must be set 1. As the results, at the first V-interruption, all V-update registers are reflected for hardware reference, FD1_CTL_CMD.STRCMD is referred to start the first frame.	After V-interruption of starting the previous frame FR [f-1], it must be set 1 after all registers about FR[f] have been set completely. As the results, at the V-interruption of the end of frame FR [f-1], the V-update registers will be reflected to hardware reference, FD1_CTL_CMD.STRCMD is referred to start the frame FR[f].
FD1_CTL_CMD.STRCMD	It must be set 1 when all registers except FD1_CTL_SGCMD.SGEN, FD1_CTL_REGEND.REGEND are set. At the first V-Interruption it is referred by hardware to start the frame.	It must be set 1 when all registers except FD1_CTL_REGEND.REGEND are set at the next V-Interruption (boundary between FR [t-1] and FR[t]) it is referred by hardware to start the frame.

Table 34.10 Register usages for stopping FDP1

Register	Stopping immediately by Software reset	Stopping after current process finished
FD1_CTL_SGCMD.SGEN	It must be cleared before setting the value of FD1_CTL_SRESET.SRST as 1 so that no more V-Interruption after FDP1 stopped.	After V-interruption at the final frame end (FD1_CTL_IRQSTA.FRE is set as 1) occurred, it must be cleared so that no more V-Interruption is generated after FDP1 stopped
FD1_CTL_REGEND.REGEND	—	1) No Interrupt Mode After V-interruption of starting the final frame, it must be set 1 right after clearing FD1_CTL_CMD.STRCMD so that the final V-interruption occurs and operation status of the final frame is updated to V-update status registers for Software reference. 2) Other modes Right after V-interruption at starting the final frame, it must be set 1 right after clearing FD1_CTL_CMD.STRCMD so that operation status of the final frame is updated to V-update status registers for Software reference.
FD1_CTL_CMD.STRCMD	After FDP1 stopped successfully (FD1_CTL_IRQSTA.FRE is set as 1), it must be cleared to prevent wrong operation when restart FDP1.	After V-interruption of starting the final frame, it must be cleared to prevent wrong operation when restart FDP1.

34.3.1.2 Register setting order for FDP1 Start and Stop

(1) Interrupt Mode or Best Effort Mode

(1a) To start the first frame, set registers in following order.

1. Set 1 to FD1_CTL_CLKCTRL.CSTP_N
2. Set registers other than FD1_CTL_CMD, FD1_CTL_SGCMD, and FD1_CTL_REGEND.
3. Set FD1_CTL_CMD.STRCMD to the value 1. Set FD1_CTL_REGEND.REGEND to the value 1.
4. Set FD1_CTL_SGCMD.SGEN to the value 1, then FDP1 starts its process. FD1_CTL_SGCMD.SGEN must be not cleared if continue to the second or later frames.

(1b) To start the second or later frame, set registers in following order.

1. After V-interruption of the previous frame start timing occurred, set registers other than FD1_CTL_CMD and FD1_CTL_REGEND.
2. Set FD1_CTL_CMD.STRCMD to the value 1.
3. Set FD1_CTL_REGEND.REGEND to the value 1.
4. At the V-interruption of the previous frame end timing, FDP1 starts the target frame. The V-interruption of the previous frame end timing and the one of the target frame start timing are the same.

(1c) To stop FDP1 operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. If this register was completed before the V-Interruption of frame end timing, FDP1 stops its operation and current frame becomes the last frame of the image sequence. If these register setting could not be completed before the V-Interruption of frame end timing, FDP1 stops its operation in the next V-interruption. In the later case, V-update status registers are not updated at V-interruption of frame end but at the next V-interruption at which FD1_CTL_REGEND.REGEND is set as 1.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.

(1d) To stop FDP1 operation immediately, set registers as the following.

1. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.
2. Set FD1_CTL_SRESET.SRST to the value 1. FDP1 will invoke termination process immediately.
3. Wait frame end interrupt from FDP1 or until the register bit FD1_CTL_IRQSTA.FRE is set to 1. After it occurs, FDP1 have finished its processing. With this operation, FDP1 can stop its process quickly, but the output frame of the last frame is corrupted.

(2) No interrupt mode

(2a) To start the first frame, set registers in following order.

Same as (1a).

(2b) To start the second or later frame, set registers in following order.

Same as (1b).

(2c) To stop FDP1 operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. At the V-Interruption of frame end timing, FDP1 stops its operation and current frame becomes the last frame of the image sequence.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP1 will stop generating V-interruption.

(2d) To stop FDP1 operation immediately, set registers as the following.

Same as (1d).

34.3.2 Look Up Table (LUT) Setting

FDP1 has the Look-Up-Tables (LUT) shown in Table 34.11 to change the characteristic of the de-interlacing function. The LUT is an 8-bit entry and 8-bit output table. Note that users can access to LUT only by 32 bit access. Do not access other bit length such as 8bit access or 16bit access. LUT behaves like immediate registers described in section 34.2.2, so do not change the value in LUT while FDP1 is under processing.

Table 34.11 List of LUT

LUT Name
DIF_ADJ
SAD_ADJ
BLD_GAIN
DIF_GAIN
MDET

The LUT is used for making the non-linear characteristic shown in Figure 34.14 where X and Y are input and output of LUT respectively.

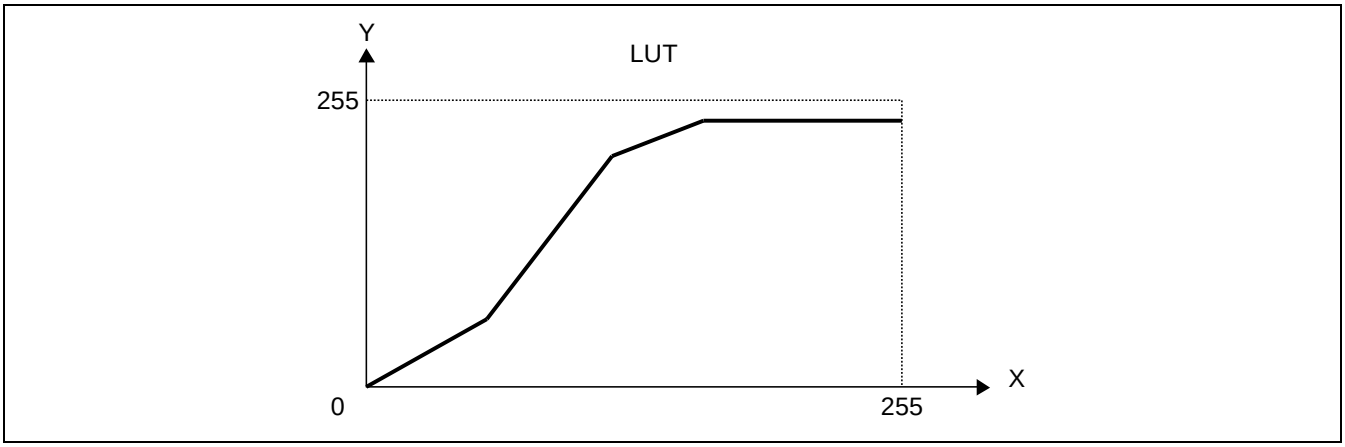

Figure 34.14 LUT for changing the de-interlacing characteristic

There are 3 types of setting values for those LUTs, “The setting 1 of each LUT”, “The setting 2 of each LUT” and “The setting 3 of each LUT”, respectively specified in Table 34.12, Table 34.13 and Table 34.14. “The setting 1 of each LUT” which keeps the balance ratio of 2D and 3D interpolated images on the output image, is recommended as default setting. When it is needed to strengthen the 3D interpolated images even if there is motion in the input image sequence, use “The setting 2 of each LUT” or “The setting 3 of each LUT” with which the ratio of 3D interpolated image increases as shown in the Figure 34.15.

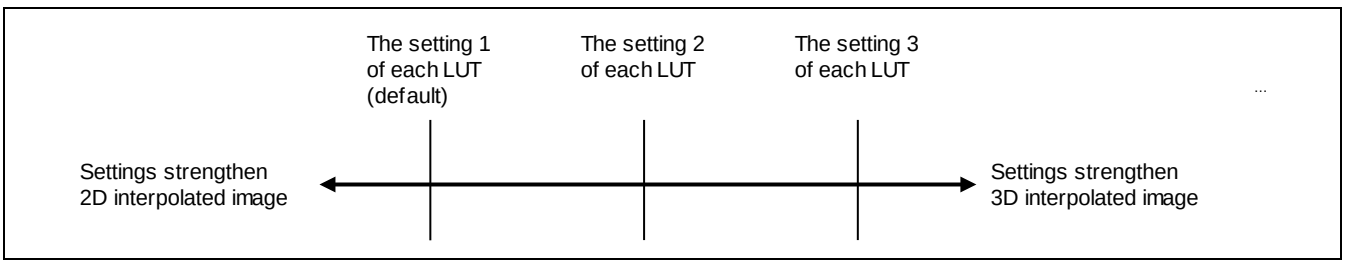

Figure 34.15 The target of each type of LUT settings

Table 34.12 The setting 1 of each LUT

34.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

34.4.1 Assignment in Memory Space

Make sure that FDP1 memory space shall be mapped to Non-Cache region.

34.4.2 FCPF connection

Bus access of FDP is carried out through FCPF (Frame Compression IP for FDP) module in RZ/G Gen2. So refer to also the section “35.4 FCP for FDP (FCPF)” in this manual.

There are some notices in FCPF connection system below.

1) FDP1 must be started, stopped in companion with FCPF as guided in section “Operation” of the section “35.4 FCP for FDP (FCPF)”.
2) There are some restrictions about register setting in FCPF connection system. Refer to the section “35.4 FCP for FDP (FCPF)” about restrictions of register setting.

34.4.3 Manipulate FDP with module stop, software reset of CPG

Please refer to Usage Notes of the section “35.4 FCP for FDP (FCPF)” about manipulating FCPF+FDP with CPG module stop, software reset.

34.4.4 Terminology

(1) Definition of operators and functions

The following operators, notations are defined for explaining the functions of FDP1.

clip0 (*x*)

Clip to 0 value if x is less than 0. [x = (x < 0)? 0: x]

clip3 (min, max, x)

The value x shall be clipped so that x shall be min < x < max. [x = (x < min)? min: ((x > max)? max:)]

(2) Unit

The unit is defined here for explaining FDP1’s functions.

[bpp]: Bits per pixel

FDP1 can handle a number of image formats. Each image format has different number of data bits. The unit [bpp] shows number of data bits for one pixel. For example, RGB 8bpp means that its format is RGB and the pixel consists of 8 data bits.

35. Frame Compression Processor (FCP)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

35.1 Overview

The FCP is a companion module of a video processing module in RZ/G 2nd generation. It provides data compression and decompression, data caching, and converting of AXI transaction in order to reduce the memory bandwidth.

There are three types of FCP. The configuration and behavior of each FCP highly depend on the module to be paired. The detail information is described in sub section as follows:

- 35.2 FCP for Codec (FCPC)
- 35.3 FCP for VSP (FCPV)
- 35.4 FCP for FDP (FCPF)

35.2 FCP for Codec (FCPC)

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

The FCPC is a frame compression module which reduces the bandwidth with Renesas lossless data compression and decompression (FCL) for the Renesas video codec processor (VCP4). And it also has the reference picture cache for the VCP4. Require software or the library to RENESAS for operating this module.

The FCPC is connected to following codec IP cores which make up the VCP4.

1. VDPB: H.265/HEVC decoder
2. VCPLF: Multi-codec decoder and encoder

There are two configurations of the FCPC. One is FCPCS and other is FCPCI.

Table 35.1 Configuration Type of the FCPC

Type	Description
FCPCS	RZ/G2H RZ/G2M V3.0 RZ/G2N RZ/G2E Shared among VDPB, VCPLF, and iVDP1C. RZ/G2M V1.3 Shared between VDPB and VCPLF.
FCPCI	RZ/G2M V1.3 Dedicated for iVDP1C or VCPLF.

Table 35.2 Number of AXI master ports

Type	Number of AXI master ports
FCPCS	RZ/G2H RZ/G2M V3.0 2 (Each AXI master port is referred to as ch0 or ch1 in this User's Manual.) RZ/G2M V1.3 RZ/G2N RZ/G2E 1
FCPCI	RZ/G2M V1.3 1

For detail connection of the FCPCS, FCPCI and iVDP1C, refer to Section 31.

For detail connection of the FCPCS, FCPCI and VCP4, refer to Section 32.

35.2.1 Features

The FCPC has the following features.

- Support for Lossless compression for decoded picture and decompression for reference picture
- Support 3840 x 2160 resolution
- Support for reference picture cache
- Lossless compression ratio is typically 50%. It may not be compressed since Lossless compression relies on the statistical nature of the original image.

Table 35.3 Main Function of the FCPC

Item	Description
Data compression and decompression	Renesas lossless (FCL) compression and decompression, Compression for decoded picture, and decompression for reference picture YCbCr 4:2:0 semi-planar and 8-bit depth are supported
Reference picture cache	FCPCS: 64 Kbyte FCPCI: 32 Kbyte
AXI transaction	Read access: Out-of-order completion allowed. Outstanding transactions supported. Write access: Out-of-order completion allowed. Outstanding transactions supported.

35.2.2 Connected Module

Table 35.4 shows modules connected to the FCPC.

Table 35.4 Connected Module

Module	Connected Module	Description
FCPCS	VDPB	**RZ/G2H** **RZ/G2M V1.3** **RZ/G2M V3.0** **RZ/G2N** **RZ/G2E** H.265 decoder
	VCPLF	Multi-codec decoder and encoder
	iVDP1C	**RZ/G2H** **RZ/G2M V3.0** **RZ/G2N** **RZ/G2E** Low delay decoder
FCPCI	iVDP1C	Low delay decoder
	VCPLF	**RZ/G2M V1.3** Multi-codec decoder and encoder

35.2.3 Usage Notes

35.2.3.1 Limitations on Software Reset, Module Standby and power-shutoff

Before executing following operations for FCPC, confirm that connected modules (VDPB, VCPLF or iVDP1C) are not encoding or decoding a picture. If connected modules are encoding or decoding a picture, wait completion of encoding or decoding.

- Execute Software Reset by CPG
- Enter Module Standby (stop clock supply) by CPG
- Enter power-shutoff status (stop power supply) by SYSC

35.3 FCP for VSP (FCPV)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

The FCPV is a frame compression module which reduces the bandwidth with Renesas near-lossless data compression (FCNL) and conducts the bus accesses with 256bit AXI bus for the Renesas video signal processor (VSP). This module is under control of software for the VSP with the control function of the FCPV executed on the host CPU.

There are three configurations of the FCPV. Those are FCPVI, FCPVB, and FCPVD.

Table 35.5 Configuration Type of the FCPV

Type	Description	Products
FCPVI	For VSPI	RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E
FCPVB	RZ/G2H: For VSPBC and VSPBD RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E: For VSPB	RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E
FCPVD	RZ/G2H, RZ/G2N: For VSPD and VSPDL RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E: For VSPD	RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E

35.3.1 Features

The FCPVI, FCPVB has the following features.

- Support FCNL compression with 50% bandwidth reduction
  - Note: FCNL decompression is executed by DBSC4, DDR3L/4 memory controller.
- Support out-of-order for the whole outstanding transactions

The FCPVD of has the following features.

- Support out-of-order for the whole outstanding transactions

Table 35.6 Main Function of the FCPV

Item	Description
Data compression	FCNL compression for formats ARGB8888, YCbCr Planar 444/422/420, YCbCr Interleave 422 YUY2
Picture size supported	Minimum: 1pixels x 1lines Maximum: 8190pixels x 8190 lines The picture sizes must follow the restriction specified in the section “33. Video Signal Processor (VSP2)” (sections “Usage Notes”, “Input Image Size” and “Output Image Size”).
Color format supported	FCNL compression: ARGB8888, YCbCr Planar 444/422/420, YCbCr Interleave 422 YUY2 Others: support all formats specified in the section “33. Video Signal Processor (VSP2)” (sections “Register Descriptions”, “RPFn Input Format Registers (VI6_RPFn_INFMT)” and “WPFn Output Format Registers (VI6_WPFn_OUTFMT)”).
AXI transactions	Read access: Access at 256 bytes boundary Support out-of-order for the whole outstanding transactions Support data interleaving Write access: Access at 256 bytes boundary Support out-of-order for the whole outstanding transactions

35.3.2 Block Diagram

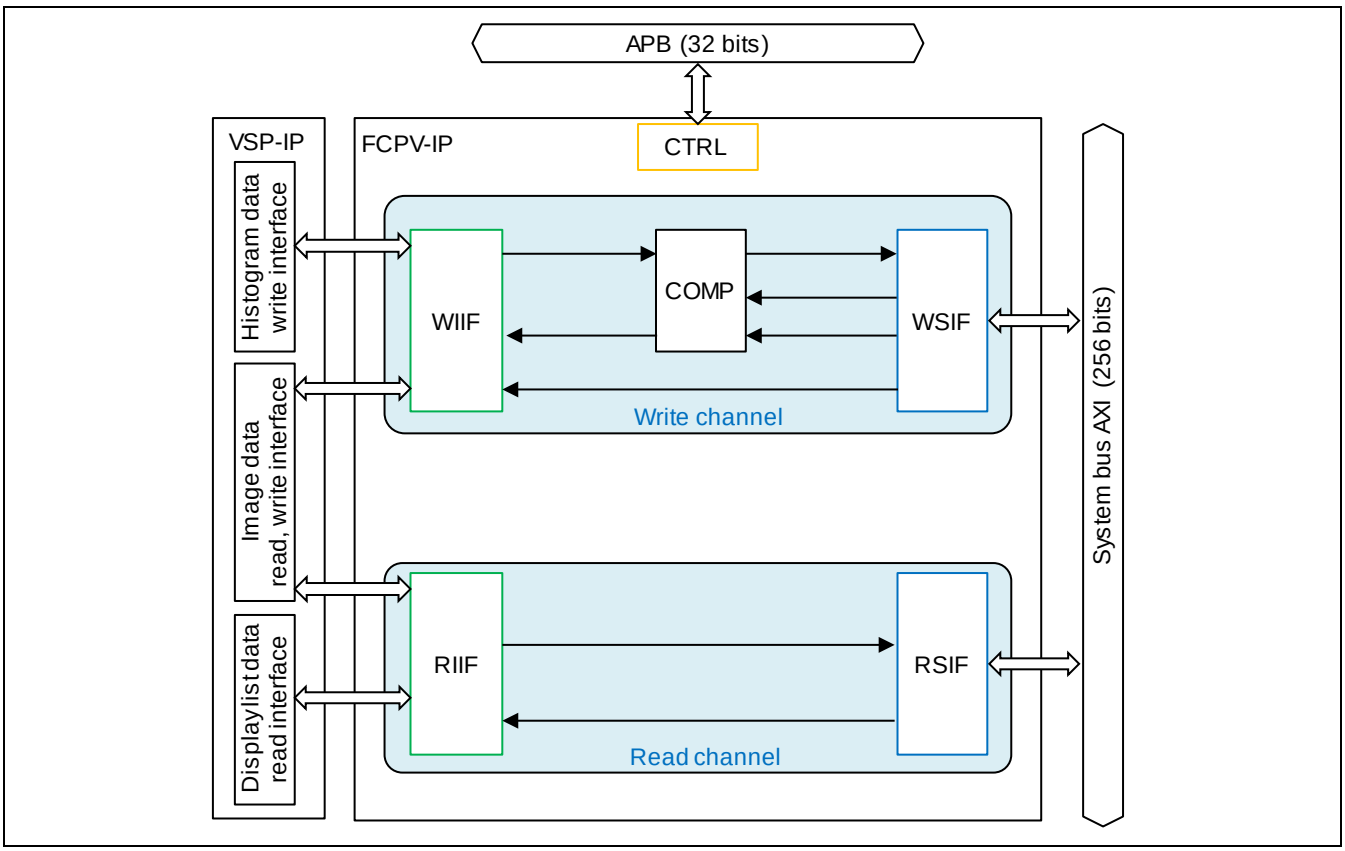

Figure 35.1 Overall Configuration of the FCPV

Table 35.7 Sub-module Description

Abbr.	Description	Abbr.	Description
COMP	Compression module	CTRL	FCPV controller
WIIF	VSP write channel interface	RIIF	VSP read channel interface
WSIF	System AXI write channel interface	RSIF	System AXI read channel interface

35.3.3 IP Set and Bus Access Functions

FCPV does not work alone but in companion with other IPs (VSP {I/B/D}) in an IP set. For each IP set the bus access function conducted by FCPV is different.

Table 35.8 Bus access function for each IP set

IP set	Bus access
VSPB + FCPVB VSPD + FCPVD VSPI + FCPVI	Following functions are conducted by FCPV • Read linear addressing image data • Read display list data • Write image data • Write histogram data *

Note: * This function is active when FCPV is connected to VSPI of RZ/G2H, RZ/G2N, RZ/G2E; VSPBC of RZ/G2H and VSPB of RZ/G2N, RZ/G2E.

35.3.4 Register Configuration

The FCPV contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in 32bits register.

The grayed portions represent reserved areas for debugging or future functional expansion. Do not access the reserved areas. Never access the registers when the FCPV is in the module standby mode (with the operation clock placed in hold status).

The following are the base addresses of the FCPV channels in case of RZ/G2H.

- FCPVI0: H'FE9A_F000
- FCPVI1: H' FE9B_F000
- FCPVB0 (for VSPBD): H' FE96_F000
- FCPVB1 (for VSPBC): H' FE92_F000
- FCPVD0: H'FEA2_7000
- FCPVD1: H'FEA2_F000

The following are the base addresses of the FCPV channels in case of RZ/G2M V1.3, RZ/G2M V3.0.

- FCPVI0: H'FE9A_F000
- FCPVB0: H' FE96_F000
- FCPVD0: H'FEA2_7000
- FCPVD1: H'FEA2_F000
- FCPVD2: H'FEA3_7000

The following are the base addresses of the FCPV channels in case of RZ/G2N, RZ/G2E.

- FCPVI0: H'FE9A_F000
- FCPVB0: H' FE96_F000
- FCPVD0: H'FEA2_7000
- FCPVD1: H'FEA2_F000

Table 35.9 List of FCPV Register

Name of Register	Abbreviation	R/W	Offset from Base Address	Initial Value	Access size	Second Generation RZ/G Series Products: RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
FCP version control register	FCP_VCR	R	H'0000	VCR_INIT *	32	√	√	√	√

35.3.6.2 FCP_CFG0: FCPV Configuration Register 0

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_CFG0 specifies the configuration of the FCPV.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCPV SEL	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	FCPVSEL	B'0	R/W	FCPV Mode Select This bit specifies the FCPV processing mode. 0: FCPVB, FCPVD 1: FCPVI This bit must not be changed during operation of the FCPV.
0	—	B'0	R	Reserved These bits are always read as 0. The write value should always be 0.

35.3.6.3 FCP_RST: FCP Reset Register

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_RST controls the FCPV reset operation. The reset operation of the FCPV highly depends on the reset sequence of the connected VSP. For detailed information, refer to the section 35.3.7.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MODRST	—	—	—	SOFTRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MODRST	B’0	R/W	FCPV MODule ReSeT This reset stops the FCPV module immediately regardless of the bus transaction state. To operate the FCPV after this reset, reconfigure all FCPV registers. After the active period of MODRST is finished, it is switched back to 0 automatically. 0: NOP 1: Forcibly terminate the FCPV operation. Note: Do not set both MODRST and SOFTRST bit to 1.
3 to 1	—	B’000	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SOFTRST	B’0	R/W	FCPV SOFT ReSeT This reset stops the FCPV module after finishing active bus transaction. To operate the FCPV after this reset, reconfigure all FCPV registers. After the active period of SOFTRST is finished, it is switched back to 0 automatically. 0: NOP 1: Terminates the FCPV operation. Note: Do not set both MODRST and SOFTRST bit to 1.

35.3.6.4 FCP_STA: FCP Status Register

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_STA indicates the FCPV status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ACT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0 or 1. Do not care about this value. The write value should always be 0.
0	ACT	B'0	R	FCPV Active Flag 0: Indicates the FCPV is not active. 1: Indicates the FCPV is active.

35.3.7 Operation

FCPV is not invoked directly by register setting. It works if there are bus accesses from the connected IP VSP. This section explains how to control operation for FCPV connected with VSP.

35.3.7.1 Operation Control Setting IP set VSPI+FCPVI

(a) FCPVI initialization

FCPVI must be initialized with following settings. This initialization must be conducted before starting image process. After initialization, those settings are kept no change until power-off or hardware reset, therefore, they don't need to be set for every image process.

- Set 1 to FCP_CFG0.FCPVSEL to enable configuration of FCPVI.

(b) To start image process of VSPI + FCPVI

FCPVI registers do not need to be set when starting an image process. Therefore, refer to section "33. Video Signal Processor (VSP2)" for the guidance of starting an image process.

The register setting of VSPI should follow restrictions in section 35.3.7.5.

Set value 1 to VI6_WPF0_OUTFMT.FCNL if writing FCNL data.

(c) To stop image process of VSPI+FCPVI immediately

Do following steps to stop immediately an image process of VSPI + FCPVI

1. Set value 1 to VSPI register VI6_WPF0_IRQ_ENB.FREE so that frame end interruption can be issued.
2. Set value 1 to VSPI register VI6_SRESET.SRST0. VSPI will invoke termination process immediately.
3. Wait frame end interruption from VSPI or until the register bit VI6_WPF0_IRQ_STA.FRE is set to 1. After it occurs, VSPI has finished its processing.
4. Set value 1 to FCPVI register FCP_RST.SOFTRST. FCPVI will invoke termination process immediately.
5. Wait until ACT bit of the FCP_STA register and become 0. After it occurs, FCPVI has finished its processing.

With this procedure, VSPI can stop its process quickly, but the output frame of the last frame is corrupted.

35.3.7.2 Operation Control Setting for IP set VSPB+FCPVB

(a) FCPVB initialization

FCPVB must be initialized with following settings. This initialization must be conducted before starting image process. After initialization, those settings are kept no change until power-off or hardware reset, therefore, they don't need to be set for every image process.

- Set 0 to FCP_CFG0.FCPVSEL to enable configuration of FCPVB.

(b) To start image process of VSPB+FCPVB

FCPVB registers do not need to be set when starting an image process. Therefore, refer to the section "33. Video Signal Processor (VSP2)" for the guidance of starting an image process.

The register setting of VSPB should follow restrictions in section 35.3.7.5.

Set value 1 to VI6_WPF0_OUTFMT.FCNL if writing FCNL data.

(c) To stop image process of VSPB+FCPVB immediately

Do following steps to stop immediately an image process

1. Set value 1 to VSPB register VI6_WPF0_IRQ_ENB.FREE so that frame end interruption can be issued.
2. Set value 1 to VSPB register VI6_SRESET.SRST0. VSPB will invoke termination process immediately.
3. Wait frame end interruption from VSPB or until the register bit VI6_WPF0_IRQ_STA.FRE is set to 1. After it occurs, VSPB has finished its processing.
4. Set value 1 to FCPVB register FCP_RST.SOFTRST. FCPVB will invoke termination process immediately.
5. Wait until ACT bit of the FCP_STA register become 0. After it occurs, FCPVB has finished its processing.

With this procedure, VSP can stop its process quickly, but the output frame of the last frame is corrupted.

35.3.7.3 Operation Control Setting for IP set VSPD+FCPVD, VSPDL+FCPVD

(a) FCPVD initialization

FCPVD must be initialized with following settings. This initialization must be conducted before starting image process. After initialization, those settings are kept no change until power-off or hardware reset, therefore, they don't need to be set for every image process.

- Set 0 to FCP_CFG0.FCPVSEL to enable configuration of FCPVD.

(b) To start image process of VSPD+FCPVD, VSPDL+FCPVD

FCPVD registers do not need to be set when starting an image process. Therefore, refer to the section "33. Video Signal Processor (VSP2)" for the guidance of starting an image process.

The register setting of VSPD should follow restrictions in section 35.3.7.5.

(c) To stop image process of VSPD+FCPVD, VSPDL+FCPVD immediately

Do following steps to stop immediately an image process

1. Stop the DU first if it is connected with VSPD (VI6_LIF{0/1}_CTRL.LIF_EN = 1). Refer to the section "36. Display Unit (DU)" for the way of stopping the DU. Not do this step if DU is not connected with VSPD (VI6_LIF{0/1}_CTRL.LIF_EN = 0).
2. Set value 1 to VSPD register VI6_WPF {0/1} _IRQ_ENB.FREE so that frame end interruption can be issued.
3. Set value 1 to VSPD register VI6_SRESET.SRST {0/1}. VSPD will invoke termination process immediately.
4. Wait frame end interruption from VSPD or until the register bit VI6_WPF {0/1} _IRQ_STA.FRE is set to 1. After it occurs, VSPD has finished its processing.
5. Set value 1 to FCPVD register FCP_RST.SOFTRST. FCPVD will invoke termination process immediately. *
6. Wait until ACT bit of the FCP_STA register become 0. After it occurs, FCPVD has finished its processing. *

Note: * In case of VSPDL+FCPVD, not apply step 5, step 6.

With this procedure, VSP can stop its process quickly, but the output frame of the last frame is corrupted.

35.3.7.4 Reset Operation

FCPV reset can be conducted by software reset and power on reset. The software reset which is controlled by software, is used to stop the FCPV operation. The software reset operation is not executed immediately; it is executed on completion of the bus transaction. The other is power on reset which initialize the whole FCPV logic immediately.

(1) Software Reset

1) Activate software reset sequence
   Set FCP_RST.SOFTRST to the value 1.
2) Confirm software reset sequence finished:
   FCP_STA.ACT becomes 0. All remain transactions with the bus system finished.

The procedure to stop operation of FCPV and connected IP is descripted at section 35.3.7.1, 35.3.7.2.

(2) Power-on Reset, Hardware reset

The power-on reset is controlled by an externally input signal called hardware reset. This reset initializes the whole internal logic of FCPV.

35.3.7.5 Register Settings and Restrictions on Connected VSP

The connected IP VSP {I/B} have to follow the setting and restrictions in following tables.

(1) Register settings on VSP{I/B}

Table 35.11 Register setting when writing FCNL data

Register	Register value	Use cases
VI6_WPF0_OUTFMT.FCNL	0	Write non FCNL data
	1	Write FCNL data

(2) Restrictions on VSP {I/B} in case of writing data via FCPV

In case of writing FCNL data (VI6_WPF0_OUTFMT.FCNL = 1), the write data swap register of VSP must be set as shown in Table 35.12.

Table 35.12 Setting restriction about data swap

Register	Register Value	Target IP
VI6_WPF0_DSWAP.{P_LLS, P_LWS, P_WDS, P_BTS}	H'8	VSP{I/B} *

Table 35.13 Setting restriction about output color formats

	Format setting (VI6_WPF0_OUTFMT)		Restrictions	
Register	**FCNL**	**ROT[2:0]**	**Register Value (explanation)**	**Target IP**
VI6_WPF0_ROT_CTRL.LN16	Don't care	4-7	1 (always output in 16 lines mode)	VSPI
VI6_WPF0_OUTFMT.WRFMT[6:0]	1	0,1	H'13 (ARGB8888)	VSP{I/B}(*2)
			H'47 (YCbCr 422 Interleave YUY2) (*1)	
			H'4A (YCbCr 444 Planar)	
			H'4B (YCbCr 422 Planar)	
			H'4C (YCbCr 420 Planar)	
		2-3	H'13 (ARGB8888)	VSPI
			H'47 (YCbCr 422 Interleave YUY2) (*1)	
			H'4A (YCbCr 444 Planar)	
			H'4B (YCbCr 422 Planar)	
			H'4C (YCbCr 420 Planar)	
		4-7	H'13 (ARGB8888)	VSPI

Notes: 1 For the format YCbCr422 Interleave YUY2, VI6_WPF0_OUTFMT.SPYCS must be set to 1 and VI6_WPF 0_OUTFMT.SPUVS must be set to 0.

Table 35.14 Setting restriction about destination stride and address for FCNL data, VSPB (*1)

Register	Restriction value
VI6_WPF0_STRIDE_Y.PICT_STRD_Y[15:0]	256n (*2)
VI6_WPF0_STRIDE_C. PICT_STRD_C[15:0]	256n
VI6_WPF0_DSTM_ADDR_Y.DSTM_ADDR_Y[31:0]	256n
VI6_WPF0_DSTM_ADDR_m.DSTM_ADDR_m[31:0] (m = C0, C1)	256n

Notes: 1. VI6_WPF0_OUTFMT.FCNL = 1
2. 256n means multiple of 256

Table 35.15 Setting restriction about destination stride and address for FCNL data, VSPI (*1)(*5)

	Format setting (VI6_WPF0_OUTFMT)		Restrictions	
Register	**ROT[2:0]**	**WRFMT[6:0]**	**Value for whole frame or first partition (*4)**	**Value for second or later partition**
VI6_WPF0_STRIDE_Y. PICT_STRD_Y[15:0]	—	—	256n (*3)	256n
VI6_WPF0_STRIDE_C. PICT_STRD_C[15:0]	—	—	256n	256n
VI6_WPF0_DSTM_ADDR_Y. DSTM_ADDR_Y[31:0]	0, 1, 2, 3	H'47(*2), H'13	256n	64n
		H'4A, H'4B, H'4C	256n	16n
	4, 5	H'13	256n + 192	64n
	6, 7	H'13	256n	64n
VI6_WPF0_DSTM_ADDR_m. DSTM_ADDR_m[31:0] (m = C0, C1)	0, 1, 2, 3	H'4A, H'4B, H'4C	256n	16n

Notes: 1. VI6_WPF0_OUTFMT.FCNL = 1
2. For the format YCbCr422 Interleave YUY2, VI6_WPF0_OUTFMT.SPYCS must be set to 1 and VI6_WPF 0_OUTFMT.SPUVS must be set to 0.
3. 256n/64n/16n means multiple of 256/64/16
4. first partition means the left edge partition in case VI6_WPF0_OUTFMT.ROT[2:0] != 4, 5 and right edge partition in case VI6_WPF0_OUTFMT.ROT[2:0] = 4, 5, as shown in Figure 35.2.

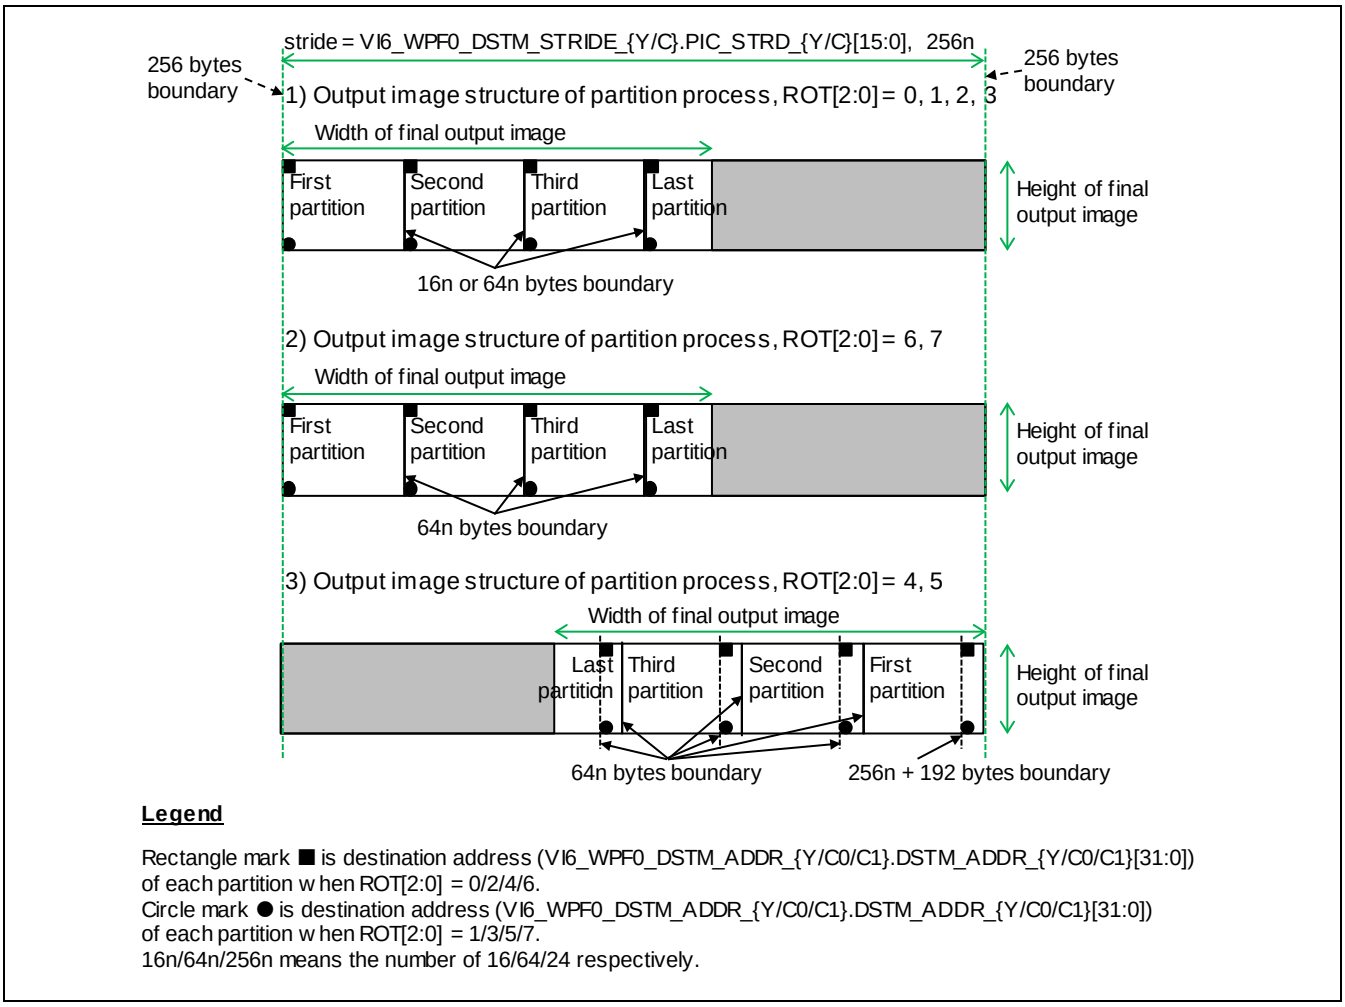

Figure 35.2 Restriction of write stride, address in case of partition process of VSPI

(3) Restrictions on VSP {I/B/D} in case of reading data via FCPV

In case of reading FCNL data, the read data swap register of VSP must be set as shown in Table 35.16. Note that this restriction is needed for only RZ/G2H, RZ/G2M V1.3, RZ/G2N, RZ/G2E which supports FCNL.

Table 35.2 Setting restriction on data swap in case of reading FCNL data

Register	Value	Target IP
VI6_RPFm_DSWAP.{P_LLS, P_LWS, P_WDS, P_BTS} (m = 0-4) in case of reading FCNL data.	H'F	VSP{I/B/D}

35.3.8 Memory Layout of FCNL Image Data

35.3.8.1 In Cases of VI6_WPF0_OUTFMT.ROT [2:0] = 0, 1, 2, 3, 6, 7

Figure 35.3 shows the memory layout of a FCNL image in cases of VI6_WPF0_OUTFMT.ROT [2:0] = 0, 1, 2, 3, 6, 7 for a final output image (distinct with output image of one partition in VSPI case). The output memory area of FCNL image data is specified as a rectangle linear address area with a destination address and a stride, as same as the raw data. However, the FCNL image data is stored in shadow address area of the rectangle linear address area. That is, in each 256 bytes area starting from 256 bytes boundary, FCNL data is stored on 128 bytes area of the lower side address.

The register setting of destination address and memory stride must follow the section “33. Video Signal Processor (VSP2)” and satisfy the restriction on section 35.3.7.5.

The buffer size for a FCNL image is equal to *stride * height*. Here, height is half of the picture height if the plane is Cb (U), Cr (V) for format YCbCr 420 planar and equal to the picture height for other cases. The buffer size doesn’t change regardless of the FCNL compression.

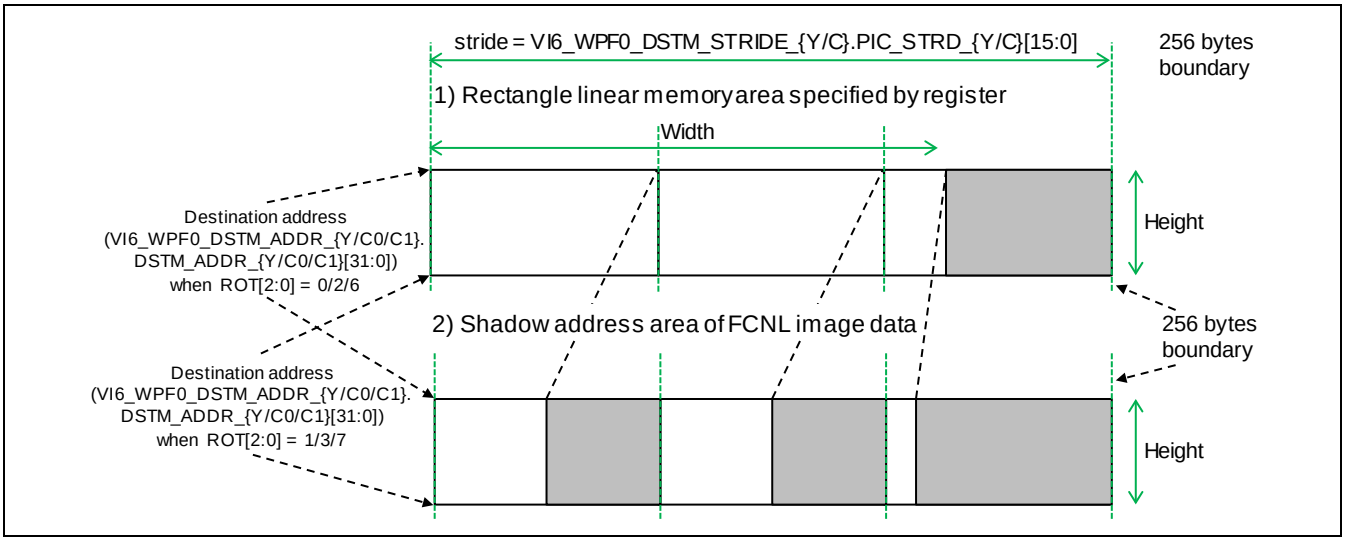

Figure 35.3 Memory layout of the FCNL image (ROT [2:0] = 0, 1, 2, 3, 6, 7)

When reading FCNL data, the source address, source stride, source image sizes must be specified basing on the rectangle linear address area. The source address must be inside the rectangle linear address area.

35.3.8.2 In Cases of VI6_WPF0_OUTFMT.ROT [2:0] = 4, 5

Figure 35.4 shows the memory layout of a FCNL image in cases of VI6_WPF0_OUTFMT.ROT [2:0] = 4, 5, for a final output image (distinct with output image of one of multiple partitions in VSPI case).

Same to the case 35.3.8.1, FCNL data is stored in the shadow address area of the rectangle linear address area specified by destination and stride registers.

As shown in the Figure 35.4, for the cases of VI6_WPF0_OUTFMT.ROT [2:0] = 4, 5, the write access is conducted from right to left of the memory area. Therefore, the destination address is specified at the right side of the rectangle linear address area.

The register setting of destination address and memory stride must follow the section “33. Video Signal Processor (VSP2)” and satisfy the restriction on 35.3.7.5.

The buffer size for a FCNL image is equal to *stride * height*. Here, height is half of the picture height if the plane is Cb (U), Cr (V) for format YCbCr 420 planar and equal to the picture height for other cases. The buffer size doesn’t change regardless of the FCNL compression.

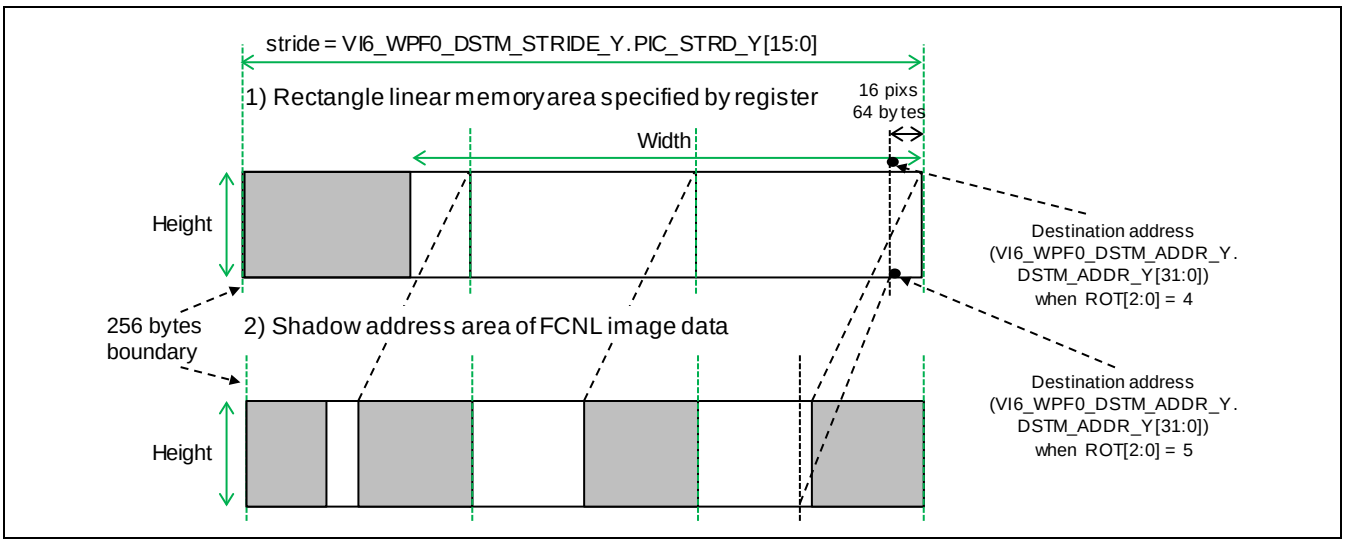

Figure 35.4 Memory layout of the FCNL image (ROT [2:0] = 4, 5)

When reading FCNL data, the source address, source stride, source image sizes must be specified basing on the rectangle linear address area. The source address must be inside the rectangle linear address area. The read access is conducted on left to right of the memory area.

35.3.9 Usage Notes

35.3.9.1 Manipulating FCPV+VSP with CPG module stop, software reset

The following notes 1) to 2) are to prevent FCPV, VSP from the unstable status which may cause hang or wrong operation.

Note 1) In the case of stopping FCPV{I/B/D} and VSP{I/B/D} using the corresponding register bit of module stop register (MSTPSR6), realtime module stop register (RMSTPCR6), system module stop register (SMSTPCR6) and software reset register (SRCR6) of the module CPG, do following steps. Note that it is needed to stop both FCPV{I/B/D} and VSP{I/B/D}.

Step1) Stop FCPV{I/B/D} + VSP{I/B/D} with the software reset sequence following to the guidance in the section 35.3.7. For VSPDL+FCPVD, it is needed to stop both two video paths corresponding to WPF0, WPF1 if both WPFs are operating.

Step2) Stop VSP{I/B/D}, FCPV{I/B/D} using the corresponding register bit of CPG register (MSTPSR6 or RMSTPCR6 or SMSTPCR6 or SRCR6). Either VSP or FCPV can be stopped first.

Note 2) In the case of re-starting FCPV{I/B/D} + VSP{I/B/D} after stopping those modules with CPG module stop, CPG software reset, be sure to run start process as defined in section “33. Video Signal Processor (VSP2)”.

35.4 FCP for FDP (FCPF)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

The FCPF is a frame compression module which reduces the bandwidth with Renesas near-lossless (FCNL) compression and lossless (FCL) decompression and conducts the bus accesses with 256 bits AXI bus for the Renesas fine display processor (FDP). This module is under control of software for the FDP with the control function of the FCPF executed on the host CPU.

35.4.1 Features

The FCPF has the following features.

- Support FCNL near-lossless compression with 50% bandwidth reduction
  - Note: FCNL decompression is executed by DBSC4, DDR3L/4 memory controller.
- Support for FCL lossless decompression for YCbCr420 semi-planar
- Support 8190 x 8190 resolution
- Support converting linear addressing access from FDP to tile addressing image
- Support out-of-order for the whole outstanding transactions

Table 35.17 Main Function of the FCPF

Item	Description
Data compression and decompression	Renesas lossless (FCL) decompression for YCbCr420 semi-planar Renesas near-lossless (FCNL) compression for formats ARGB8888, YCbCr 444/422/420 Planar, YCbCr 422 Interleave YUY2
Picture size supported	Tile addressing image: Min: 32 pixels x 16 lines Max: Horizontal 8190 pixels x vertical 8190 lines Others: support all picture sizes specified in the section “34. Fine Display Processor (FDP1)” (sections “Overview”, “Features”) under additional restrictions at 35.4.7.3.
Color format	Tile addressing image: YCbCr420 semi-planar FCNL compression: ARGB8888, YCbCr Planar 444/422/420, YCbCr Interleave 422 YUY2 Others: support all formats specified in the section “34. Fine Display Processor (FDP1)” (sections “Register Descriptions”, “Source Picture Format Register (FD1_RPF_FORMAT)” and “Destination Picture Format Register (FD1_WPF_FORMAT)”)
AXI transaction	Read access: Support out-of-order for all outstanding transactions Support data interleaving Tile/linear address conversion (format YCbCr420 semi-planar only) Write access: Support out-of-order for all outstanding transactions

35.4.2 Block Diagram

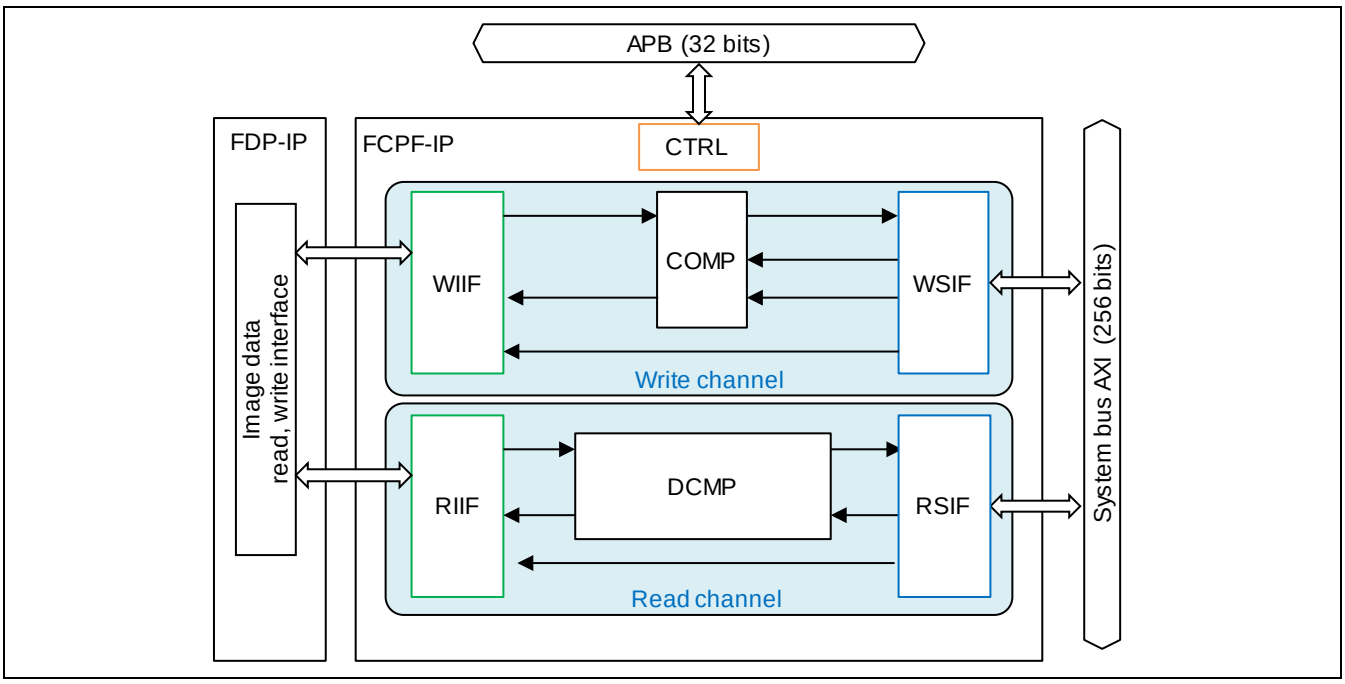

Figure 35.5 Overall Configuration of the FCPF

Table 35.18 Sub-module Description

Abbr.	Description	Abbr.	Description
COMP	Compression module	DCMP	Decompression module
WIIF	Connected IP write channel interface	RIIF	Connected IP read channel interface
WSIF	System AXI write channel interface	RSIF	System AXI read channel interface
CTRL	FCPF controller	—	—

35.4.3 IP set and bus access functions

FCPF works in companion with other IPs (FDP) in an IP set. As shown in Table 35.19 the bus access function conducted by FCPF is different according to each IP set.

Table 35.19 Bus access function for each IP set

IP set	Bus access
FDP + FCPF	Following functions are conducted by FCPF • Read linear addressing image data • Read tile addressing image data • Write image data

35.4.4 Register Configuration

The FCPF contains the registers which can directly be read and written to by the host CPU. The host can access any long word (32 bits) in the registers. Therefore, read-modify-write is needed to change partial bits in 32bits register.

There are 2 types of registers in FCPF: immediate register, V-update Register. The values of immediate registers are reflected to H/W behavior immediately after changing its values. Hence, do not change these immediate registers while FCPF is processing (FCP_STA.ACT is set to 1) unless this manual allows it explicitly. The values of V-update registers are reflected to H/W behavior at the next V-interruption of FDP. For FDP connection case users can set V-update registers of the next frame/field while FDP+FCPF is processing the current frame/field.

Refer to the sections 35.4.7.1 to grasp the flow of setting registers of FCPF and connected IP.

There are many settings such as byte swaps, formats, etc which are set in connected IP and transferred to FCPF. Those registers must be set following to the section 35.4.7.3 of this document.

The grayed portions represent reserved areas for debugging or future functional expansion. Do not access the reserved areas. Never access the registers when the FCPF is in the module standby mode (with the operation clock placed in hold status).

The following are the base addresses of the FCPF channels.

- FCPF0: H'FE95_0000
- FCPF1: H'FE95_1000 (RZ/G2H only)

Table 35.20 FCPF Registers

Imm: immediate register

Vupdt: V-update register

Note: * VCR_INIT: depend on product generation, refer to section 35.4.6.1 for detail

35.4.5 Connected Module

Table 35.21 shows modules related to the FCPF.

Table 35.3 Connected Module

Module	Related Module	Description
FCPF	FDP	I/P convertor

35.4.6 Register Descriptions

35.4.6.1 FCP_VCR: FCP Version Control Register

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_VCR is a version control register of the FCPF. The value read is fixed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	CATEGORY	H'01	R	FCP use case category. 1: RZ/G
7 to 0	REVISION	H'04 or H'02 or H'06 or H'08	R	Version of LSI product H'04: FCP revision is RZ/G2H H'02: FCP revision is RZ/G2M V1.3, RZ/G2M V3.0 H'06: FCP revision is RZ/G2N H'08: FCP revision is RZ/G2E

35.4.6.2 FCP_RST: FCP Reset Register

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_RST controls the FCPF reset operation. The reset operation of the FCPF highly depends on the reset sequence of FDP. For detailed information, refer to the section 35.4.7.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	RIIFRST	RSIFRST	DCMPRST	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOFTRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	RIIFRST	B'0	R/W	RIIF ReSeT 0: NOP 1: Initialize the module RIIF. After the active period of RIIFRST is finished, it is switched back to 0 automatically.
21	RSIFRST	B'0	R/W	RSIF ReSeT 0: NOP 1: Initialize the module RSIF. After the active period of RSIFRST is finished, it is switched back to 0 automatically.
20	DCMPRST	B'0	R/W	DCMP ReSeT 0: NOP 1: Initialize the module DCMP. After the active period of DCMPRST is finished, it is switched back to 0 automatically.
19 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SOFTRST	B'0	R/W	FCPF SOFT ReSeT This reset stops the FCPF module after finishing active bus transaction. To operate the FCPF after this reset, reconfigure all FCPF registers. After the active period of SOFTRST is finished, it is switched back to 0 automatically. 0: NOP 1: Terminates the FCPF operation.

35.4.6.3 FCP_STA: FCP Status Register

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_STA indicates the FCPF status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ACT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0 or 1. Do not care about this value. The write value should always be 0.
0	ACT	B'0	R	FCPF Active Flag 0: Indicates the FCPF is not active. 1: Indicates the FCPF is active.

35.4.6.4 FCP_TL_CTRL: FCP Tile/Linear Control Register

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_TL_CTRL specifies the control of Tile/Linear address conversion on FCPF. Refer to section 35.4.7.4(3) to grasp how to set registers when reading a tile addressing image.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TLEN	—	—	VPOS_C												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VPOS_Y												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	TLEN	B'0	R/W	Tile Linear Enable 0: Disable Tile/Linear address conversion 1: Enable Tile/Linear address conversion
30 to 29	—	B'00	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	VPOS_C	All 0	R/W	Vertical POSition of Chroma Vertical position of tile address chroma plane which FDP start to read. This register must be set value from 0 to H'FFE.
15 to 13	—	B'000	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	VPOS_Y	All 0	R/W	Vertical POSition of Y plane Vertical position of tile address luma plane which FDP start to read. This register must be set value from 0 to H'1FFD.

35.4.6.5 FCP_PICINFO1: FCP Picture Information 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_PICINFO1 specifies the picture information of the tile address image. Refer to section 35.4.7.4(3) to grasp how to set registers when reading a tile addressing image.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

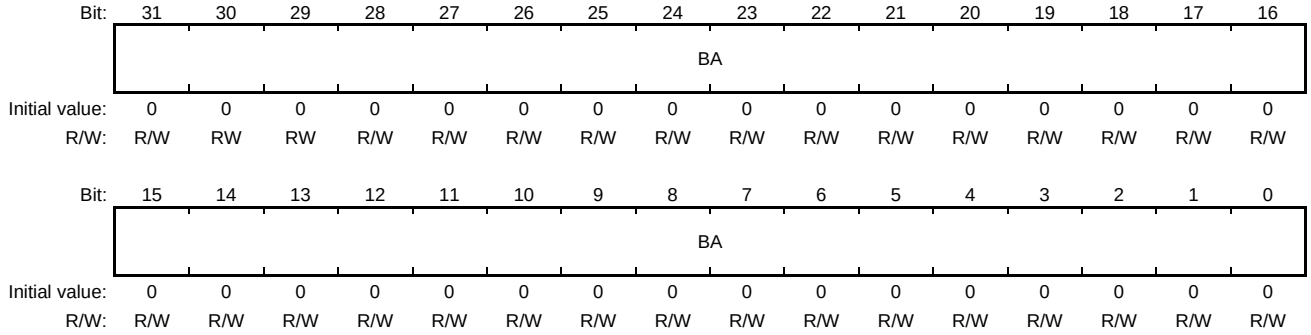
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	STRIDE_DIV16										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	STRIDE_DIV16	All 0	R/W	STRIDE DIVided by 16 Memory stride of the tile addressing image. Common for all luma and chroma planes Y0, Y1, Y2 and C. It must be specified so that STRIDE_DIV16*16 is exponent of 2 and larger than or equal to 128. STRIDE_DIV16*16 must be the same with memory stride of Y plane, C plane set by FDP registers. This bit must get value from H'8 to H'200.

35.4.6.6 FCP_BA_ANC_m {m: Y0, Y1, Y2, C}: FCP Base Address Ancillary information of plane m

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_BA_ANC_m specifies the base address of the ancillary information of the plane Y0, Y1, Y2, C. The ancillary information is explained at the section 35.4.7.4.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BA	All 0	R/W	Base Address of ancillary data The base address of the ancillary information of the plane Y0, Y1, Y2, and C. It must be specified in 128 bytes unit. In case of FDP connection Y0, Y1, Y2 are corresponding to the luma plane of previous, current, next field (frame in case of progressive input) respectively. C is corresponding to the chroma plane of the current field (frame). Be sure to set 0 to this register in one of following cases 1. Tile/Linear address conversion is off (FCP_TL_CTRL.TLEN = 0) 2. Tile/Linear address conversion is on (FCP_TL_CTRL.TLEN = 1) but the corresponding plane is unused. This bit must be set value from 0 to H'FFFF_FF80

35.4.6.7 FCP_BA_REF_m {m: Y0, Y1, Y2, C}: FCP Base Address Reference picture of plane m

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FCP_BA_REF_m specifies the base address of the reference picture of the plane Y0, Y1, Y2, C which is located in tile addressing. Those registers are different from the source address registers set in FDP. Refer to the section 35.4.7.4(2) to grasp the way of setting address registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BA															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	RW	RW	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BA															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BA	All 0	R/W	Base Address of reference picture The base address of the tile addressing image of the plane Y0, Y1, Y2, C. It must be specified in 16384 bytes unit. In case of FDP connection Y0, Y1, Y2 are corresponding to the luma plane of previous, current, next field (frame in case of progressive input) respectively. C is corresponding to the chroma plane of the current field (frame). This bit must be set value from 0 to H'FFFF_4000

35.4.7 Operation

This section explains how to control operation of an IP set which includes FCPF.

35.4.7.1 Operation Control Setting for the IP set FCPF+FDP

(1) The case FDP in Interrupt Mode or Best Effort Mode

(1a) to start the first frame, set registers of FDP, FCPF as following order.

1. Set value 1 to register FD1_CTL_CLKCTRL.CSTP_N
2. Set FDP registers other than FD1_CTL_CMD, FD1_CTL_SGCMD, and FD1_CTL_REGEND. FDP registers must follow restriction at 35.4.7.3.
   In case of writing FCNL data set 1 to FD1_WPF_FORMAT.FCNL.
3. Set FCPF registers (V-update registers and other registers if necessary).
   In case of reading tile addressing image set 1 to FCP_TL_CTRL.TLEN.
4. Set FD1_CTL_CMD.STRCMD to the value 1. Set FD1_CTL_REGEND.REGEND to the value 1.
5. Set FD1_CTL_SGCMD.SGEN to the value 1, then FDP starts its process. FD1_CTL_SGCMD.SGEN must be not cleared if continue to the second or later frames.

(1b) to start the second or later frame, set registers in following order.

1. After V-interruption of the previous frame start timing occurred, set all FDP registers other than FD1_CTL_CMD and FD1_CTL_REGEND. FDP registers must follow restriction at 35.4.7.3.
   In case of writing FCNL data set 1 to FD1_WPF_FORMAT.FCNL.
2. Set FCPF V-update registers.
   In case of reading tile addressing image set 1 to FCP_TL_CTRL.TLEN.
3. Set FD1_CTL_CMD.STRCMD to the value 1.
4. Set FD1_CTL_REGEND.REGEND to the value 1.
5. At the V-interruption of the previous frame end timing, FDP starts the target frame. The V-interruption of the previous frame end timing and the one of the target frame start timing are the same.

(1c) to stop FDP, FCPF operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. If this register was completed before the V-Interruption of frame end timing, FDP stops its operation and current frame becomes the last frame of the image sequence. If these register setting could not be completed before the V-Interruption of frame end timing, FDP stops its operation in the next V-interruption. In the latter case, V-update status registers are not updated at V-interruption of frame end but at the next V-interruption at which FD1_CTL_REGEND.REGEND is set as 1.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP will stop generating V-interruption.

(1d) to stop FDP, FCPF operation immediately, set registers as the following.

1. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP will stop generating V-interruption.
2. Set FD1_CTL_SRESET.SRST to the value 1. FDP will invoke termination process immediately.
3. Wait frame end interrupt from FDP or until the register bit FD1_CTL_IRQSTA.FRE is set to 1. After it occurs, both FDP and FCPF have finished its processing.
4. Set FCP_RST.SOFTRST to the value 1. FCPF will invoke termination process immediately.
5. Wait until ACT bit of the FCP_STA register become 0. After it occurs, FCPF has finished its processing.

With this operation, FDP can stop its process quickly, but the output frame of the last frame is corrupted.

(2) The case FDP in No interrupt mode

(2a) to start the first frame, set registers in following order.
Same as (1a).

(2b) to start the second or later frame, set registers in following order.
Same as (1b).

(2c) to stop FDP operation after current frame finished, set registers as the following.

1. After V-interruption of the current frame start timing occurred, set FD1_CTL_CMD.STRCMD to the value 0.
2. Set FD1_CTL_REGEND.REGEND to the value 1. At the V-Interruption of frame end timing, FDP stops its operation and current frame becomes the last frame of the image sequence.
3. Set FD1_CTL_SGCMD.SGEN to the value 0, then FDP will stop generating V-interruption.

(2d) to stop FDP operation immediately, set registers as the following.
Same as (1d).

35.4.7.2 Reset Operation

FCPF reset can be conducted by software reset and power on reset. The software reset which is controlled by software, is used to stop the FCPF operation. The software reset operation is not executed immediately; it is executed on completion of the bus transaction. The other is power on reset which initialize the whole FCPF logic immediately.

(1) Software Reset

The procedure of software reset of the FCPF is as following:

1) Activate software reset sequence
Set FCP_RST.SOFTRST to the value 1.
2) Confirm software reset sequence finished:
FCP_STA.ACT becomes 0. All remain transactions with the bus system finished.

The procedure to stop operation of an IP set including FCPF is descripted at the sections 35.4.7.1.

(2) Power-on Reset

The power-on reset is controlled by an externally input signal called hardware reset. This reset initializes the whole internal logic of FCPF.

35.4.7.3 Register settings and restrictions on connected IP (FDP)

The connected FDP has to follow the setting and restrictions in following tables.

(1) Register setting on connected IP (FDP)

Table 35.22 Setting restriction when writing FCNL data

Register	Register value	Use cases
FD1_WPF_FORMAT.FCNL	0	Write non FCNL data
	1	Write FCNL data

(2) Restrictions on FDP read side

In case of reading tile addressing image (FCP_TL_CTRL.TLEN = 1), the setting of input data swap (FD1_RPF_SWAP.ISWAP [3:0]), line memory pixel number (FD1_IPC_LMEM.PNUM [11:0]), read color format (FD1_RPF_FORMAT.RD T [6:0]), read memory stride (FD1_RPF_PSTRIDE.SRC_STRD_Y [15:0], FD1_RPF_PSTRIDE.SRC_STRD_C [15:0]) must follow the Table 35.23.

Table 35.23 Setting restriction on FDP read side

Register	Value
FD1_RPF_SWAP.ISWAP[3:0]	H'F
Max value of FD1_IPC_LMEM.PNUM[11:0]	960
FD1_RPF_FORMAT.RD T[6:0]	H'42 (YCbCr420 semi-planar)
FD1_RPF_PSTRIDE.SRC_STRD_Y[15:0]	STRIDE
FD1_RPF_PSTRIDE.SRC_STRD_C[15:0]	STRIDE

STRIDE = FCP_PICINFO1.STRIDE_DIV16 [10:0]*16

(3) Restrictions on FDP write side

The connected FDP have to follow the setting and restrictions in following tables.

In case of reading tile addressing image (FCP_TL_CTRL.TLEN = 1), the setting of still mask write data swap must follow Table 35.24.

Table 35.24 Setting restriction about still mask write data swap

Register	Register Value
FD1_WPF_SWAP.SSWAP[3:0]	H'F

In case of writing FCNL data (FD1_WPF_FORMAT.FCNL = 1), the setting of image write data swap (FD1_WPF_SWAP.OSWAP [3:0]), output color format (FD1_WPF_FORMAT.
WR T [6:0]), output memory stride (FD1_WPF_PSTRIDE.DST_STRD_Y [15:0], FD1_WPF_PSTRIDE.DST_STRD_C [15:0]) and output memory address (FD1_WPF_ADDR_m.DST_ADDR_m [31:0] (m = Y, C0, C1)) must follow Table 35.25.

Table 35.25 Setting restriction on FDP write side

Register	Register Value
FD1_WPF_SWAP.OSWAP[3:0]	H'8
FD1_WPF_FORMAT. WR T[6:0]	H'13 (ARGB8888) H'47 (YCbCr 422 Interleave YUY2) (*) H'4A (YCbCr 444 Planar) H'4B (YCbCr 422 Planar) H'4C (YCbCr 420 Planar)
FD1_WPF_PSTRIDE.DST_STRD_Y[15:0] FD1_WPF_PSTRIDE.DST_STRD_C[15:0] FD1_WPF_ADDR_m.DST_ADDR_m[31:0] (m = Y, C0, C1)	256n (multiple of 256 bytes)

Note: * In this case, FD1_WPF_FORMAT.WSPYCS must be set to 1 and FD1_WPF_FORMAT.WSPUVS must be set to 0.

Data Stored in External RAM and Its Format

35.4.7.4 Decode data

Decode data consists of 2 separated data, one is ancillary information data and the other is tile addressing image data.

(1) Ancillary information data

The ancillary information data is an additional data to access to tile addressing image and to decompress the lossless compressed picture data. It is required for each Luminance plane and Chrominance plane. The information mention about whether decompress or not (the data is lossless compressed or not) is embedded in this ancillary data and automatically analyzed by FCPF.

The access to ancillary information data memory area of FCPF is shown in Table 35.26.

Table 35.26 Access to Ancillary Information memory area

Write / Read	Access trigger	Remarks
Write	None (FCPF does not conduct Write access)	
Read	Always if set the FCP_BA_ANC_*n* (*n*: Y0/Y1/Y2/C) register	Pre-fetch the next 128bytes

The size of ancillary information data is shown in Table 35.27. And the ancillary information data should be aligned on a 128-byte boundary.

Table 35.27 Data Size of Ancillary Information

Number of Buffer	Data Size per Buffer
Same as maximum number of frames/fields	CEIL128(2 + ((2 × the number of GROUP in a picture) + 7) / 8) + 384 bytes (*) [The number of GROUP in a picture] Luminance: (STRIDE × CEIL32(BLOCK_HEIGHT + 4)) /256 (*) Chrominance: (STRIDE × CEIL32(BLOCK_HEIGHT/2 + 4)) /256 where STRIDE = FCP_PICINFO1.STRIDE_DIV16 * 16 BLOCK_HEIGHT = pixel height of picture in the size of MB or CTB boundary [pixel height of picture in the size of MB or CTB boundary] MB: CEIL16(pixel height) CtbSizeY = 16: CEIL16 (pixel height) CtbSizeY = 32: CEIL32 (pixel height) CtbSizeY = 64: CEIL64 (pixel height) Ex) Picture size: 1920 × 1080, STRIDE: 2048, CtbSizeY: 16 Luminance: The number of GROUP in a picture = (2048 × CEIL32(CEIL16(1080) +4)) /256 = 8960 Data size of Ancillary information = CEIL128(2 + ((2 × 8960) +7) /8) +384 = 2688 bytes Chrominance: The number of GROUP in a picture = (2048 × CEIL32(CEIL16(1080)/2 + 4)) /256 = 4608 Data size of Ancillary information = CEIL128(2 + ((2 × 4608) +7) /8) +384 = 1664 bytes

Note: * CEIL*n*(a) = ((a + (*n* – 1)) / *n*) * *n*

(2) Tile addressing image data

Image data is located on memory in tile addressing as shown in Figure 35.6. Although the valid image data exists in the green area only, the tile addressing area is extended to horizontal and vertical direction. The tile size is 128bytes x 32lines. The stride of allocation memory area is exponent of 2.

The pixels in the first line of the picture are stored in 2 lines shift down in the case of H.264 frame picture in interlace sequence (not MBAFF). Note that reading access to an address is converted to the address of 2lines below. The Figure 35.7 shows examples of the stored 2 line shift down.

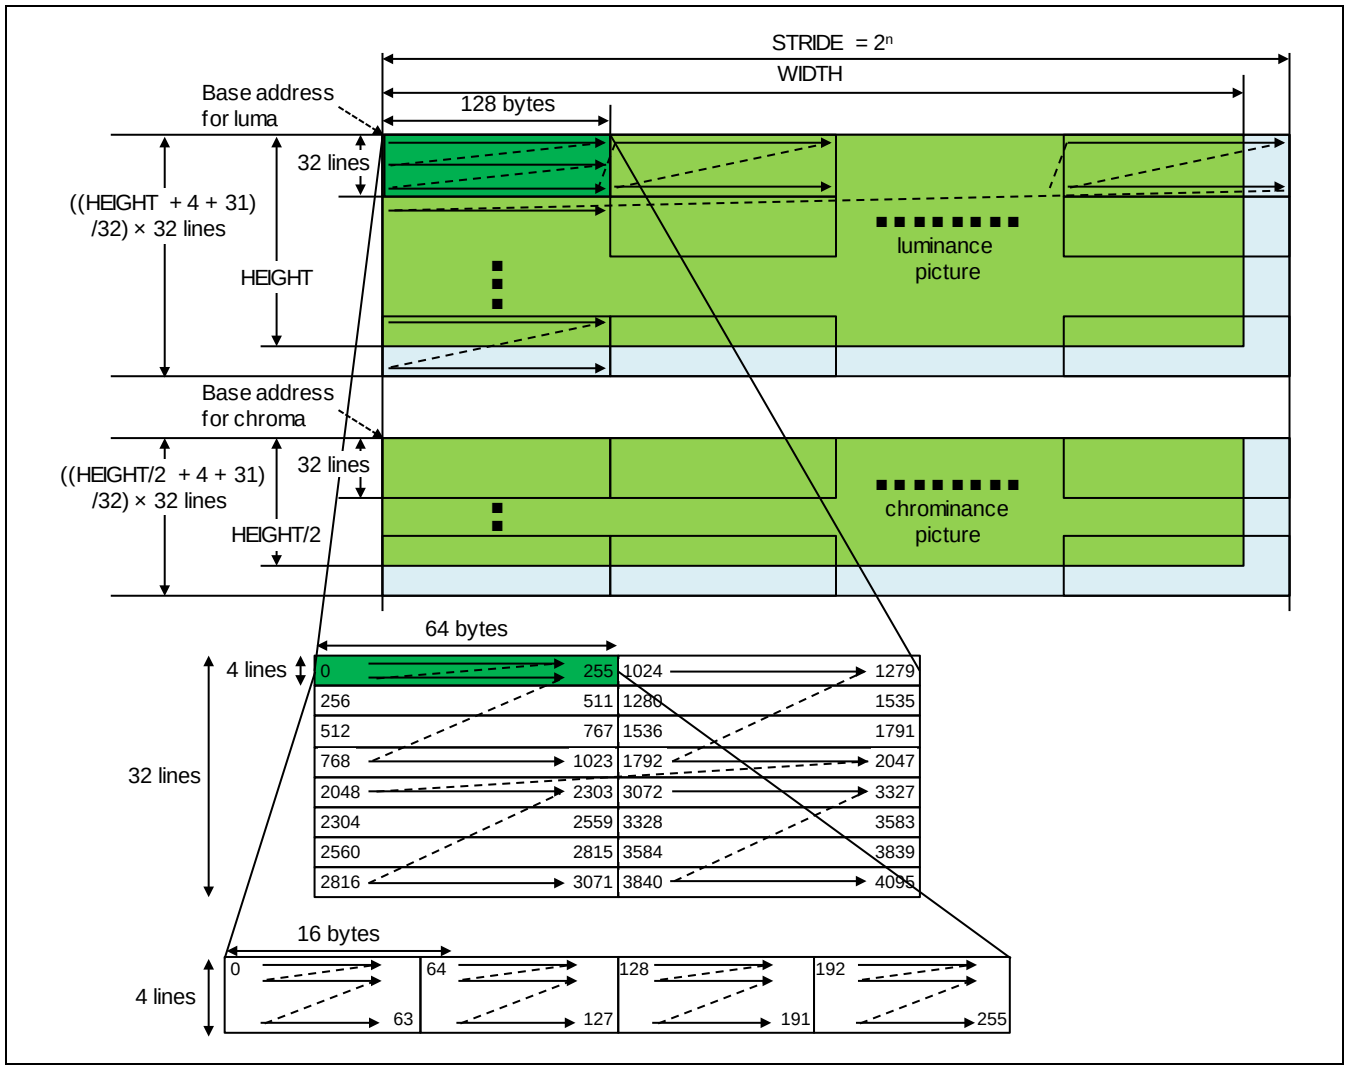


Figure 35.6 Memory allocation of tile addressing image

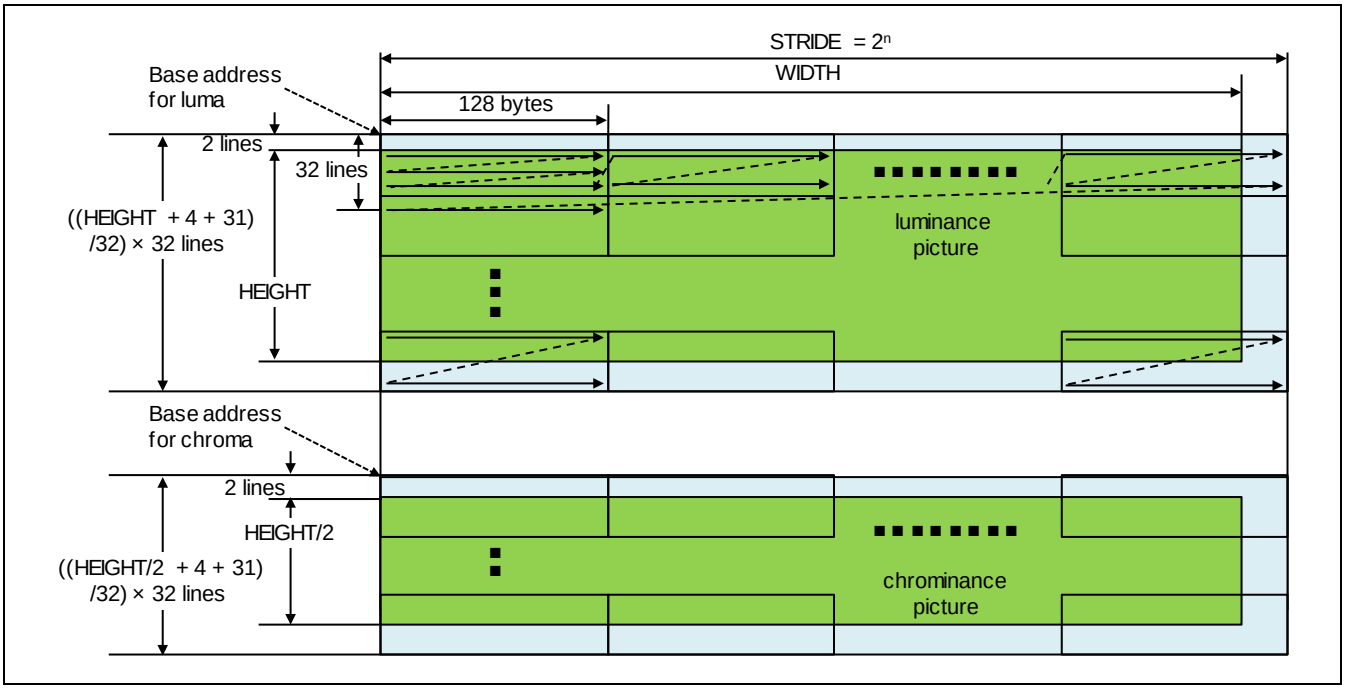

Figure 35.7 An Example of 2 line shift down

Parameters in Figure 35.6 and Figure 35.7:

- STRIDE = FCP_PICINFO1. STRIDE_DIV16 * 16
- HEIGHT, WIDTH: the height and width of the tile addressing image
- Base address for luma: value of register FCP_BA_REF_{Y0,Y1,Y2}.BA[31:0]
- Base address for chroma: value of register FCP_BA_REF_C.BA[31:0]

The buffer size needed for a tile addressing image is shown in Table 35.28

:

Table 35.28 Data Size of a tile addressing image

Number of Pic	Data Size per Picture
Maximum number of frames/fields	Luminance: STRIDE x CEIL32(BLOCK_HEIGHT + 4) bytes (*) Chrominance: STRIDE x CEIL32(BLOCK_HEIGHT/2 + 4) bytes where STRIDE = FCP_PICINFO1. STRIDE_DIV16 * 16 BLOCK_HEIGHT = pixel height of picture in the size of MB or CTB boundary [pixel height of picture in the size of MB or CTB boundary] MB: CEIL16(pixel height) CtbSizeY = 16: CEIL16 (pixel height) CtbSizeY = 32: CEIL32 (pixel height) CtbSizeY = 64: CEIL64 (pixel height)

Note: * CEIL*n*(a) = ((a + (*n* – 1)) / *n*) * *n*

(3) Tile/Linear addressing conversion

In order to enable the FDP which supports only linear addressing to access the tile addressing image data, the software needs to set the registers following to Figure 35.8. Note that the value of VPOS_{Y/C} is set basing on base address regardless of 2 lines of line-shift because reading access to an address is converted to the address of 2lines below.

In order to enable tile/linear addressing conversion, set 1 to the register FCP_TL_CTRL.TLEN and set values other than 0 to base address of ancillary information (FCP_BA_REF_m {m: Y0, Y1, Y2, C}) of the in-used plane.

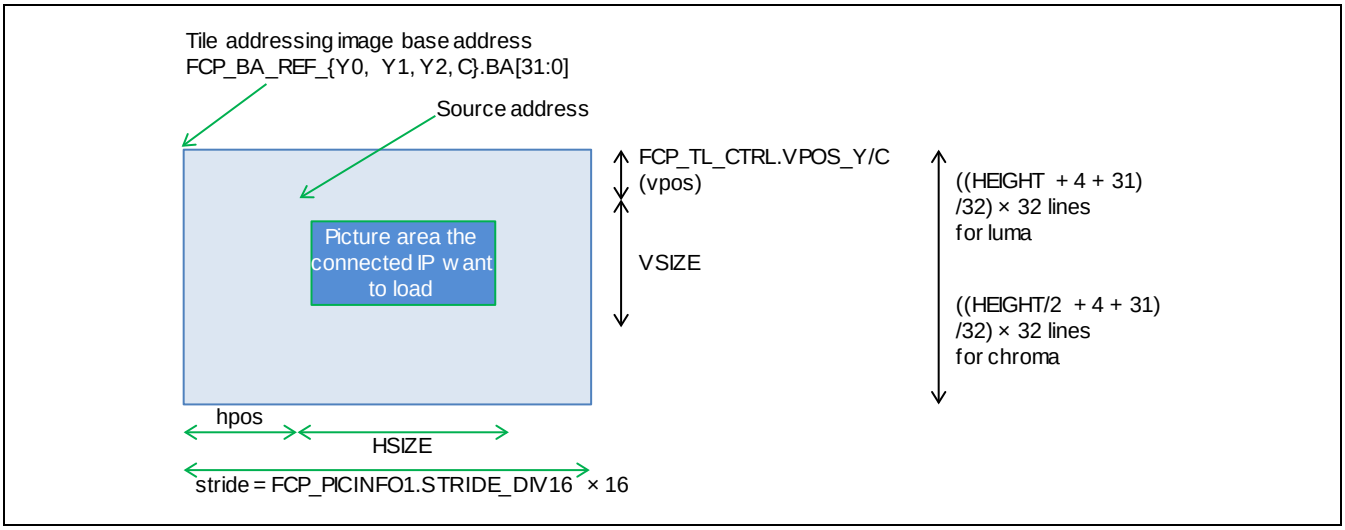

Figure 35.8 Reading tile addressing image by linear access

Parameters in Figure 35.8:

- “Source address”: FD1_RPF{n}_ADDR_{Y/C0}.PSRC_ADDR_{Y/C0}[31:0], n = 0/1/2
  “Source address” = “Tile addressing image base address” + vpos * stride + hpos
- hpos: the start reading byte position for each line in linear addressing. This value is automatically calculated by FCP and not needed to be set as register.
- VSIZE: FD1_RPF_SIZE.VSIZE[12:0]
- HSIZE: FD1_RPF_SIZE.HSIZE[12:0]

Registers of FDP must satisfy the restrictions on 35.4.7.3.

35.4.7.5 FCNL image data

Figure 35.9 shows the memory layout of a FCNL image. Although the output memory area, which is specified by a destination address and a stride, is a rectangle linear address area, the FCNL data is located on the shadow address area of that. That is, in each 256 bytes area starting from 256 bytes boundary, FCNL data is located on 128 bytes area of the lower side address.

The destination start address and memory stride which is specified by VSP registers must satisfy the restriction on section 35.4.7.3.

The buffer size for a FCNL image is equal to *stride * height*. Here, height is half of the picture height if the plane is Cb (U), Cr (V) for format YCbCr 420 planar and equal to the picture height for other cases.

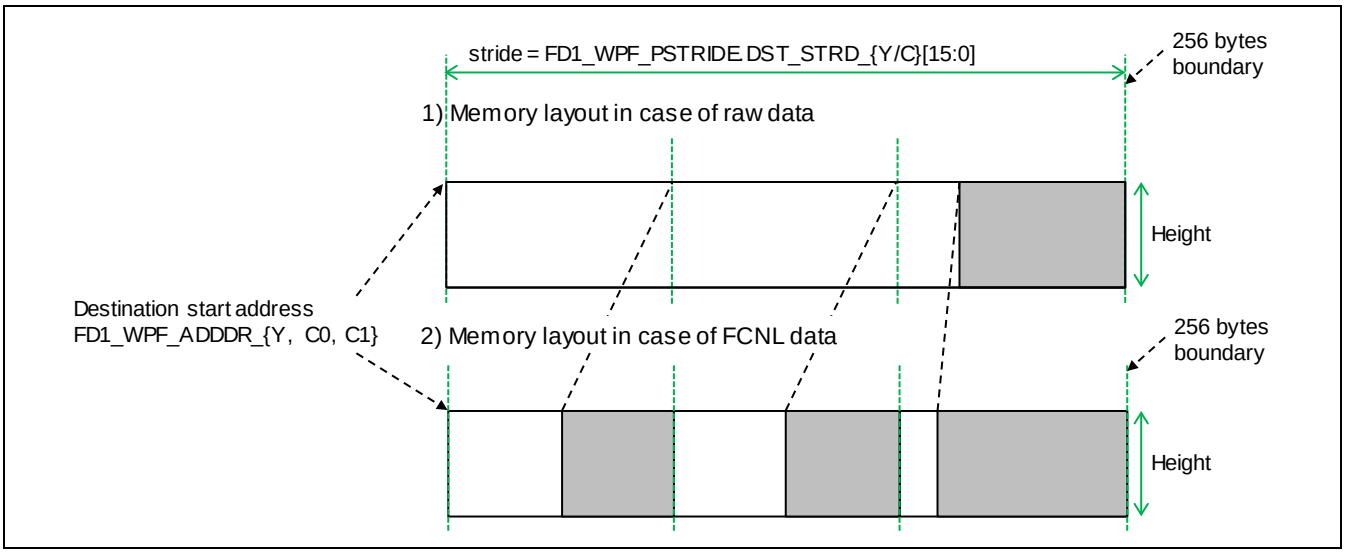

Figure 35.9 Memory layout of the FCNL image

Parameters in Figure 35.9:

- Height: the height of output image.

35.4.7.6 Operation status

Operation status of FDP, FCPF is defined for the whole IP set as follows.

1) If both register bits FD1_CTL_STATUS.BSY and FCP_STA.ACT are 0, both of modules FDP, FCPF are stopping.
2) If either register bit FD1_CTL_STATUS.BSY or FCP_STA.ACT is 1, both of modules FDP, FCPF are operating.

35.4.8 Usage Notes

35.4.8.1 Manipulating FCPF+FDP with CPG module stop, software reset

The following notes 1) to 2) are to prevent FCPF, FDP from the unstable status which may cause hang or wrong operation.

Note 1) In the case of stopping FCPF and FDP using the corresponding register bit of module stop registers (MSTPSR1, MSTPSR6), realtime module stop registers (RMSTPCR1, RMSTPCR6), system module stop registers (SMSTPCR1, SMSTPCR6) and software reset registers (SRCR1, SRCR6) of the module CPG, do following steps. Note that it is needed to stop both FCPF and FDP.

Step1) Stop FCPF + FDP with the software reset sequence following to the guidance in the section 35.4.7.1.

Step2) Stop FDP using the corresponding register bit of CPG register (MSTPSR1 or RMSTPCR1 or SMSTPCR1 or SRCR1) and stop FCPF using the corresponding register bit of CPG register (MSTPSR6 or RMSTPCR6 or SMSTPCR6 or SRCR6). Either FDP or FCPF can be stopped first.

Note 2) In the case of re-starting FCPF + FDP after stopping those modules with CPG module stop, CPG software reset, be sure to run FDP start process as defined in the section 35.4.7.1.

36. Display Unit (DU)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

36.1 Overview

Display Unit (hereinafter it is called DU) is a module to input an image data from VSP* and to output the data to LVDS-IF, HDMI-IF, and digital RGB etc. in accordance with optionally settable display timing.

Note: In this section, VSP means VSP2 (Video Signal Processor 2), the notation of VSP0, VSP1 and VSP2 in this section means channel-0 of VSP2, channel-1 of VSP2 and channel-2 of VPS2.
When using DU, set the desired value in VSP2's registers. For details of VSP2, refer to section 33 in this manual.

36.1.1 Features

(1) Display Channel

Display functions are individually controllable, and equip plural channels. For the channel number of each products, refer to Table 36.1.

(2) Plane

Each of the display surfaces configured to display an image on the screen is called plane in this section. For the plane number of each products, refer to Table 36.1. Parameters for each plane can be set independently through the settings of an internal register. The internal register settings can also be used to set the display priority order.

- Display size
- Display position
- Display data format (32-bit/pixel or YC)
- Plane superimposing

(3) Synchronization Method

Internal register settings can be used to select any of three synchronization modes for the display output timing.
RZ/G2E support only master mode (internal sync mode).

- Master mode (internal sync mode)
- TV sync mode (external sync mode)
- Sync method switching mode

(4) CRT Scan Mode (CRT Scan Method)

Internal register settings can be used to select from among three scan modes.
RZ/G2E support only non-interlaced mode.

- Non-interlaced mode
- Interlaced sync mode
- Interlaced sync & video mode

(5) YC → RGB Color Space Conversion Functions

Image data stored in YC format can be converted into the RGB color space and displayed in a window. The conversion coefficients can be set in a register.

(6) Register Access Control

The module has internal control registers; these are writable/readable by the APB protocol over the APB. The unit of access is fixed to 32 bits.

(7) VSP Connection

VSP output provides RGB or YCbCr444 data format for the DU. The DU is not connected with external memory. For VSP connection of each products, refer to Table 36.1.

(8) LVDS-IF Connection

Connection with the LVDS-IF allows the output of image data via the LVDS-IF. In this case, data format is RGB. For LVDS-IF connection of each products, refer to Table 36.1.

(9) DPAD Connection

Connection with the DPAD allows the output of the digital RGB data and the YC format data via a pin. In this case, data format is RGB or YCbCr422. For DPAD connection of each products, refer to Table 36.1.

(10) HDMI-IF Connection [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

Connection with the HDMI-IF allows the output of image data via the HDMI-IF. In this case, data format is RGB or YCbCr444. For HDMI-IF connection of each products, refer to Table 36.1.

Table 36.1 Configuration of channel, plane and connection for each product

			Connection				Second Generation RZ/G Series Products			
			VSP							
Channel	Abbr.	Plane		LVDS-IF	HDMI-IF	DPAD	RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
channel0	DU0	plane1 and plane3*1	VSP0	LVDS-IF	—	—	√	√	√	—
				LVDS0-IF		DPAD *2	—	—	—	√
channel1	DU1	plane1 and plane3*1	VSP1	—	HDMI-IF0	—	√	√	√	—
				LVDS1-IF	—	DPAD *2	—	—	—	√
channel2	DU2	plane1	VSP2	—	—	DPAD	—	√	—	—
channel3	DU3	plane1 and plane3*1	VSP0	—	—	DPAD	√	—	—	—
		plane3					—	—	√	—

Notes: 1. Up to two display planes can be superimposed on each other. Correspondences between the DU0 and DU1, the DU2 and DU3 planes are not fixed but can be selected as desired through register settings.

2. DPAD can be connected with the DU0 or DU1. [RZ/G2E]

Table 36.2 Corresponding data format for each product

	Implementation				Corresponding data format			
Product	DU0	DU1	DU2	DU3	DU0	DU1	DU2	DU3

36.1.2 Block Diagram

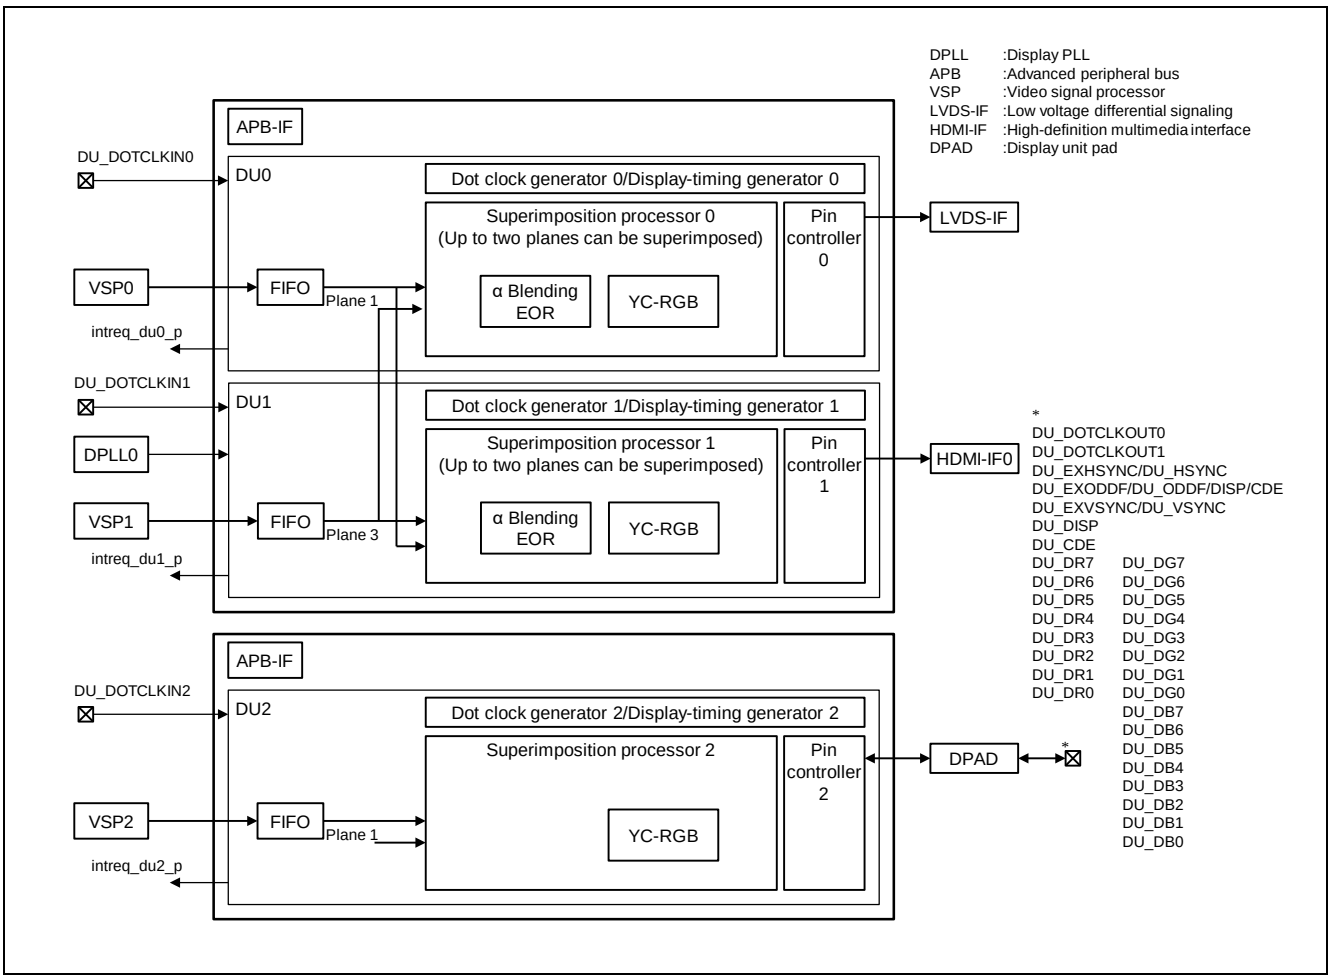

Figure 36.1 Block Diagram of the DU [RZ/G2M V1.3, RZ/G2M V3.0]

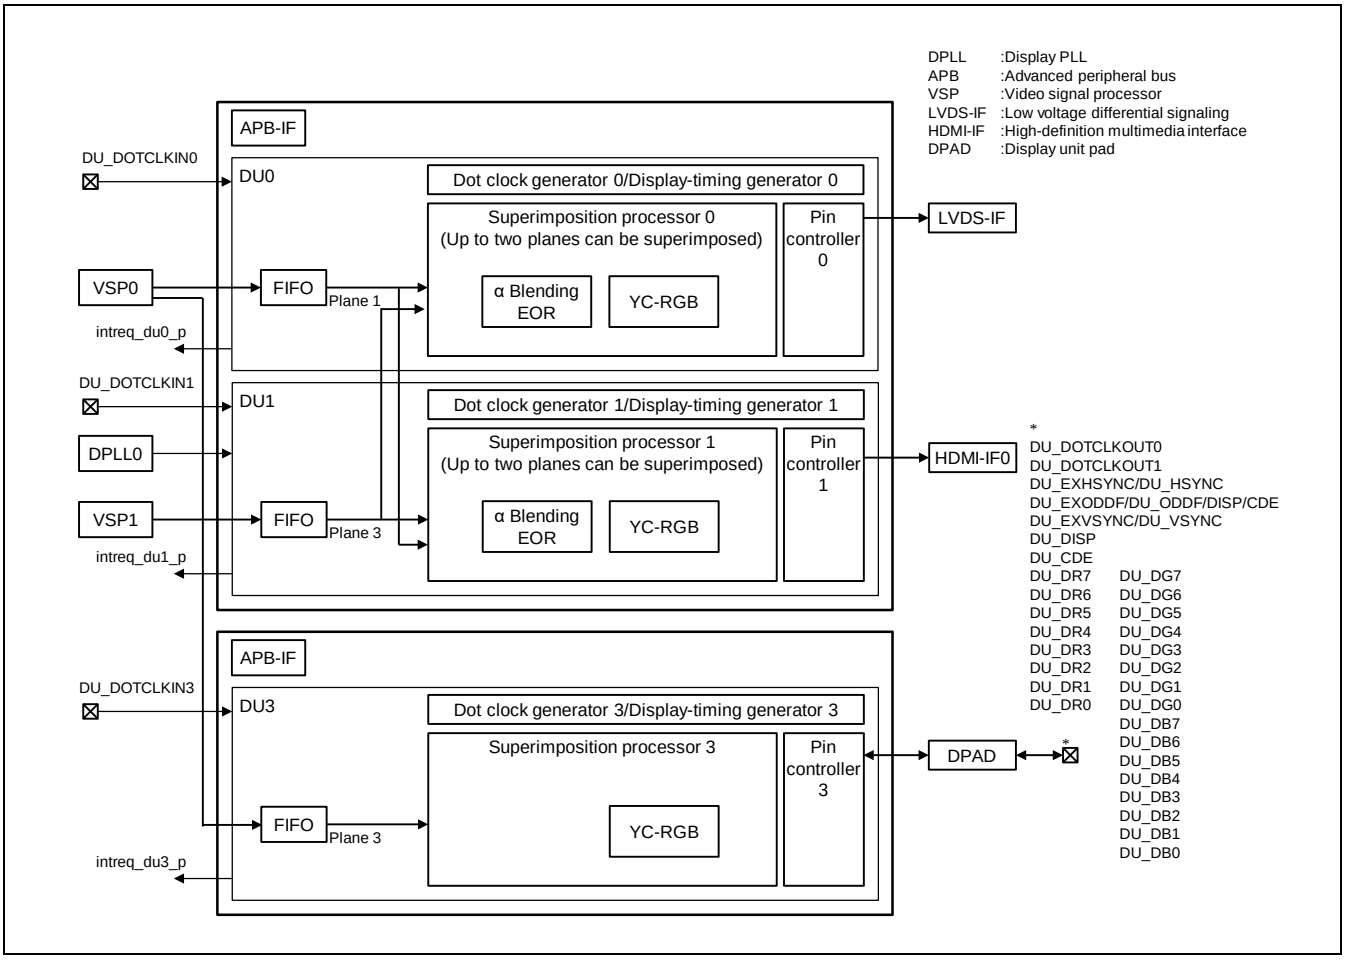

Figure 36.2 Block Diagram of the DU [RZ/G2H, RZ/G2N]

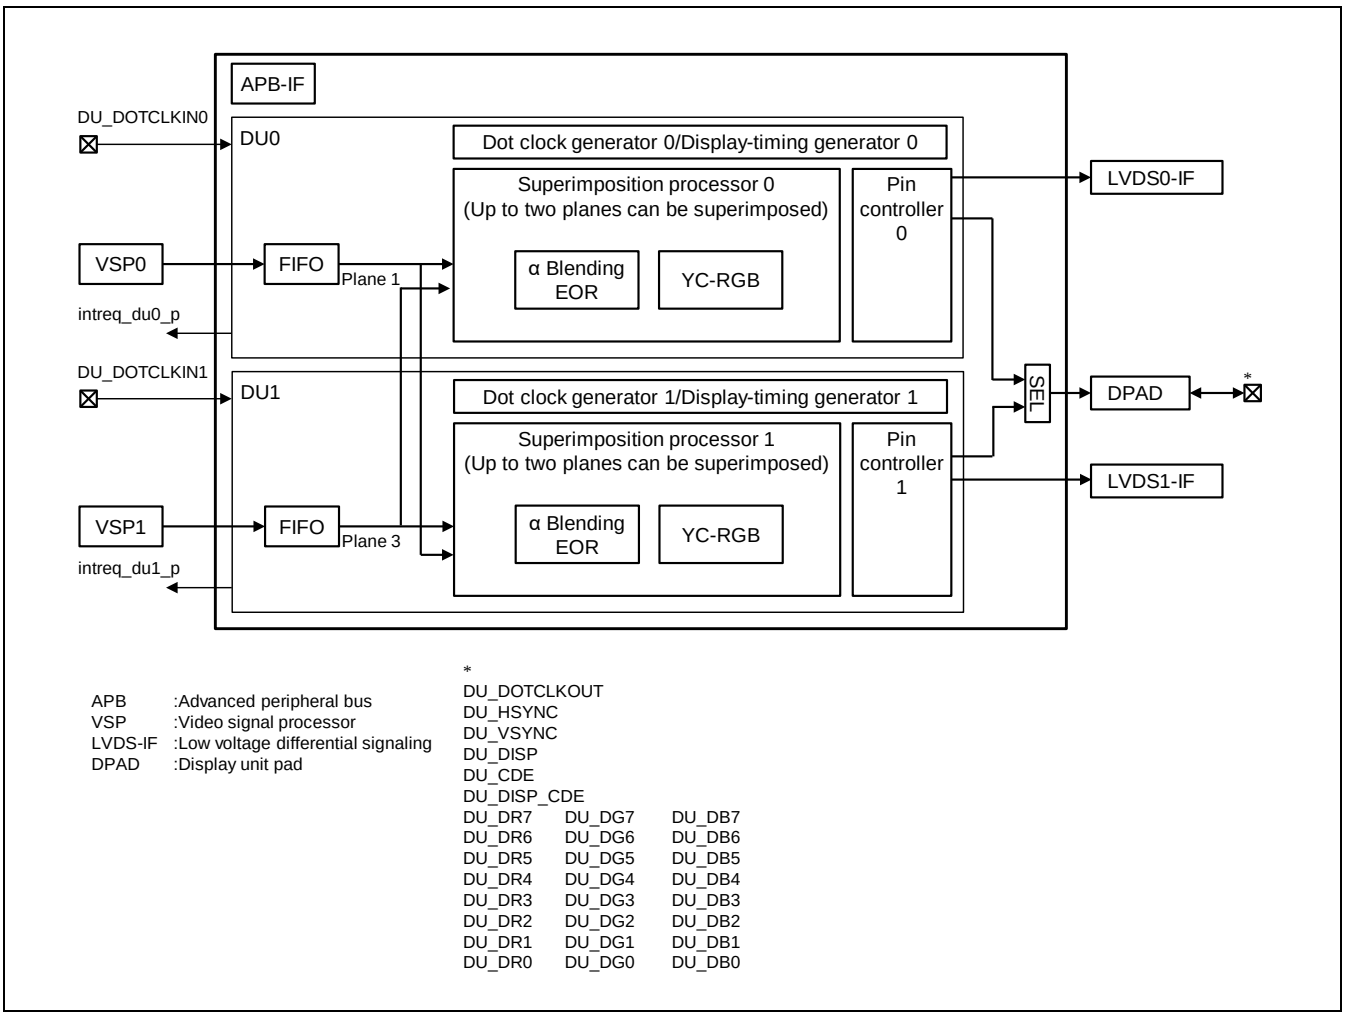

Figure 36.3 Block Diagram of the DU [RZ/G2E]

36.1.3 External Pins

Supplementary explanation of the signals listed in column “Signal Name Used in This Section” are as follows.
DISP is a signal activated during the period “Display area” in figure 36.14 and is activated during output display data valid period.
CLAMP is a signal that determines the activation period with CLAMPSRn and CLAMPWRn registers. Refer to these two registers.
DE is a signal that determines the activation period with DESRn and DEWRn registers. Refer to these two registers.
CDE is a signal activated when output display data and CDERn register match. Refer to section 36.3.13.

Table 36.3 Pin Functions (DU0/DU1/DU3 [RZ/G2H, RZ/G2N])

Name	Pin Name	I/O	Function	Signal Name Used in This Section
DU0 input dot clock	DU_DOTCLKIN0	Input	DU0 input dot clock	DCLKIN

	DU_DB5	Output	DU2 digital blue 5	
	DU_DB6	Output	DU2 digital blue 6	
	DU_DB7	Output	DU2 digital blue 7	

Notes: 1. There are expressed as EXHSYNC, EXVSYNC, and EXODDF in explanations of the functions as input signals and as HSYNC, VSYNC and ODDF otherwise.
2. In this section, unless otherwise noted, "dot clock" refers to the output dot clock.
3. In YC format display, refer to Table 36.32.

Table 36.5 Pin Functions (DU0/DU1 [RZ/G2E])

Name	Pin Name	I/O	Function	Signal Name Used in This Section
DU0 input dot clock	DU_DOTCLKIN0	Input	DU0 input dot clock	DCLKIN
DU1 input dot clock	DU_DOTCLKIN1	Input	DU1 input dot clock	DCLKIN
DU output dot clock 0	DU_DOTCLKOUT0	Output	DU0 or DU1*4 output dot clock (normal phase)	DCLKOUT
DU horizontal synchronous output	DU_HSYNC	Output	DU0 or DU1*4 horizontal synchronous output	HSYNC
DU vertical synchronous output	DU_VSYNC	Output	DU0 or DU1*4 vertical synchronous output	VSYNC
DU display interval/ DU color detection	DU_DISP_CDE*1	Output	DU0 or DU1*4 CLAMP output signal	CLAMP
			DU0 or DU1*4 display interval	DISP
			DU0 or DU1*4 color detection	CDE
DU display interval	DU_DISP	Output	DU0 or DU1*4 display interval (Initial value)	DISP
			DU0 or DU1*4 DE output signal	DE
DU color detection	DU_CDE	Output	DU0 or DU1*4 color detection (Initial value)	CDE

Name	Pin Name	I/O	Function	Signal Name Used in This Section
DU display data	DU_DR0	Output	DU0 or DU1*4 digital red 0 green 4*5	Digital RGB or YC*2
	DU_DR1	Output	DU0 or DU1*4 digital red 1 green 5*5	
	DU_DR2	Output	DU0 or DU1*4 digital red 2 green 6*5	
	DU_DR3	Output	DU0 or DU1*4 digital red 3 green 7*5	
	DU_DR4	Output	DU0 or DU1*4 digital red 4 blue 0*5	
	DU_DR5	Output	DU0 or DU1*4 digital red 5 blue 1*5	
	DU_DR6	Output	DU0 or DU1*4 digital red 6 blue 25	
	DU_DR7	Output	DU0 or DU1*4 digital red 7 blue 3*5	
	DU_DG0	Output	DU0 or DU1*4 digital green 0 blue 4*5	
	DU_DG1	Output	DU0 or DU1*4 digital green 1 blue 5*5	
	DU_DG2	Output	DU0 or DU1*4 digital green 2 blue 6*5	
	DU_DG3	Output	DU0 or DU1*4 digital green 3 blue 7*5	
	DU_DG4	Output	DU0 or DU1*4 digital green 4	
	DU_DG5	Output	DU0 or DU1*4 digital green 5	
	DU_DG6	Output	DU0 or DU1*4 digital green 6	
	DU_DG7	Output	DU0 or DU1*4 digital green 7	
	DU_DB0	Output	DU0 or DU1*4 digital blue 0	
	DU_DB1	Output	DU0 or DU1*4 digital blue 1	
	DU_DB2	Output	DU0 or DU1*4 digital blue 2	
	DU_DB3	Output	DU0 or DU1*4 digital blue 3	
	DU_DB4	Output	DU0 or DU1*4 digital blue 4	
	DU_DB5	Output	DU0 or DU1*4 digital blue 5	
	DU_DB6	Output	DU0 or DU1*4 digital blue 6	
	DU_DB7	Output	DU0 or DU1*4 digital blue 7	

Notes: 1. Initial value of the DU_DISP_CDE pin is fixed to 0. For the DU_DISP_CDE pin functions as CLAMP or DISP or CDE output, it is necessary for setting the ODPM bit in DSMR0 and the ODPM02 bit in DEF6R0 for the DU0, or the ODPM bit in DSMR1 and the ODPM12 bit in DEF6R0 for the DU1.
2. In this section, unless otherwise noted, "dot clock" refers to the output dot clock.
3. In YC format display, refer to Table 36.32.
4. Digital RGB signal from the DU0 or DU1 can be selected by setting the DRGBS bit in DEF8R0.
5. RZ/G2E supports multiple output display.

36.1.4 Register Configuration

Table 36.6 shows the meaning of the suffix associated with register name and register abbreviation in this manual. The suffix, means different from Table 36.6, show as Notes.

Table 36.6 The meaning of suffix associated with register name and register abbreviation

								Second Generation RZ/G Series Products			
Suffix	Significance	Cond.	Value	Target channel/plane	component (Figure 36.1, 36.2, 36.3)			RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
m	common	—	0	DU0/DU1	—	—	—	√	√	√	√
	channel number		2	DU2/DU3				√	√	√	—

			3	Plane3	—	—	—	√	√	√	√
		m = 2	1	Plane1	—	—	—	—	√	—	—
			3	Plane3	—	—	—	√	—	√	—

For DU, there are two register update methods; the external update and the internal update. The internal update has two reflection timings. Refer to Table 36.7 for the update methods and the reflecting timings in DU registers.

Table 36.7 Register update methods

Update Methods	Reflection timings	Definitions of the Internal Updates in the Bit Description Table	Remarks
External Update	After the end of CPU access	Not available	—
Internal Update	When the DRES bit in DSYSRn is 1.	DRES	—
	When the DRES bit in DSYSRn is 1 and at the beginning of each frame, which is the VSYNC falling edge if the VSL bit in DSMRn is 0 and the VSYNC rising edge if the VSL bit in DSMRn is 1.	Available	Disabled when the IUPD bit in DSYSRn is 1.

(1) External Update

An "external update" is an update which reflects the address-mapped register settings made by the CPU after the end of CPU access. Registers related to display control (for example, DSYSRn) and the settings of which are updated through external updates can be overwritten without display flicker by using bits 11 and 14 in DSSRn indicating the start position of the vertical blanking interval.

(2) Internal Update

An "internal update" is an update that reflects the address-mapped register settings with the internal update timing of the DU. Hence in the case of a register with an internal update function, even when the CPU overwrites address-mapped registers related to display operation without being aware of the display timing, display flicker can be prevented.

There are two types of internal update timings. One reflects the register value when the DRES bit is set to 1. The other reflects the register value in the following cases: (a) When the DRES bit is set to 1, and (b) when the VSYNC falling edge occurs if the VSL bit in DSMRn is 0 and when the VSYNC rising edge occurs if the VSL bit in DSMRn is 1. The type of internal update timings is defined by registers and that appears in the bit description table.

Bits which are internally updated in response to setting of the DRES bit in DSYSRn are listed in the column headed "Bit with Internal Update Function" in tables on the following pages.

Updates are performed at the falling edge of VSYNC output when the sync method of DSYSRn is master mode (bit 7 = 0, bit 6 = 0), or at the falling edge of EXVSYNC detected in TV sync mode (bit 7 = 1, bit 6 = 0). In sync transition mode (bit 7 = 0, bit 6 = 1), internal updates are not performed. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

For RZ/G2E, Updates are performed at the falling edge of VSYNC output.

The address-mapped registers with an internal update function are shown in Table 36.8 to Table 36.21. The initial settings for these registers should be made during the interval in which the DRES bit in DSYSRn is 1.

(3) Register Configurations

(a) Display Unit System Control Register Configuration

Table 36.8 Display Unit System Control Register Configuration (1)

Base address: DU0: H'FEB0_0000 (suffix 0)
DU1: H'FEB3_0000 (suffix 1)
DU2: H'FEB4_0000 (suffix 2) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
DU3: H'FEB7_0000 (suffix 3) [RZ/G2H, RZ/G2N]

	CPG	Output system clocks and dot clock.	√	√	√	√
	PFC	Select the external pins	√	√	√	√
	Module Standby	Control to stop clocks	√	√	√	√
	Software Reset	Execute software reset	√	√	√	√

36.2 Register Description

Legend for Register Description

Initial value: Register value after a reset.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be 0.

R1: Read-only. The write value should always be 1.

—/W: Write-only. The read value is undefined.

Plane p: Indicates plane 1 and plane 3

Note: Do not access locations that appear empty in the address map. Operation is not guaranteed in case of access to change the value at any location other than those of the registers listed in Table 36.8 to Table 36.21.

36.2.1 Display Unit System Control Registers

(1) Display Unit System Control Register n (DSYSRn)

Note: n = 0 and 2 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
n = 0 [RZ/G2E]

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Notes: 1. For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details, refer to following table.
2. Bits 16, 9, and 8 in DSYSR0 are shared by the DU0 and DU1. For RZ/G2H, bits 16, 9, and 8 in DSYSR2 are shared by the DU2 and DU3. For RZ/G2H, RZ/G2N, bits 16, 9, and 8 in DSYSR2 are shared by the DU3.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31, 30	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
29	ILTS	B'0	R/W	Not available	Input Pad Latch Timing Select [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] To enable this bit, the DEFE bit in DEFRn should be set to 1. In the initial state, this bit is fixed to 0. 0: A signal of the input pad is latched at the DCLKIN rising edge. 1: A signal of the input pad is latched at the DCLKIN falling edge. Electrical characteristics do not apply.
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.
28 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16	IUPD	B'0	R/W	Not available	Internal Updating Disable When DRES = 1, internal register updating occurs regardless of this bit setting. For details on internal updating, see section 36.1.4(2), Internal Update. 0: Internal register updating occurs for each vertical synchronous signal (VSYNC) assertion. 1: If this bit is set to 1, internal register updating does not occur. • If this bit is set to 0, register updating occurs according to the next vertical synchronous signal (VSYNC). • This bit is shared by the DU0 and DU1. For , this bit is shared by the DU2 and DU3. For RZ/G2N, RZ/G2H, this bit is shared by the DU3.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
15 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9	DRES	B'1	R/W	Not available	Display Reset
8	DEN	B'0	R/W	Available	Display Enable B'00: Display synchronous operation starts. If any register has not been set yet, the DU may perform unexpected operation, thus set DRES to 0 after setting all registers in the DU. For DEN = 0, the display data becomes values set with the DOORn. B'01: Display synchronous operation starts. If any register has not been set yet, the DU may perform unexpected operation, thus set DRES = 0, DEN = 1 after setting all registers in the DU. To re-set DRES to 1 following the start of operations for synchronization of the display with this setting, proceed with steps 1 and 2 in section 36.4.2, Transition to Module Standby Mode before doing so. For DEN = 1, the display data becomes values stored on the unified memory from the next frame. B'10: Display operation stops.[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] Display operation and synchronization operation stop. The set values except for the following bits in DSSRn are retained. In this setting, the following operations occur: 1. All 0s are output as display data. 2. The following bits of DSSRn are cleared to 0: TV synchronization signal error flag (TVR) Frame flag (FRM) Vertical blanking flag (VBK) Raster interrupt flag (RINT) Horizontal blanking flag (HBK) 3. HSYNC, VSYNC, and ODDF pins function as inputs. However, the ODDF pin functions as a CLAMP output when the ODPM bit in DSMRn is 1. B'10: Display operation stops. [RZ/G2E] Display operation and synchronization operation stop. The set values except for the following bits in DSSRn are retained. In this setting, the following operations occur: 1. All 0s are output as display data. 2. The following bits of DSSRn are cleared to 0: Vertical blanking flag (VBK) Raster interrupt flag (RINT) Horizontal blanking flag (HBK) B'11: Setting prohibited • This bit is shared by the DU0 and DU1. For , this bit is shared by the DU2 and DU3. For RZ/G2N, RZ/G2H, this bit is shared by the DU3.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
7, 6	TVM	B’10	R/W	Not available	TV Synchronized Mode [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] B’00: Master Mode HSYNC, VSYNC, and CSYNC are output. B’01: Sync Method Switching Mode. Use this mode if necessary when switching from TV synchronized mode to master mode or vice versa is performed. In this mode, display operation forcibly stops and the DISP pin outputs the low level. Moreover, clock supply to DCLKIN can be stopped (input invalid) (the inside of the LSI is fixed to the high level). The EXHSYNC, EXVSYNC, and EXODDF pins are used as input pins. B’10: TV Sync Mode EXHSYNC, EXVSYNC, and EXODDF are input. When the ODPM bit in DSMRn* is set to 1, the ODDF pin functions as an output pin. B’11: Setting prohibited
					TV Synchronized Mode [RZ/G2E] B’00: Master Mode others: Setting prohibited
5, 4	SCM	B’00	R/W	Not available	Scan Mode [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] B’00: Non-interlaced mode B’01: Setting prohibited B’10: Interlace sync mode B’11: Interlace sync & video mode
					Scan Mode [RZ/G2E] B’00: Non-interlaced mode others: Setting prohibited
3 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details, refer to following table.

For RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, all bit in this register setting is also available for the display data output via the LVDS-IF. Bit 24, 18 and 17 in this register setting is also available for the display data output via the HDMI-IF.

For RZ/G2E, all bit in this register setting is also available for the display data output via the LVDS-IF.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 29	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
28	VSPM	B'0	R/W	DRES	VSYNC Pin Mode [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: The VSYNC signal is output to the VSYNC pin. 1: The CSYNC signal is output to the VSYNC pin. In case of the output via the DPAD, "VSYNC pin" refers to the DU_VSYNC/DU_EXVSYNC pin indicated in Table 36.3 and Table 36.4. In case of the output via the LVDS-IF, "VSYNC pin" connected with the VSYNC signal of the LVDS-IF.
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
27	ODPM	B’0	R/W	DRES	ODDF Pin Mode [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: The ODDF signal is output to the ODDF pin. 1: The CLAMP signal is output to the ODDF pin. Even if bits 7 and 6 in DSYSRn indicate TV synchronized mode, the ODDF pin becomes an output. In case of the output via the DPAD, "ODDF pin" refers to the DU_ODDF/DU_EXODDF pin indicated in Table 36.3 and Table 36.4. In case of the output via the LVDS-IF, "ODDF pin" connected with the Odd/even signal of the LVDS-IF.
					DU_DISP_CDE Pin Mode [RZ/G2E] 0: The DU_DISP_CDE pin is fixed to 0. 1: The CLAMP signal is output to the DU_DISP_CDE pin. In case of the output via the DPAD, "DU_DISP_CDE pin" refers to the DU_DISP_CDE pin indicated in Table 36.5. In case of the output via the LVDS-IF, "DU_DISP_CDE pin" connected with the Odd/even signal of LVDS-IF.
26, 25	DIPM	B’00	R/W	DRES	DISP Pin Mode[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] B’00: The DISP signal is output to the DISP pin. B’01: The CSYNC signal is output to the DISP pin. B’10: Setting prohibited. (Fixed to 0.) B’11: The DE signal is output to the DISP pin. In case of the output via the DPAD, "DISP pin" refers to the DU_DISP pin indicated in Table 36.3 and Table 36.4. In case of the output via the LVDS-IF, "DISP pin" connected with the DISP signal of the LVDS-IF.
					DISP Pin Mode [RZ/G2E] B’00: The DISP signal is output to the DISP pin. B’01: Setting prohibited. B’10: Setting prohibited. (Fixed to 0.) B’11: The DE signal is output to the DISP pin. In case of the output via the DPAD, "DISP pin" refers to the DU_DISP pin indicated in Table 36.5. In case of the output via the LVDS-IF, "DISP pin" connected with the DISP signal of the LVDS-IF.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
24	CSPM	B'0	R/W	DRES	CSYNC Pin Mode [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] This description is the specification in case of the output via the DPAD and the LVDS-IF. 0: The CSYNC signal is output to the CSYNC pin. 1: The HSYNC signal is output to the CSYNC pin. In case of the output via the DPAD, "CSYNC pin" refers to the DU_HSYNC/DU_EXHSYNC pin indicated in Table 36.3 and Table 36.4. In case of the output via the LVDS-IF, "CSYNC pin" connected with the HSYNC signal of the LVDS-IF.
					CSYNC Pin Mode [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] This description is the specification in case of the output via the HDMI-IF. 0: Setting prohibited. (Initial value) 1: The HSYNC signal is output to the HSYNC pin. "HSYNC pin" connected with the HSYNC signal of the HDMI-IF.
					HSYNC Pin Mode [RZ/G2E] 0: Setting prohibited (Initial value) 1: The HSYNC signal is output to the HSYNC pin. In case of the output via the DPAD, "HSYNC pin" refers to the DU_HSYNC pin indicated in Table 36.5. In case of the output via the LVDS-IF, "HSYNC pin" connected with the HSYNC signal of the LVDS-IF.
23 to 20	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
19	DIL	B'0	R/W	DRES	DISP Polarity Select 0: The DISP signal becomes a high level during display period. 1: The polarity of the DISP signal is inverted.
18	VSL	B'0	R/W	DRES	VSYNC Polarity Select 0: The VSYNC signal becomes active low. 1: The polarity of VSYNC is inverted.
17	HSL	B'0	R/W	DRES	HSYNC Polarity Select 0: The HSYNC signal becomes active low. 1: The polarity of the HSYNC signal is inverted.
16	DDIS	B'0	R/W	Available	DISP Disable 0: The DISP signal is output. 1: The DISP signal is not output.
15	CDEL	B'0	R/W	Available	CDE Polarity Select 0: The CDE signal becomes high when the CDERn match. 1: The polarity of the CDE signal is inverted.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
14, 13	CDEM	B'00	R/W	Available	CDE Output Mode B'00: The CDE signal is output as is. B'01: The CDE signal is output as is. B'10: The low level is output outside the display period. B'11: The high level is output outside the display period.
12	CDED	B'0	R/W	Available	CDE Disable 0: The CDE signal is output. 1: The CDE signal output is prohibited.
11 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
8	ODEV	B'0	R/W	Available	Odd Even Location for ODDF Signal [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: The odd field (ODDF = low) is located in the first half of the same frame of the interlace display. 1: The odd field (ODDF = low) is located in the second half of the same frame of the interlace display.
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.
7, 6	CSY	B'00	R/W	Available	CSYNC Mode [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] B'00: A waveform obtained by performing exclusive logical OR for VSYNC and HSYNC is output as CSYNC. B'01: Setting prohibited B'10: During intervals of 3 rasters from the VSYNC falling edge, the equalizing pulse is output. After that, during intervals of 3 rasters, the serration pulse is output. After that, during intervals of 3 rasters, the equalizing pulse is output. During other intervals, the HSYNC waveform is output as CSYNC. B'11: After 1/2 rasters from the VSYNC falling edge, the equalizing pulse is output during intervals of 2.5 rasters. After that, during intervals of 2.5 rasters, the serration pulse is output. After that, during intervals of 2.5 rasters, the equalizing pulse is output. During other intervals, the HSYNC waveform is output as CSYNC.
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.
5 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	TVR	B'0	R	Not available	TV Synchronization Error Flag [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: Indicates that, after the TVR bit is cleared with the DRES bit in DSYSRn or the TVCL bit in DSRCRn, the EXVSYNC rising edge is detected every time within the vertical cycle determined with the setting of the VCRn. 1: Indicates that, in TV synchronized mode, the EXVSYNC rising edge was not detected within the vertical cycle determined with the setting of the VCRn. The TVR bit retains its status until it is cleared with the DRES or TVCL bit.
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.
14	FRM	B'0	R	Not available	Frame Flag [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: Indicates the period from the time when the FRM bit is cleared by the DRES bit in DSYSRn or by the FRCL bit in DSRCRn to the time when display of the next field is completed in the non-interlaced mode, or when display of the next even field is completed in interlace sync mode or interlace sync & video mode. 1: Indicates the period (in units of frames) from the start of the vertical blanking period of the first even field after the FRM bit is cleared by the DRES or FRCL bit, to the time when the FRM bit is cleared again.
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.
13, 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
11	VBK	B'0	R	Not available	Vertical Blanking Flag 0: Indicates the period from the time when the VBK bit is cleared by the DRES bit in DSYSRn or by the VBCL bit in DSRCRn to the time when display of the next field is completed. 1: Indicates the period (in units of fields) from the start of the first vertical blanking period after the VBK bit is cleared by the DRES or VBCL bit, to the time when the VBK bit is cleared again.
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9	RINT	B'0	R	Not available	Raster Interrupt Flag 0: Indicates the period from the time when the RINT bit is cleared by the DRES bit in DSYSRn or by the RICL bit in DSRCRn to the time when the period of the rasters set in the RINTOFSRn has elapsed after the beginning of the next field display. 1: Indicates the period from the time when the period of the RINTOFSRn has elapsed after the beginning of the next field display after the RINT bit is cleared by the DRES or RICL bit, to the time when the RINT bit is cleared again.
8	HBK	B'0	R	Not available	Horizontal Blanking Flag 0: Indicates the period from the time when the HBK bit is cleared by the DRES bit in DSYSRn or by the HBCL bit in DSRCRn to the time of the next HSYNC assertion. 1: Indicates the period from the start of the first horizontal blanking period after the HBK bit is cleared by the DRES or HBCL bit, to the time when the HBK bit is cleared again.
7 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details, refer to following table.

The DIERn allows the generation of interrupts for the CPU by aspects of the internal state of the DU as reflected in bits of DSSRn as the sources. When a bit of this register is set, setting of the bit in the same position within DSSRn will lead to the generation of an interrupt for the CPU.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15	TVE	B'0	R/W	Not available	TV Synchronization Signal Error Interrupt Enable [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: Disables the TVR flag interrupt of DSSRn. 1: Enables the TVR flag interrupt of DSSRn.
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.
14	FRE	B'0	R/W	Not available	Frame Flag Interrupt Enable [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: Disables the FRM flag interrupt of DSSRn. 1: Enables the FRM flag interrupt of DSSRn.
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.
13, 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11	VBE	B'0	R/W	Not available	Vertical Blanking Flag Interrupt Enable 0: Disables the VBK flag interrupt of DSSRn. 1: Enables the VBK flag interrupt of DSSRn.
10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
9	RIE	B'0	R/W	Not available	Raster Interrupt Flag Interrupt Enable 0: Disables the RINT flag interrupt of DSSRn. 1: Enables the RINT flag interrupt of DSSRn.
8	HBE	B'0	R/W	Not available	HBK Flag Interrupt Enable 0: Disables the HBK flag interrupt of DSSRn. 1: Enables the HBK flag interrupt of DSSRn.
7 to 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

The following are conditions, based on DSSRn and DIERn, for issuing an interrupt to the CPU from the DUn.
Conditions for issuing an interrupt from each DU = a + b + c + d + e [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
Conditions for issuing an interrupt from each DU = c + d + e [RZ/G2E]

- a = TVR & TVE
- b = FRM & FRE
- c = VBK & VBE
- d = RINT & RIE
- e = HBK & HBE

This register is used to adjust the latency of two display data items output from the DU0 and DU1 when two image data items are output from the LVDS-IF on both edges (rising and falling edges) of the output dot clock.
This register should not be changed from its initial value when the DR0D bit in DORCR0 is 0. When the DR0D bit is set to 1 (when two image data items are output from the LVDS-IF on both edges of the output dot clock), set the necessary bits in this register to 1.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 16	CODE	—	—/W	Not available	DDLTR Enabling Code (register available code) For a value written to DDLTR to be effective, the value must include H'7766 in these bits.

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details, refer to following table.

For RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, the DPLLCR0 control DPLL0. There is no DPLL1.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	CODE	—	—/W	Not available	DPLLCRm* Enabling Code (register available code) For a value written to DPLLCRm* to be effective, the value must include H'95 in these bits.
23	PLCS1	B'0	R/W	DRES	DU1 DPLL Clock Select 0: The DU1 input dot clock source is the DCLKIN pin. 1: The DU1 input dot clock source is the DPLL0. For , this bit is not provided in DPLLCR2.
22 to 19	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
18	CLKE	B'0	R/W	DRES	DPLL0/DPLL1 Clock Output Enable 0: The DPLL0/DPLL1 clock is not output. 1: The DPLL0/DPLL1 clock is output.
17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
16 to 12	FDPLL	H'00	R/W	DRES	Frequency division of the output DPLL0/DPLL1 clock. These bits set the frequency division ratio of output the DPLL0/DPLL1 clock. The clock source is divided by the division ratio of 1/(setting + 1). H'00: Setting prohibited H'01: x1/2 H'02: x1/3 : H'1F: x1/32 The frequency of the divided clock should be less than 400 MHz. There is the frequency division ratio that the duty cycle of the divided clock is not 50%. FDPLL can also be set by the DPLLC2Rm*. In case of setting x 1/33 and over, set by the DPLLC2Rm*.
11 to 5	N	H'00	R/W	DRES	DPLL0/DPLL1 Multiplier Setting of Feedback clock H'00 to H'26: Setting prohibited. H'27: x40 H'28: x41 : H'77: x120 H'78 to H'7F: Setting prohibited. DPLL0/DPLL1 Output Frequency = (DPLL0/DPLL1 Input Frequency x (N+1)) / (M+1) / (FDPLL+1).
4, 3	M	B'00	R/W	DRES	DPLL0/DPLL1 Divider Setting of Clock Input B'00: x1 B'01: x1/2 B'10: x1/3 B'11: x1/4 M can also be set by the DPLLC2Rm*. In case of setting x 1/5 and over, set by the DPLLC2Rm*.
2	STBY	B'0	R/W	DRES	DPLL0/DPLL1 Enable Controls the DPLL0/DPLL1 operation. 0: The DPLL0/DPLL1 stopped. 1: The DPLL0/DPLL1 operates.
1, 0	INCS	B'00	R/W	DRES	DPLL0 Input Clock Select [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] B'00: The DPLL0 input clock source is the DU_DOTCLKIN0 pin. B'01: Setting prohibited. B'10: The DPLL0 input clock source is the DU_DOTCLKIN1 pin. B'11: Setting prohibited.

7	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
6 to 0	FDPLL	H'00	R/W	DRES	Frequency division of the output DPLL0/DPLL1 clock. These bits set the frequency division ratio of output DPLL0/DPLL1 clock. The clock source is divided by the division ratio of 1/(setting + 1). H'00: Setting prohibited H'01: x1/2 H'02: x1/3 : H'7F: x1/128 The frequency of the divided clock should be less than 400MHz. There is the frequency division ratio that the duty cycle of the divided clock is not 50%. To enable this bit, set the SELC bit in this register to 1.

Note: * m = 0 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

36.2.2 Display Timing Generation Registers

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: All registers in section 36.2.2 are common to RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N. For RZ/G2E, there are not EQWRn and SPWRn registers, other registers are common.

The sets of display timing generation registers are for the respective channels and have the same functions; they are described as one here.

(1) Horizontal Display Start Register n (HDSRn)

Address: DU0: H'FEB0_0040, DU1: H'FEB3_0040, DU2: H'FEB4_0040, DU3: H'FEB7_0040

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	HDS									
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9 to 0	HDS	—	R/W	Available	Horizontal Display Start To enable bit 9, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 9 cannot be written to. These bits are used to set the horizontal display start position in dot clock units. The set value is retained at a reset. HDS should be set to 1 or greater.

(2) Horizontal Display End Register n (HDERn)

Address: DU0: H'FEB0_0044, DU1: H'FEB3_0044, DU2: H'FEB4_0044, DU3: H'FEB7_0044

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HDE												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	HDE	—	R/W	Available	Horizontal Display End To enable bit 11, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 11 cannot be written to. To enable bit 12, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12 cannot be written to. These bits are used to set the horizontal display end position in dot clock units. The set value is retained at a reset.

(3) Vertical Display Start Register n (VDSRn)

Address: DU0: H'FEB0_0048, DU1: H'FEB3_0048, DU2: H'FEB4_0048, DU3: H'FEB7_0048

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VDS								
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
8 to 0	VDS	—	R/W	Available	Vertical Display Start These bits are used to set the vertical display start position in raster line units. The set value is retained at a reset. VDS should be set to 1 or greater.

(4) Vertical Display End Register n (VDERn)

Address: DU0: H'FEB0_004C, DU1: H'FEB3_004C, DU2: H'FEB4_004C, DU3: H'FEB7_004C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VDE												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	VDE	—	R/W	Available	Vertical Display End To enable bit 10, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 10 cannot be written to. To enable bit 12, 11, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12, 11 cannot be written to. These bits are used to set the vertical display end position in raster line units. The set value is retained at a reset.

(5) Horizontal Cycle Register n (HCRn)

Address: DU0: H'FEB0_0050, DU1: H'FEB3_0050, DU2: H'FEB4_0050, DU3: H'FEB7_0050

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HC												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	HC	—	R/W	Available	Horizontal Cycle [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] To enable bit 11, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 11 cannot be written to. To enable bit 12, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12 cannot be written to. These bits are used to set one horizontal scan cycle including the horizontal blanking period in dot clock units. In TV synchronized mode, set this register so that the HSYNC cycle set with this register is equal to or greater than the EXHSYNC cycle. The set value is retained at a reset.
					Horizontal Cycle [RZ/G2E] To enable bit 11, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 11 cannot be written to. To enable bit 12, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12 cannot be written to. These bits are used to set one horizontal scan cycle including the horizontal blanking period in dot clock units. The set value is retained at a reset.

(6) Horizontal Sync Width Register n (HSWRn)

Address: DU0: H'FEB0_0054, DU1: H'FEB3_0054, DU2: H'FEB4_0054, DU3: H'FEB7_0054

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	HSW								
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 9	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
8 to 0	HSW	—	R/W	Available	Horizontal Sync Width These bits are used to set the low-level pulse width of the horizontal synchronous signal in dot clock units. The set value is retained at a reset.

(7) Vertical Cycle Register n (VCRn)

Address: DU0: H'FEB0_0058, DU1: H'FEB3_0058, DU2: H'FEB4_0058, DU3: H'FEB7_0058

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VC												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	VC	—	R/W	Available	Vertical Cycle [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] To enable bit 10, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 10 cannot be written to. To enable bit 12, 11, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12, 11 cannot be written to. These bits are used to set the vertical scan cycle including the vertical blanking period in raster line units. In TV synchronized mode, set the time limit of the EXVSYNC rising edge detection. If the EXVSYNC rising edge is not detected within the time limit, the result is reflected in bit 15 in DSSRn. The set value is retained at a reset. Vertical Cycle [RZ/G2E] To enable bit 10, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 10 cannot be written to. To enable bit 12, 11, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12, 11 cannot be written to. These bits are used to set the vertical scan cycle including the vertical blanking period in raster line units. The set value is retained at a reset.

(8) Vertical Sync Point Register n (VSPRn)

Address: DU0: H'FEB0_005C, DU1: H'FEB3_005C, DU2: H'FEB4_005C, DU3: H'FEB7_005C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	VSP												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	VSP	—	R/W	Available	Vertical Sync Point [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] To enable bit 10, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 10 cannot be written to. To enable bit 12, 11, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12, 11 cannot be written to. These bits are used to set the vertical synchronous signal start position in raster line units. In TV synchronized mode, set this register so that the VSYNC falling edge setting position set with this register is the same as or comes after that of the EXVSYNC falling edge. The set value is retained at a reset. Vertical Sync Point [RZ/G2E] To enable bit 10, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 10 cannot be written to. To enable bit 12, 11, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12, 11 cannot be written to. These bits are used to set the vertical synchronous signal start position in raster line units. The set value is retained at a reset.

(9) Equal Pulse Width Register n (EQWRn)

Address: DU0: H'FEB0_0060, DU1: H'FEB3_0060, DU2: H'FEB4_0060, DU3: H'FEB7_0060

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	EQW						
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 7	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
6 to 0	EQW	—	R/W	Available	Equal Pulse Width [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] These bits are used to set the low-level equalizing pulse width of the CSYNC signal in dot clock units. To validate this setting, set bit 7 in DSMRn to 1. The set value is retained at a reset.

(10) Serration Width Register n (SPWRn)

Address: DU0: H'FEB0_0064, DU1: H'FEB3_0064, DU2: H'FEB4_0064, DU3: H'FEB7_0064

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPW									
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
9 to 0	SPW	—	R/W	Available	Serration Width [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] These bits are used to set the low-level serration pulse width of the CSYNC signal in dot clock units. Set a value smaller than 1/2 of HC. To validate this setting, set bit 7 in DSMRn to 1. The set value is retained at a reset.

(11) CLAMP Signal Start Register n (CLAMPSRn)

Address: DU0: H'FEB0_0070, DU1: H'FEB3_0070, DU2: H'FEB4_0070, DU3: H'FEB7_0070

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CLAMPS												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	CLAMPS	—	R/W	Available	CLAMP Signal Start To enable bit 11, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 11 cannot be written to. To enable bit 12, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12 cannot be written to. These bits are used to set the CLAMP signal rising edge position in dot clock units, using as the reference the HSYNC signal falling edge. The CLAMP signal rises (setting value + 1) cycle after the HSYNC signal falls. Therefore, the CLAMP signal cannot rise in the same cycle as the HSYNC signal falling edge. The set value is retained at a reset.

(12) CLAMP Signal Width Register n (CLAMPWRn)

Address: DU0: H'FEB0_0074, DU1: H'FEB3_0074, DU2: H'FEB4_0074, DU3: H'FEB7_0074

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	CLAMPW												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	CLAMPW	—	R/W	Available	CLAMP Signal Width To enable bit 11, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 11 cannot be written to. To enable bit 12, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12 cannot be written to. These bits are used to set the high-level width of the CLAMP signal in dot clock units. When the CLAMP signal is high, if the HSYNC signal falls, the CLAMP signal falls. The set value is retained at a reset.

(13) DE Signal Start Register n (DESRn)

Address: DU0: H'FEB0_0078, DU1: H'FEB3_0078, DU2: H'FEB4_0078, DU3: H'FEB7_0078

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DES												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	DES	—	R/W	Available	DE Signal Start To enable bit 11, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 11 cannot be written to. To enable bit 12, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12 cannot be written to. These bits are used to set the DE signal rising edge position in dot clock units, using as the reference the HSYNC signal falling edge. The DE signal rises (setting value + 1) cycle after the HSYNC signal falls. Therefore, the DE signal cannot rise in the same cycle as the HSYNC signal falling edge. During a vertical blanking period, the DE signal is fixed to the low level. The set value is retained at a reset.

(14) DE Signal Width Register n (DEWRn)

Address: DU0: H'FEB0_007C, DU1: H'FEB3_007C, DU2: H'FEB4_007C, DU3: H'FEB7_007C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DEW												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	DEW	—	R/W	Available	DE Signal Width To enable bit 11, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 11 cannot be written to. To enable bit 12, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12 cannot be written to. These bits are used to set the high-level width of the DE signal in dot clock units. When the DE signal is high, if the HSYNC signal falls, the DE signal falls. The set value is retained at a reset.

36.2.3 Display Attribute Registers

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: All registers in section 36.2.3 are common to RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E.

The sets of display attribute registers are for the respective channels and have the same functions; they are described as one here.

(1) Display Off Mode Output Register n (DOORn)

Address: DU0: H'FEB0_0090, DU1: H'FEB3_0090, DU2: H'FEB4_0090, DU3: H'FEB7_0090

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	DOR						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOG						—	—	DOB						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	DOR	—	R/W	Available	Display Off Mode Output Red These bits are used to set the red display data to be output when the display is off (DRES and DEN bits in DSYSRn are B'00). The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	DOG	—	R/W	Available	Display Off Mode Output Green These bits are used to set the green display data to be output when the display is off (DRES and DEN bits in DSYSRn are B'00). The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	DOB	—	R/W	Available	Display Off Mode Output Blue These bits are used to set the blue display data to be output when the display is off (DRES and DEN bits in DSYSRn are B'00). The set value is retained at a reset.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

(2) Color Detection Register n (CDERn)

Address: DU0: H'FEB0_0094, DU1: H'FEB3_0094, DU2: H'FEB4_0094, DU3: H'FEB7_0094

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CDR						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CDG						—	—	CDB						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	CDR	—	R/W	Available	Color Detection Red These bits are used to set the red data for color detection. The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	CDG	—	R/W	Available	Color Detection Green These bits are used to set the green data for color detection. The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	CDB	—	R/W	Available	Color Detection Blue These bits are used to set the blue data for color detection. The set value is retained at a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Note: When output data matches the setting value of this register, the high level is output from the CDE pin. For details about the output color data format, see section 36.3.5 Data Formats for Output.

(3) Background Plane Output Register n (BPORn)

Address: DU0: H'FEB0_0098, DU1: H'FEB3_0098, DU2: H'FEB4_0098, DU3: H'FEB7_0098

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	BPOR						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BPOG						—	—	BPOB						—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 18	BPOR	—	R/W	Available	Background Plane Output Red These bits are used to set the red color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
17, 16	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
15 to 10	BPOG	—	R/W	Available	Background Plane Output Green These bits are used to set the green color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
9, 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 2	BPOB	—	R/W	Available	Background Plane Output Blue These bits are used to set the blue color to be displayed if no plane to be displayed exists due to a display size, transparent color, and so on. The set value is retained at a reset.
1, 0	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

(4) Raster Interrupt Offset Register n (RINTOFSRn)

Address: DU0: H'FEB0_009C, DU1: H'FEB3_009C, DU2: H'FEB4_009C, DU3: H'FEB7_009C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	RINTOFS												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	RINTOFS	—	R/W	Available	Raster Interrupt Offset To enable bit 10, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 10 cannot be written to. To enable bit 12, 11, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12, 11 cannot be written to. These bits are used to set the raster offset value (number of Hs) that is based on the number of rasters set with the vertical display start register n (VDSRn). If the offset value is assumed to be n, bit 9 in DSSRn is set to 1 at the HSYNC falling edge after the horizontal display period of (VDS + n-the raster). The set value is retained at a reset.

36.2.4 Display Plane Registers

In descriptions of registers that are common to planes 1 and 3, the planes are generically referred to as plane p. The meanings of characters # is given below.

#: Replaces p (in hexadecimal) in addresses. For example, address H'FEB0_0#00 for the plane 3 mode register corresponds to H'FEB0_0300.

(1) Plane p Mode Register m (PpMRm)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Address: DU0/DU1: H'FEB0_0#00, DU2/DU3: H'FEB4_0#00

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	PpSPIM			—	—	—	—	—	—	—	—	—	—	PpDDF	
Initial value:	—	0	0	0	—	—	—	—	—	—	—	—	—	—	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 15	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
14 to 12	PpSPIM	B'000	R/W	Available	Plane p Super Impose Mode [(DU0/DU1)] B’000: Setting prohibited. B’001: Setting prohibited. B’010: Setting prohibited. B’011: Setting prohibited. B’100: Transparent color processing is not performed for plane p. Plane p is displayed. B’101: α blending of plane p and the lower plane is performed. The transparent color specification for plane p is ignored, and α blending is performed between all the pixels of plane p and the lower plane. B’110: An EOR operation is performed on plane p and the lower plane. The transparent color specification for plane p is ignored, and EOR operation is performed on all the pixels of plane p and the lower plane. B’111: Setting prohibited Plane 1 Super Impose Mode [RZ/G2M V1.3, RZ/G2M V3.0(DU2)] B’000: Setting prohibited. B’001: Setting prohibited. B’010: Setting prohibited. B’011: Setting prohibited. B’100: Transparent color processing is not performed for plane 1. Plane 1 is displayed. B’101: Setting prohibited. B’110: Setting prohibited. B’111: Setting prohibited Plane 3 Super Impose Mode [RZ/G2H, RZ/G2N(DU3)] B’000: Setting prohibited. B’001: Setting prohibited. B’010: Setting prohibited. B’011: Setting prohibited. B’100: Transparent color processing is not performed for plane 3. Plane 3 is displayed. B’101: Setting prohibited. B’110: Setting prohibited. B’111: Setting prohibited
11 to 2	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
1, 0	PpDDF	B'00	R/W	Available	Plane p Display Data Format B’00: Setting prohibited. B’01: 16-bit/pixel B’10: Setting prohibited. B’11: YC. For RZ/G2H, RZ/G2N, bits 9 and 8 in DEFR3 are set to B'10 or B'11 and bit 15 and bit 14 in DEF10R2 set to 1. For RZ/G2M V1.3, RZ/G2M V3.0, bits 9 and 8 in DEFR2 are set to B'10 or B'11 and bit 11 and bit 10 in DEF10R2 set to 1. For RZ/G2E, when YC is output from DU0, Bits 9 and 8 in DEFR0 are set to B'10 or B'11 and bit 11 and bit 10 in DEF10R0 set to 1. Alternatively, when YC is output from DU1, bits 9 and 8 in DEFR1 are set to B'10 or B'11 and bit 15 and bit 14 in DEF10R0 set to 1. In the case of 32-bit/pixel data, set these bits to B'01.

(2) Plane p Display Size X Register m (PpDSXRm)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Address: DU0/DU1: H'FEB0_0#10, DU2/DU3: H'FEB4_0#10

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PpDSX												
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 13	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
12 to 0	PpDSX	—	R/W	Available	Plane p Display Size X To enable bit 11, set the DEFE5 bit in DEF5Rm to 1. In the initial state, bit 11 cannot be written to. To enable bit 12, set the DEFE10 bit in DEF10Rm to 1. In the initial state, bit 12 cannot be written to. The horizontal-direction display size of plane p should be set in dot clock units. Note: When YC has been selected by the PpDDF bits in PpMRm, this value should be set to an even number. The value is retained during a reset.

(3) Plane p Display Size Y Register m (PpDSYRm)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Address: DU0/DU1: H'FEB0_0#14, DU2/DU3: H'FEB4_0#14

	—	—	—	—	—	—	SYNCSEL/—*		—	—	FRQSEL					
Initial value:	—	—	—	—	—	—	0/—*	0/—*	—	—	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W*	R/W*	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Note: * For reserved bit (bit name: —), initial value is undefined, writing is not available and writing value should be specified. For details of bit description, refer to following table.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 26	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
25	DCKOINV	B'0	R/W	Not available	DCLKOUT Invert To enable this bit, set the DEFE bit in DEFRn to 1. In the initial state, this bit is fixed to 0. 0: The DCLKOUT is output in normal phase. 1: The DCLKOUT is output in counter phase. For RZ/G2H, RZ/G2N, this bit is provided in ESCR3. For RZ/G2M V1.3, RZ/G2M V3.0, this bit is provided in ESCR2. For RZ/G2E, this bit is provided in ESCR1 or ESCR0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
24	DCKOSEL	B'0	R/W	Not available	Output Dot Clock Select (DCLKOUT Select) To enable this bit, set DEFE to 1 in DEFRn. In the initial state, this bit is fixed at 0. Set this bit to 1 to specify display output in YC data format. 0: The DCLKOUT division ratio is determined by bits 5 to 0 in this register. 1: The DCLKIN is used as the DCLKOUT, regardless of the division ratio. For RZ/G2H, RZ/G2N, this bit is provided in ESCR3. For RZ/G2M V1.3, RZ/G2M V3.0, this bit is provided in ESCR2. For RZ/G2E, this bit is provided in ESCR1 or ESCR0.
23 to 21	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
20	DCLKSEL	B'0	R/W	Not available	DCLKIN Select [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: The input dot clock source is the DCLKIN pin 1: The input dot clock source is the S2D1ϕ clock. If this setting is made, ensure that the frequency of the input dot clock is divided by two or a greater value (so that the result of dividing the frequency is more than or equal to half the S2D1ϕ frequency).
					DCLKIN Select [RZ/G2E] 0: The input dot clock source is the DCLKIN pin 1: The input dot clock source is the S1D1ϕ clock. If this setting is made, ensure that the frequency of the input dot clock is divided by two or a greater value (so that the result of dividing the frequency is more than or equal to half the S1D1ϕ frequency).
19 to 17	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
16	DCLKDIS	B'0	R/W	Not available	DCLKOUT Disable 0: The DCLKOUT is output. 1: The DCLKOUT is not output. The DCLKOUT is fixed to low level. For RZ/G2H, RZ/G2N, this bit is provided in ESCR3. For RZ/G2M V1.3, RZ/G2M V3.0, this bit is provided in ESCR2. For RZ/G2E, this bit is provided in ESCR1 or ESCR0.
15 to 10	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
9, 8	SYNCSEL	B'00	R/W	Not available	SYNC Select t [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] B'00: Phases are not synchronized B'01: Phases are not synchronized B'10: Phases are synchronized by using the EXVSYNC signal B'11: Phases are synchronized by using the EXHSYNC signal
	—	—	R	—	Reserved [RZ/G2E] The read value is undefined. The write value should always be 0.
7, 6	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
5 to 0	FRQSEL	B'00_0000	R/W	Not available	Frequency Select To enable bit 5, the DEFE bit in DEFRn must be set to 1. In the initial state, bit 5 is fixed to 0. If frequency division is by an odd number, the duty cycle of the frequency divided dot clock will be below 50%. For RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, these bits are not provided in ESCR1. B'00_0000: Frequency division of the input dot clock (clock for division) is not performed. Dot clock is the DCLKIN pin. B'00_0001: Division by 2 of the input dot clock (clock for division) B'00_0010: Division by 3 of the input dot clock (clock for division) : Division by (FRQSEL+1) of the input dot clock : (clock for division) B'11_1111: Division by 64 of the input dot clock (clock for division)

(2) Output Signal Timing Adjustment Register n (OTARn)

Note: n = 3 [RZ/G2H, RZ/G2N]
n = 2 [RZ/G2M V1.3, RZ/G2M V3.0]
n = 0 and 1 [RZ/G2E]

Address: DU0: H'FEB1_0004, DU1: H'FEB3_1004, DU2: H'FEB5_0004, DU3: H'FEB7_1004

B’010: The CLAMP signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. B’011: The CLAMP signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. B’100: The CLAMP signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. B’101: The CLAMP signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. B’110: The CLAMP signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. B’111: The CLAMP signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing.
23	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
22 to 20	DRGBA	B’000	R/W	DRES	Digital RGB Output Timing Adjustment B’000: Adjustment of output timing is not performed. The digital RGB signal is output on the rising edge of the dot clock, with the reference timing. B’001: The digital RGB signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. B’010: The digital RGB signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. B’011: The digital RGB signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. B’100: The digital RGB signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. B’101: The digital RGB signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. B’110: The digital RGB signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. B’111: The digital RGB signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing.
19 to 11	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
10 to 8	CDEA	B’000	R/W	DRES	CDE Output Timing Adjustment B’000: Adjustment of output timing is not performed. The CDE signal is output on the rising edge of the dot clock, with the reference timing. B’001: The CDE signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. B’010: The CDE signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. B’011: The CDE signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. B’100: The CDE signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. B’101: The CDE signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. B’110: The CDE signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. B’111: The CDE signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing.
7	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
6 to 4	DISPA	B’000	R/W	DRES	DISP Output Timing Adjustment B’000: Adjustment of output timing is not performed. The DISP signal is output on the rising edge of the dot clock, with the reference timing. B’001: The DISP signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. B’010: The DISP signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. B’011: The DISP signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. B’100: The DISP signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. B’101: The DISP signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. B’110: The DISP signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. B’111: The DISP signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing.
3	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
2 to 0	SYNCA	B’000	R/W	DRES	SYNC* Output Timing Adjustment B’000: Adjustment of output timing is not performed. The SYNC* signal is output on the rising edge of the dot clock, with the reference timing. B’001: The SYNC* signal is output on the rising edge, delayed one dot clock cycle relative to the reference timing. B’010: The SYNC* signal is output on the rising edge, delayed two dot clock cycles relative to the reference timing. B’011: The SYNC* signal is output on the rising edge, delayed three dot clock cycles relative to the reference timing. B’100: The SYNC* signal is output on the falling edge, preceding the reference timing by 1/2 dot clock cycle. B’101: The SYNC* signal is output on the falling edge, delayed 1/2 dot clock cycle relative to the reference timing. B’110: The SYNC* signal is output on the falling edge, delayed (1+1/2) dot clock cycles relative to the reference timing. B’111: The SYNC* signal is output on the falling edge, delayed (2+1/2) dot clock cycles relative to the reference timing. Note: * HSYNC, VSYNC, CSYNC, and ODDF signals. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] Note: * HSYNC, VSYNC, signals. [RZ/G2E]

Note: For RZ/G2E, when signals are to be output on the falling edge, the electrical characteristics do not apply.

36.2.7 YC-RGB Conversion Coefficient Registers

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The sets of YC-RGB conversion coefficient registers are for the respective channels and have the same functions; they are described as one here. However, the usable bits by each products are as Table 36.23. The unusable bits are changed to the reserved bits.

Table 36.23 Configuration of YC-RGB Conversion Coefficient Registers

			Second Generation RZ/G Series Products			
Suffix m of register	**Register bits**	**Suffix m of superimposition processors**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
0	31 to 16	1	√	√	√	√
	15 to 0	0	√	√	√	√
2	31 to 16	3	√	—	√	—
	15 to 0	2	—	√	—	—

(1) Y Normalization Coefficient Register m (YNCRm)

Address: DU0/DU1: H'FEB1_4080, DU2/DU3: H'FEB5_4080

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	YNC1

R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	YNC0											
Initial value:	—	—	—	—	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	YNC1	H'800	R/W	Available	Y Normalization Coefficient 1 This coefficient is for normalization of Y values in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	YNC0	H'800	R/W	Available	Y Normalization Coefficient 0 This coefficient is for normalization of Y values in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.

(2) Y Normalization Offset Register m (YNORm)

Address: DU0/DU1: H'FEB1_4084, DU2/DU3: H'FEB5_4084

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	YNO1							
Initial value:	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	YNO0							
Initial value:	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 16	YNO1	H'00	R/W	Available	Y Normalization Offset 1 This offset is to be subtracted from Y values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The offset is an unsigned 8-bit integer. Its default value is 0.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	YNO0	H'00	R/W	Available	Y Normalization Offset 0 This offset is to be subtracted from Y values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The offset is an unsigned 8-bit integer. Its default value is 0.

(3) Cr Normalization Offset Register m (CRNORm)

Address: DU0/DU1: H'FEB1_4088, DU2/DU3: H'FEB5_4088

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CRNO1							
Initial value:	—	—	—	—	—	—	—	—	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CRNO0							
Initial value:	—	—	—	—	—	—	—	—	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 16	CRNO1	H'80	R/W	Available	Cr Normalization Offset 1 This offset is to be subtracted from Cr values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The offset is an unsigned 8-bit integer. Its default value is 128.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	CRNO0	H'80	R/W	Available	Cr Normalization Offset 0 This offset is to be subtracted from Cr values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The offset is an unsigned 8-bit integer. Its default value is 128.

(4) Cb Normalization Offset Register m (CBNORm)

Address: DU0/DU1: H'FEB1_408C, DU2/DU3: H'FEB5_408C

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CBNO1							
Initial value:	—	—	—	—	—	—	—	—	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 24	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
23 to 16	CBNO1	H'80	R/W	Available	Cb Normalization Offset 1 This offset is to be subtracted from Cb values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The offset is an unsigned 8-bit integer. Its default value is 128.
15 to 8	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
7 to 0	CBNO0	H'80	R/W	Available	Cb Normalization Offset 0 This offset is to be subtracted from Cb values before they are normalized in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The offset is an unsigned 8-bit integer. Its default value is 128.

(5) Red Cr Coefficient Register m (RCRCRm)

Address: DU0/DU1: H'FEB1_4090, DU2/DU3: H'FEB5_4090

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	RCRC1											
Initial value:	—	—	—	—	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	RCRC0											
Initial value:	—	—	—	—	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	RCRC1	H'AF0	R/W	Available	Red Cr Coefficient 1 Cr is multiplied by this coefficient to create the red component in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.37.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	RCRC0	H'AF0	R/W	Available	Red Cr Coefficient 0 Cr is multiplied by this coefficient to create the red component in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.37.

(6) Green Cr Coefficient Register m (GCRCRm)

Address: DU0/DU1: H'FEB1_4094, DU2/DU3: H'FEB5_4094

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	GCRC1

Initial value:	—	—	—	—	1	1	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Internal Update	Description
31 to 28	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
27 to 16	BCBC1	H'DE0	R/W	Available	Blue Cb Coefficient 1 Cb is multiplied by this coefficient to create the blue component in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.73.
15 to 12	—	—	R	—	Reserved The read value is undefined. The write value should always be 0.
11 to 0	BCBC0	H'DE0	R/W	Available	Blue Cb Coefficient 0 Cb is multiplied by this coefficient to create the blue component in YC-RGB conversion by the YC-RGB conversion generation by superimposition processors m. The coefficient is a fixed-point 12-bit value. The 11th bit represents the integer one or zero and the 10th to 0th bits represent the value below the fixed point. The default value is 1.73.

36.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

36.3.1 Configuration of Output Screen

The DU executes window displays with up to a maximum of two window layers. Each of these windows is called a "plane", and the order of stacking of the planes can be set arbitrarily. For each plane, display can be turned on and off, and the display data format (32-bit/pixel, YC), blending functions, and other settings can be changed independently. For RZ/G2M V1.3, RZ/G2M V3.0, plane 3 in the DU2 cannot be used and plane 1 superimposing in DU2 cannot be operated. For RZ/G2H, RZ/G2N, plane 1 in the DU3 cannot be used and plane 3 superimposing in DU3 cannot be operated.

Table 36.24 Display Functions of Planes

		Display Data Format			
	Display On/Off	YC	32-bit/pixel	Superimposing	Size
Plane 1	✓	✓	✓	α blending/EOR operation	X, Y (as desired)
Plane 3	✓	✓	✓	Same as above	Same as above

36.3.2 Display On/Off

All plane display can be turned on and off using the DEN bit in DSYSRn. When the DEN bit is 0, the display data set in DOORn is displayed.

When the value of the DPRS bit in DORCRm is 0, DPPRm is used to turn the display of planes 1 and 3 on and off. When the value of the DPRS bit in DORCRm is 1, on the other hand, DSPRn are used to turn the display of planes 1 and 3 on and off. Under the following display conditions, display data set in BPORn is displayed. RZ/G2M V1.3, RZ/G2M V3.0, plane 3 in the DU2 cannot be used. For RZ/G2H, RZ/G2N, plane 1 in the DU3 cannot be used.

1. When display of all planes 1 and 3 is turned off
2. In an area with no plane for display, due to the display size and display position
3. When the pixels in a plane for display are all a transparent color

Table 36.25 Turning On and Off the Display of Planes 1 and 3 (when the DPRS bit in DORCRm is 0)

Display Plane	Display Plane Priority Register m (DPPRm)
Plane 1	Plane 1 is selected in one among priority positions 1 and 2, and the corresponding enable bit is set to 1
Plane 3	Plane 3 is selected in one among priority positions 1 and 2, and the corresponding enable bit is set to 1

Table 36.26 Turning On and Off the Display of Planes 1 and 3 (when the DPRS bit in DORCRm is 1)

Display Plane	Display Superimpose Priority Register n (DSPRn)
Plane 1	Plane 1 is selected in one among priority positions 1 and 2 (setting to select the plane: B'0001)
Plane 3	Plane 3 is selected in one among priority positions 1 and 2 (setting to select the plane: B'0011)

Notes: Even if display on is set using DPPRm and DSPRn under the following conditions, the setting is handled as display off, and the corresponding plane is not displayed.

- Planes for which the value set in PpDPXRm is greater than the screen size (horizontal display end (HDE) - horizontal display start (HDS))
- Planes for which the value set in PpDPYRm is greater than the screen size (vertical display end (VDE) - vertical display start (VDS))
- Planes for which the value set in PpDSXRm is 0
- Planes for which the value set in PpDSYRm is 0

36.3.3 Plane Parameter

For each plane, a display area start position, memory width, display start position, and display size are set using registers.

The followings are the schematic diagram of start positions and sizes related to planes and the registers used for setting start positions and sizes.

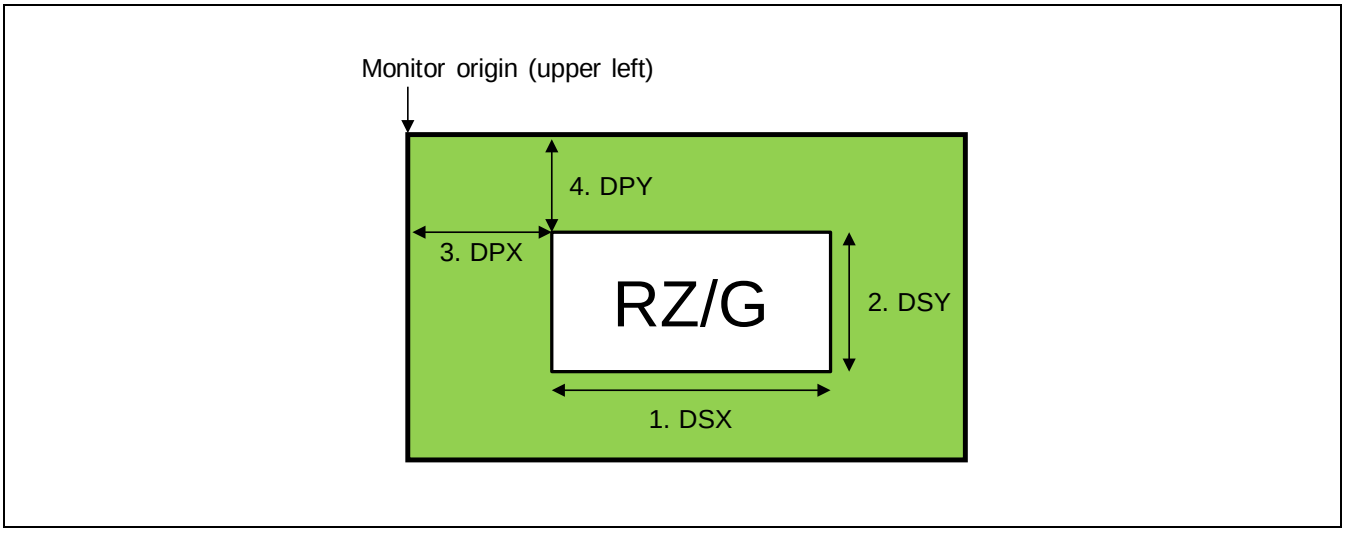

Figure 36.4 Parameters

Table 36.27 Monitor Parameter Setting Registers

No.	Name Used in the Figure	Register	Description
1	DSX (Display size X)	PpDSXRm	The X-direction display size of plane is set in dot-clock units.
2	DSY (Display size Y)	PpDSYRm	The Y-direction display size of plane is set in raster line units.
3	DPX (Display position X)	PpDPXRm	The X-direction distance to the display position is set in dot-clock units, taking the upper-left corner of the monitor as the origin.
4	DPY (Display position Y)	PpDPYRm	The Y-direction distance to the display position is set in raster line units, taking the upper-left corner of the monitor as the origin.

36.3.4 Data Format for Input

The following format is used for color data used in display. A data configuration is shown in which data is allocated to the unified memory in little endian.

(1) 32-bit/pixel: ARGB8888

Levels for A, R, G, and B are represented by 8 bits each (ARGB8888). Note that the format includes a setting for alpha ratio in addition to the R, G, and B values. In this section, "32-bit/pixel" refers to the ARGB8888 format unless otherwise specified.
A 32-bit/pixel (ARGB8888) display should be specified with the PpEDF bits in PpDDC4Rm.
Only the value A is applied as the alpha value in ARGB8888.

32-bit/pixel data (ARGB8888 data) format

(2) 32-bit/pixel: RGB888

Levels for R, G, and B are represented by 8 bits each (RGB888). "—" Indicates any desired value.

A 32-bit/pixel (RGB888) display should be specified with the PpEDF bits in PpDDC4Rm.

32-bit/pixel data (RGB888 data) format

(3) 32-bit/pixel: RGB666

Levels for R, G, and B are represented by 6 bits each (RGB666). "—" Indicates any desired value.

A 32-bit/pixel (RGB666) display should be specified with the PpEDF bits in PpDDC4Rm.

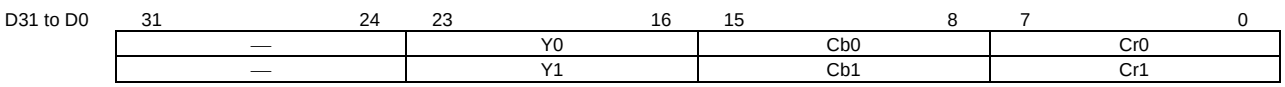
32-bit/pixel data (RGB666 data) format

(4) YC: YCbCr444

Image data has the format YC (YCbCr) = 4:4:4. "—" Indicates any desired value.

A YC(YCbCr444) display should be specified with the PpEDF bits in PpDDC4Rm and value other than B’11 is specified in the PpDDF bit in PpMRm.

YC(YCbCr444) format



The formulae for YC-RGB conversion are given below. The underlined coefficients are defined by the settings in the corresponding registers.

R = YNC * (Y - YNO) + RCRC * (Cr - CRNO)
G = YNC * (Y - YNO) - GCRCR * (Cr - CRNO) - GCBC * (Cb - CBNO)
B = YNC * (Y - YNO) + BCBC * (Cb - CBNO)

The formulae for YC-RGB conversion in the default state are thus as follows.

R = Y + 1.37 * (Cr - 128)
G = Y - 0.698 * (Cr - 128) - 0.336 * (Cb - 128)
B = Y + 1.73 * (Cb - 128)

36.3.5 Data Formats for Output

In the case of digital RGB output from the DU, superimposing in the form of α blending and EOR operations is performed after the display data format has been expanded into the RGB888 format, and then the data are output. The supplementary formats in the case of expansion to RGB888 and output data formats are as indicated in the following table. For YCbCr422 output formats, refer to section 36.3.9 YC Format Display.

Table 36.28 Output Data Format

		Red								Green								Blue							
		7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Expanded data	32-bit/pixel (ARGB8888)	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (RGB888)	R (8 bits)								G (8 bits)								B (8 bits)							
	32-bit/pixel (RGB666)	R (6 bits)						0	0	G (6 bits)						0	0	B (6 bits)						0	0
After superimposing		R (8 bits)								G (8 bits)								B (8 bits)							
Output Data Format		R (8 bits)								G (8 bits)								B (8 bits)							
		Y								Cb								Cr							
		7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Expanded data		Y (8 bits)								Cb (8 bits)								Cr (8 bits)							
After superimposing		Y (8 bits)								Cb (8 bits)								Cr (8 bits)							
Output Data Format (YCbCr444) (After YC-RGB conversion)		Y (8 bits)								Cb (8 bits)								Cr (8 bits)							
		R (8 bits)								G (8 bits)								B (8 bits)							

36.3.6 Superimposing of Planes

For each plane, two types of combined superimposing are possible: α blending and EOR operations. By setting the PpSPIM bits in PpMRm, the super positioned display type can be selected.

However, α blending and EOR operation cannot be performed simultaneously on the same plane.

The alpha ratio of the 32-bit/pixel data (ARGB8888) can only be the higher-order eight bits (A value).

Table 36.29 Superimposing

PpSPIM	Superimposing
B'000	Setting prohibited. (Default)
B'001	Setting prohibited.
B'010	Setting prohibited.
B'011	Setting prohibited
B'100	The specified plane is displayed.
B'101	Blending of the specified plane with the lower plane is performed.
B'110	EOR operation of the specified plane and the lower plane is performed.
B'111	Setting prohibited

After the image data format has been expanded to RGB888, α blending or EOR operation is performed. The complementary format of each display data format is shown in Table 36.28. α blending and EOR operation are performed in the sequence of the lower plane to the upper plane. The block diagram is shown below.

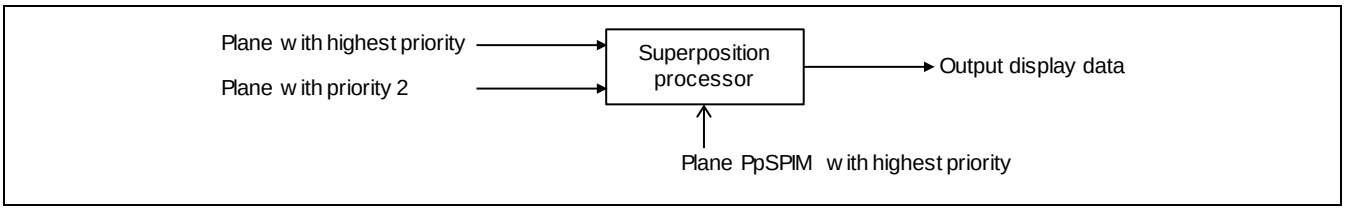


Figure 36.5 Plane Processing Sequence in α Blending and EOR Operation

When display of all lower planes is turned off, the specified plane is displayed. That is, α blending or EOR operation of the specified plane with the image data specified in BPORn is not performed.

(1) α Blending

The alpha ratio can only be the higher-order eight bits (A value) of the 32-bit/pixel data (ARGB8888).

$$\text{Result of blending} \approx (\text{specified plane} \times \alpha/255 + \text{lower plane} \times (1 - \alpha/255) \quad \text{(Approximation)}$$

In the above formula, the blending result, α, the specified plane, and the lower plane are all given as 8-bit data.

(2) EOR Operation

EOR operation of the specified plane with the lower plane is performed.

36.3.7 Sync Mode

In order to facilitate synchronization with external equipment, in addition to master mode, a TV synchronization function is provided. Selection of master mode and TV sync mode is performed using bits 7 and 6 in DSYSRn. In master mode (internal sync mode), the position of the falling edge of the vertical sync signal (VSYNC) set by VSPRn is detected. In TV sync mode (external sync mode), the position of the falling edge of the EXVSYNC signal is detected. The results are then reflected in the bits 14 and 11 in DSSRn.

Master Mode (Internal Sync Mode): By setting the period and pulse width of the horizontal and vertical sync signals (HSYNC, VSYNC) in the display timing generation registers, the corresponding waveforms are output. Also, display data is output in sync with these signals.

In interlaced sync mode and interlaced sync & video mode, a signal is output to the ODDF pin indicating odd/even fields.

TV Sync Mode (External Sync Mode): In TV sync mode, display data is output in sync with a horizontal sync signal and vertical sync signal (EXHSYNC, EXVSYNC) input from a TV, video, or other external sync signal generation circuit. Display data is output with reference to the falling edge of the EXHSYNC signal and the rising edge of the EXVSYNC signal.

The horizontal sync signal, vertical sync signal, and clock signal from the external sync signal generation circuit are input to the EXHSYNC, EXVSYNC, and DCLKIN pins, respectively. CSYNC is at high level. In interlaced sync mode and interlaced sync & video mode, a signal should be input to the EXODDF pin indicating odd/even fields. In non-interlaced mode, the input to the EXODDF pin should be fixed at low level or at high level.

When operating the DU in TV sync mode also, values must be set in HSWRn, HCRn, VSPRn, and VCRn in

Display Timing Generation Registers

When the EXVSYNC signal is input, either before or after completion of display of the display size portion set in the DU, the DU performs vertical display completion operation and transitions to control for the next screen. When the EXVSYNC signal is not input, the unit continues to wait for the EXVSYNC signal while remaining in the vertical blanking interval (auto-control is not performed). Similarly, when the EXHSYNC signal is input the DU performs horizontal display completion operation and transitions to control for the next raster line; but if the EXHSYNC signal is not input, the unit continues to wait for the EXHSYNC signal while remaining in the horizontal blanking interval (auto-control is not performed).

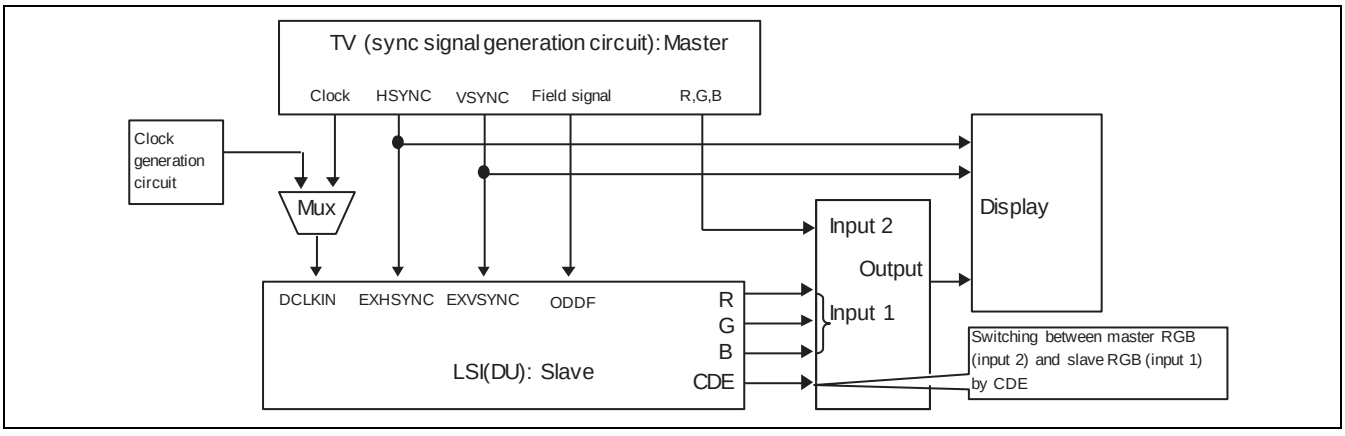

Figure 36.6 Signal Flow in TV Sync Mode [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

Sync Method Switching Mode: When switching from master mode into TV sync mode, or from TV sync mode into master mode, when necessary this mode should be switched into first. Even if a transition to this mode is not made first, switching of the synchronization method is possible.

In this mode, input/output pins connected to the DU are for input, and so collision of pin signals can be avoided. Also, in this mode the internal dot clock is stopped, so that disorder in the input dot clock has no effect on display operation.

36.3.8 Dual Display Output

The DU has superimposition processors, display-timing generators, pin controllers, and dot-clock generators, each of which is independently controllable. The DU0 and DU1 realize various types of display because two channels are available for selecting from among the two display planes.

(1) Independent Display

Different images can be displayed with different sizes by specifying different superimposition processors, display-timing generators, pin controllers, and dot-clock generators.
However, separate output images cannot be produced from a single plane. To display a single set of image data in separate output images, two planes must be used.

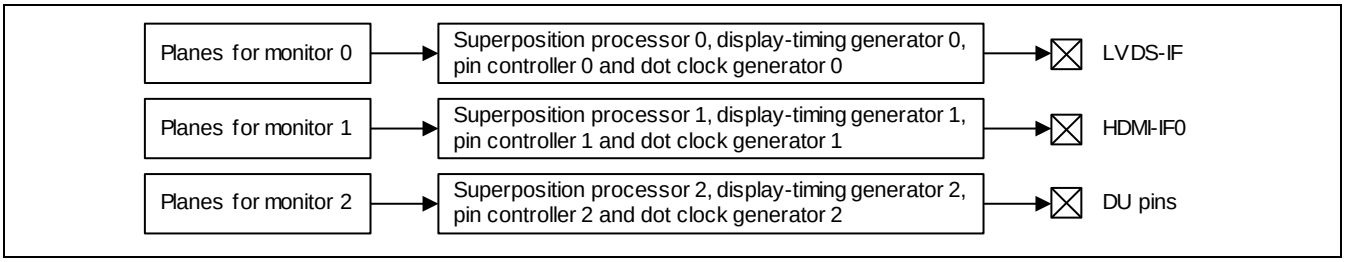

Figure 36.7 Independent Display [RZ/G2M V1.3, RZ/G2M V3.0]

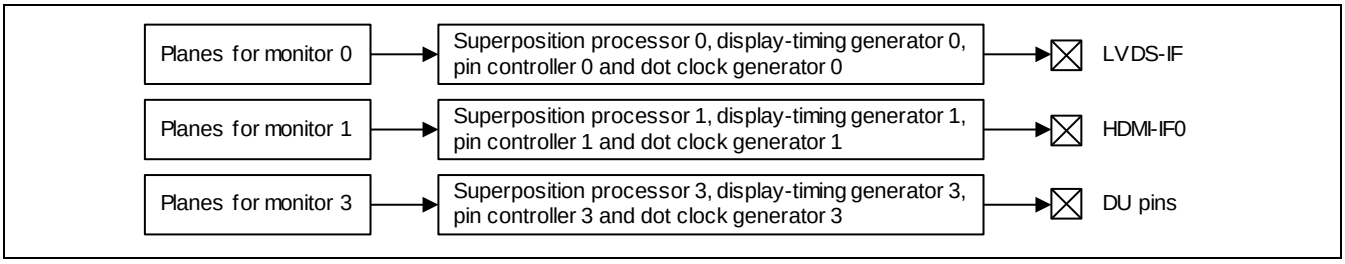

Figure 36.8 Independent Display [RZ/G2H, RZ/G2N]

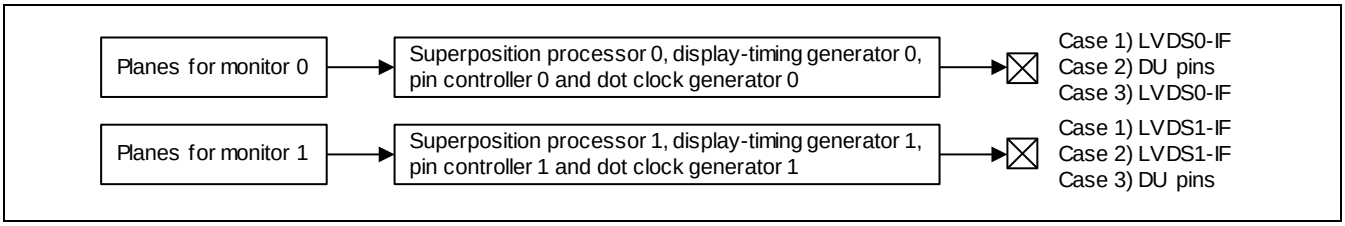

Figure 36.9 Independent Display [RZ/G2E]

(2) Display of Different Images on Monitors of the Same Size

Different images can be displayed on monitors of the same size when the same display-timing generator and dot-clock generator have been specified but the superimposition processors and pin controllers are different.

Images can be output to two monitors through a single set of pins by switching the display data in synchronization with the output dot clock.

When images are output to two monitors through a single set of pins, the image data can be output only via the LVDS-IF.

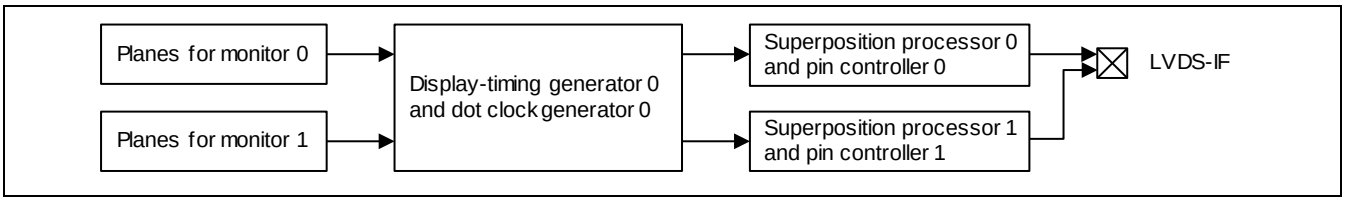

Figure 36.10 Display of Different Images on Monitors of the Same Size

The timing for switching of display data in synchronization with the output dot clock is shown below. This feature is only supported by the LVDS-IF. For switching display data in synchronization with the output dot clock, the output dot clock should be set to be division by two or more of the input dot clock.

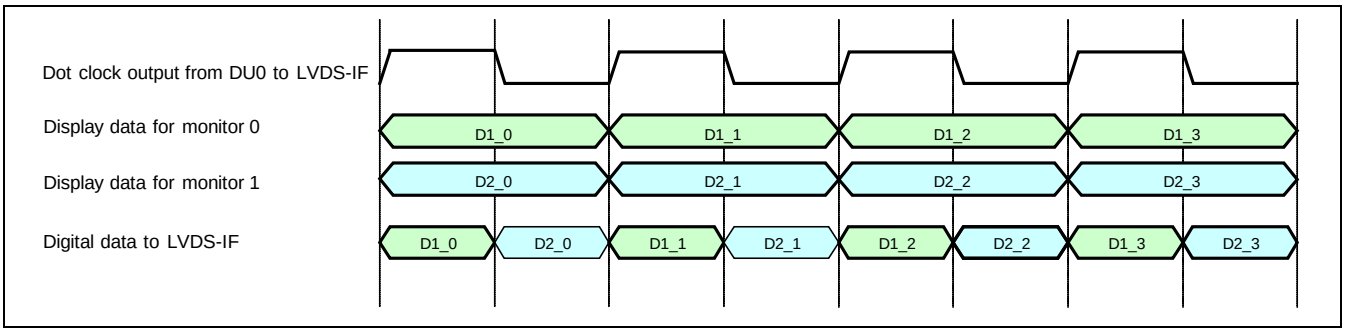

Figure 36.11 Switching Display Data in Synchronization with the Output Dot Clock

(3) Combinations of Blocks for Dual Display Output

For dual display output, the dot clock to be supplied to blocks in the DU, timing signals including SYNC, and display data are specifiable by setting the corresponding registers. Table 36.30 is a matrix of the combinations of blocks, and Table 36.31 gives the meanings of the symbols used in Table 36.30.

When the input block is superimposition processor 1, for example, the information indicated in the table is as follows.

- The dot clock is that from dot-clock generator 0 or 1 as selected by the DR0D and DK1S bits in DORCR0 (No. 5 in the table).
- The timing signal is that from display-timing generator 0 or 1 as selected by the DR0D and PG1T bits in DORCR0 (No. 3 in the table).
- The planes for superimposing of data are selected in DSPR0 (No. 12 in the table).

Take care with register settings because timing signals such as the dot clock, sync signals and so on are freely specifiable, but if the dot clock or other timing signals differ from block to block, a normal display will not be possible.

Table 36.30 Combinations of Blocks

Input Block \ Output Block	Dot-clock generator 0 (clock)	Dot-clock generator 0 (external SYNC)	Dot-clock generator 1 (clock)	Dot-clock generator 1 (external SYNC)	Display-timing generator 0	Display-timing generator 1	Superimposition processor 0	Superimposition processor 1	Pin controller (output timing adjustment) 0	Pin controller (output timing adjustment) 1	Planes 1 and 3	DU0 input pins	DU1 input pins

36.3.9 YC Format Display

In addition to RGB format display, YC format can be displayed. YCbCr444 data from VSP convert into YCbCr422 format and display as YC format. For RZ/G2H, RZ/G2N, YC(YCbCr422) format can be displayed from the DU3 to external pins. YC format display cannot be superimposed. For RZ/G2M V1.3, RZ/G2M V3.0, YC (YCbCr422) format can be displayed from the DU2 to external pins. For RZ/G2E, YC (YCbCr422) format can be displayed from the DU0 or DU1 to external pins.

RGB format display and YC format display is selected by setting bits 9 and 8 in DEFRn*. Bits 9 and 8 setting of B'10 selects 16-bit YC format display (non-multiplexed), and a setting of B'11 selects 8-bit YC format display (multiplexed). A setting of B'00 selects RGB format.

When YC format is displayed by timing as shown in Figure 36.12 and Figure 36.15, input a 2× clock to DCLKIN and specify division by 2. Also output a 2× clock from DCLKOUT. Both 2× clock output and division by 2 are specified by settings in ESCRn*. Non-multiplexed YC format can be displayed in Figure 36.13 and Figure 36.14, this setting is not required.

Note: * n = 3 [RZ/G2H, RZ/G2N], n = 2 [RZ/G2M V1.3, RZ/G2M V3.0], n = 0, 1 [RZ/G2E]

36.3.10 Display Timing Generation

In the DU, display timing is generated for the horizontal direction and vertical direction of the display screen. Display timing is set by using display timing generation registers in section 36.2.2. Figure 36.16 shows the display timing in non-interlaced mode. Here, the display screen is defined in terms of the variables of Table 36.33.

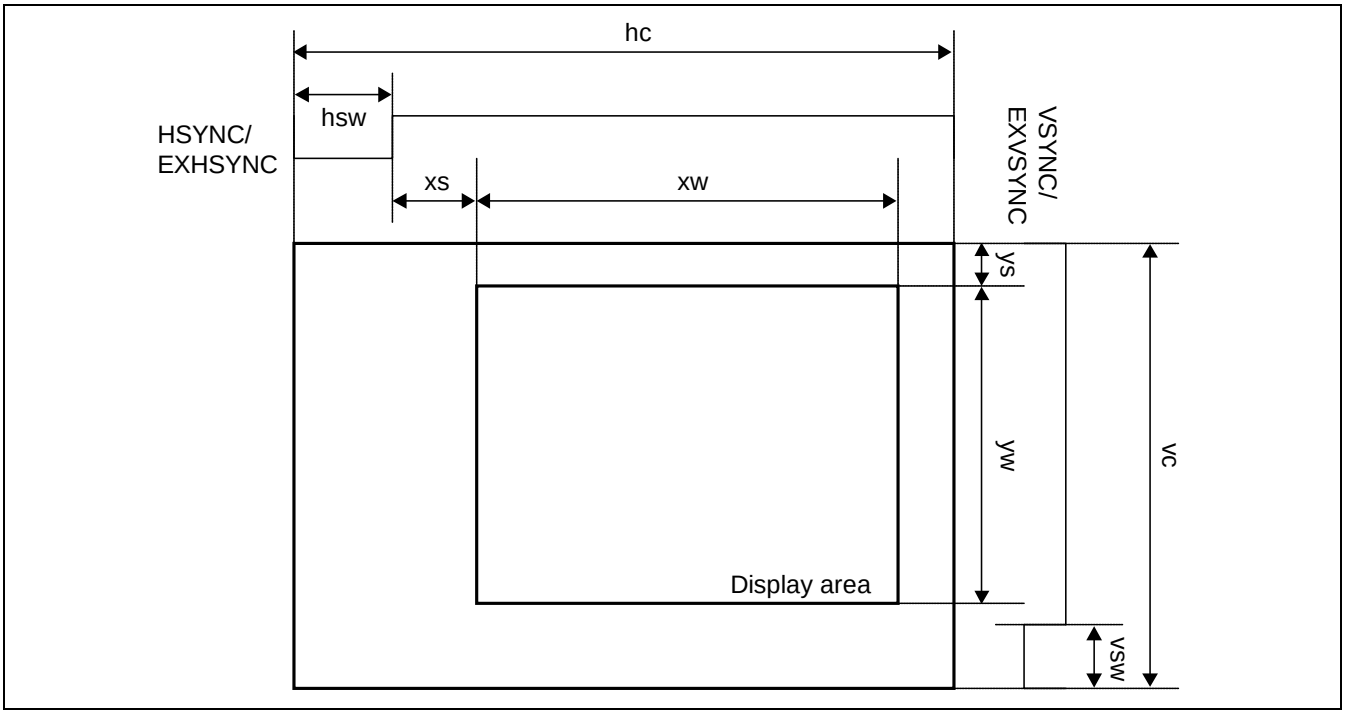

Figure 36.16 Display Timing Generation for Horizontal Direction and Vertical Direction of Display Screen

Table 36.33 Variables Defined in Display Screen

Variables	Contents	Units
hc*1	Horizontal scan period	Dot clock
hsw	Horizontal sync pulse width	Dot clock
xs	From rise of HSYNC to display start position in the horizontal direction of the display screen	Dot clock
xw	Display width per 1 raster of display screen	Dot clock
vc*2	Vertical scan period	Raster line
vsw	Vertical sync pulse width	Raster line
ys	From rise of VSYNC to display start position in the vertical direction of the display screen	Raster line
yw	Vertical display period of display screen	Raster line

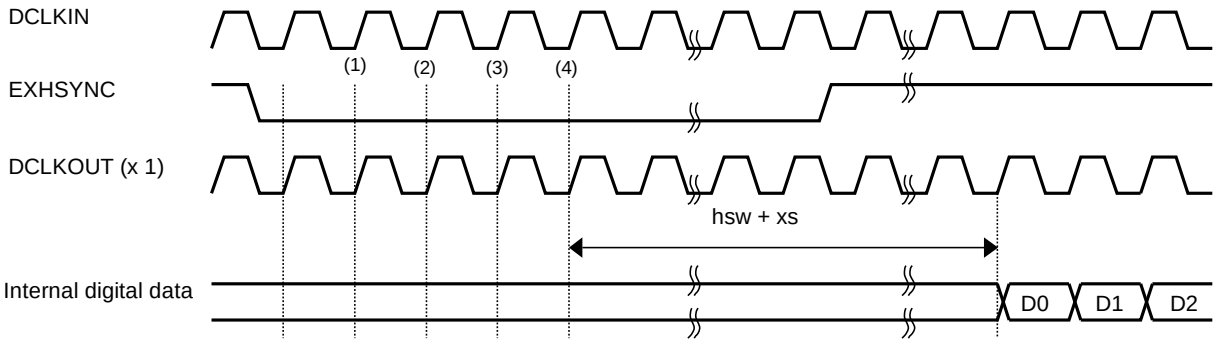
Notes: 1. Should be set such that hsw + xs + xw < hc
2. Should be set such that vsw + ys + yw < vc

The display timing generation register settings are different depending on the scan method and synchronization method. Hence the value of the display timing generation registers should be set after performing calculations like those indicated in Table 36.34.

Table 36.34 Correspondence Table of Settings of Display Timing Generation Registers

		Synchronization Method	
Register Name	**Bit Name**	**Master Mode**	**TV Sync Mode**
Horizontal display start register n (HDSRn)	HDS*6	hsw + xs – 19*5	hsw + xs – 25*2*5
Horizontal display end register n (HDERn)	HDE	hsw + xs – 19*5 + xw	hsw + xs – 25 + xw*2*5
Vertical display start register n (VDSRn)	VDS	ys – 2*3	ys – 2*3
Vertical display end register n (VDERn)	VDE	ys – 2 + yw	ys – 2 + yw
Horizontal synch width register n (HSWRn)	HSW	hsw – 1	hsw – 1
Horizontal cycle register n (HCRn)	HC	hc – 1	hc – 1
Vertical synch point register n (VSPRn)	VSP	vc – vsw – 1	vc – vsw – 1
Vertical cycle register n (VCRn)	VC	vc – 1	vc – 1

Notes: 1. In all scan modes, VDS, VDE, VSP, VC settings are in single-field units.
2. The values of HDS and HDE are from the fourth rising edge of DCLKOUT after detection of the falling edge of EXHSYNC through the rising edge of DCLKOUT



3. VDS should be set to 1 or greater.
4. HC should be set so as to satisfy HC > HDE.
5. If the function below is used, the following correction value is subtracted from both HDS and HDE in Table 36.34.
6. HDS should be set to 1 or greater.

- When using the YC-RGB conversion function (YCRGB0 or YCRGB1 bits in DEF5Rm are set to 1), 3 should be subtracted.

36.3.11 CSYNC [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

In master mode, a CSYNC (composite sync) signal is output. EQWRn is used to set the low-level pulse width of the CSYNC equivalent pulse. SPWRn is used to set the low-level pulse width of the CSYNC serration pulse.

The CSYNC waveform is selected using the CSY bit in DSMRn.

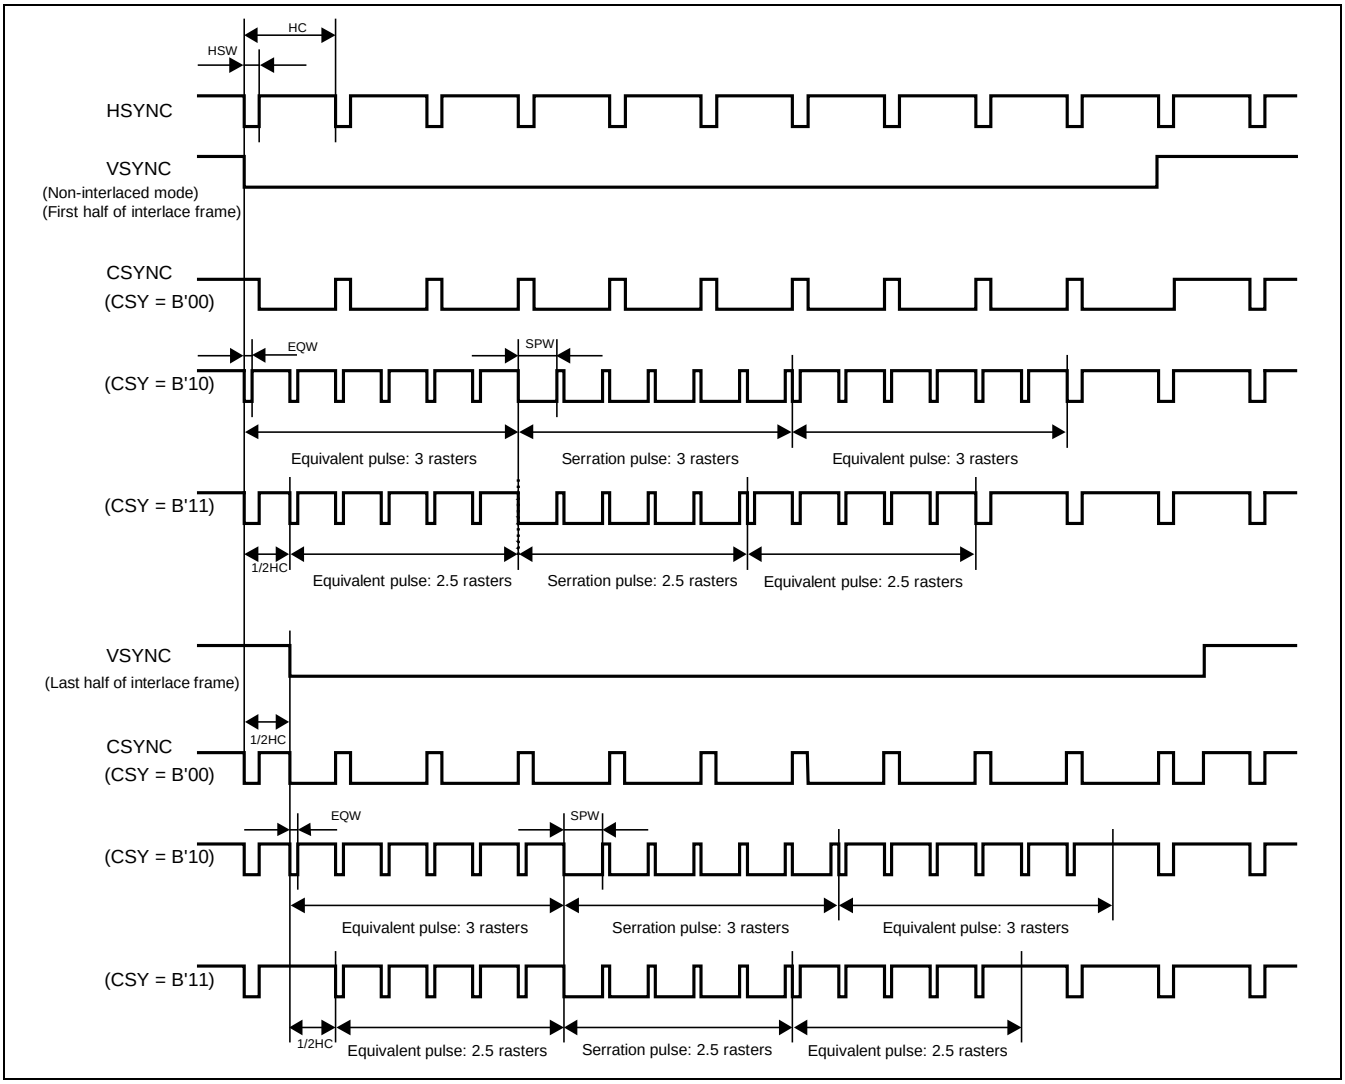


Figure 36.17 CSYNC Timing Chart

36.3.12 Scan Method

The scan method can be selected from among non-interlaced mode, interlaced sync mode, and interlaced sync & video mode. The mode is selected using bit 5 and bit 4 in DSYSRn.

RZ/G2E support only non-interlaced mode, and does not support Interlaced sync mode and Interlaced sync & video mode.

- Non-interlaced mode
  In this scan method, one frame consists of a single field.
- Interlaced sync mode
  In this scan method, one frame consists of two fields. The two fields are an even field and an odd field, displaying the same data.
- Interlaced sync & video mode
  In this scan method, one frame consists of two fields. The two fields are an even field and an odd field, displaying different data.

The ODEV bit in DSMRn is used to set the display order of fields in interlaced sync mode and in interlaced sync & video mode. When the ODEV bit is 0, the display order for one frame is odd field, then even field; when the ODEV bit is 1, the order for one frame is even field, then odd field.

In master mode, high level is output from the ODDF pin during even field display, and low level is output during odd field display. In TV sync mode, high level is input to the EXODDF pin to cause display of the even field, and low level is input to cause display of the odd field.

Note: When non-interlaced mode is selected in TV sync mode, the EXODDF pin should be fixed at low level or high level.

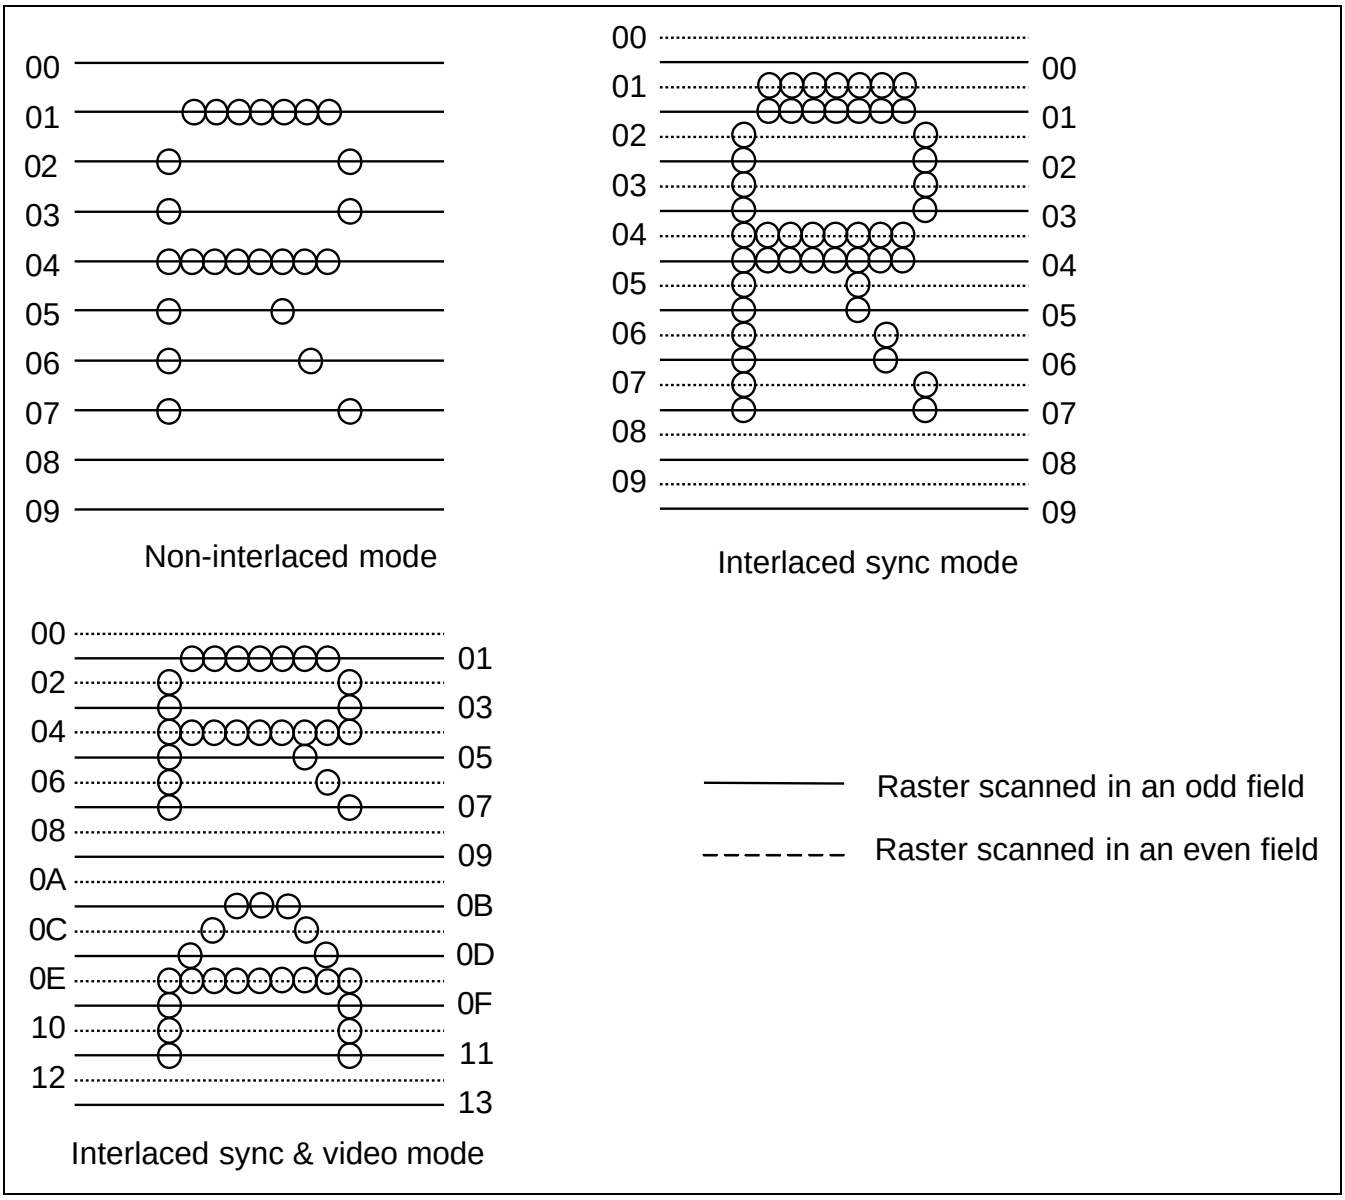

Figure 36.18 Example of Display in Each Scan Mode

- Example of vertical scan period
  Non-interlaced mode: 1/60 second/field, 1/30 second/field
  Interlaced sync mode: 1/30 second/frame
  Interlaced sync & video mode: 1/30 second/frame
- Display in non-interlaced method
  In this method, all lines are displayed at once without providing intervals between input video signals.
  This input method is for monitors capable of high-resolution display.

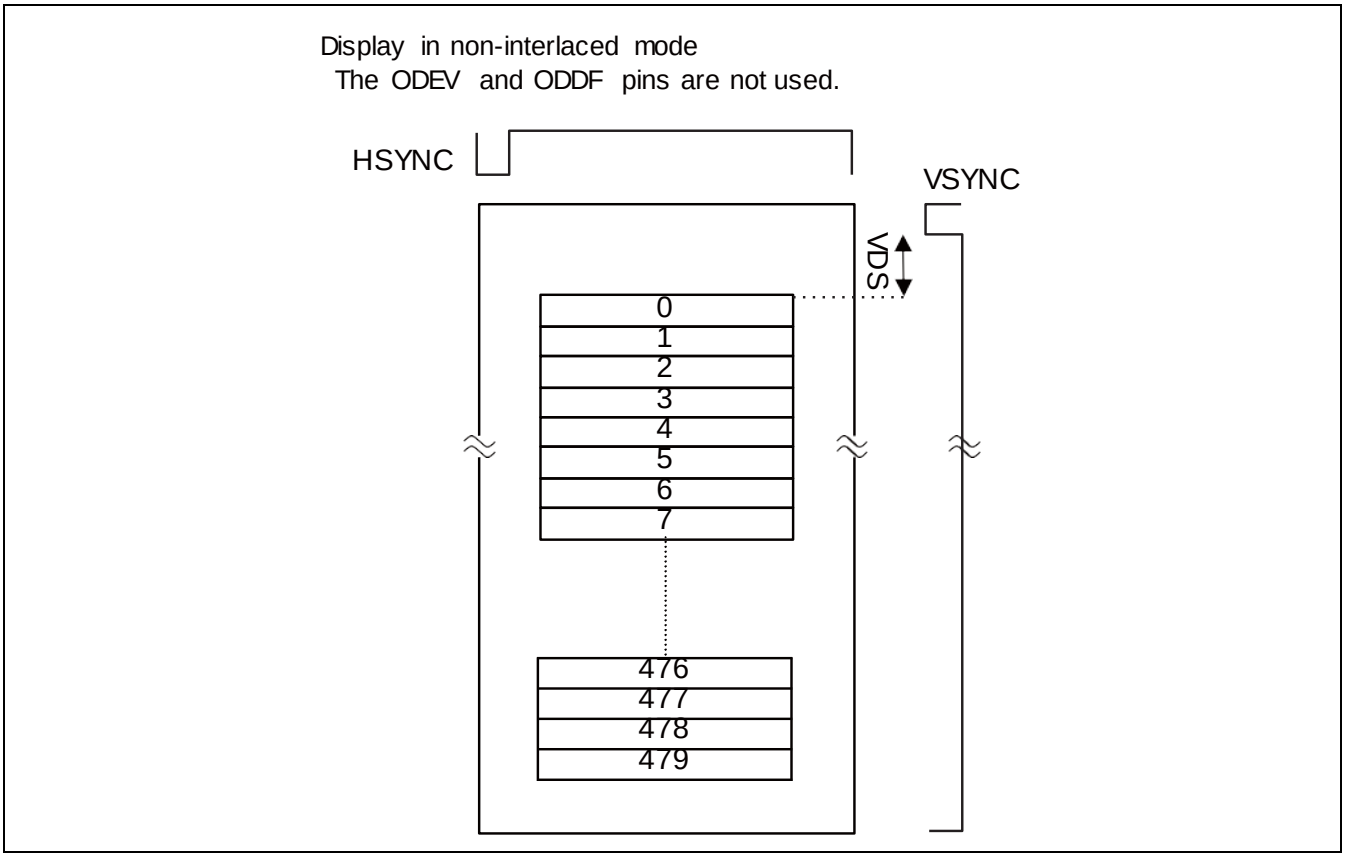

Figure 36.19 Display in Non-Interlaced Method

- Display in interlaced method

  At every scan period VC of the input video signal, even lines and odd lines are switched and displayed in alternation, and a single screen (one frame) is combined and displayed (with the afterimage of the preceding VC) with a period of 2VC. This is a basic TV input method.

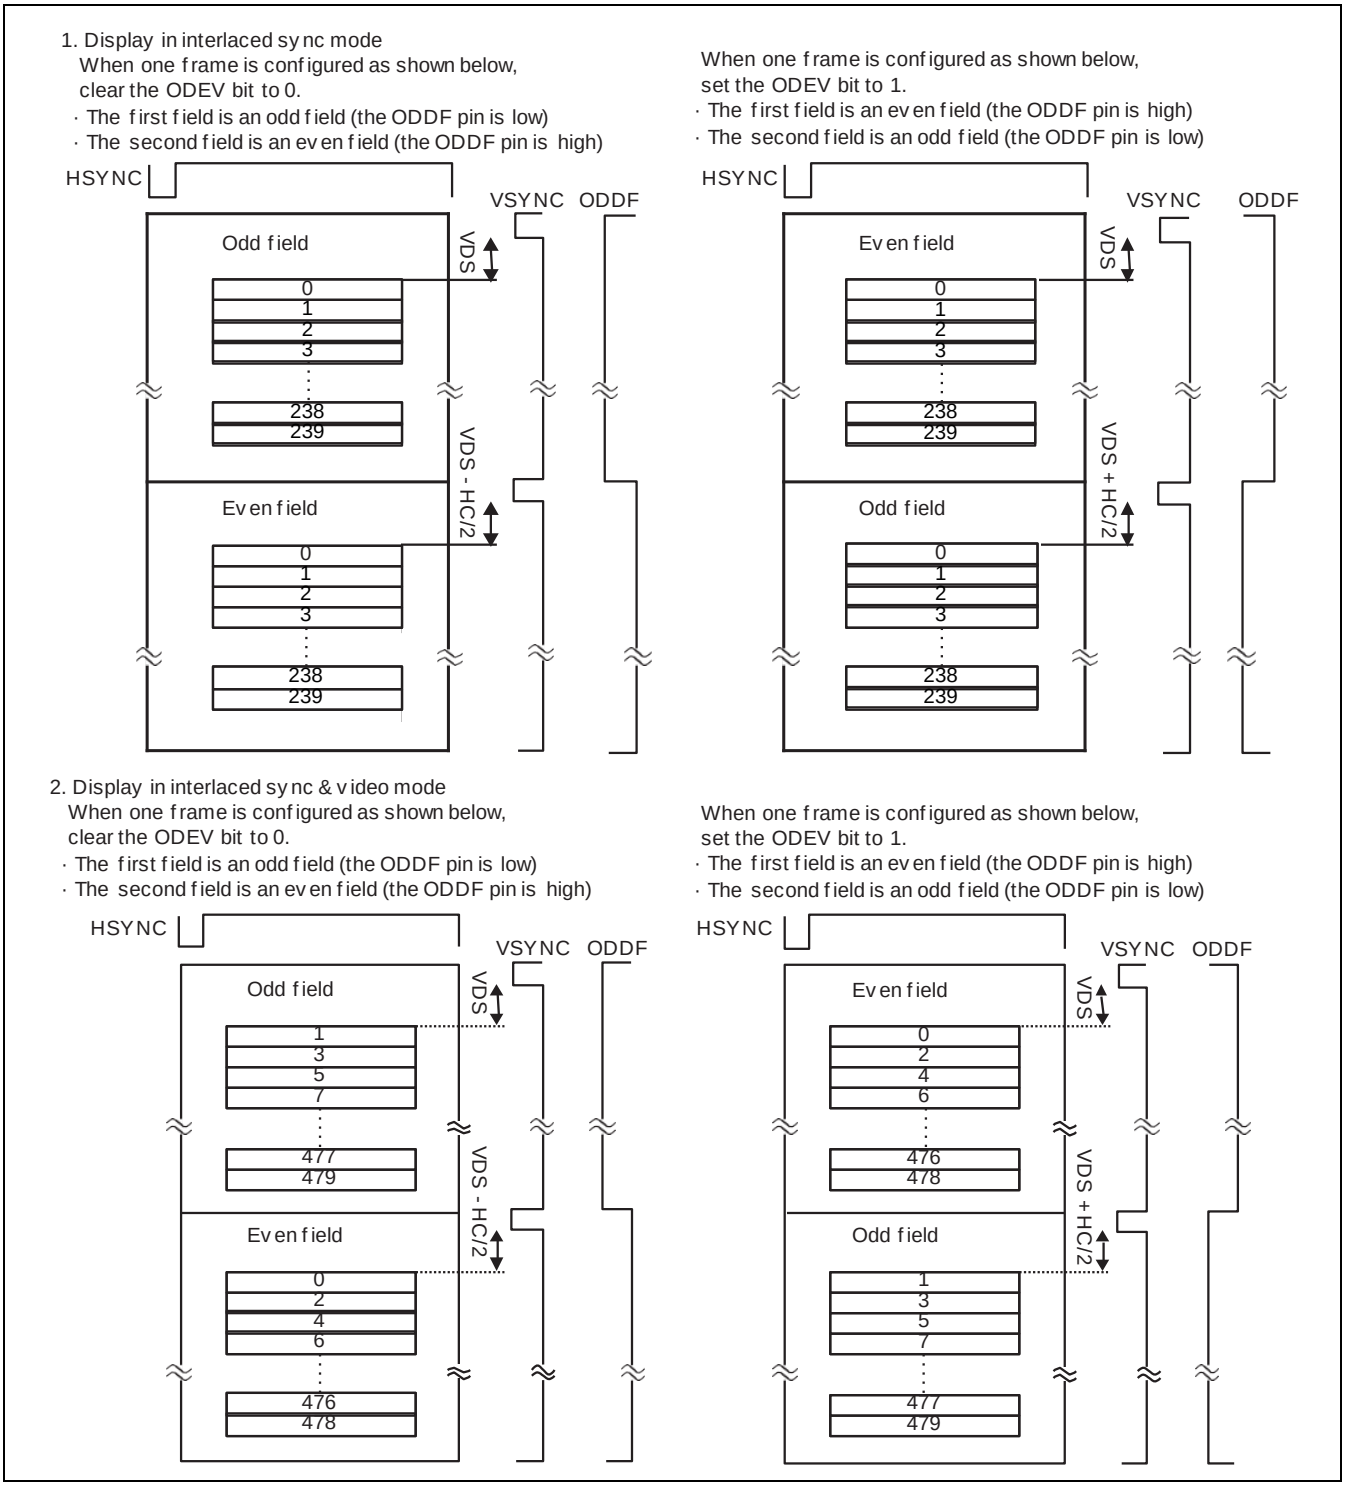

Figure 36.20 Display in Interlaced Method

36.3.13 Color Detection

When output display data matches a color set in CDERn, high level is output from the CDE pin. The CDEM bit in DSMRn can be used to fix the level outside display intervals. Also, the CDEL bit in DSMRn can be used to select the polarity of the output level. See Table 36.36 for the bits to be compared.

When the following display functions are set, the color detection function cannot be used.

- YC-RGB conversion performed by setting the YCRGB0 or YCRGB1 bits in DEF5Rm

Table 36.35 Output Level of the CDE Pin

		The CDE pin in display intervals		The CDE pin outside display intervals	
		Result of Comparison of Output Display Data and CDERn		Value of CDERn*	
CDEL	CDEM	Same	Different	0	Other than 0
0	B'00	High level	Low level	High level	Low level
0	B'01	High level	Low level	High level	Low level
0	B'10	High level	Low level	Low level	Low level
0	B'11	High level	Low level	High level	High level
1	B'00	Low level	High level	Low level	High level
1	B'01	Low level	High level	Low level	High level
1	B'10	Low level	High level	High level	High level
1	B'11	Low level	High level	Low level	Low level

Note: * Output display data is 0 outside display intervals.

Table 36.36 Data Comparison by CDERn

Bits	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CDERn	CDR						X	X	CDG						X	X	CDB						X	X
Output display data	R7	R6	R5	R4	R3	R2	R1	R0	G7	G6	G5	G4	G3	G2	G1	G0	B7	B6	B5	B4	B3	B2	B1	B0

Note: "X" is not compared.

36.3.14 External Sync Control [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

In TV-sync mode, the DU is capable of using an externally input dot clock (clock signal for frequency multiplication: DCLKIN) to generate a dot clock (output dot clock: DCLKOUT) that is in accord with external synchronizing signals (EXHSYNC, EXVSYNC). Supply the externally input dot clock (multiplication clock: DCLKIN) and set the following parameters in ESCRn.

Table 36.37 External Sync Control Parameters

Variable	Function
ESCRn/SYNCSEL	Selects the sync signal (EXHSYNC or EXVSYNC) to use in phase matching of the dot clock.
ESCRn/FRQSEL	Selects the dot-clock division ratio.

1. Use the SYNCSEL bits in ESCRn to set the sync timing of the dot clock (output dot clock: DCLKOUT) generated from the internal dot clock.
2. Use the FRQSEL bits in ESCRn to set the division ratio for generation of the internal dot clock. The following figure shows the internal dot clock timing where the input dot clock has been synchronized with EXHSYNC and then divided by four.

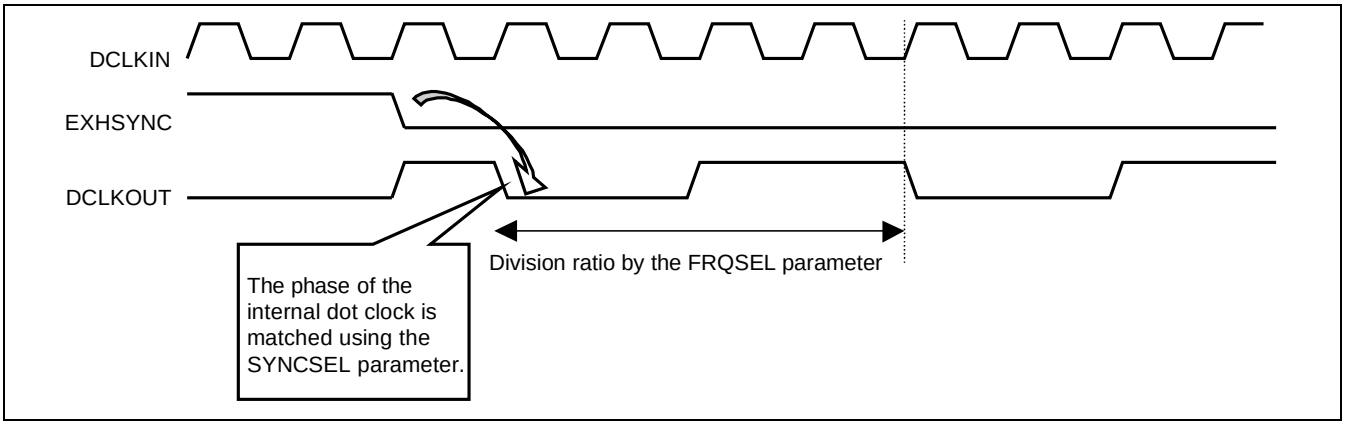

Figure 36.21 DCLKOUT Timing Chart where DCLKIN Synchronized with EXHSYNC is divided by four

36.3.15 Output Signal Timing Adjustment

The DU enables selection of output timing, with respect to the output dot clock, of the various output signals (the four sync signals HSYNC, VSYNC, CSYNC*1 and ODDF*1, as well as DISP, CDE, CLAMP, DE and digital RGB signals). Timing is selected by setting OTARn*2.

Notes: 1. RZ/G2E does not support CSYNC and ODDF signal.
2. n = 3 [RZ/G2N]
n = 2 [RZ/G2M V1.3, RZ/G2M V3.0]
n = 0 and 1 [RZ/G2E]

Table 36.38 Output Signal Timing Setting Parameters

Variable	Function
SYNCA	Sets output timing of the HSYNC, VSYNC, CSYNC and ODDF signals. [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
	Sets output timing of the HSYNC and VSYNC signals. [RZ/G2E]
DISPA	Sets output timing of the DISP signal
CDEA	Sets output timing of the CDE signal
DRGBA	Sets output timing of digital RGB signal
CLAMPA	Sets output timing of the CLAMP signal
DEA	Sets output timing of the DE signal

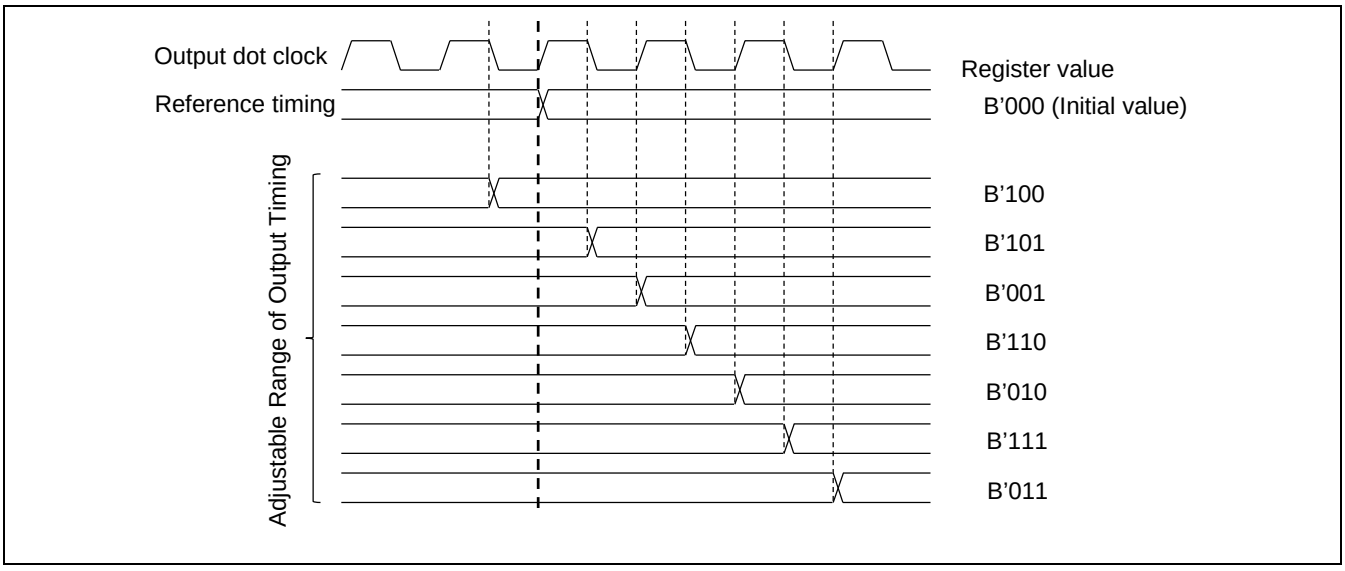

Figure 36.22 Adjustable Range of Output Timing

36.4 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

36.4.1 Module Standby Mode

Module Standby mode, in which supply of the clock signal to the DU is stopped, is supported.

Even when the DU enters the standby mode, the register values are retained. Do not access the DU during periods in standby mode. For RZ/G2N, when running the DU3, release module standby mode of the DU2 and DU3.

36.4.2 Transition to Module Standby Mode

1. Set both the DEN and DRES bits in DSYSRn to 0 to stop access to the VSP.
2. Test bit 11 in DSSRn to confirm the next VBK flag. The setting made in step 1 becomes effective with the timing of VBK and access to the VSP is stopped. The value of the display data becomes the value set in DOORn
   For RZ/G2M V1.3, RZ/G2M V3.0, when the DU0, DU1 and DU2 are running, test bit 11 of all of DSSR0, DSSR1, and DSSR2.
   For RZ/G2H, RZ/G2N, when the DU0, DU1 and DU3 are running, test bit 11 of all of DSSR0, DSSR1, and DSSR3.
   For RZ/G2E, when the DU0 and DU1 are running, test bit 11 of all of DSSR0 and DSSR1.
3. Stop the clock.

36.4.3 Release from Module Standby Mode and Restarting Display

1. Start the clock.
2. Make settings to turn the display on by setting the DEN and DRES bits in DSYSRn to 1 and 0 respectively.

36.4.4 Acquisition of External Sync Signal [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The following three ways of acquiring the external SYNC signal are available.

(a) The SYNC signal is acquired on rising edges of DCLKIN (or the frequency-divided clock signal derived from this if division has been set up).
(b) The SYNC signal is acquired on falling edges of DCLKIN (or the frequency-divided clock signal derived from this if division has been set up).
(c) Assuming that division has been set up, the SYNC signal that is acquired by the pre-division clock signal is latched on edges of the frequency-divided clock signal.

The electrical characteristics (AC spec.) are only guaranteed for case (a) above. There is no guarantee of electrical characteristics (AC spec.) for cases (b) and (c).

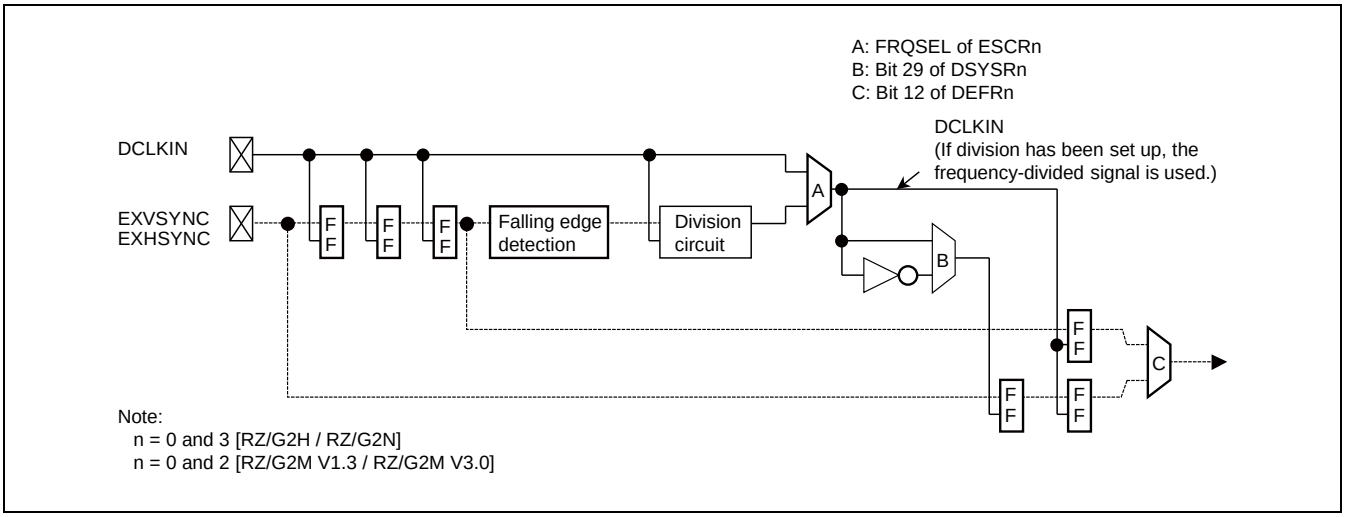

Figure 36.23 Diagram of Circuit that Generates the Display Timing from an External Sync Signal

36.4.5 Restrictions on Changing the Synchronization of the External SYNC Signal [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

When electrical characteristics (AC spec.) related to the acquisition of an external signal are not satisfied, ensure an interval of at least two cycles between changes of EXHSYNC or EXVSYNC, i.e. the external SYNC signals.

The frequency-divided dot clock is used as the basis of the cycle period when bit 12 in DEFRn is 0. The pre-division dot clock is used when bit 12 is 1.

36.4.6 Note on Register Settings

At the time of a reset, some registers of the DU have fixed initial values but others do not. The initial values of the latter when the power for the LSI is turned on can be either 0 or 1. From the initial state after power is switched on, be sure to set all of the registers in the DU to the desired values before starting synchronization of the display*[1].

If turning on the display*[2] is attempted while values in registers are unknown, operation may be incorrect due to access by the DU to areas other than those intended (the DU is capable of access to any area).

Notes: 1. Setting (a) or (b) starts synchronization of the display.
(a) The DRES and DEN bits in DSYSRn are B'00.
(b) The DRES and DEN bits in DSYSRn are B'01.
2. Setting (a) or (b) turns the display on.
(a) When the DPRS bit in DORCRm is 0:
With setting (b) in note 1, setting any of bits DPE2 and DPE1 in DPPRm to 1.
(b) When the DPRS bit in DORCRm is 1:
With setting (b) in note 1, setting bits S0S2 and S0S1 in DSPR0 and DSPR2 or bits S1S2 and S1S1 in DSPR1 and DSPR3 to any value from B'0001 and B'0011.

36.4.7 Transition to Display operation stop by DRES bit in DSYSRn

(1) Display screen is not disturbed

1. Execute the procedure of 1. and 2. of section 36.4.2.
2. Set the DRES and DEN bits in DSYSRn to B’10.

(2) Display screen is disturbed

1. Set the DRES and DEN bits in DSYSRn to B’10.

2. Execute software reset to VSP module.

37. LVDS Interface

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

37.1 Overview

The LVDS-IF (low voltage differential signaling) module converts an RGB signal output by the DU module to the LVDS format and outputs those signals.

The LVDS-IF interface supports 8 output data formats with the conversion formats selected by register settings. The output control signals can also be selected freely.

The LVDS-IF supports the Dual-link output by using vertical stripe output function. [RZ/G2E]

37.1.1 Features

This module has the following features.

- Output pins: Five differential output pairs (4 data and 1 clock) that conform to the TIA/EIA-644 standard.
- Number of channels:
  RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 1ch
  RZ/G2E: 2ch
- Operating frequency: dot clock frequency is from 31MHz to 148.5 MHz. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
  Operating frequency: dot clock frequency is from 5 MHz to 148.5 MHz. [RZ/G2E]
- Supports eight output data formats
- Supports the Dual-link output by using vertical stripe output function. [RZ/G2E]

37.1.2 Block Diagram

Figure 37.1 and Figure 37.2 show the block diagrams of the LVDS-IF module.

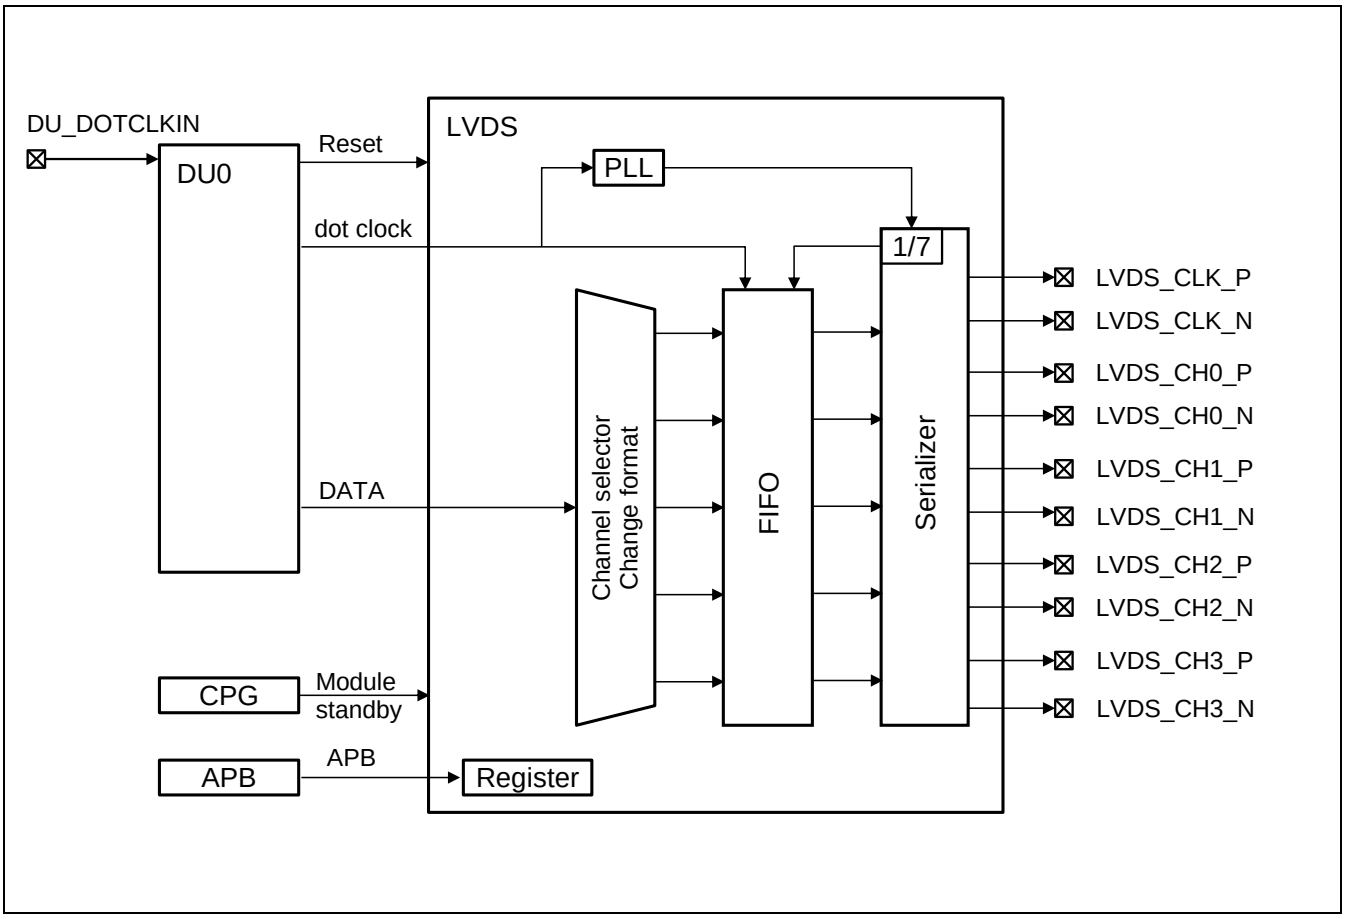

Figure 37.1 Block Diagram of LVDS-IF module for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N

Notes: [RZ/G2E]

1. This register in the LVDS0-IF is controlled by software reset register SRCR7[27] and SRSTCLR7[27].
2. This register in the LVDS1-IF is controlled by software reset register SRCR7[26] and SRSTCLR7[26].
3. This register for clock in the LVDS0-IF and the LVDS1-IF is controlled by software reset register SRCR7[25] and SRSTCLR7[25].

37.1.5 Connected Module

Table 37.3 Connected module

Module name	Connected module name	Function of connected module
LVDS-IF	CPG	Clock Pulse Generator
	DU	Display Unit

37.2 Register Description

Explanation of abbreviation of register

Initial value:	Value of the register after power-on reset
—:	Undefined value
R/W:	The bit or field is readable and writable.
R/WC0:	The bit or field is readable and writable. Writing 0 to the bit initializes the bit. Writing 1 to the bit is ignored.
R:	The bit or field is readable only. When writing to the register, write 0 to it.
—/WB:	The bit or field is writable. Note that values read from write-only bits are not guaranteed.

37.2.1 LVDS-IF Control Register 0 (LVDCR0 / LVD1CR0)

37.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

The LVDS-IF module converts the RGB signals output by DU to the LVDS format and outputs those signals. Since the output data format can be selected by register settings, this module can convert to any of the LVDS formats. The output data format is determined by (1) the mode selection, (2) the Ctrl signal selection, and (3) the CH selection.

The registers concerned with the output data format must be set before the LVDS-IF module is started and must not be changed during module operation. (See section 37.3.7 Setting Procedure, for details.)

37.3.1 Mode Selection

The mode is selected by the LDMD bits in the LVDS-IF control register 0. Figure 37.3 shows the modes that can be set.

Here, R0 to R7, G0 to G7, and B0 to B7 are the RGB signals and Ctrl0 to Ctrl3 are control signals (such as HSYNC and VSYNC). The Ctrl signals can be set by the CTR control register.

CH0, CH1, CH2, CLK and CH3 are buffers that hold data temporarily. The default is for the CH0, CH1, CH2, CLK and CH3 data to be output directly without change to LVDS0_CH0_P/N, LVDS0_CH1_P/N, LVDS0_CH2_P/N, LVDS0_CLK_P/N and LVDS0_CH3_P/N. The CH assignment can be switched with the CH control register settings.

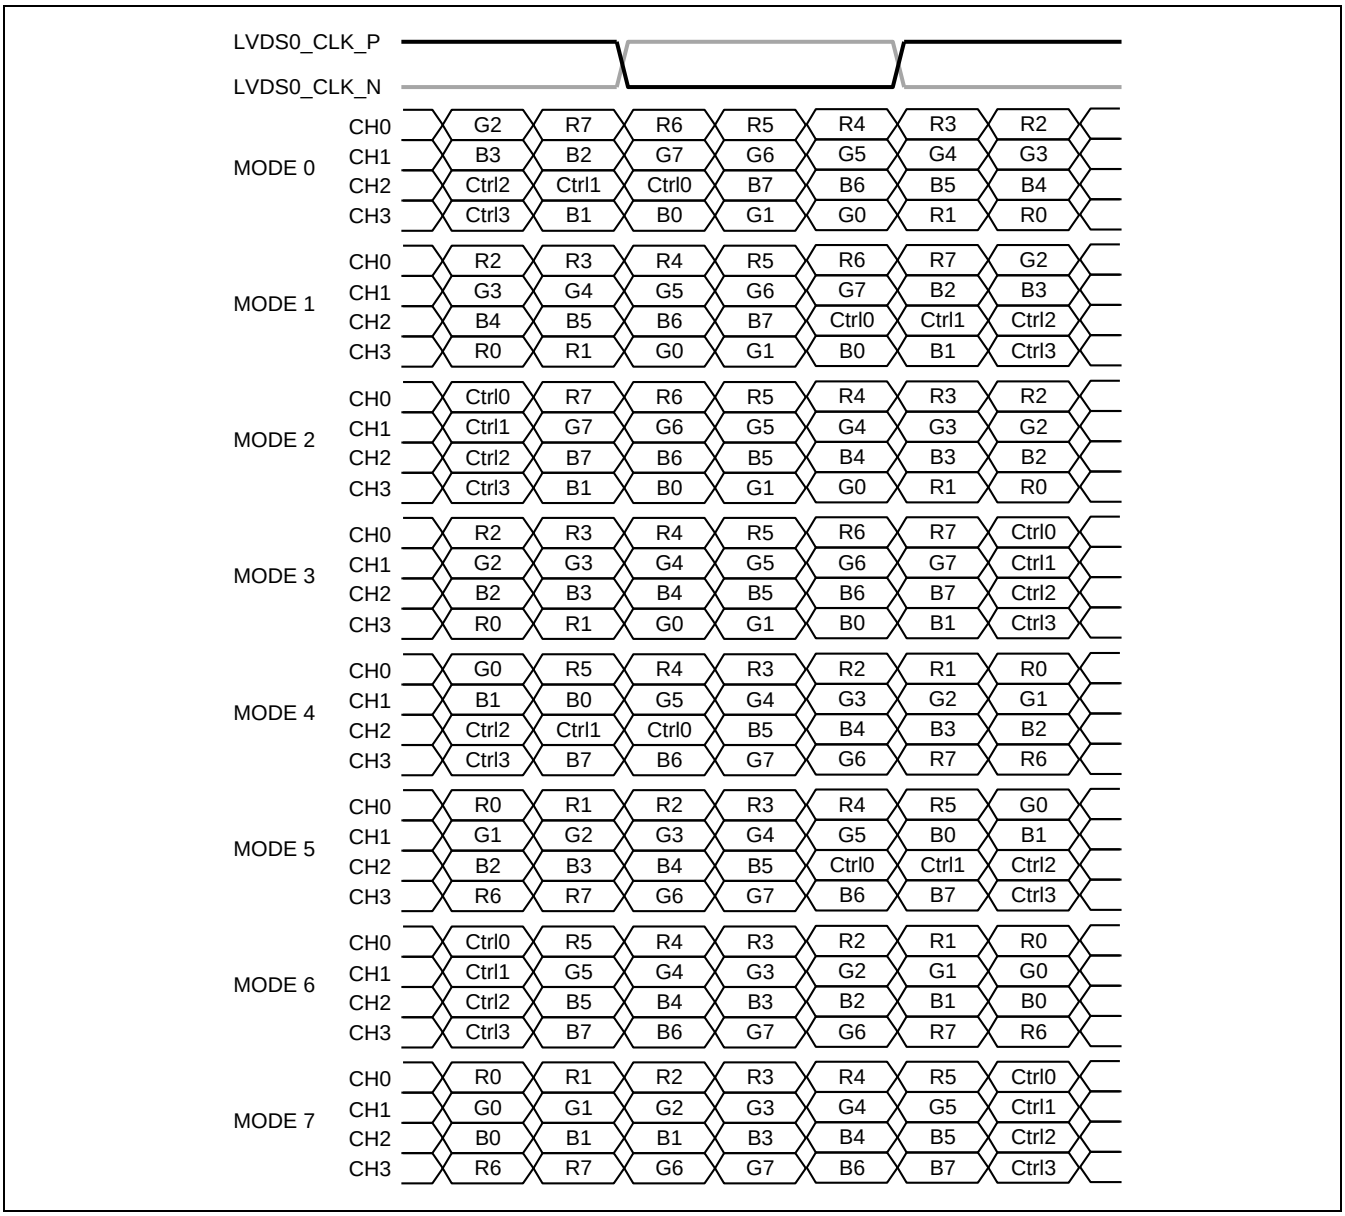

Figure 37.3 Output Data Format

37.3.2 Ctrl Signal Selection

The two stage settings shown below are required to select the Ctrl signals.

1. DU Output Signal Selection

The DU output ports are multiplexed. The signals that you want to output are set up with the corresponding register. The specified signals are input to the LVDS-IF module ports.

2. LVDS Port Selection

The LVDS ports used to output to the Ctrl signals are selected with the CTR control register (LVDCTRCR). This results in the signals input to the LVDS ports being output as Ctrl signals.

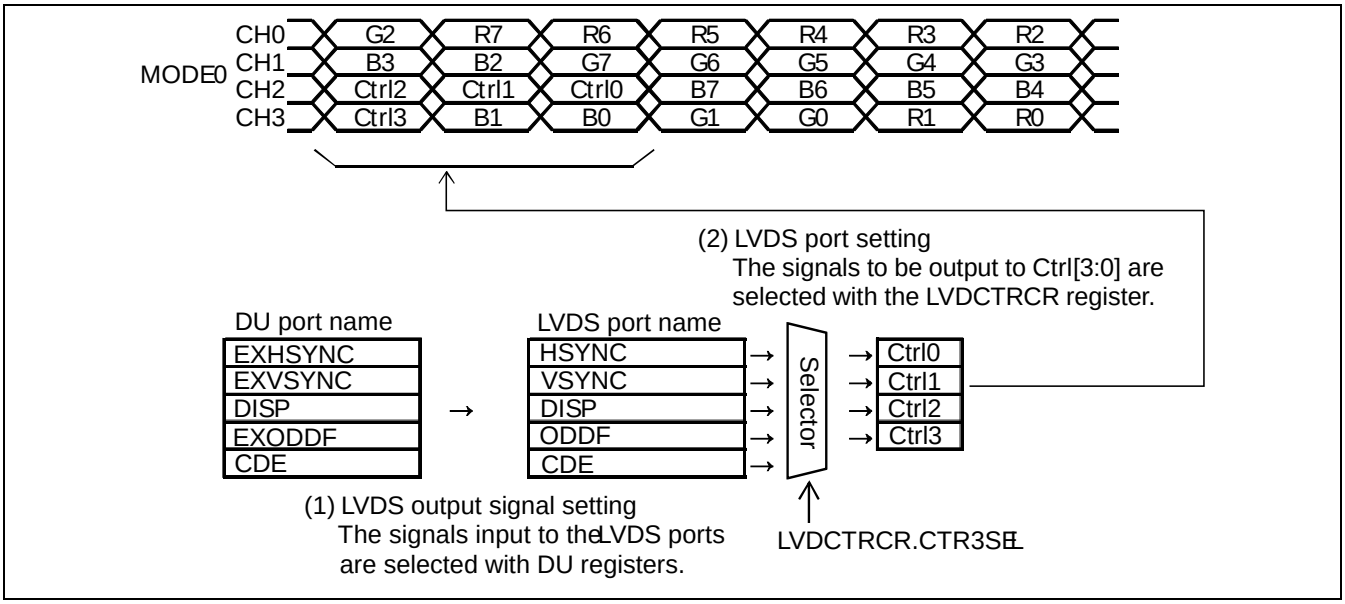

Figure 37.4 Ctrl Signal Selection

Set the desired Ctrl signal characteristics with the DU registers.

For example, to reverse the polarity of the HSYNC signal, the polarity must be set with DU register settings. (The LVDS-IF module only converts the signals output from DU to the LVDS format.)

An example of Ctrl signal settings is shown below.

1. Ctrl0 = HSYNC, Ctrl1 = VSYNC, and Ctrl2 = DISP

   Set the DU registers so that HSYNC, VSYNC, and DISP are output.

   Then set the CTR control register (LVDCTRCR) so that CTR0SEL = B’000, CTR1SEL = B’000, and CTR2SEL = B’000.
2. Ctrl0 = CSYNC, Ctrl1 = ODDF, and Ctrl2 = CDE

   Set the DU registers so that CSYNC, ODDF, and CDE are output.

   Then set the LVDS-IF register (LVDCTRCR) so that CTR0SEL = B’000, CTR1SEL = B’010, and CTR2SEL = B’010.

   (Note that since CSYNC can also be output from other ports, CTR0SEL must be set to match the port from which DU outputs CSYNC.)

37.3.3 CH Selection

The LVDS-IF module stores the RGB signal data in CH0, CH1, CH2, and CH3 according to the mode selection and Ctrl signal selection registers.

The CH0, CH1, CH2, and CH3 data is then stored in the CH0, CH1, CH2, and CH3 FIFOs according to the CH selection register setting. The data stored in the CH0, CH1, CH2, and CH3 FIFOs is output from the external pins after passing through the LVDS buffers.

37.3.4 Vertical stripe output [RZ/G2E]

The LVDS-IF supports the vertical stripe output separated the even data and the odd data by setting the Vertical Stripe Control Register (LVDSTRIPE.ST_ON = B'1 and LVD1STRIPE.ST_ON = B'1). Figure 37.5 shows the vertical stripe output. The LVDS0_* ports output the even data and the LVDS1_* ports output the odd data. The even data corresponds to the first pixel, and the odd data corresponds to the second pixel. Also, the even data and the odd data can swap by setting LVDSTRIPE.ST_SWAP = B'1.

The vertical stripe output is possible only from DU0 input.

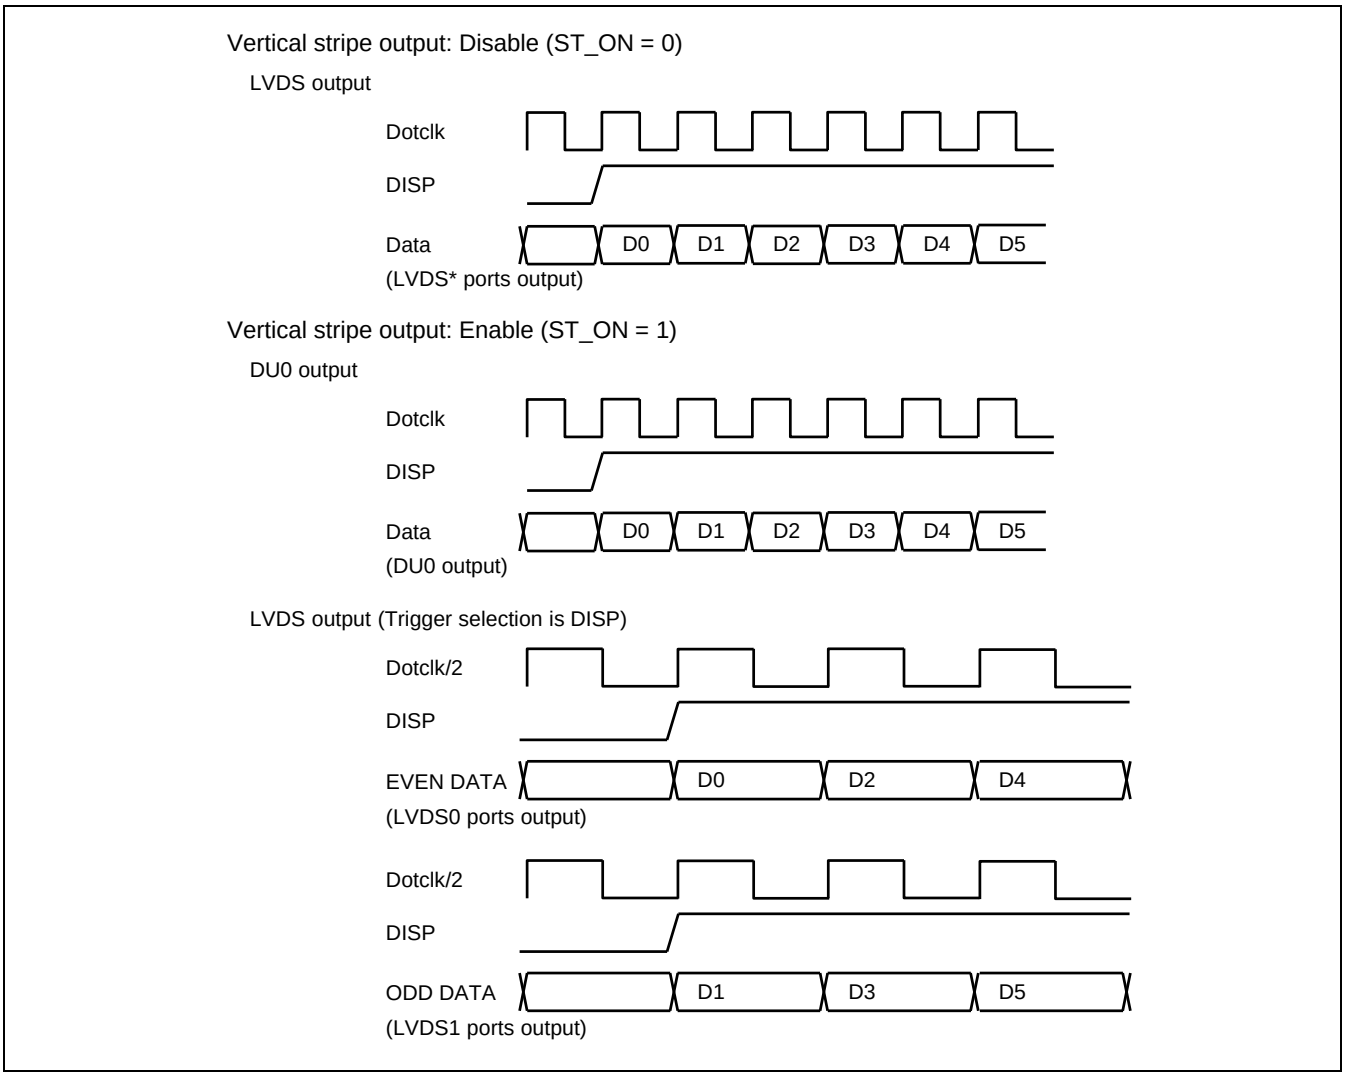

Figure 37.5 Vertical Stripe output for DUAL-Link

Note: The EVEN DATA corresponds to the first pixel, and the ODD DATA corresponds to the second pixel in Figure 37.5

37.3.5 Dot clock Settings

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The LVDS-IF module dot clock frequency is determined by the clock source selected and the divisor settings. This section describes how this frequency is set.

The individual settings are made with the DU (Display Unit) registers. Refer to the corresponding sections for details on the registers, notes, and other information on these settings.

- Clock source selection
  The clock source can be selected to be either the internal clock or an external input (DU_DOTCLKIN*).
  This is set with the DCLKSEL bit in the DU external synchronization control register (ESCR0).
- Divisor setting
  This setting specifies the divisor applied to the clock source.

This is set with the FRQSEL field in the DU external synchronization control register (ESCR0).

[RZ/G2E]

This section describes how this frequency of the LVDS-IF module and the digital output from pin (DPAD) set. Figure 37.6 shows the path for dot clock.

Setting output clock form the LVDS-IF to the DU:

- Clock source of the PLL selection
  The clock source of the PLL can be selected to be either the EXTAL, an external input (DU_DOTCLKIN0/1) or LV0 ϕ /1ϕ clock form CPG. (LVDPLLCR.CKSEL / LVD1PLLCR.CKSEL)
- Frequency of the PLL setting (See Section 37.3.6 PLL Setting)
- 1/N divisor setting (LVDDIV / LVD1DIV)

When the LVDS-IF enable:

- Select 7 divider in the LVDS-IF.
  (LVDS0: LVDPLLCR.OCKSEL = B’0 and LVDPLLCR.CLKOUT = B’1LVDS1: LVD1PLLCR.OCKSEL = B’0 and LVD1PLLCR.CLKOUT = B’1)
- Select the LVDS output clock in the DU0/1.
  (DIDSR0.LVCS0/1 = B’1, ESCR0/1.DCLKSEL = B’0 and ESCR0/1.FRQSEL = B’0*)

Note: * However, when outputting from the LVDS0-IF as section (2) Display of Different Images on Monitors of the Same Size of 35.3.8 Dual Display Output, the output dot clock should be set to be division by two of the input dot clock. (ESCR0.FRQSEL = B’1)

When the digital output from pin (DPAD) enable:

- Clock source selection
  The clock source can be selected to be either the internal clock or an external input (DU_DOTCLKIN0/1) or the LVDS-IF output clock. When select the LVDS-IF output clock, setting bypass 7 divider in the LVDS-IF. (LVDS0: LVDPLLCR.OCKSEL = B’1 and LVDPLLCR.CLKOUT = B’0, LVDS1: LVD1PLLCR.OCKSEL = B’1 and LVD1PLLCR.CLKOUT = B’0)
- Divisor setting in the DU0/1.
  This setting specifies the divisor applied to the clock source.

This is set with the FRQSEL field in the DU external synchronization control register (ESCR0/1).

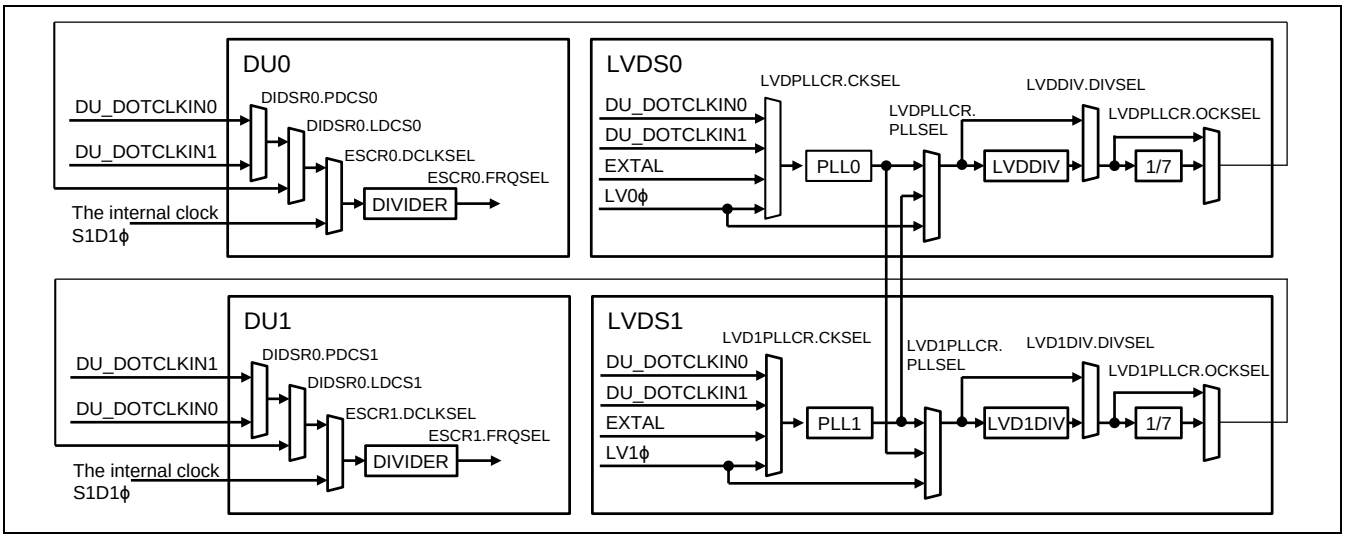

Figure 37.6 Path for dot clock [RZ/G2E]

37.3.6 PLL Setting [RZ/G2E]

1. PLL Frequency is calculated as the following.

- Not use E-Divide, Setting OUTCLKSEL = B'0 and STP_CLKOUTE = B'0

  Fout = Fin (Input Clock Frequency) * (PLLN+1) / (PLLM+1)

- Use E-Divide, Setting OUTCLKSEL = B'1 and STP_CLKOUTE = B'1

  Fout = Fin (Input Clock Frequency) * (PLLN+1) / ((PLLM+1) *(PLLE+1)*2)

- Limited Setting:

Input Clock Frequency Range: Fin	12 ≤ Fin ≤ 192 (MHz)
Comparison Frequency Range: Fpfd = Fin/(PLLM+1)	12 ≤ Fpfd ≤ 24 (MHz)
VCO operating range: Fvco = Fin* (PLLN+1)/(PLLM+1)	900 ≤ Fvco ≤ 1800 (MHz)
Output Frequency Range: Fout	Fout ≤ 1039.5 (MHz)
N-Divider Setting: PLLN	60 ≤ PLLN+1 ≤ 120

2. Modulation frequency of SSCG Function is calculated as the following.

- Modulation Frequency(Fmod)

  Fmod = Fpfd / (Cv * Sr)

  Cv = 256 + 16 × TWGCNT[3:0]

  Sr = 2 ^ SDIV[1:0]

  Comparison Frequency Range: Fpfd = Fin / (PLLM+1)

- Fmod Limited

  Fmod <= Fpfd / 450, 3kHz <= Fmod <= 30kHz

- BANDSET Setting

  When Fmod > 10kHz, Setting BANDSET = B'0

  When Fmod <= 10 kHz, Setting BANDSET = B'1

- Mode and Modulation Depth Setting (%)

MODE = B'0 (Center spread) DEPTH[1:0] = B'00		±0.5%
MODE = B'0 (Center spread) DEPTH[1:0] = B'01		±1.0%
MODE = B'0 (Center spread) DEPTH[1:0] = B'10		±1.5%
MODE = B'1 (Down spread) DEPTH[1:0] = B'00	PLLN = 59-78	-1.17% ~ 0.17% *1
MODE = B'1 (Down spread) DEPTH[1:0] = B'00	PLLN = 79-119	-1.0%
MODE = B'1 (Down spread) DEPTH[1:0] = B'01		-2.0%
MODE = B'1 (Down spread) DEPTH[1:0] = B'10		-3.0%

Note 1. In this region, the modulation depth increase. The unwished effect results from the limitation of circuit architecture.

3. Setup sequence

- When not using SSC function, setup sequence is constraint free. After the parameter setting, the PLL output stable after 200 µs.
- Figure 37.7 shows setup sequence, when using SSC Function. The parameter cannot be changed after releasing LVDSCR / LVD1SCR.RSTN.

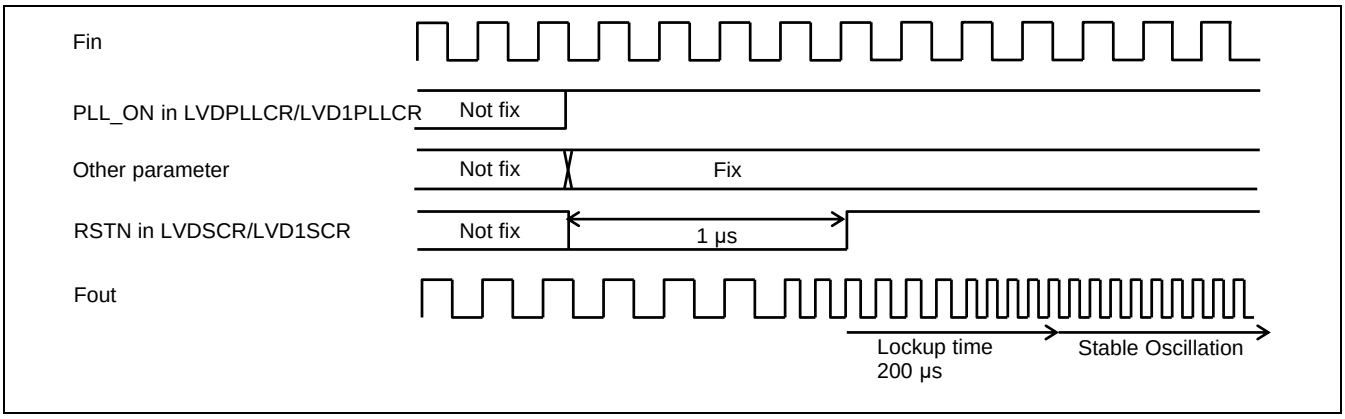

Figure 37.7 Setup sequence when using SSC Function

37.3.7 Setting Procedure

The procedure for using the LVDS-IF module is shown below.

Startup Procedure: Example of ch0

1. Clear the DU and LVDS-IF module standby states using CPG module stop control register.*[1]
2. Set the DU registers.*[2]
3. Set the LVDS-IF registers other than LVDCR0.PLLON [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N], PWD, LVRES, and LVDCR1.CHnSTBY.*[3]
4. Set LVDCR1.CHnSTBY to B'11 to turn on the LVDS IO.
5. Set LVDCR0.PLLON to B'1 to turn on the PLL. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
6. Set LVDCR0.PWD to B'1 to turn on the LVDS Normal mode. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
7. Set LVDCR0.LVEN to B'1 to turn on the LVDS PHY. [RZ/G2E]
8. When all of the following conditions have been met, set LVDCR0.LVRES to B'1.
   At least 100 µs has elapsed since LVDCR0.PLLON and LVDCR0.PWD were set to 1. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
9. Signals will be output from the LVDS pins after LVDCR0.LVRES is set to B'1. *[4]

Turning the Display On or Off

Display Off

1. Set LVDCR0.LVRES to B'0 to turn the display off.
2. Set LVDCR0.LVEN to B'0 to turn the LVDS PHY. [RZ/G2E]
3. Set LVDCR0.PWD to B'0 to turn the LVDS Power Down mode.
4. Set LVDCR0.PLLON to B'0 to turn the LVDS-IF PLL circuit off.
5. Set LVDCR1.CHnSTBY to B'0 to turn the LVDS IO off.
6. Set CPG software reset register *[5]to B'1 to reset LVDS-IF module.

Display On

6. Set CPG software reset clearing register *[5]to B'1 to clear reset of LVDS-IF module.
7. Re-perform the above procedure [Startup Procedure]

Notes: 1. For the DU and LVDS-IF modules, the initial state is the module standby state. When starting the module immediately after a reset, the module standby state must be cleared.

2. Here, it is possible to proceed as long as the dot clock signal is output. (The LVDS-IF PLL must be started.) Other items may be set while waiting for the conditions of step 6 to be met. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

   The Clock including the PLL must set before setting the DU registers. (See setup sequence in 37.3.6 PLL Setting.) Also, It is necessary to set the divider (LVDDIV/ LVD1DIV) after the PLL output stable. [RZ/G2E]

3. This refers to settings other than those that are concerned with LVDS-IF startup. These items may be set while waiting for the conditions of step 6 to be met. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
4. When the vertical stripe output, set LVDCR0.LVRES after set LVD1CR0.LVRES. [RZ/G2E]
5. When display on in the LVDS0-IF, it is necessary to reset (SRCR7[27]) and reset clearing (SRSTCLR7[27]) LVDS0-IF module.

   When display on in the LVDS1-IF, it is necessary to reset (SRCR7[26]) and reset clearing (SRSTCLR7[26]) LVDS0-IF module.

   When display on in the dual output operates, it is necessary to reset (SRCR7[27] and SRCR7[26]) and reset clearing (SRSTCLR7 [27] and SRSTCLR7 [26]) LVDS0-IF and LVDS1-IF module. [RZ/G2E]

Table 37.4 shows example of PLL setting. [RZ/G2E].

Figure 37.9 shows example of dual output and register setting. [RZ/G2E].

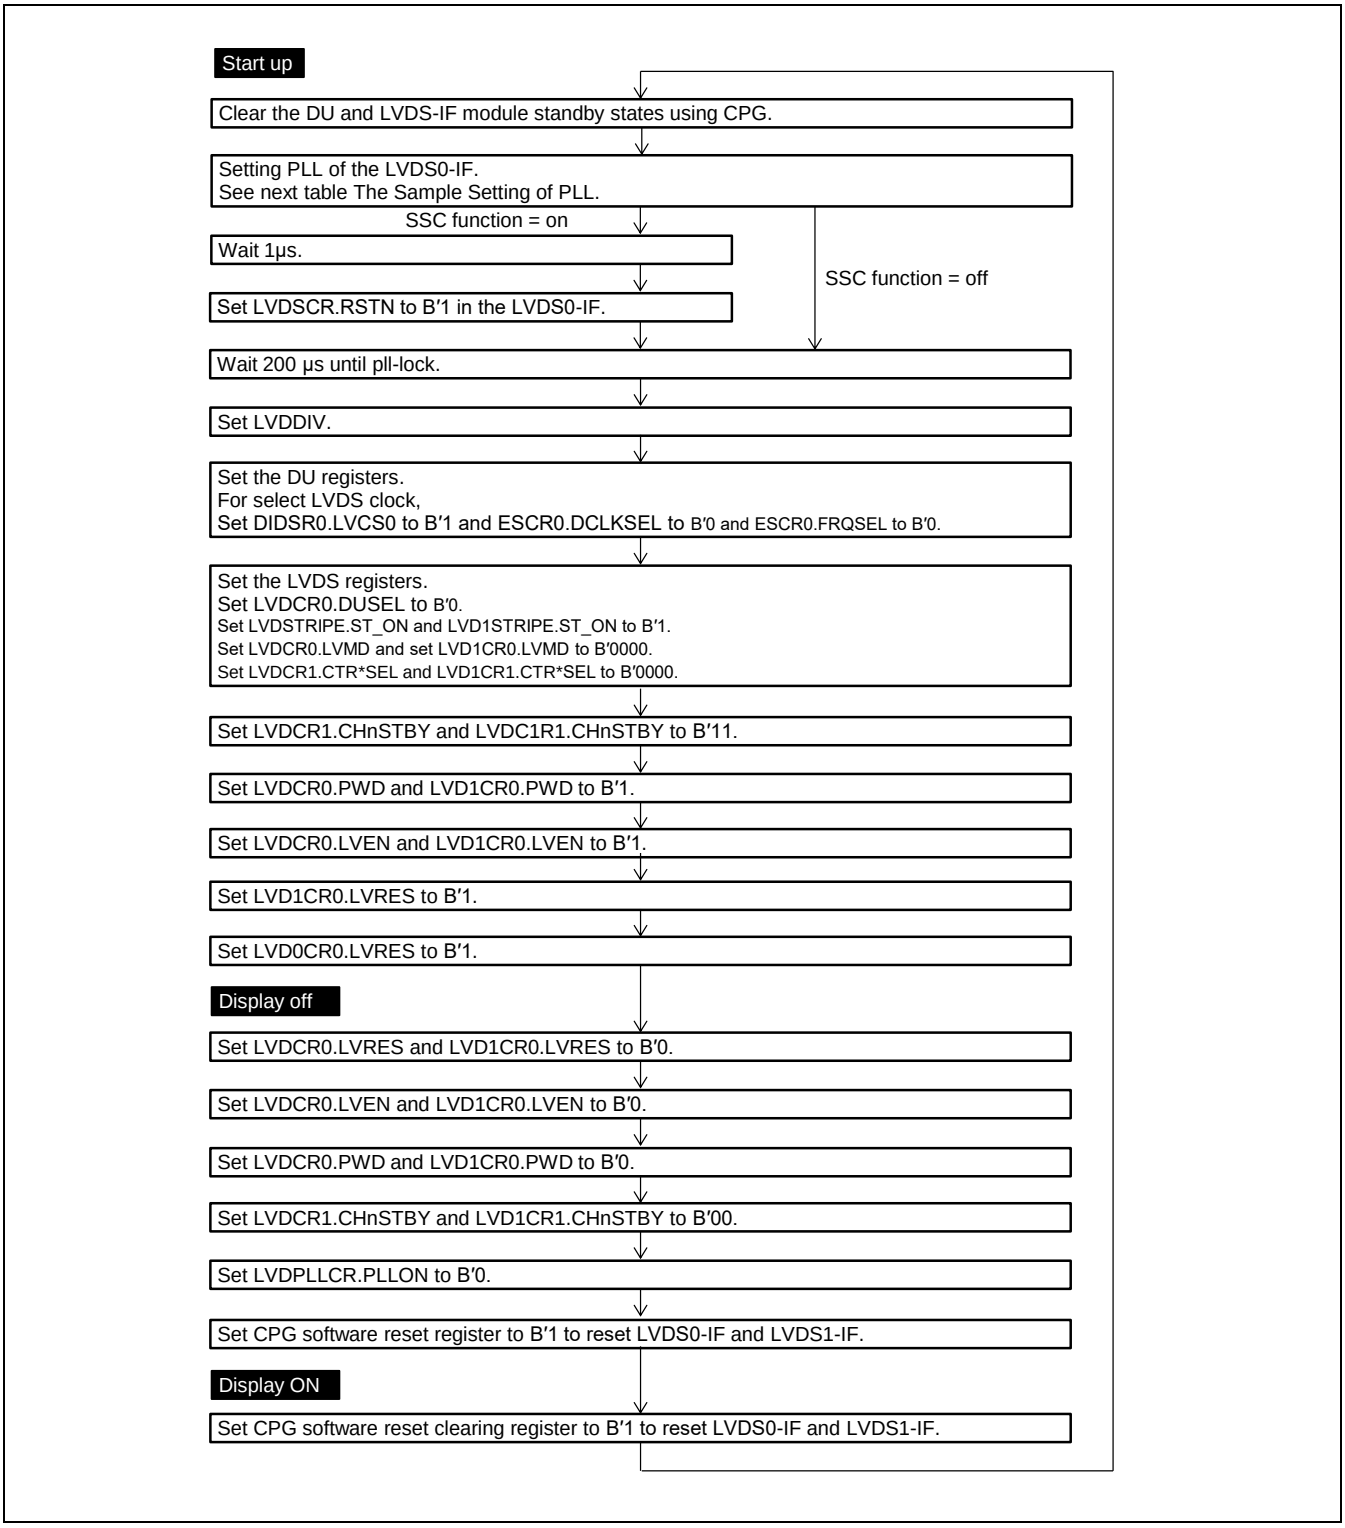

Figure 37.8 The sample setting of the vertical stripe output [RZ/G2E]

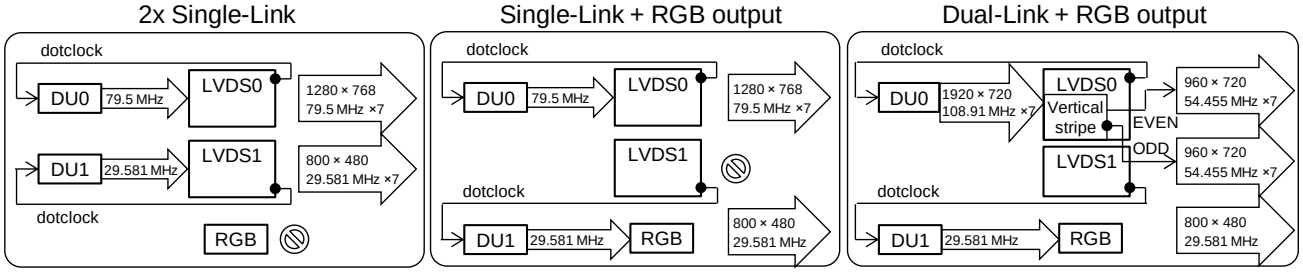
Notes: 1. Example of SSC function setting. Fmod = 0.03 MHz / Mode = Down spread (-3.0%)
When SSCG is no used, set LVDSCR or LVD1SCR to H'0000_0040 or H'0000_0000.
2. It is necessary to select the frequency of dot clock within the bus bandwidth.



Notes:
- In this case, the dot clock of DU0/1 is generated by the PLL0/1 in the LVDS0/1-IF. Also, EXTAL is selected as the source clock of the PLL0/1 in the LDVS0/1-IF
- During Dual-Link operation, the PLL1 in the LVDS1-IF can output the dot clock to DU1.

Note *: LVRES and LVEN is set to B'11 at the same time.

Figure 37.9 Example of dual output [RZ/G2E]

37.4 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

The following notes must be observed when using the LVDS-IF module.

Incorrect operation and damage to the device itself may occur if these notes are not followed.

- Since the LVDS-IF module includes logic that operates from the dot clock signal output by the DU module, incorrect operation may occur if the DU registers are not set appropriately. Also, do not change any DU register values during LVDS-IF operation. (If dot clock output is not stable, the LVDS-IF PLL is unlocked, and thus operation cannot be guaranteed.) There are two DU registers related to dot clock: Display unit System Control Register (DSYSR0) and External Synchronization Control Register (ESCR0). These registers must not be changed during LVDS-IF operation. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
- Set the dot clock signal input to the LVDS-IF module to a frequency within the LVDS-IF module's guaranteed operating range (5[RZ/G2E]/ 31[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] to 148.5 MHz).
- Application systems should be implemented in a failsafe manner, such as by connecting the LVDS outputs to a failsafe receiver or by connecting terminators, so that no problems in or damage to the application can occur if the LVDS pins become unstable (for example, the differential outputs going to the same level).

38. HDMI

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

38.1 Overview

38.1.1 Features

HDMI TX supports the following features.

(1) Number of channels

- RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2H and RZ/G2N: 1ch (HDMI0)

(2) Video formats

- CEA-861-E video formats up to 1080p at 60 Hz and 720p/1080i
- Optional HDMI 1.4b video formats
  - CEA-861-E video formats up to 1080p
  - HDMI 1.4b 4K x 2K@30Hz video formats
  - HDMI 1.4b 3D video modes with up to 297 MHz (TMDS clock)

(3) Input Colorimetry

- 24-bit RGB 4:4:4/YCbCr 4:4:4

(4) Color space converter (CSC)

- RGB (4:4:4) to YCbCr (4:4:4 or 4:2:2)
- YCbCr (4:4:4) to RGB (4:4:4) /YCbCr (4:2:2)

(5) HDMI 1.4b supported Infoframes

- Audio InfoFrame packet extension to support LFE playback level information
- AVI infoFrame packet extension to support YCC Quantization range (Limited Range, Full Range)
- AVI infoFrame packet extension to support Content type (Graphics, Photo, Cinema, Game)

(6) Audio formats

- Up to 192 kHz IEC60958 audio sampling rate
- I2S 2 x 4 Ch L-PCM Input

(7) Pixel clock from 25MHz up to 297MHz

(8) I2C DDC, EDID block read mode

(9) Single-channel DVI 1.0 backward compatibility (dual-link DVI not supported)

39. AUDIO

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

39.1 Overview

This section describes the data path between audio modules, list of routings, and transfer flow.

39.1.1 Features

Audio module is a module connecting Audio-DMAC, Audio-DMACpp, SCU, SSIU, and ADG.

Refer to the section of each module for the detailed function.

39.1.2 Block Diagram

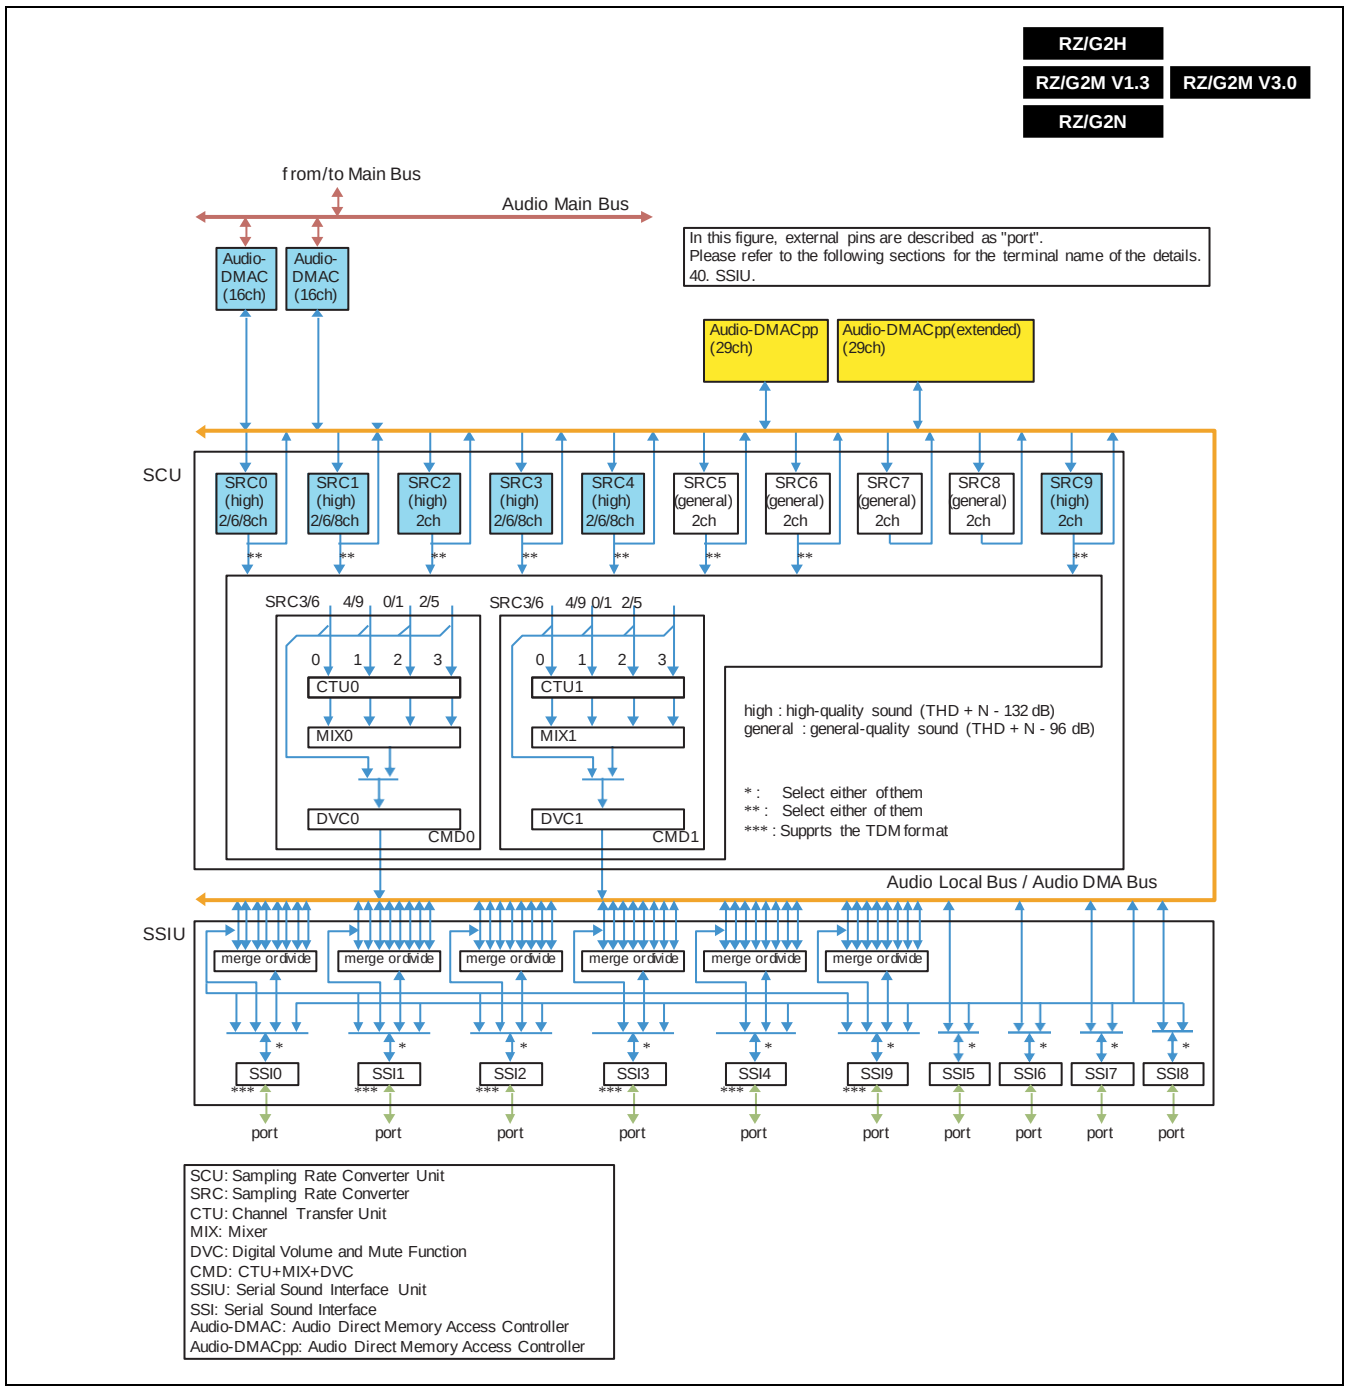

Figure 39.1 Data Paths between Audio Modules [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

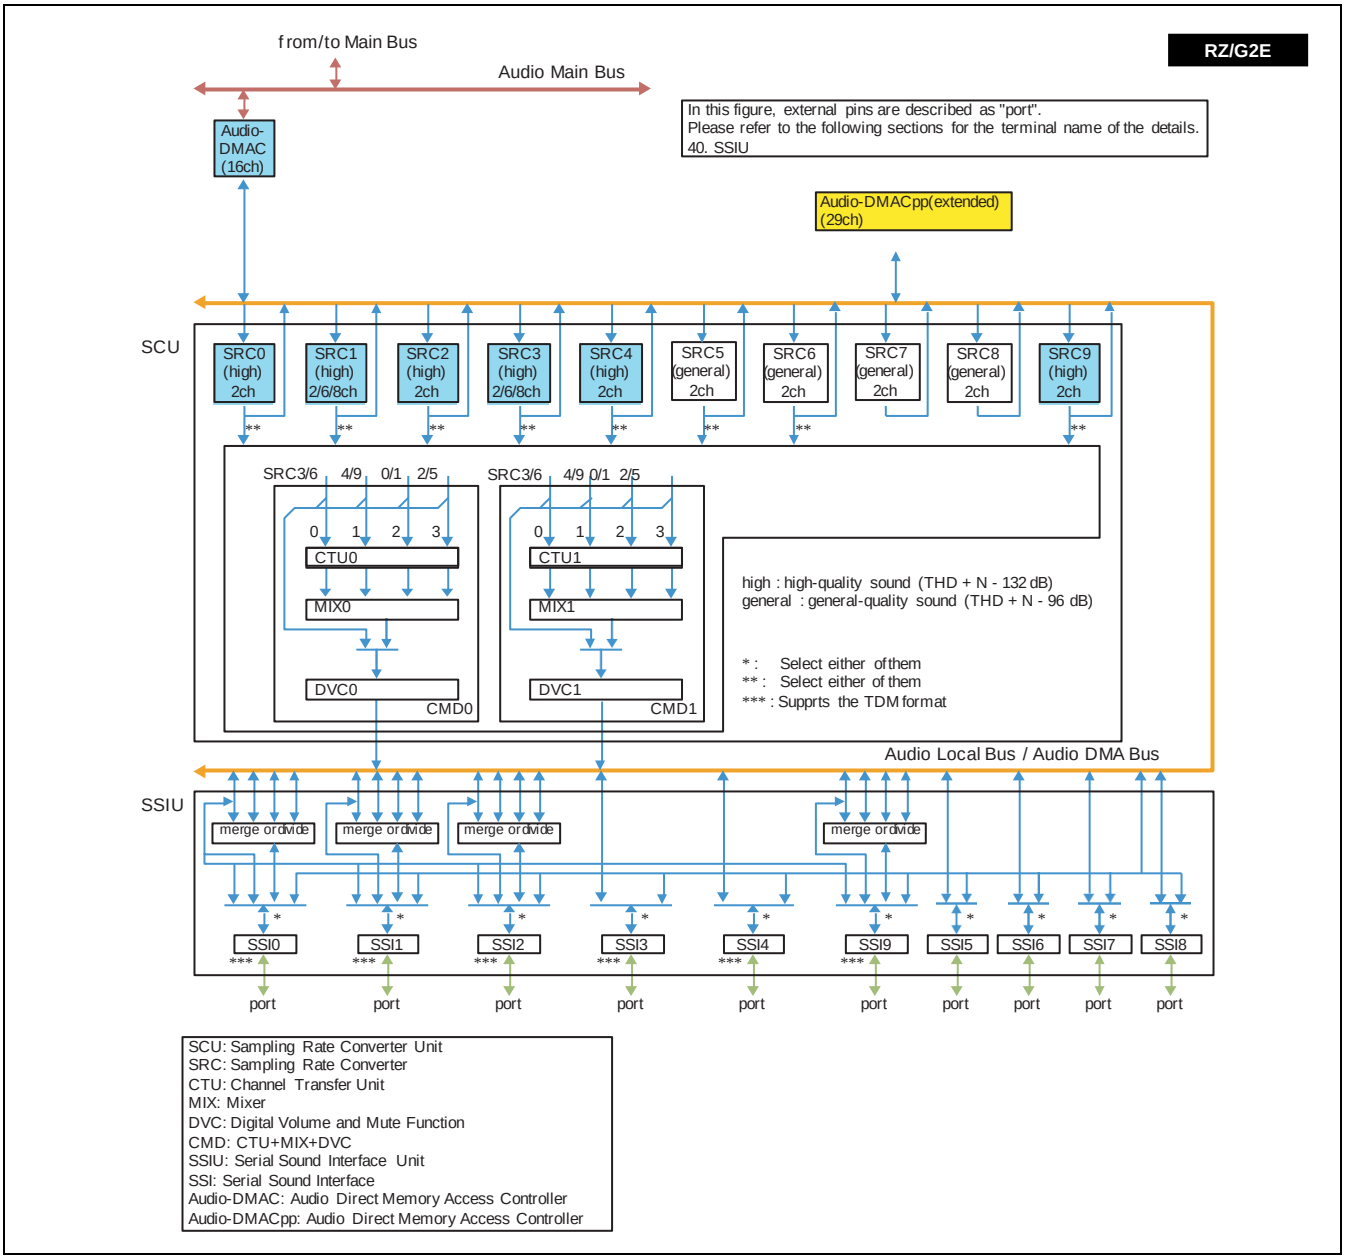

Figure 39.2 Data Paths between Audio Modules [RZ/G2E]

39.1.3 External Pins

Refer to the section 41(SSIU) for more information about terminal information.

39.1.4 Register Configuration

The Audio module does not have a register.

39.1.5 Connected Module

Table 39.1 Connected Modules

Module name		Connected module name	Function of connected module
Audio	Related	APMU	Access the Register
		PFC	Select External pins
		CPG	Output Clocks
		Module Standby	Control to stop clocks
		Software Reset	Execute software reset
		INTC-AP	Control to interrupt
	Including	SSIU	Serial Sound Interface Unit
		SSI	Serial Sound Interface
		ADG	Output Clocks for Audio module
		SCU	Sampling Rate Converter Unit
		Audio-DMAC	Control Direct Memory Access for Audio module
		Audio-DMACpp	Control Direct Memory Access for Audio module connected to the audio local bus

39.2 Register Description

The Audio module does not have a register.

39.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

39.3.1 List of Routings

Data transmission paths in the Audio module are shown in Figure 39.3.

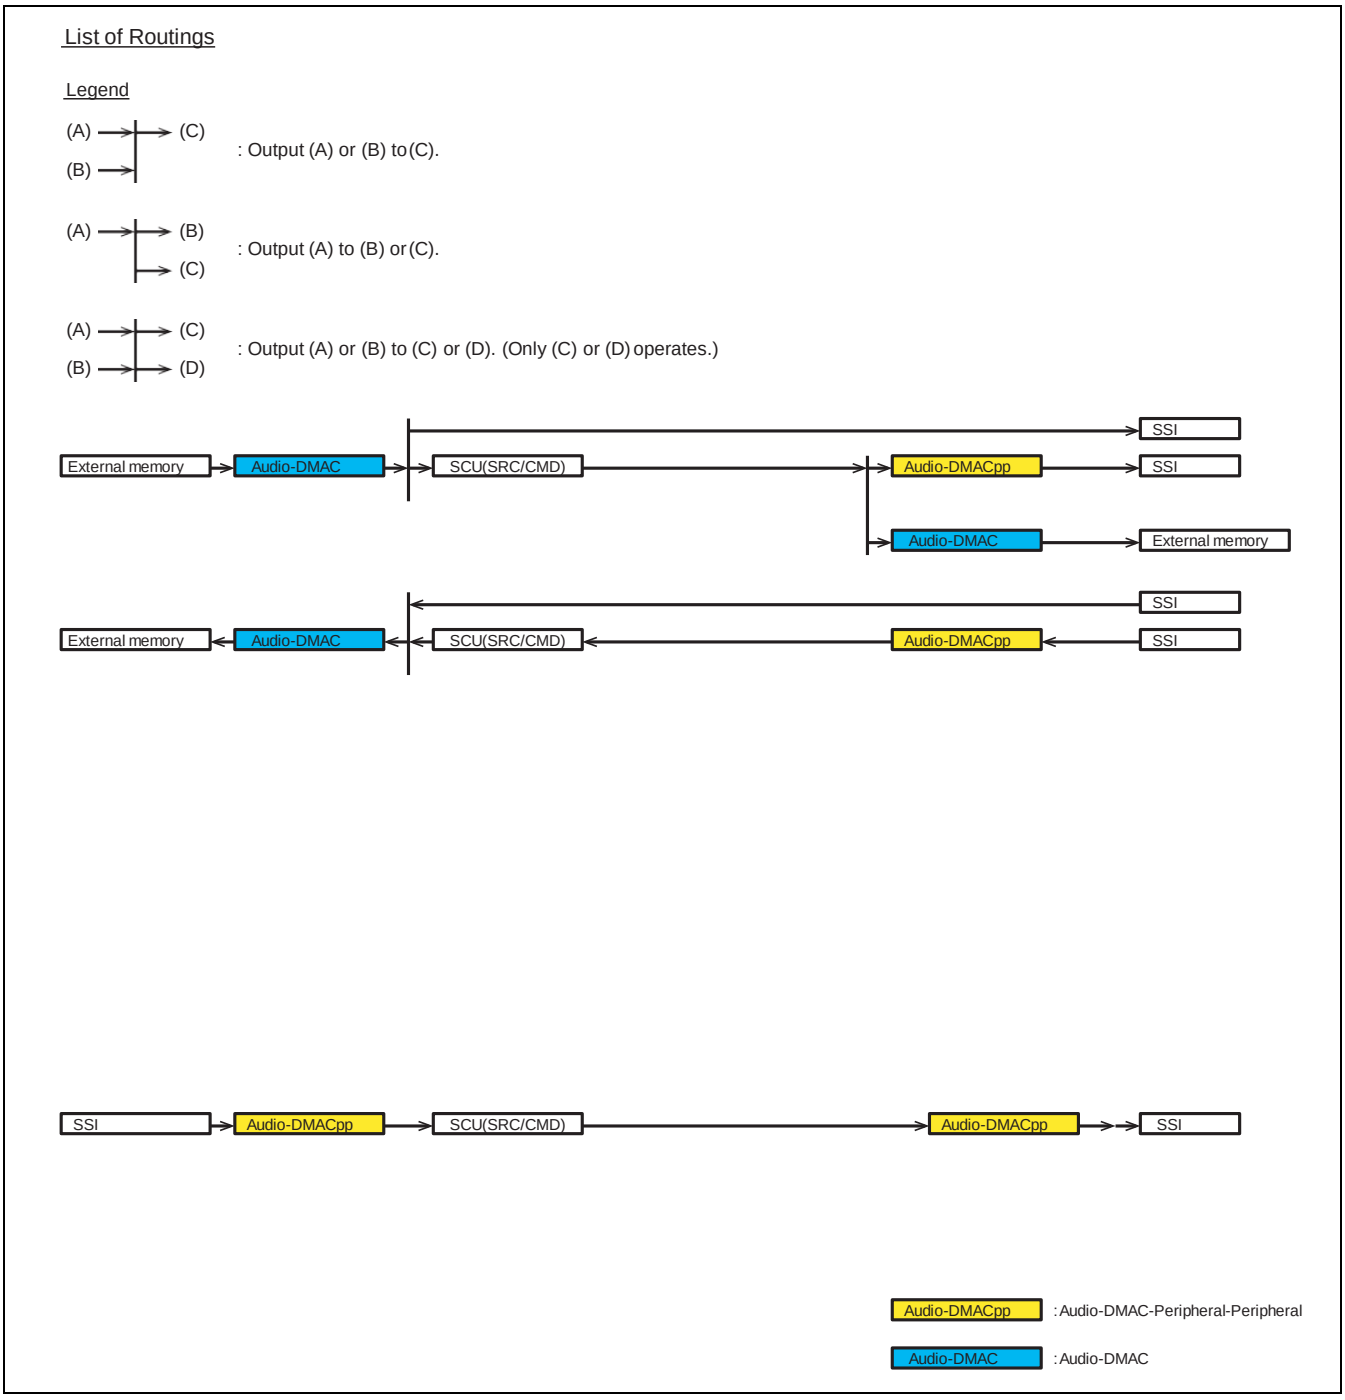

Figure 39.3 List of Routings

39.3.2 Audio-DMAC

The Audio-DMAC is used by data transfer between the external memory and audio modules. The setting values of DMASAR and DMADAR of the Audio-DMAC are shown in Table 39.2.

Table 39.2 Setting Values of DMASAR and DMADAR of Audio-DMAC

Notes: 1. Used only by DMASAR.
2. Used only by DMADAR.

39.3.3 Data Format on Audio Local Bus

Figure 39.4 shows the data formats handled in the audio local bus. When writing or reading data through the Audio-DMAC, align data to match the appropriate data format from those in Figure 39.4.

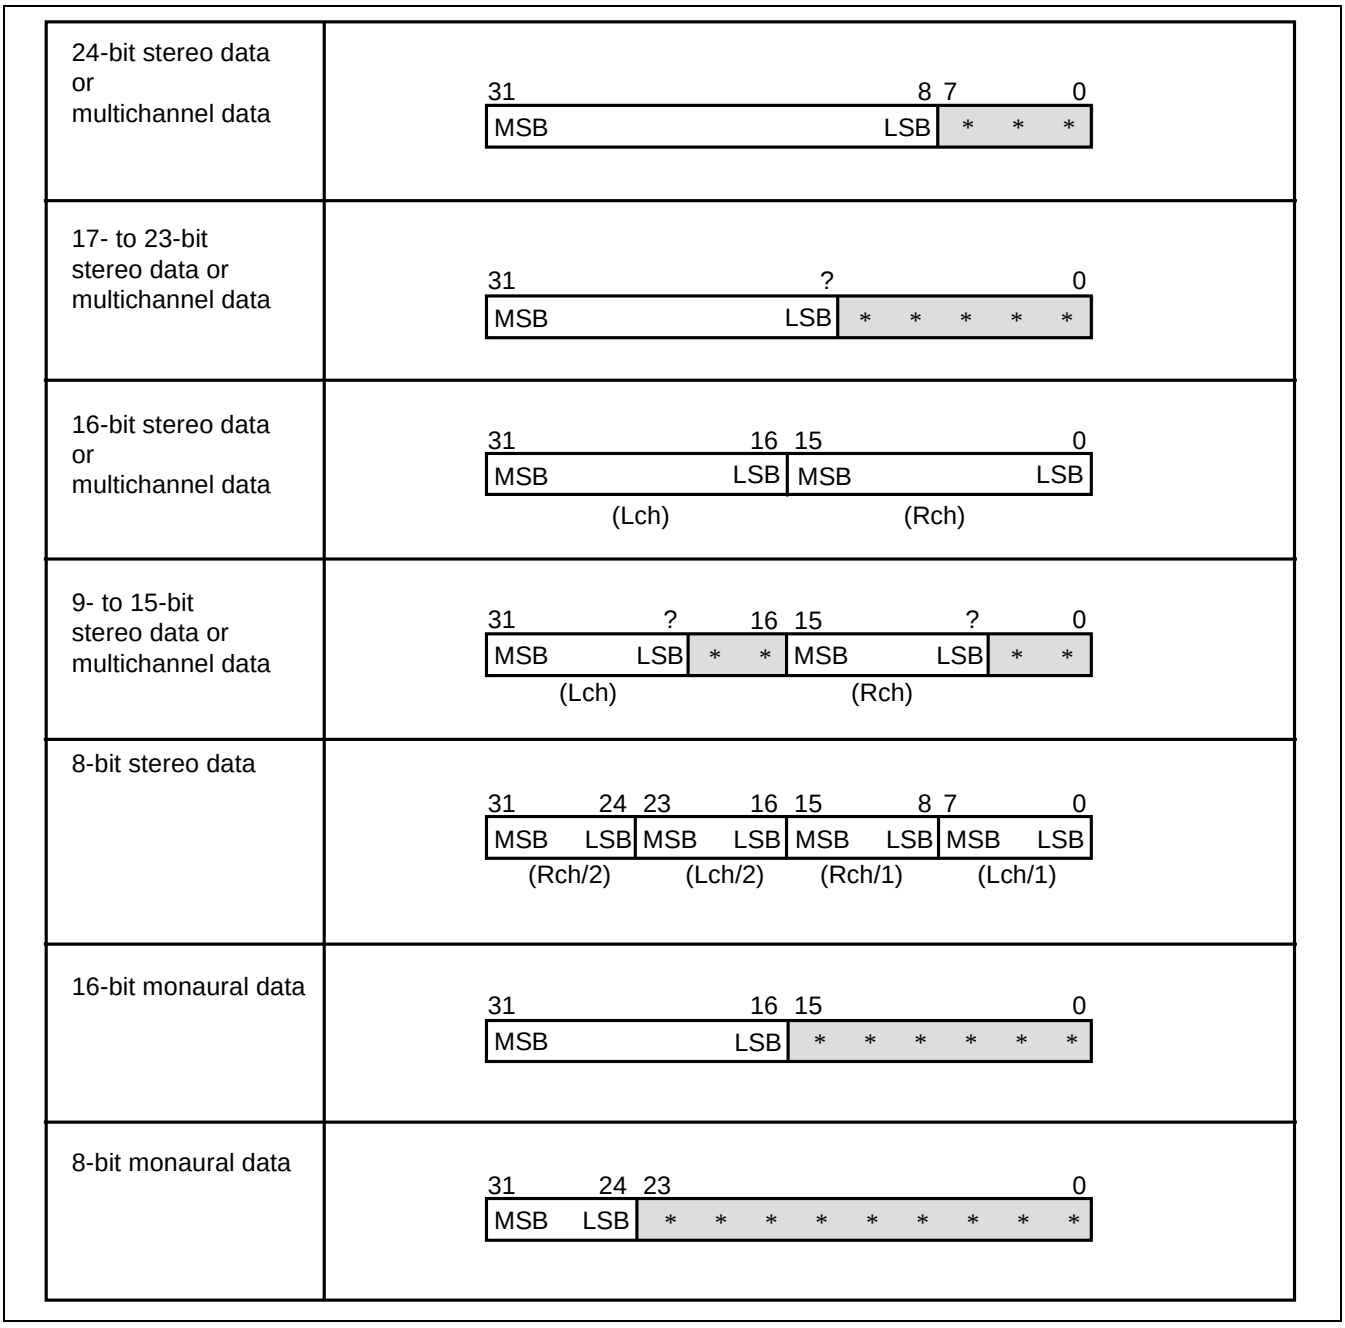

Figure 39.4 Data Format

Notes: 1. Write 0 to the * bits in the figure when writing data. When reading data, ignore the values read from these bits.
2. In the 8-bit stereo data format, (Lch/1) and (Rch/1) indicate the data pair to be processed first and (Lch/2) and (Rch/2) indicate the next data pair to be processed.
3. Only the MSB-first data formats can be used.
4. In Data Format of "16-bit stereo data or multichannel data" and "9- to 15-bit stereo data or multichannel data", set SSIU.SSI_MODE0.ind_word_swap*(* = 0-9) in the setup of independent SSI transmission (SSIU.SSI_MODE0.ind*(* = 0-9) = 1).

39.3.4 Rearranging the Order of Data

For the audio modules (SSI, SCU), rearranging the order of data is possible in the channel unit. Places of data in each data format are defined as in Table 39.3 to 39.6.

Table 39.3 Definition of Data Places in Each Data Format (1)

SSI · Stereo (2 channels)	SSI · Stereo x 3 (6 channels)	SSI · TDM (6 channels)	SSI · Stereo x 4 (8 channels)	SSI · TDM (8 channels)	
Table 39.4 Definition of Data Places in Each Data Format (4)

BUSIF · Stereo (2 channels) · 24 bits	External memory image 31 0 H'00 Place 0 * H'04 Place 1 * H'08 Place 0 * H'0C Place 1 * ... ... *
BUSIF · Stereo (2 channels) · 16 bits	External memory image 31 0 H'00 Place 0 Place 1 H'04 Place 0 Place 1 H'08 Place 0 Place 1 H'0C Place 0 Place 1 ... ...
BUSIF · Stereo (2 channels) · 8 bits	External memory image 31 0 H'00 Place 1 Place 0 Place 1 Place 0 H'04 Place 1 Place 0 Place 1 Place 0 ... ...
BUSIF · Monaural (1 channel) · 8/16 bits	External memory image 31 0 H'00 Place 0 * H'04 Place 0 * H'08 Place 0 * H'0C Place 0 * ... ... *
BUSIF · Multichannel (4 channels) · 24 bits	External memory image 31 0 H'00 Place 0 * H'04 Place 1 * H'08 Place 2 * H'0C Place 3 * H'10 Place 0 * H'14 Place 1 * H'18 Place 2 * H'1C Place 3 * ... ... *
BUSIF · Multichannel (4 channels) · 16 bits	External memory image 31 0 H'00 Place 0 Place 1 H'04 Place 2 Place 3 H'08 Place 0 Place 1 H'0C Place 2 Place 3 ... ...

39.3.5 Transfer Flow

When data transfer is performed between the audio modules, use the Audio-DMAC and Audio-DMACpp to perform settings in accord with the transfer flow shown in Figure 39.5.

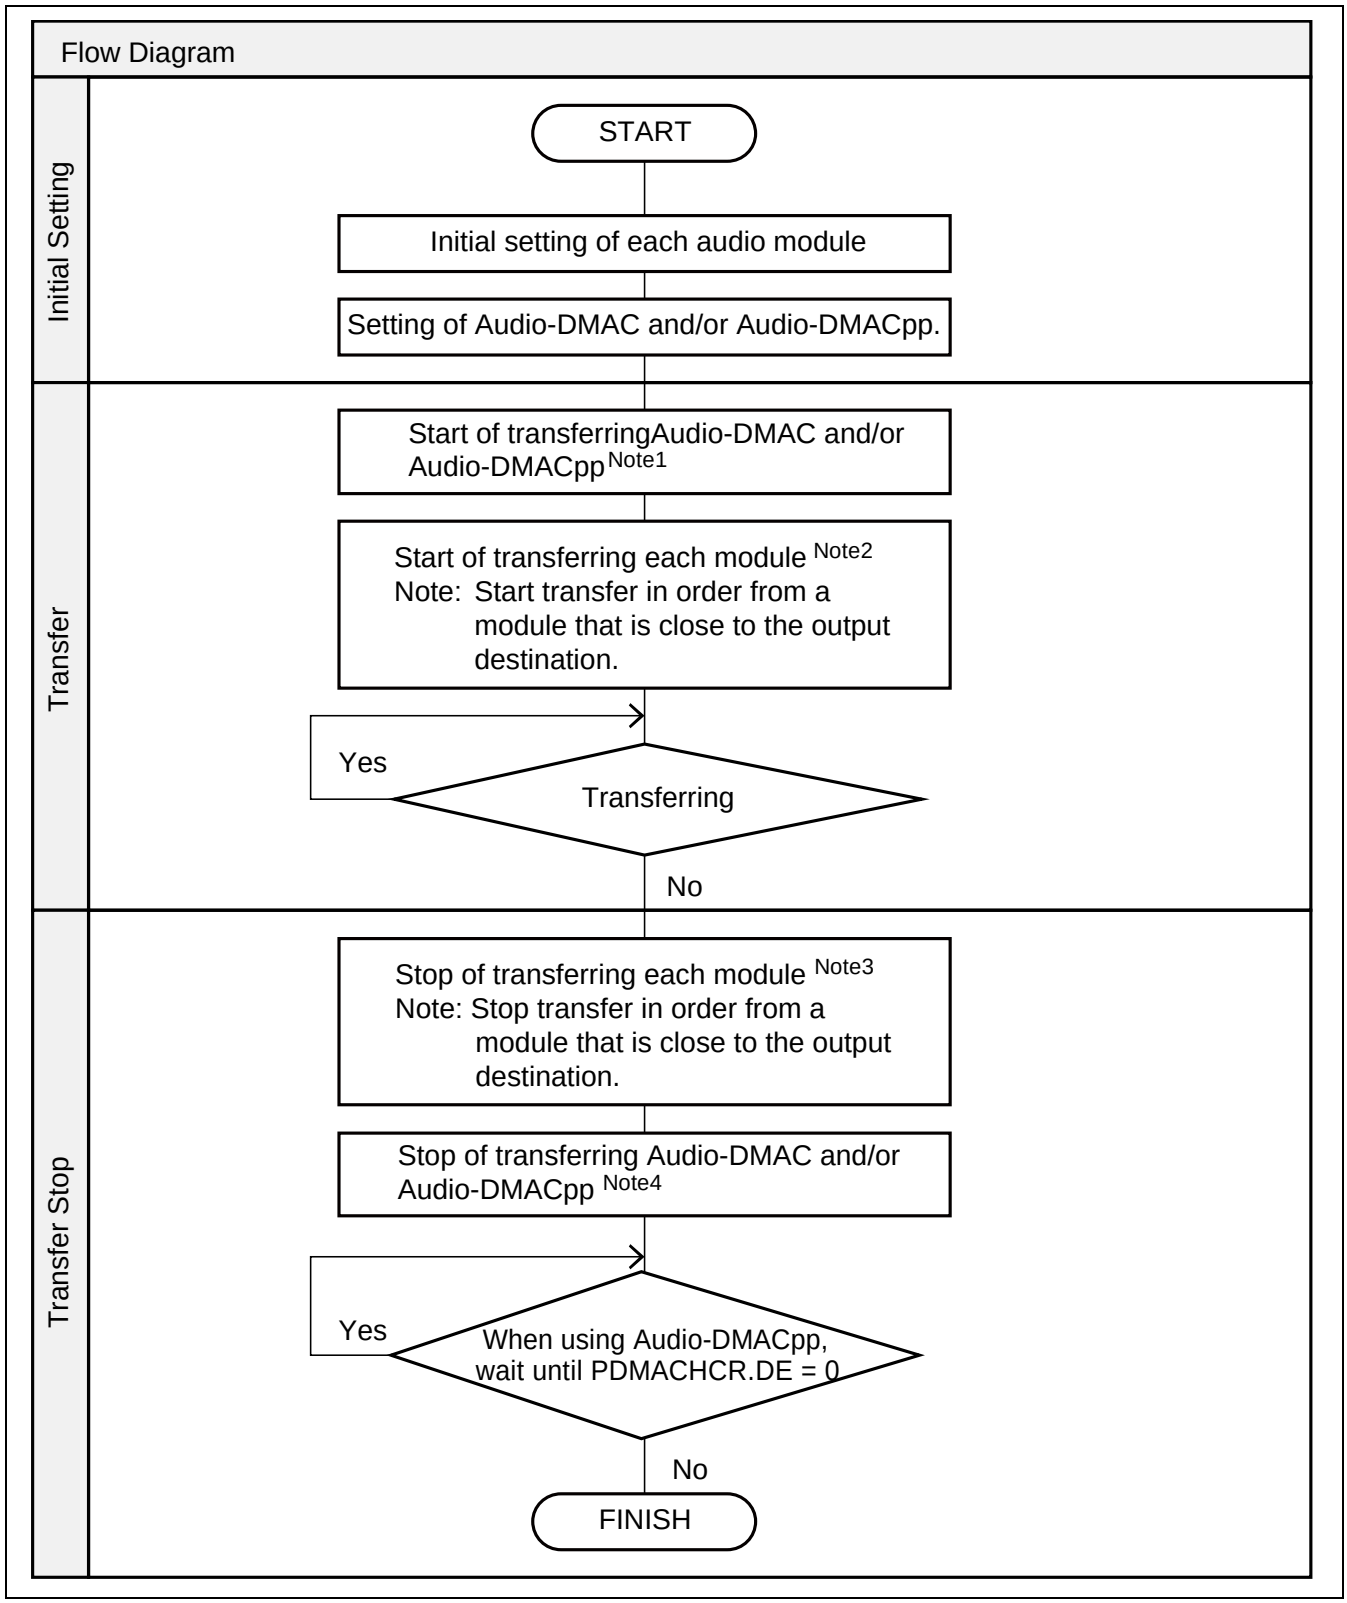

Figure 39.5 Transfer Flow

Notes: 1 For Audio-DMAC, set DMACHCR.DE.

For Audio-DMACpp, set PDMACHCR.DE.

Set up registers except the above in “setting of Audio-DMAC and/or Audio-DMACpp.”

2. For SSI (except for the case when TDM split mode, SSI independent transfer, SSI0, SSI1, SSI2, or SSI9, and SSI3 or SSI4 are used at the same time), when transmitting (from SSI to the external device), set SSIq/r_CONTROL.start after setting SSICR.en/dmen). When receiving (from the external device to SSI), set SSICR.en/dmen after setting SSIq/r_CONTROL.start.

   For SSI (In the case of TDM split mode) regardless of transmission and reception, set SSIq/r_CONTROL.start after setting SSICR.en/dmen.

   For SSI (In the case of SSI independent transfer), set SSICR.en/dmen.

   For SSI (When using SSI0, SSI1, SSI2, or SSI9 and SSI3 or SSI4 at the same time), when transmitting (from SSI to the external device) set SSIq/r_CONTROL.start after setting SSI_CONTROL. When receiving (from the external device to SSI), set SSI_CONTROL after setting SSIq/r_CONTROL.start. (Set SSICR.dmen at the time of the initial setting.)

   For SCU, Set SRCm_CONTROL and CMDn_CONTROL.

   Set up registers except the above in “initial setting of each audio module”.

3. For SSI (except for the case when TDM split mode, SSI independent transfer, SSI0, SSI1, SSI2, or SSI9, and SSI3 or SSI4 are used at the same time), when transmitting (from SSI to the external device), clear SSIq/r_CONTROL.start after clearing SSICR.en/dmen. When receiving (from the external device to SSI), clear SSICR.en/dmen after clearing SSIq/r_CONTROL.start.

   For SSI (In the case of TDM split mode), regardless of transmission and reception, clear all SSIq/r_CONTROL.start of the relevant channels to clear SSICR.en/dmen.

   For SSI (In the case of SSI independent transfer), clear SSICR.en/dmen.

   For SSI (When using SSI0, SSI1, SSI2, or SSI9 and SSI3 or SSI4 at the same time), when transmitting (from SSI to the external device) clear SSIq/r_CONTROL.start after clearing SSICR.dmen of each module and SSI_CONTROL. When receiving (from the external device to SSI), clear SSICR.dmen of each module and SSI_CONTROL after clearing SSIq/r_CONTROL.start.

   For SCU, clear SRCm_CONTROL and CMDn_CONTROL.

   Because transfer is stopped in order from a module that is close to the output destination, overflow may occur in a preceding module. Be careful.

4. For Audio-DMACpp, clear PDMACHCR.DE. At this time, Other bits must not change.
   For Audio-DMAC, clear DMACHCR.DE. Clear processing of Audio-DMAC can be cleared anywhere in a TransferStop sequence.

39.3.6 Module Standby Function

For the register settings to make a transition to or from module standby mode, refer to section 8A, Module Standby and Software Reset.

(1) Transition to Module Standby Mode

To make a transition to module standby mode by the module standby function, refer to the following transition procedure for each module.

(a) SSIU/SSI

1. Check the following registers' settings.
   [SSIU]
   - All bits in the SSIq control register (SSIq_CONTROL) (q = 0-0, 1-0, 2-0, 3-0, 4-0, or 9-0) are cleared to 0 (data transfer stopped).
   - All bits in the SSIr control register (SSIr_CONTROL) (r = 5 to 8) are cleared to 0 (data transfer stopped).
   - All bits in the SSIq interrupt enable register (SSIq_INT_ENABLE_MAIN) (q = 0-0, 1-0, 2-0, 3-0, 4-0, or 9-0) are cleared to 0 (interrupt disabled).
   - All bits in the SSIr interrupt enable register (SSIr_INT_ENABLE_MAIN) (r = 5 to 8) are cleared to 0 (interrupt disabled).
   - All bits in the SSI control register (SSI_CONTROL) are cleared to 0 (data transfer stopped)

   [SSI]
   - The DMEN and EN bits in the control register (SSICRn) (n = 0 to 9) are cleared to 0 (disabled).
   - The IDST bit in the status register (SSISRn) (n = 0 to 9) is set to 1.
   - The CONT bit in the WS mode register (SSIWSRn) (n = 0 to 9) is cleared to 0 (disabled).
2. Set the MSTP1005 to MSTP1015 bits in the module stop control register (RMSTPCR10/SMSTPCR10)

Note: The above bits should be set while the module operation has been completed and is placed in the idle state in which the module cannot be activated by external pins or other modules.

(b) SCU

1. Check the following registers' settings.
   - All bits in the SRCm control register (SRCm_CONTROL) (m = 0 to 9) are cleared to 0 (data transfer stopped).
   - All bits in the CMDn control register (CMDn_CONTROL) (n = 0, 1) are cleared to 0 (data transfer stopped).
   - All bits in the SRCm interrupt enable register 0 (SRCm_INT_ENABLE0) (m = 0 to 6, 9) are cleared to 0 (interrupt disabled).
   - All bits in the SRCn interrupt enable register 0 (SRCn_INT_ENABLE0) (n = 7, 8) are cleared to 0 (interrupt disabled).
2. Set the MSTP1017 to MSTP1031 bits in the module stop control register (RMSTPCR10/SMSTPCR10)

Note: The above bits should be set while the module operation has been completed and is placed in the idle state in which the module cannot be activated by external pins or other modules.

(c) ADG

1. Set the MSTP922 bit in the module stop control register (RMSTPCR9/SMSTPCR9) to 1.

Note: The above bit is for clock divider(brgclk/avb_counter8).
The above bit should be set while the module cannot be activated by other modules

(2) Releasing and Restarting from Module Standby Mode

After the transition to module standby mode, modules can be released from module standby mode by a power-on reset or the appropriate procedure from the list below.

(a) SSIU/SSI

1. Supply the clock signal to SSIU/SSI modules.
2. Clear the MSTP1005 to MSTP1015 bits in the module stop control register (RMSTPCR10/SMSTPCR10).

(b) SCU

1. Clear the MSTP1017 to MSTP1031 bits in the module stop control register (RMSTPCR10/SMSTPCR10).

(c) ADG

1. Supply the clock signal to ADG modules.
2. Clear the MSTP922 bit in the module stop control register (RMSTPCR9/SMSTPCR9).

39.4 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

39.4.1 Notes on Route Switching and Setting Changes

When switching the transfer route, stop the current transfer, specify the new transfer route, and then start transfer. Also, when changing the quantization bit count or the formats, once stop transfer, and then start transfer again after resetting. If this procedure is not followed, correct operation is not guaranteed.

39.4.2 Use of SSI3 and SSI4

Table 39.7 shows the combinations of SSI3 and SSI4 usage and register settings.

Table 39.7 Combinations of SSI3 and SSI4 Usage and Register Settings

	SSI_MODE1 Register Settings		Bit Used to Control Start or Stop Operation
	ssi34_sync	ssi4_pin	
Operating SSI3 and SSI4 independently	0	00	SSICRn.EN (n = 3 and 4)
Operating SSI4 with the SCK and WS signals of SSI3 being shared by both SSI3 and SSI4	0	01 or 10	SSICRn.EN (n = 3 and 4)
Synchronizing serial data of SSI3 and SSI4	1	01 or 10	SSI_CONTROL.ssi34

39.4.3 Notes on CMD Block Usage

When a single sound source is split into two routes, CMD0 and CMD1, and output to SSI3 and SSI4, use the settings for "Synchronizing serial data of SSI3 and SSI4" in Table 39.7, Combinations of SSI3 and SSI4 Usage and Register Settings. The quantization bit count and sampling frequency settings should be the same between SSI3 and SSI4. Note that only the stereo format can be specified for SSI3 and SSI4. For example, it is not possible to output TDM-format data from SSI3 and stereo-format data from SSI4. The reverse combination is not possible either (stereo-format data from SSI3 or TDM-format data from SSI4).

When a single sound source is split into two routes, CMD0 and CMD1, the sampling frequency settings should be the same.

When a single sound source is split into two routes, CMD0 and CMD1, transfer to different types of destination is impossible. For example, outputting CMD0 to SSI is not allowed.

39.4.4 Note when SSI0, SSI1, and SSI2, or SSI0, SSI1, SSI2, and SSI9 are Used for Single-Source Audio Data

When SSI0, SSI1, and SSI2, or SSI0, SSI1, SSI2, and SSI9 are used for single-source audio data, specifying eight-bit quantization and six- or eight-channel operation at the same time is not possible.

39.4.5 Note on Transfer

When an underflow or an overflow occurs in any audio module, stop the transfer.

39.4.6 Note on Usage of the SCU Module

Before starting data transfer, the SCU module needs certain “input data timing” and “output data timing”. When “input data timing” and “output data timing” are not inputted before the transmission start, it does not operate correctly.

In addition, if the SSI module operates in master mode, and if the WS signal is used as "input/output timing signal for the SRC", set SSIWSRn.CONT to 1.
(The WS signal inputted into the ADG module is the same signal as the SSI_WS terminal.)

39.4.7 Note on Usage of the SSIU Module [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

When an SSIU module is used in "TDM-16ch mode", only the transfer with the external memory is available.

39.4.8 Note on software reset during data transfer

If software reset (Software Reset.SRCR) is performed during data transfer, abnormal operation may occur. At this time, normal values can not be guaranteed for the transferred data.

40. Serial Sound Interface Unit (SSIU)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

40.1 Overview

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]

The SSIU, incorporating ten SSI modules, allows independent operation of SSI modules, operation of multiple SSI modules sharing the same serial clock, and connection or split of multichannel data. Refer to section 41 to understand single SSI module in detail.

Note: Configure the system so that connected external devices can operate on the same clock source.

40.1.1 Features

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

- Incorporates ten SSI modules.
- Supports 6 channels/1 sound source with three SSI modules (SSI0, SSI1, and SSI2).
- Supports 8 channels/1 sound source with four SSI modules (SSI0, SSI1, SSI2, and SSI9).
- Operation of multiple modules on the same serial clock (SSI0/SSI1/SSI2/SSI3/SSI9, SSI3/SSI4/SSI9, or SSI7/SSI8).
- TDM format (Basic Configuration) corresponds to 4, 6 or 8-channel data.
- TDM format corresponds to 16-channel data (TDM-16ch mode).
- Handles 8-channel data on the serial bus and 6-channel data in the LSI (TDM extend mode).
- Handles 6-channel data on the serial bus and 8-channel data in the LSI (TDM extend mode).
- Connects monaural or stereo data to output TDM format data (TDM split mode).
- Splits TDM format input data into monaural or stereo data (TDM split mode).
- Connects stereo or multi data to output TDM format data (TDM ex-split mode).
- Splits TDM format input data into stereo or multi data (TDM ex-split mode).
- The frequency range of SCK signal is from 297.3 kHz to 12.5MHz at master mode, and from 297.3 kHz to 15.1 MHz at slave mode.
- Selects SSI signals that is transmitted to the 1-channel of HDMI-IF (at master transmitter mode only). [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

[RZ/G2E]

- Incorporates ten SSI modules.
- Supports 6 channels/1 sound source with three SSI modules (SSI0, SSI1, and SSI2).
- Supports 8 channels/1 sound source with four SSI modules (SSI0, SSI1, SSI2, and SSI9).
- Operation of multiple modules on the same serial clock (SSI0/SSI1/SSI2/SSI3/SSI9, SSI3/SSI4/SSI9, or SSI7/SSI8).
- TDM format (Basic Configuration) corresponds to 4, 6 or 8-channel data.
- Handles 8-channel data on the serial bus and 6-channel data in the LSI (TDM extend mode).
- Handles 6-channel data on the serial bus and 8-channel data in the LSI (TDM extend mode).
- Connects monaural or stereo data to output TDM format data (TDM split mode).
- Splits TDM format input data into monaural or stereo data (TDM split mode).
- Connects stereo or multi data to output TDM format data (TDM ex-split mode).
- Splits TDM format input data into stereo or multi data (TDM ex-split mode).

- The frequency range of SCK signal is from 297.3 kHz to 12.5MHz at master mode, and from 297.3 kHz to 15.1 MHz at slave mode.

Serial data pin for SSI9 (Group B)	SSI_SDATA9_B	I/O	Serial data	√	√	√	—

Note: Although each SSI is multiplexed on multiple LSI pins, the combinations of pins in use must be from the same group. For Example, the use of combinations such as SSI_SCK1_A, SSI_WS1_B, and SSI_SDATA1_A is prohibited. Refer to section 8, Pin Function Controller (PFC) for details.

40.1.4 Register Configuration

Table 40.2 shows the register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a longword (32 bits). Operation cannot be guaranteed if the register is not accessed as a longword.

Note: * Address H'EC10_xxxx is used for data transfer with the Audio-DMAC. Address H'EC40_xxxx is used for data transfer with the Audio-DMACpp.

40.1.5 Connected Module

Table 40.3 Connected Module

Module name	Connected module name	Function of connected module
SSIU	APMU	Access the Register
	PFC	Select External pins
	CPG	Output Clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-AP	Control to interrupt
	SSI	Serial Sound Interface
	ADG	Output Clocks for Audio module
	SCU	Sampling Rate Converter Unit
	Audio-DMAC	Control Direct Memory Access for Audio module
	Audio-DMACpp	Control Direct Memory Access for Audio modules connected to the audio local bus

40.2 Register Description

Legend for Register Description

Initial value: Register value after a reset. H'xxxx represents a hexadecimal number. Others are represented in binary numbers.

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.

—/W: Write-only. The read value is undefined.

All access to registers is made in longword units.

40.2.1 SSIn BUSIF Mode Register (SSIn_BUSIF_MODE)

Note: n = 0-0 to 0-7, 1-0 to 1-7, 2-0 to 2-7, 3-0 to 3-7, 4-0 to 4-7, 5 to 8, or 9-0 to 9-7 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
n = 0-0 to 0-3, 1-0 to 1-3, 2-0 to 2-3, 3-0 to 3-3, 4-0 to 4-3, 5 to 8, or 9-0 to 9-3 [RZ/G2E]

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSIn_BUSIF_MODE determines the initial settings of the bus interface.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	sft_dir	sft_num			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	word_ swap	—	—	—	—	—	—	—	dma

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	sft_dir	B'0	R/W	ssi***n***_busif_shift_dir Selects the bit-shift direction for valid bit position adjustment in the SSI***n***_BUSIF input and output data. 0: Shift to left. 1: Shift to right.
19 to 16	sft_num	H'0	R/W	ssi***n***_busif_shift_num Selects the bit-shift count for valid bit position adjustment in the SSI***n***_BUSIF input and output data. B'0000: 0 bit B'0001: 1 bit B'0010: 2 bits B'0011: 3 bits B'0100: 4 bits B'0101: 5 bits B'0110: 6 bits B'0111: 7 bits B'1000: 8 bits B'1001: 9 bits B'1010: 10 bits B'1011: 11 bits B'1100: 12 bits B'1101: 13 bits B'1110: 14 bits B'1111: 15 bits
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	word_swap	B'0	R/W	word_swap_en Swaps the word order in SSI***n***_BUSIF. 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	dma	B'1	R/W	ssi***n***_dma Selects the access type for SSI***n***_BUSIF. 0: PIO access (setting prohibited) 1: DMA access Be sure to specify the DMA access.

40.2.2 SSIm BUSIF Audio Information Register (SSIm_BUSIF_ADINR)

Note: m = 0-0 to 0-7, 1-0 to 1-7, 2-0 to 2-7, 3-0 to 3-7, 4-0 to 4-7, or 9-0 to 9-7 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
m = 0-0 to 0-3, 1-0 to 1-3, 2-0 to 2-3, 3-0 to 3-3, 4-0 to 4-3, or 9-0 to 9-3 [RZ/G2E]

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSIm_BUSIF_ADINR is a 32-bit readable/writable register that selects channel number and bit length of output audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	place7	B’0111	R/W	Changes the stream data order. These bits are used for the 8- or more channel setting. **For the 6- or less channel setting or TDM split mode setting (tdm_split = 1, ex_func = 0), the initial value should not be changed.** **If SSIq are used for the 8channel, B'1000 to B'1111 is reserved, the initial value should not be changed.** **If SSIq are used for the 10channel, B'1010 to B'1111 is reserved, the initial value should not be changed.** The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 7 on the output side. B’0000: Data at input-side place 0 is sent to output-side place 7. B’0001: Data at input-side place 1 is sent to output-side place 7. B’0010: Data at input-side place 2 is sent to output-side place 7. B’0011: Data at input-side place 3 is sent to output-side place 7. B’0100: Data at input-side place 4 is sent to output-side place 7. B’0101: Data at input-side place 5 is sent to output-side place 7. B’0110: Data at input-side place 6 is sent to output-side place 7. B’0111: Data at input-side place 7 is sent to output-side place 7. B’1000: Data at input-side place 8 is sent to output-side place 7. B’1001: Data at input-side place 9 is sent to output-side place 7. B’1010: Data at input-side place 10 is sent to output-side place 7. B’1011: Data at input-side place 11 is sent to output-side place 7. B’1100: Data at input-side place 12 is sent to output-side place 7. B’1101: Data at input-side place 13 is sent to output-side place 7. B’1110: Data at input-side place 14 is sent to output-side place 7. B’1111: Data at input-side place 15 is sent to output-side place 7.

Bit	Bit Name	Initial Value	R/W	Description
27 to 24	place6	B’0110	R/W	Changes the stream data order. These bits are used for the 8- or more channel setting. **For the 6- or less channel setting or TDM split mode setting (tdm_split = 1, ex_func = 0), the initial value should not be changed.** **When SSIq are used for the 8channel, B'1000 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 10channel, B'1010 to B'1111 is reserved, the initial value should not be changed.** The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 6 on the output side. B’0000: Data at input-side place 0 is sent to output-side place 6. B’0001: Data at input-side place 1 is sent to output-side place 6. B’0010: Data at input-side place 2 is sent to output-side place 6. B’0011: Data at input-side place 3 is sent to output-side place 6. B’0100: Data at input-side place 4 is sent to output-side place 6. B’0101: Data at input-side place 5 is sent to output-side place 6. B’0110: Data at input-side place 6 is sent to output-side place 6. B’0111: Data at input-side place 7 is sent to output-side place 6. B’1000: Data at input-side place 8 is sent to output-side place 6. B’1001: Data at input-side place 9 is sent to output-side place 6. B’1010: Data at input-side place 10 is sent to output-side place 6. B’1011: Data at input-side place 11 is sent to output-side place 6. B’1100: Data at input-side place 12 is sent to output-side place 6. B’1101: Data at input-side place 13 is sent to output-side place 6. B’1110: Data at input-side place 14 is sent to output-side place 6. B’1111: Data at input-side place 15 is sent to output-side place 6.

Bit	Bit Name	Initial Value	R/W	Description
23 to 20	place5	B’0101	R/W	Changes the stream data order. These bits are used for the 6- or more channel setting. **For the 4- or less channel setting or TDM split mode setting (tdm_split = 1, ex_func = 0), the initial value should not be changed.** **When SSIq are used for the 6channel, B'0110 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 8channel, B'1000 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 10channel, B'1010 to B'1111 is reserved, the initial value should not be changed.** The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 5 on the output side. B’0000: Data at input-side place 0 is sent to output-side place 5. B’0001: Data at input-side place 1 is sent to output-side place 5. B’0010: Data at input-side place 2 is sent to output-side place 5. B’0011: Data at input-side place 3 is sent to output-side place 5. B’0100: Data at input-side place 4 is sent to output-side place 5. B’0101: Data at input-side place 5 is sent to output-side place 5. B’0110: Data at input-side place 6 is sent to output-side place 5. B’0111: Data at input-side place 7 is sent to output-side place 5. B’1000: Data at input-side place 8 is sent to output-side place 5. B’1001: Data at input-side place 9 is sent to output-side place 5. B’1010: Data at input-side place 10 is sent to output-side place 5. B’1011: Data at input-side place 11 is sent to output-side place 5. B’1100: Data at input-side place 12 is sent to output-side place 5. B’1101: Data at input-side place 13 is sent to output-side place 5. B’1110: Data at input-side place 14 is sent to output-side place 5. B’1111: Data at input-side place 15 is sent to output-side place 5.

Bit	Bit Name	Initial Value	R/W	Description
19 to 16	place4	B’0100	R/W	Changes the stream data order. These bits are used for the 6- or more channel setting. **For the 4- or less channel setting or TDM split mode setting (tdm_split = 1, ex_func = 0), the initial value should not be changed.** **When SSIq are used for the 6channel, B'0110 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 8channel, B'1000 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 10channel, B'1010 to B'1111 is reserved, the initial value should not be changed.** The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 4 on the output side. B’0000: Data at input-side place 0 is sent to output-side place 4. B’0001: Data at input-side place 1 is sent to output-side place 4. B’0010: Data at input-side place 2 is sent to output-side place 4. B’0011: Data at input-side place 3 is sent to output-side place 4. B’0100: Data at input-side place 4 is sent to output-side place 4. B’0101: Data at input-side place 5 is sent to output-side place 4. B’0110: Data at input-side place 6 is sent to output-side place 4. B’0111: Data at input-side place 7 is sent to output-side place 4. B’1000: Data at input-side place 8 is sent to output-side place 4. B’1001: Data at input-side place 9 is sent to output-side place 4. B’1010: Data at input-side place 10 is sent to output-side place 4. B’1011: Data at input-side place 11 is sent to output-side place 4. B’1100: Data at input-side place 12 is sent to output-side place 4. B’1101: Data at input-side place 13 is sent to output-side place 4. B’1110: Data at input-side place 14 is sent to output-side place 4. B’1111: Data at input-side place 15 is sent to output-side place 4.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	place3	B’0011	R/W	Changes the stream data order. These bits are used for the 4- or more channel setting. **For the 2- or less channel setting or TDM split mode setting (tdm_split = 1, ex_func = 0), the initial value should not be changed.** **When SSIq are used for the 4channel, B'0100 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 6channel, B'0110 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 8channel, B'1000 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 10channel, B'1010 to B'1111 is reserved, the initial value should not be changed.** The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 3 on the output side. B’0000: Data at input-side place 0 is sent to output-side place 3. B’0001: Data at input-side place 1 is sent to output-side place 3. B’0010: Data at input-side place 2 is sent to output-side place 3. B’0011: Data at input-side place 3 is sent to output-side place 3. B’0100: Data at input-side place 4 is sent to output-side place 3. B’0101: Data at input-side place 5 is sent to output-side place 3. B’0110: Data at input-side place 6 is sent to output-side place 3. B’0111: Data at input-side place 7 is sent to output-side place 3. B’1000: Data at input-side place 8 is sent to output-side place 3. B’1001: Data at input-side place 9 is sent to output-side place 3. B’1010: Data at input-side place 10 is sent to output-side place 3. B’1011: Data at input-side place 11 is sent to output-side place 3. B’1100: Data at input-side place 12 is sent to output-side place 3. B’1101: Data at input-side place 13 is sent to output-side place 3. B’1110: Data at input-side place 14 is sent to output-side place 3. B’1111: Data at input-side place 15 is sent to output-side place 3.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	place2	B’0010	R/W	Changes the stream data order. These bits are used for the 4- or more channel setting. **For the 2- or less channel setting or TDM split mode setting (tdm_split = 1, ex_func = 0), the initial value should not be changed.** **When SSIq are used for the 4channel, B'0100 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 6channel, B'0110 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 8channel, B'1000 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 10channel, B'1010 to B'1111 is reserved, the initial value should not be changed.** The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 2 on the output side. B’0000: Data at input-side place 0 is sent to output-side place 2. B’0001: Data at input-side place 1 is sent to output-side place 2. B’0010: Data at input-side place 2 is sent to output-side place 2. B’0011: Data at input-side place 3 is sent to output-side place 2. B’0100: Data at input-side place 4 is sent to output-side place 2. B’0101: Data at input-side place 5 is sent to output-side place 2. B’0110: Data at input-side place 6 is sent to output-side place 2. B’0111: Data at input-side place 7 is sent to output-side place 2. B’1000: Data at input-side place 8 is sent to output-side place 2. B’1001: Data at input-side place 9 is sent to output-side place 2. B’1010: Data at input-side place 10 is sent to output-side place 2. B’1011: Data at input-side place 11 is sent to output-side place 2. B’1100: Data at input-side place 12 is sent to output-side place 2. B’1101: Data at input-side place 13 is sent to output-side place 2. B’1110: Data at input-side place 14 is sent to output-side place 2. B’1111: Data at input-side place 15 is sent to output-side place 2.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	place1	B’0001	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 1 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) B’xxx0: Data at input-side place 0 is sent to output-side place 1. B’xxx1: Data at input-side place 1 is sent to output-side place 1. * x is don't care. • When other mode is used (exclude "TDM split mode") B’0000: Data at input-side place 0 is sent to output-side place 1. B’0001: Data at input-side place 1 is sent to output-side place 1. B’0010: Data at input-side place 2 is sent to output-side place 1. B’0011: Data at input-side place 3 is sent to output-side place 1. B’0100: Data at input-side place 4 is sent to output-side place 1. B’0101: Data at input-side place 5 is sent to output-side place 1. B’0110: Data at input-side place 6 is sent to output-side place 1. B’0111: Data at input-side place 7 is sent to output-side place 1. B’1000: Data at input-side place 8 is sent to output-side place 1. B’1001: Data at input-side place 9 is sent to output-side place 1. B’1010: Data at input-side place 10 is sent to output-side place 1. B’1011: Data at input-side place 11 is sent to output-side place 1. B’1100: Data at input-side place 12 is sent to output-side place 1. B’1101: Data at input-side place 13 is sent to output-side place 1. B’1110: Data at input-side place 14 is sent to output-side place 1. B’1111: Data at input-side place 15 is sent to output-side place 1. And, when TDM Ex-Split mode is used (tdm_split = 1, ex_func = 1), add the following condition. **When SSIq are used for the 2channel, B'0010 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 4channel, B'0100 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 6channel, B'0110 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 8channel, B'1000 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 10channel, B'1010 to B'1111 is reserved, the initial value should not be changed.**

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	place0	B’0000	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 0 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) B’xxx0: Data at input-side place 0 is sent to output-side place 0. B’xxx1: Data at input-side place 1 is sent to output-side place 0. * x is don't care. • When other mode is used (exclude "TDM split mode") B’0000: Data at input-side place 0 is sent to output-side place 0. B’0001: Data at input-side place 1 is sent to output-side place 0. B’0010: Data at input-side place 2 is sent to output-side place 0. B’0011: Data at input-side place 3 is sent to output-side place 0. B’0100: Data at input-side place 4 is sent to output-side place 0. B’0101: Data at input-side place 5 is sent to output-side place 0. B’0110: Data at input-side place 6 is sent to output-side place 0. B’0111: Data at input-side place 7 is sent to output-side place 0. B’1000: Data at input-side place 8 is sent to output-side place 0. B’1001: Data at input-side place 9 is sent to output-side place 0. B’1010: Data at input-side place 10 is sent to output-side place 0. B’1011: Data at input-side place 11 is sent to output-side place 0. B’1100: Data at input-side place 12 is sent to output-side place 0. B’1101: Data at input-side place 13 is sent to output-side place 0. B’1110: Data at input-side place 14 is sent to output-side place 0. B’1111: Data at input-side place 15 is sent to output-side place 0. And, when TDM Ex-Split mode is used (tdm_split = 1, ex_func = 1), add the following condition. **When SSIq are used for the 2channel, B'0010 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 4channel, B'0100 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 6channel, B'0110 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 8channel, B'1000 to B'1111 is reserved, the initial value should not be changed.** **When SSIq are used for the 10channel, B'1010 to B'1111 is reserved, the initial value should not be changed.**

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	place7	B’111	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 7 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIt are used for the 4 channel setting** B’100: Data at input-side place 4 is sent to output-side place 7. B’101: Data at input-side place 5 is sent to output-side place 7. B’110: Data at input-side place 6 is sent to output-side place 7. B’111: Data at input-side place 7 is sent to output-side place 7. Other settings are prohibited. **Other Setting (Include SSIq are 8 channel)** All bit is reserved. The initial value should not be changed.
11	—	B’0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	place6	B’0110	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 6 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIt are used for the 4 channel setting** B’100: Data at input-side place 4 is sent to output-side place 6. B’101: Data at input-side place 5 is sent to output-side place 6. B’110: Data at input-side place 6 is sent to output-side place 6. B’111: Data at input-side place 7 is sent to output-side place 6. Other settings are prohibited. **Other Setting (Include SSIq are 8 channel)** All bit is reserved. The initial value should not be changed.
7	—	B’0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	place5	B’0101	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 5 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) B’xx0: Data at input-side place 4 is sent to output-side place 5. B’xx1: Data at input-side place 5 is sent to output-side place 5. * x is don't care. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIt are used for the 4 channel setting** B’100: Data at input-side place 4 is sent to output-side place 5. B’101: Data at input-side place 5 is sent to output-side place 5. B’110: Data at input-side place 6 is sent to output-side place 5. B’111: Data at input-side place 7 is sent to output-side place 5. Other settings are prohibited. **When SSIt are used for the 2 channel setting** B’100: Data at input-side place 4 is sent to output-side place 5. B’101: Data at input-side place 5 is sent to output-side place 5. Other settings are prohibited. **Other Setting (Include SSIq are 6 to 8 channel)** All bit is reserved. The initial value should not be changed.
3	—	B’0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	place4	B’0100	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 4 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) B’xx0: Data at input-side place 4 is sent to output-side place 4. B’xx1: Data at input-side place 5 is sent to output-side place 4. * x is don't care. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIt are used for the 4 channel setting** B’100: Data at input-side place 4 is sent to output-side place 4. B’101: Data at input-side place 5 is sent to output-side place 4. B’110: Data at input-side place 6 is sent to output-side place 4. B’111: Data at input-side place 7 is sent to output-side place 4. Other settings are prohibited. **When SSIt are used for the 2 channel setting** B’100: Data at input-side place 4 is sent to output-side place 4. B’101: Data at input-side place 5 is sent to output-side place 4. Other settings are prohibited. **Other Setting (Include SSIq are 6 to 8 channel)** All bit is reserved. The initial value should not be changed.

B’1011: Data at input-side place 11 is sent to output-side place 10. Other settings are prohibited. **Other Setting (Include SSIq are 16 channel)** All bit is reserved. The initial value should not be changed.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	place9	B’1001	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 9 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIv are used for the 8 channel setting** B’1000: Data at input-side place 8 is sent to output-side place 9. B’1001: Data at input-side place 9 is sent to output-side place 9. B’1010: Data at input-side place 10 is sent to output-side place 9. B’1011: Data at input-side place 11 is sent to output-side place 9. B’1100: Data at input-side place 12 is sent to output-side place 9. B’1101: Data at input-side place 13 is sent to output-side place 9. B’1110: Data at input-side place 14 is sent to output-side place 9. B’1111: Data at input-side place 15 is sent to output-side place 9. **When SSIv are used for the 6 channel setting** B’1000: Data at input-side place 8 is sent to output-side place 9. B’1001: Data at input-side place 9 is sent to output-side place 9. B’1010: Data at input-side place 10 is sent to output-side place 9. B’1011: Data at input-side place 11 is sent to output-side place 9. B’1100: Data at input-side place 12 is sent to output-side place 9. B’1101: Data at input-side place 13 is sent to output-side place 9. Other settings are prohibited. **When SSIv are used for the 4 channel setting** B’1000: Data at input-side place 8 is sent to output-side place 9. B’1001: Data at input-side place 9 is sent to output-side place 9. B’1010: Data at input-side place 10 is sent to output-side place 9. B’1011: Data at input-side place 11 is sent to output-side place 9. Other settings are prohibited. **When SSIv are used for the 2 channel setting** B’1000: Data at input-side place 8 is sent to output-side place 9. B’1001: Data at input-side place 9 is sent to output-side place 9. Other settings are prohibited. **Other Setting (Include SSIq are 10 to 16 channel)** All bit is reserved. The initial value should not be changed.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	place8	B’1000	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 8 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIv are used for the 8 channel setting** B’1000: Data at input-side place 8 is sent to output-side place 8. B’1001: Data at input-side place 9 is sent to output-side place 8. B’1010: Data at input-side place 10 is sent to output-side place 8. B’1011: Data at input-side place 11 is sent to output-side place 8. B’1100: Data at input-side place 12 is sent to output-side place 8. B’1101: Data at input-side place 13 is sent to output-side place 8. B’1110: Data at input-side place 14 is sent to output-side place 8. B’1111: Data at input-side place 15 is sent to output-side place 8. **When SSIv are used for the 6 channel setting** B’1000: Data at input-side place 8 is sent to output-side place 8. B’1001: Data at input-side place 9 is sent to output-side place 8. B’1010: Data at input-side place 10 is sent to output-side place 8. B’1011: Data at input-side place 11 is sent to output-side place 8. B’1100: Data at input-side place 12 is sent to output-side place 8. B’1101: Data at input-side place 13 is sent to output-side place 8. Other settings are prohibited. **When SSIv are used for the 4 channel setting** B’1000: Data at input-side place 8 is sent to output-side place 8. B’1001: Data at input-side place 9 is sent to output-side place 8. B’1010: Data at input-side place 10 is sent to output-side place 8. B’1011: Data at input-side place 11 is sent to output-side place 8. Other settings are prohibited. **When SSIv are used for the 2 channel setting** B’1000: Data at input-side place 8 is sent to output-side place 8. B’1001: Data at input-side place 9 is sent to output-side place 8. Other settings are prohibited. **Other Setting (Include SSIq are 10 to 16 channel)** All bit is reserved. The initial value should not be changed.

40.2.10 SSIw BUSIF Data Align Register (SSIw_BUSIF_DALIGN)

Note: w = 0-5, 1-5, 2-5, 3-5, 4-5, 9-5

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 12	place15	B’1111	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 15 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIx are used for the 4 channel setting** B’1100: Data at input-side place 12 is sent to output-side place 15. B’1101: Data at input-side place 13 is sent to output-side place 15. B’1110: Data at input-side place 14 is sent to output-side place 15. B’1111: Data at input-side place 15 is sent to output-side place 15. Other settings are prohibited. **Other Setting (Include SSIq are 16 channel or SSIv are 8 channel)** All bit is reserved. The initial value should not be changed.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	place14	B'1110	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 14 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Func mode is used (tdm_split = 1, ex_func = 1) **When SSIx are used for the 4 channel setting** B'1100: Data at input-side place 12 is sent to output-side place 14. B'1101: Data at input-side place 13 is sent to output-side place 14. B'1110: Data at input-side place 14 is sent to output-side place 14. B'1111: Data at input-side place 15 is sent to output-side place 14. Other settings are prohibited. **Other Setting (Include SSIq are 16 channel or SSIv are 8 channel)** All bit is reserved. The initial value should not be changed.
7 to 4	place13	B'1101	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 13 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIx are used for the 4 channel setting** B'1100: Data at input-side place 12 is sent to output-side place 13. B'1101: Data at input-side place 13 is sent to output-side place 13. B'1110: Data at input-side place 14 is sent to output-side place 13. B'1111: Data at input-side place 15 is sent to output-side place 13. Other settings are prohibited. **When SSIx are used for the 2 channel setting** B'1100: Data at input-side place 12 is sent to output-side place 13. B'1101: Data at input-side place 13 is sent to output-side place 13. Other settings are prohibited. **Other Setting (Include SSIq are 16 channel or SSIv are 6 to 8 channel)** All bit is reserved. The initial value should not be changed.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	place12	B’1100	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 12 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIx are used for the 4 channel setting** B’1100: Data at input-side place 12 is sent to output-side place 12. B’1101: Data at input-side place 13 is sent to output-side place 12. B’1110: Data at input-side place 14 is sent to output-side place 12. B’1111: Data at input-side place 15 is sent to output-side place 12. Other settings are prohibited. **When SSIx are used for the 2 channel setting** B’1100: Data at input-side place 12 is sent to output-side place 12. B’1101: Data at input-side place 13 is sent to output-side place 12. Other settings are prohibited. **Other Setting (Include SSIq are 16 channel or SSIv are 6 to 8 channel)** All bit is reserved. The initial value should not be changed.

40.2.12 SSIy BUSIF Data Align Register (SSIy_BUSIF_DALIGN)

Note: y = 0-7, 1-7, 2-7, 3-7, 4-7, 9-7

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: SSIy_BUSIF_DALIGN determines the initial settings of the SSIy route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	place15	B’1111	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 15 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIy are used for the 2 channel setting** B’1110: Data at input-side place 14 is sent to output-side place 15. B’1111: Data at input-side place 15 is sent to output-side place 15. Other settings are prohibited. **Other Setting (Include SSIq are 16 channel or SSIv are 8 channel or SSIx are 4 channel)** All bit is reserved. The initial value should not be changed.
3 to 0	place14	B’1110	R/W	Changes the stream data order. The data order is changed between the SSI and bus interface. Selects the input-side data to be output to place 14 on the output side. • When TDM split mode is used (tdm_split = 1, ex_func = 0) All bit is reserved. The initial value should not be changed. • When TDM Ex Func mode is used (tdm_split = 1, ex_func = 1) **When SSIy are used for the 2 channel setting** B’1110: Data at input-side place 14 is sent to output-side place 14. B’1111: Data at input-side place 15 is sent to output-side place 14. Other settings are prohibited. **Other Setting (Include SSIq are 16 channel or SSIv are 8 channel or SSIx are 4 channel)** All bit is reserved. The initial value should not be changed.

40.2.13 SSIq Mode Register (SSIq_MODE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: q = 0-0, 1-0, 2-0, 3-0, 4-0 or 9-0

Function: SSIq_MODE determines the initial settings of the SSIq route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	fs_ mode	—	—	—	—	tdm_ split	—	—	—	—	—	—	—	tdm_ext
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	fs_mode	B'0	R/W	ssi***i***_fs_mode (***i*** = 0, 1, 2, 3, 4 or 9) Selects fs to be used with TDM split mode for ssi***i***. • When TDM split mode is used (tdm_split = 1, ex_func = 0) 0: ssi***i*** TDM split mode is used with 256 fs (stereo x 4). 1: ssi***i*** TDM split mode is used with 128 fs (monaural x 4). • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) The write value should always be 0, then this value should not be changed.
12 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	tdm_split	B'0	R/W	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] ssi***i***_tdm_split (***i*** = 0, 1, 2, 3, 4 or 9) Selects whether or not TDM split mode is used for ssi***i***. • When TDM ex-split mode/TDM - 16ch mode Disable (ex_func = 0) 0: TDM split mode is not used for ssi***i*** (only ssi***i*** -0_BUSIF is used). 1: TDM split mode is used for ssi***i*** (ssi***i*** -1_BUSIF to ssi***i***-3_BUSIF are also used). • When TDM ex-split mode/TDM - 16ch mode Enable (ex_func = 1) 0: TDM split mode is not used for ssi***i*** (only ssi***i*** -0_BUSIF is used). 1: TDM split mode is used for ssi***i*** (ssi***i*** -1_BUSIF to ssi***i***-7_BUSIF are also used). [RZ/G2E] ssi***i***_tdm_split (***i*** = 0, 1, 2, 3, 4 or 9) Selects whether or not TDM split mode is used for ssi***i***. As for split mode and Ex Split mode as well. 0: TDM split mode is not used for ssi***i*** (only ssi***i*** -0_BUSIF is used). 1: TDM split mode is used for ssi***i*** (ssi***i*** -1_BUSIF to ssi***i***-3_BUSIF are also used).

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	tdm_ext	B'0	R/W	ssi***i***_tdm_ext (***i*** = 0, 1, 2, 3, 4 or 9) Selects whether or not TDM extend mode is used for ssi***i***. 0: ssi***i*** TDM extend mode is not used. 1: ssi***i*** TDM extend mode is used.

Note: Bit 0 (tdm_ext) and bit 8 (tdm_split) cannot be set to 1 at the same time.

40.2.14 SSIq Control Register (SSIq_CONTROL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

Note: q = 0-0, 1-0, 2-0, 3-0, 4-0 or 9-0

Function: SSIq_CONTROL controls the start and stop of data transfer.

Note: Refer to 40.4.1 Note on Transfer

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	start_7	—	—	—	start_6	—	—	—	start_5	—	—	—	start_4

R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	start_7	B'0	R/W	SSI***i-7***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-7***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	start_6	B'0	R/W	SSI***i-6***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-6***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	start_5	B'0	R/W	SSI***i-5***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-5***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	start_4	B'0	R/W	SSI***i-4***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-4***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	start_3	B'0	R/W	SSI***i-3***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-3***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	start_2	B'0	R/W	SSI***i-2***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-2***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	start_1	B'0	R/W	SSI***i-1***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-1***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	start_0	B'0	R/W	SSI***i-0***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-0***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.

Note: If only SSI***i-0*** is used and TDM split mode is not used, SSI***i-1***_start flag to SSI***i-7***_start flag should be set to 0 (transfer stopped).

[RZ/G2E]

Note: q = 0-0, 1-0, 2-0, 3-0, 4-0 or 9-0

Function: SSIq_CONTROL controls the start and stop of data transfer.

Note: Refer to 40.4.1 Note on Transfer

R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	start_3	B'0	R/W	SSI***i-3***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-3***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	start_2	B'0	R/W	SSI***i-2***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-2***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	start_1	B'0	R/W	SSI***i-1***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-1***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	start_0	B'0	R/W	SSI***i-0***_start_flag (i = 0 to 4, 9) Starts or stops data transfer through SSI***i-0***. 0: Transfer is stopped. 1: Transfer is started. When changing the corresponding bit, do not change other bits.

Note: If only SSI***i-0*** is used and TDM split mode is not used, SSI***i-1***_start flag to SSI***i-3***_start flag should be set to 0 (transfer stopped).

40.2.15 SSIr Control Register (SSIr_CONTROL)

Note: r = 5 to 8

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSIr_CONTROL controls the start and stop of data transfer.

Note: Refer to 40.4.1 Note on Transfer

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	start	B'0	R/W	SSI*r*_start_flag Starts or stops data transfer through SSI*r*. 0: Transfer is stopped. 1: Transfer is started.

40.2.16 SSIq Status Register (SSIq_STATUS)

Note: q = 0-0, 1-0, 2-0, 3-0, 4-0, 9-0

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSIq_STATUS indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSIq Interrupt Enable Register, the interrupt signal is not output (refer to section 40.2.18 and section 40.3.14).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	FCST	DTST	UIRQ	OIRQ	IIRQ	DIRQ	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	FCST	B'0	R	SSI***i***_FCST (i = 0 to 4, 9) Indicates the state of SSIFSR***i***_FCST. 0: — 1: The WS signal has stopped.
28	DTST	B'0	R	SSI***i***_DTST (i = 0 to 4, 9) Indicates the state of SSIFSR***i***_DTST. 0: — 1: The frequency switching has been detected.
27	UIRQ	B'0	R	SSI***i***_UIRQ (i = 0 to 4, 9) Indicates the state of SSISR***i***_UIRQ. 0: — 1: An underflow has occurred. Note: Not indicated by the interrupt signal when SSICR***i***.UIEN = 0.
26	OIRQ	B'0	R	SSI***i***_OIRQ (i = 0 to 4, 9) Indicates the state of SSISR***i***_OIRQ. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSICR***i***.OIEN = 0.
25	IIRQ	B'0	R	SSI***i***_IIRQ (i = 0 to 4, 9) Indicates the state of SSISR***i***_IIRQ. 0: — 1: Idle state Note: Not indicated by the interrupt signal when SSICR***i***.IIEN = 0.

Bit	Bit Name	Initial Value	R/W	Description
24	DIRQ	B'0	R	SSI***i***_DIRQ (i = 0 to 4, 9) Indicates the state of SSISR***i***_DIRQ. 0: — 1: When SSICR***i***.TRMD is 0, DIRQ = 1 indicates that there are unread data in SSIRDR. When SSICR***i***.TRMD is 1, DIRQ = 1 indicates that data can be written to SSITDR. Note: Not indicated by the interrupt signal when SSICR***i***.DIEN = 0.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	uf_3	B'0	R	buf_under_flow***i***-3 (i = 0 to 4, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.uf***i***-3. 0: — 1: An underflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.uf***i***-3_ie = 0.
14	uf_2	B'0	R	buf_under_flow***i***-2 (i = 0 to 4, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.uf***i***-2. 0: — 1: An underflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.uf***i***-2_ie = 0.
13	uf_1	B'0	R	buf_under_flow***i***-1 (i = 0 to 4, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.uf***i***-1. 0: — 1: An underflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.uf***i***-1_ie = 0.
12	uf_0	B'0	R	buf_under_flow***i***-0 (i = 0 to 4, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.uf***i***-0. 0: — 1: An underflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.uf***i***-0_ie = 0.
11	of_3	B'0	R	buf_over_flow***i***-3 (i = 0 to 4, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.of***i***-3. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.of***i***-3_ie = 0.
10	of_2	B'0	R	buf_over_flow***i***-2 (i = 0 to 4, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.of***i***-2. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.of***i***-2_ie = 0.

Bit	Bit Name	Initial Value	R/W	Description
9	of_1	B'0	R	buf_over_flow*i*-1 (i = 0 to 4, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.of*i*-1. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.of*i*-1_ie = 0.
8	of_0	B'0	R	buf_over_flow*i*-0 (i = 0 to 4, 9) Indicates the state of SSI_SYSTEM_STATUS2/3.of*i*-0. 0: — 1: An overflow has occurred. Note: Not indicated by the interrupt signal when SSI_SYSTEM_INT_ENABLE2/3.of*i*-0_ie = 0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

40.2.17 SSIr Status Register (SSIr_STATUS)

Note: r = 5 to 8

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSIr_STATUS indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSIr Interrupt Enable Register, the interrupt signal is not output (refer to section 40.2.19 and section 40.3.14).

Bit	Bit Name	Initial Value	R/W	Description
20	ind_word_swap4	B'0	R/W	ind_word_swap_en4 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
19	ind_word_swap3	B'0	R/W	ind_word_swap_en3 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
18	ind_word_swap2	B'0	R/W	ind_word_swap_en2 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
17	ind_word_swap1	B'0	R/W	ind_word_swap_en1 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
16	ind_word_swap0	B'0	R/W	ind_word_swap_en0 Swaps the word order (only for access to SSITDR or SSIRDR). 0: Word order is not swapped. 1: Word order is swapped. Note: Select this function only when the data length is 16 bits.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	ind9	B'0	R/W	Independent SSI9 transfer setting 0: Independent SSI9 transfer is not performed. 1: Independent SSI9 transfer is performed.
8	ind8	B'0	R/W	Independent SSI8 transfer setting 0: Independent SSI8 transfer is not performed. 1: Independent SSI8 transfer is performed.
7	ind7	B'0	R/W	Independent SSI7 transfer setting 0: Independent SSI7 transfer is not performed. 1: Independent SSI7 transfer is performed.
6	ind6	B'0	R/W	Independent SSI6 transfer setting 0: Independent SSI6 transfer is not performed. 1: Independent SSI6 transfer is performed.
5	ind5	B'0	R/W	Independent SSI5 transfer setting 0: Independent SSI5 transfer is not performed. 1: Independent SSI5 transfer is performed.

Bit	Bit Name	Initial Value	R/W	Description
4	ind4	B’0	R/W	Independent SSI4 transfer setting 0: Independent SSI4 transfer is not performed. 1: Independent SSI4 transfer is performed.
3	ind3	B’0	R/W	Independent SSI3 transfer setting 0: Independent SSI3 transfer is not performed. 1: Independent SSI3 transfer is performed.
2	ind2	B’0	R/W	Independent SSI2 transfer setting 0: Independent SSI2 transfer is not performed. 1: Independent SSI2 transfer is performed.
1	ind1	B’0	R/W	Independent SSI1 transfer setting 0: Independent SSI1 transfer is not performed. 1: Independent SSI1 transfer is performed.
0	ind0	B’0	R/W	Independent SSI0 transfer setting 0: Independent SSI0 transfer is not performed. 1: Independent SSI0 transfer is performed.

40.2.21 SSI Mode Register 1 (SSI_MODE1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSI_MODE1 specifies the SSI pin modes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	ssi34_sync	—	—	ssi4_pin	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ssi012_3mod	ssi2_pin		ssi1_pin	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	ssi34_sync	B'0	R/W	ssi34_sync_mode Selects whether to synchronize SSI3 and SSI4. 0: SSI3 and SSI4 are not synchronized. 1: SSI3 and SSI4 are synchronized. This bit can be set to 1 only when the ssi4_pin_mode bits are set to 01 or 10.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	ssi4_pin	B'00	R/W	ssi4_pin_mode Select the connections of the SSI_SCK4_A/ SSI_SCK4_B and SSI_WS4_A/ SSI_WS4_B pins. B'00: SSI3 and SSI4 use their own pins independently. B'01: The SSI3 pins are used in common by SSI3 and SSI4. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI3 are used. B'10: The SSI3 pins are used in common by SSI3 and SSI4. SSI3 works as the master and SSI4 works as a slave. The SSI_WS and SSI_SCK pins of SSI3 are used. B'11: Setting prohibited
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	ssi012_ 3mod	B'0	R/W	ssi012_3module_mode Selects whether to use three modules (SSI0, SSI1, and SSI2) together as six channels. 0: SSI0, SSI1, and SSI2 are not used as six channels. 1: SSI0, SSI1, and SSI2 are used as six channels. This bit should be cleared to 0 when the ssi1_pin_mode or ssi2_pin_mode bits are set to 00. It can be set to 1 only when the ssi1_pin_mode and ssi2_pin_mode bits are set to 01 or when the ssi1_pin_mode and ssi2_pin_mode bits are set to 10. Either ssi012_3module_mode or ssi0129_4module_mode must be set to 1.
3, 2	ssi2_pin	B'00	R/W	ssi2_pin_mode Select the connections of the SSI_SCK2 and SSI_WS2 pins. B'00: SSI0 and SSI2 use their own pins independently. B'01: The SSI0 pins are used in common by SSI0 and SSI2. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI0 are used. B'10: The SSI0 pins are used in common by SSI0 and SSI2. SSI0 works as the master and SSI2 works as a slave. The SSI_WS and SSI_SCK pins of SSI0 are used. B'11: Setting prohibited
1, 0	ssi1_pin	B'00	R/W	ssi1_pin_mode Select the connections of the SSI_SCK1 and SSI_WS1 pins. B'00: SSI0 and SSI1 use their own pins independently. B'01: The SSI0 pins are used in common by SSI0 and SSI1. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI0 are used. B'10: The SSI0 pins are used in common by SSI0 and SSI1. SSI0 works as the master and SSI1 works as a slave. The SSI_WS and SSI_SCK pins of SSI0 are used. B'11: Setting prohibited

40.2.22 SSI Mode Register 2 (SSI_MODE2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSI_MODE2 specifies the SSI pin modes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ssi0129_4mod	—	ssi9_pin		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ssi0129_4mod	B’0	R/W	ssi0129_4module_mode Selects whether to use four modules (SSI0, SSI1, SSI2, and SSI9) together as eight channels. 0: SSI0, SSI1, SSI2, and SSI9 are not used as eight channels. 1: SSI0, SSI1, SSI2, and SSI9 are used as eight channels. This bit should be cleared to 0 when the ssi1_pin_mode or ssi2_pin_mode bits are set to B’00, or when ssi9_pin_mode bits are set to B’000. It can be set to 1 only when the ssi1_pin_mode and ssi2_pin_mode bits are set to 01 and the ssi9_pin_mode bits are set to B’001, or when the ssi1_pin_mode and ssi2_pin_mode bits are set to 10 and the ssi9_pin_mode bits are set to B’010. Either ssi0129_4module_mode or ssi012_3module_mode must be set to 1.
3	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	ssi9_pin	B’000	R/W	ssi9_pin_mode Selects the connections of the SSI_SCK9 and SSI_WS9 pins. B’000: SSI0 and SSI9 use their own pins independently. B’001: The SSI0 pins are used in common by SSI0 and SSI9. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI0 are used. B’010: The SSI0 pins are used in common by SSI0 and SSI9. SSI0 works as the master and SSI9 works as a slave. The SSI_WS and SSI_SCK pins of SSI0 are used. B’011: Setting prohibited B’100: Setting prohibited B’101: The SSI3 pins are used in common by SSI3 and SSI9. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI3 are used. B’110: The SSI3 pins are used in common by SSI3 and SSI9. SSI3 works as the master and SSI9 works as a slave. The SSI_WS and SSI_SCK pins of SSI3 are used. B’111: Setting prohibited

40.2.23 SSI Mode Register 3 (SSI_MODE3)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSI_MODE3 specifies the SSI pin modes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ssi3_pin	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ssi3_pin	B’00	R/W	ssi3_pin_mode Select the connections of the SSI_SCK349 and SSI_WS349 pins. B’00: SSI0 and SSI3 use their own pins independently. B’01: The SSI0 pins are used in common by SSI0 and SSI3. Both modules work as slaves. The SSI_WS and SSI_SCK pins of SSI0 are used. B’10: The SSI0 pins are used in common by SSI0 and SSI3. SSI0 works as the master and SSI3 works as a slave. The SSI_WS and SSI_SCK pins of SSI0 are used. B’11: Setting prohibited When setting these bits to use the pins in common by SSI0 and SSI3, ssi4_pin_mode should be 00 and ssi9_pin_mode should be B’000, B’001, or B’010 (selection of the SSI3 pins is prohibited).

40.2.24 SSI Control Register (SSI_CONTROL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: * Some restrictions apply.

Function: SSI_CONTROL controls the startup of the SSI modules when multiple SSI modules are used at the same time.

Note: Refer to 40.4.1 Note on Transfer

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ssi34	—	—	—	ssi0129
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ssi34	B'0	R/W	ssi34_enable Starts or stops data transfer through two SSI modules (SSI3 and SSI4) at the same time. 0: Transfer through SSI3 and SSI4 is stopped. 1: Transfer through SSI3 and SSI4 is started. When changing the corresponding bit, do not change other bits.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ssi0129	B'0	R/W	ssi0129_enable • When ssi012_3module_mode is 1 Starts or stops data transfer through three SSI modules (SSI0, SSI1, and SSI2) at the same time. 0: Transfer through SSI0, SSI1, and SSI2 is stopped. 1: Transfer through SSI0, SSI1, and SSI2 is started. • When ssi0129_4module_mode is 1 Starts or stops data transfer through four SSI modules (SSI0, SSI1, SSI2, and SSI9) at the same time. 0: Transfer through SSI0, SSI1, SSI2, and SSI9 is stopped. 1: Transfer through SSI0, SSI1, SSI2, and SSI9 is started. When changing the corresponding bit, do not change other bits.

Note: This function should be used only when data is transferred through multiple SSI modules in synchronization. When using each SSI module independently, use the EN bit of SSICRn (n = 0 to 4 and 9) for the SSI module to control the transfer.

40.2.25 SSI Control Register 2 (SSI_CONTROL2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSI_CONTROL2 is same function with SSI_CONTROL. This register is prepared for multi-CPU.

Note: Refer to 40.4.1 Note on Transfer

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ssi34_2	B'0	R/W	ssi34_enable Starts or stops data transfer through two SSI modules (SSI3 and SSI4) at the same time. 0: Transfer through SSI3 and SSI4 is stopped. 1: Transfer through SSI3 and SSI4 is started. When changing the corresponding bit, do not change other bits.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ssi0129_2	B'0	R/W	ssi0129_enable • When ssi012_3module_mode is 1 Starts or stops data transfer through three SSI modules (SSI0, SSI1, and SSI2) at the same time. 0: Transfer through SSI0, SSI1, and SSI2 is stopped. 1: Transfer through SSI0, SSI1, and SSI2 is started. • When ssi0129_4module_mode is 1 Starts or stops data transfer through four SSI modules (SSI0, SSI1, SSI2, and SSI9) at the same time. 0: Transfer through SSI0, SSI1, SSI2, and SSI9 is stopped. 1: Transfer through SSI0, SSI1, SSI2, and SSI9 is started. When changing the corresponding bit, do not change other bits.

Note: This function should be used only when data is transferred through multiple SSI modules in synchronization. When using each SSI module independently, use the EN bit of SSICRn (n = 0 to 4 and 9) for the SSI module to control the transfer.

40.2.26 SSI SYSTEM Status Register 0 (SSI_SYSTEM_STATUS0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSI_SYSTEM_STATUS0 indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSI_SYSTEM Interrupt Enable Register 0, the interrupt signal is not output (refer to section 40.2.30 and section 40.3.14).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

40.2.28 SSI SYSTEM Status Register 2 (SSI_SYSTEM_STATUS2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSI_SYSTEM_STATUS2 indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSI_SYSTEM Interrupt Enable Register 2, the interrupt signal is not output (refer to section 40.2.32 and section 40.3.14).

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	uf4-3	B'0	R/WC1	buf_under_flow4-3 Indicates the state of the SSI4-3_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
18	uf4-2	B'0	R/WC1	buf_under_flow4-2 Indicates the state of the SSI4-2_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
17	uf4-1	B'0	R/WC1	buf_under_flow4-1 Indicates the state of the SSI4-1_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
16	uf4-0	B'0	R/WC1	buf_under_flow4-0 Indicates the state of the SSI4-0_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
15	uf3-3	B'0	R/WC1	buf_under_flow3-3 Indicates the state of the SSI3-3_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
14	uf3-2	B'0	R/WC1	buf_under_flow3-2 Indicates the state of the SSI3-2_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.

Bit	Bit Name	Initial Value	R/W	Description
13	uf3-1	B'0	R/WC1	buf_under_flow3-1 Indicates the state of the SSI3-1_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
12	uf3-0	B'0	R/WC1	buf_under_flow3-0 Indicates the state of the SSI3-0_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
11	uf2-3	B'0	R/WC1	buf_under_flow2-3 Indicates the state of the SSI2-3_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
10	uf2-2	B'0	R/WC1	buf_under_flow2-2 Indicates the state of the SSI2-2_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
9	uf2-1	B'0	R/WC1	buf_under_flow2-1 Indicates the state of the SSI2-1_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
8	uf2-0	B'0	R/WC1	buf_under_flow2-0 Indicates the state of the SSI2-0_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
7	uf1-3	B'0	R/WC1	buf_under_flow1-3 Indicates the state of the SSI1-3_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
6	uf1-2	B'0	R/WC1	buf_under_flow1-2 Indicates the state of the SSI1-2_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
5	uf1-1	B'0	R/WC1	buf_under_flow1-1 Indicates the state of the SSI1-1_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
4	uf1-0	B'0	R/WC1	buf_under_flow1-0 Indicates the state of the SSI1-0_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
3	uf0-3	B'0	R/WC1	buf_under_flow0-3 Indicates the state of the SSI0-3_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.

Bit	Bit Name	Initial Value	R/W	Description
2	uf0-2	B'0	R/WC1	buf_under_flow0-2 Indicates the state of the SSI0-2_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
1	uf0-1	B'0	R/WC1	buf_under_flow0-1 Indicates the state of the SSI0-1_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.
0	uf0-0	B'0	R/WC1	buf_under_flow0-0 Indicates the state of the SSI0-0_BUSIF buffer. 0: Normal operation 1: An underflow has occurred.

40.2.29 SSI SYSTEM Status Register 3 (SSI_SYSTEM_STATUS3)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SSI_SYSTEM_STATUS3 indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSI_SYSTEM Interrupt Enable Register 3, the interrupt signal is not output (refer to section 40.2.33 and section 40.3.14).

40.2.34 SSI SYSTEM Status Register 4 (SSI_SYSTEM_STATUS4)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: SSI_SYSTEM_STATUS4 indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSI_SYSTEM Interrupt Enable Register 4, the interrupt signal is not output (refer to section 40.2.38 and section 40.3.14).

31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	of4-7	B'0	R/WC1	buf_over_flow4-7 Indicates the state of the SSI4-7_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
18	of4-6	B'0	R/WC1	buf_over_flow4-6 Indicates the state of the SSI4-6_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
17	of4-5	B'0	R/WC1	buf_over_flow4-5 Indicates the state of the SSI4-5_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
16	of4-4	B'0	R/WC1	buf_over_flow4-4 Indicates the state of the SSI4-4_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
15	of3-7	B'0	R/WC1	buf_over_flow3-7 Indicates the state of the SSI3-7_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
14	of3-6	B'0	R/WC1	buf_over_flow3-6 Indicates the state of the SSI3-6_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.

Bit	Bit Name	Initial Value	R/W	Description
13	of3-5	B'0	R/WC1	buf_over_flow3-5 Indicates the state of the SSI3-5_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
12	of3-4	B'0	R/WC1	buf_over_flow3-4 Indicates the state of the SSI3-4_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
11	of2-7	B'0	R/WC1	buf_over_flow2-7 Indicates the state of the SSI2-7_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
10	of2-6	B'0	R/WC1	buf_over_flow2-6 Indicates the state of the SSI2-6_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
9	of2-5	B'0	R/WC1	buf_over_flow2-5 Indicates the state of the SSI2-5_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
8	of2-4	B'0	R/WC1	buf_over_flow2-4 Indicates the state of the SSI2-4_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
7	of1-7	B'0	R/WC1	buf_over_flow1-7 Indicates the state of the SSI1-7_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
6	of1-6	B'0	R/WC1	buf_over_flow1-6 Indicates the state of the SSI1-6_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
5	of1-5	B'0	R/WC1	buf_over_flow1-5 Indicates the state of the SSI1-5_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
4	of1-4	B'0	R/WC1	buf_over_flow1-4 Indicates the state of the SSI1-4_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
3	of0-7	B'0	R/WC1	buf_over_flow0-7 Indicates the state of the SSI0-7_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.

Bit	Bit Name	Initial Value	R/W	Description
2	of0-6	B'0	R/WC1	buf_over_flow0-6 Indicates the state of the SSI0-6_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
1	of0-5	B'0	R/WC1	buf_over_flow0-5 Indicates the state of the SSI0-5_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.
0	of0-4	B'0	R/WC1	buf_over_flow0-4 Indicates the state of the SSI0-4_BUSIF buffer. 0: Normal operation 1: An overflow has occurred.

40.2.35 SSI SYSTEM Status Register 5 (SSI_SYSTEM_STATUS5)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: SSI_SYSTEM_STATUS5 indicates the internal buffer state. When a bit in this register is set, its status is indicated by the corresponding interrupt signal. However, when the interrupt output is masked by the SSI_SYSTEM Interrupt Enable Register 5, the interrupt signal is not output (refer to section 40.2.39 and section 40.3.14).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

B'1101: Data at input-side place 13 is sent to output-side place 11. B'1110: Data at input-side place 14 is sent to output-side place 11. B'1111: Data at input-side place 15 is sent to output-side place 11.

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	place10	B'1010	R/W	Changes the stream data order. These bits are used for the TDM-16ch mode (tdm_split = 0, ex_func = 1, chnum = 10000). **Other setting, the initial value should not be changed.** B'0000: Data at input-side place 0 is sent to output-side place 10. B'0001: Data at input-side place 1 is sent to output-side place 10. B'0010: Data at input-side place 2 is sent to output-side place 10. B'0011: Data at input-side place 3 is sent to output-side place 10. B'0100: Data at input-side place 4 is sent to output-side place 10. B'0101: Data at input-side place 5 is sent to output-side place 10. B'0110: Data at input-side place 6 is sent to output-side place 10. B'0111: Data at input-side place 7 is sent to output-side place 10. B'1000: Data at input-side place 8 is sent to output-side place 10. B'1001: Data at input-side place 9 is sent to output-side place 10. B'1010: Data at input-side place 10 is sent to output-side place 10. B'1011: Data at input-side place 11 is sent to output-side place 10. B'1100: Data at input-side place 12 is sent to output-side place 10. B'1101: Data at input-side place 13 is sent to output-side place 10. B'1110: Data at input-side place 14 is sent to output-side place 10. B'1111: Data at input-side place 15 is sent to output-side place 10.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	place9	B'1001	R/W	Changes the stream data order. These bits are used for the TDM-16ch mode (tdm_split = 0, ex_func = 1, chnum = 10000). or TDM Ex Split Mode (tdm_split = 0, ex_func = 1) **Other setting, the initial value should not be changed.** • When TDM 16Ch mode is used (tdm_split = 0, ex_func = 1, chnum = 10000). B'0000: Data at input-side place 0 is sent to output-side place 9. B'0001: Data at input-side place 1 is sent to output-side place 9. B'0010: Data at input-side place 2 is sent to output-side place 9. B'0011: Data at input-side place 3 is sent to output-side place 9. B'0100: Data at input-side place 4 is sent to output-side place 9. B'0101: Data at input-side place 5 is sent to output-side place 9. B'0110: Data at input-side place 6 is sent to output-side place 9. B'0111: Data at input-side place 7 is sent to output-side place 9. B'1000: Data at input-side place 8 is sent to output-side place 9. B'1001: Data at input-side place 9 is sent to output-side place 9. B'1010: Data at input-side place 10 is sent to output-side place 9. B'1011: Data at input-side place 11 is sent to output-side place 9. B'1100: Data at input-side place 12 is sent to output-side place 9. B'1101: Data at input-side place 13 is sent to output-side place 9. B'1110: Data at input-side place 14 is sent to output-side place 9. B'1111: Data at input-side place 15 is sent to output-side place 9. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIq_0 are used for the 10 channel setting** B'0000: Data at input-side place 0 is sent to output-side place 9. B'0001: Data at input-side place 1 is sent to output-side place 9. B'0010: Data at input-side place 2 is sent to output-side place 9. B'0011: Data at input-side place 3 is sent to output-side place 9. B'0100: Data at input-side place 4 is sent to output-side place 9. B'0101: Data at input-side place 5 is sent to output-side place 9. B'0110: Data at input-side place 6 is sent to output-side place 9. B'0111: Data at input-side place 7 is sent to output-side place 9. B'1000: Data at input-side place 8 is sent to output-side place 9. B'1001: Data at input-side place 9 is sent to output-side place 9. **Other Setting** All bit is reserved. The initial value should not be changed.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	place8	B'1000	R/W	Changes the stream data order. These bits are used for the TDM-16ch mode (tdm_split = 0, ex_func = 1, chnum = 10000). or TDM Ex Split Mode (tdm_split = 0, ex_func = 1) **Other setting, the initial value should not be changed.** • When TDM 16Ch mode is used (tdm_split = 0, ex_func = 1, chnum = 10000). B'0000: Data at input-side place 0 is sent to output-side place 8. B'0001: Data at input-side place 1 is sent to output-side place 8. B'0010: Data at input-side place 2 is sent to output-side place 8. B'0011: Data at input-side place 3 is sent to output-side place 8. B'0100: Data at input-side place 4 is sent to output-side place 8. B'0101: Data at input-side place 5 is sent to output-side place 8. B'0110: Data at input-side place 6 is sent to output-side place 8. B'0111: Data at input-side place 7 is sent to output-side place 8. B'1000: Data at input-side place 8 is sent to output-side place 8. B'1001: Data at input-side place 9 is sent to output-side place 8. B'1010: Data at input-side place 10 is sent to output-side place 8. B'1011: Data at input-side place 11 is sent to output-side place 8. B'1100: Data at input-side place 12 is sent to output-side place 8. B'1101: Data at input-side place 13 is sent to output-side place 8. B'1110: Data at input-side place 14 is sent to output-side place 8. B'1111: Data at input-side place 15 is sent to output-side place 8. • When TDM Ex Split mode is used (tdm_split = 1, ex_func = 1) **When SSIq_0 are used for the 10 channel setting** B'0000: Data at input-side place 0 is sent to output-side place 8. B'0001: Data at input-side place 1 is sent to output-side place 8. B'0010: Data at input-side place 2 is sent to output-side place 8. B'0011: Data at input-side place 3 is sent to output-side place 8. B'0100: Data at input-side place 4 is sent to output-side place 8. B'0101: Data at input-side place 5 is sent to output-side place 8. B'0110: Data at input-side place 6 is sent to output-side place 8. B'0111: Data at input-side place 7 is sent to output-side place 8. B'1000: Data at input-side place 8 is sent to output-side place 8. B'1001: Data at input-side place 9 is sent to output-side place 8. **Other Setting** All bit is reserved. The initial value should not be changed.

40.3.2 Basic Configuration

Data transfer is performed between the SSIU and other audio modules or external memories via BUSIF connected to the audio local bus and the audio DMA bus.

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

Figure 40.5 shows the data transfer of SSI0. As shown in Figure 40.5, SSI0-1_BUSIF to SSI0-7_BUSIF are not used. This basic configuration is also applied to SSI1, SSI2, SSI3, SSI4 and SSI9. Figure 40.6 shows the data transfer of SSI5, which is also applied to SSI6 to SSI8.

[RZ/G2E]

Figure 40.7 shows the data transfer of SSI0. As shown in Figure 40.7, SSI0-1_BUSIF to SSI0-3_BUSIF are not used. This basic configuration is also applied to SSI1, SSI2, SSI3, SSI4 and SSI9. Figure 40.6 shows the data transfer of SSI5, which is also applied to SSI6 to SSI8.

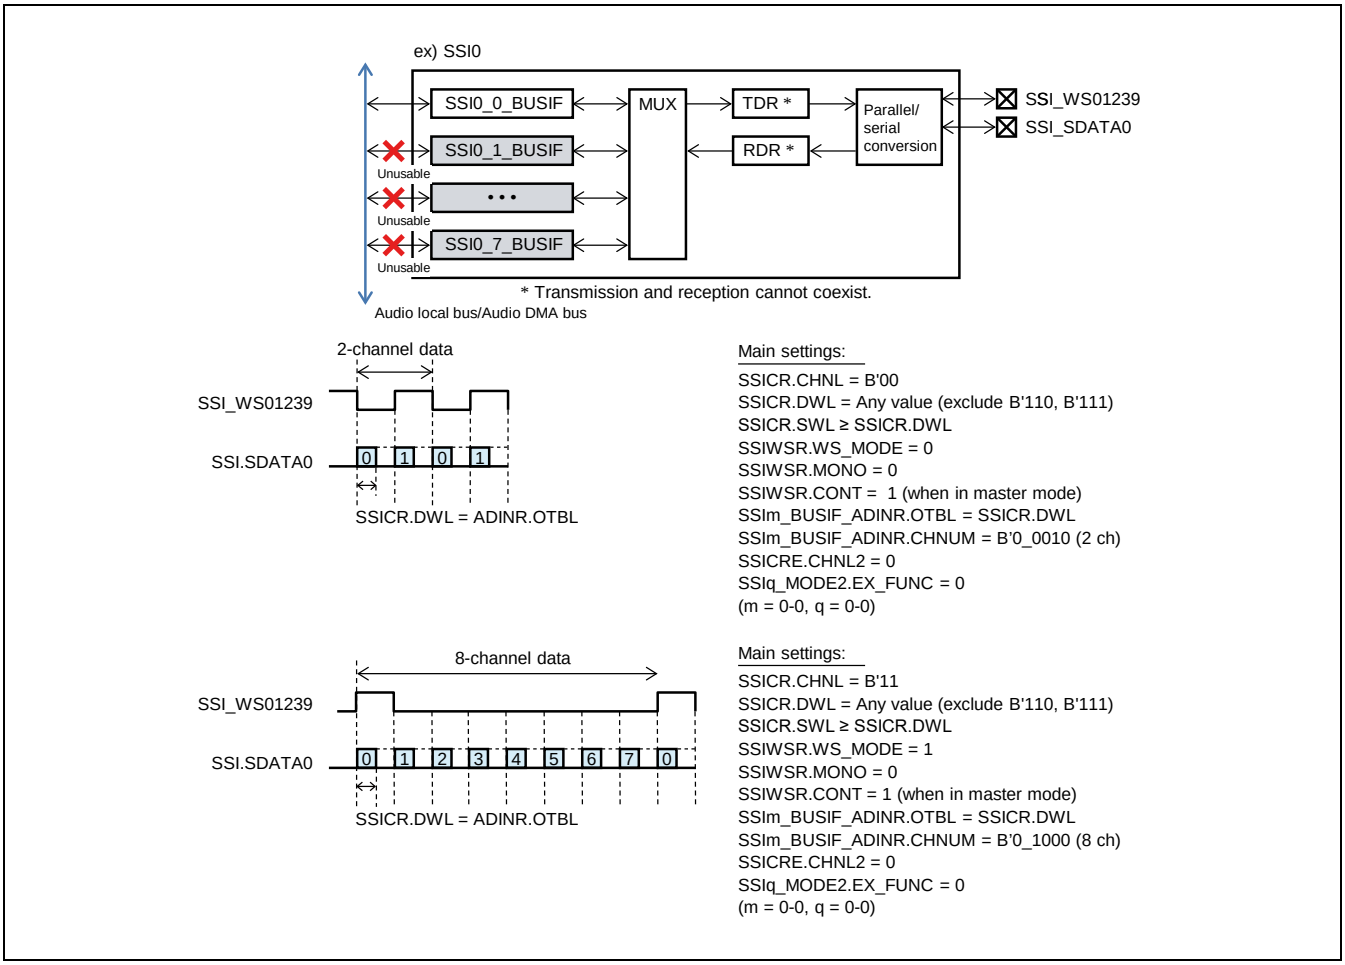

Figure 40.5 Basic Configuration (SSI0) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

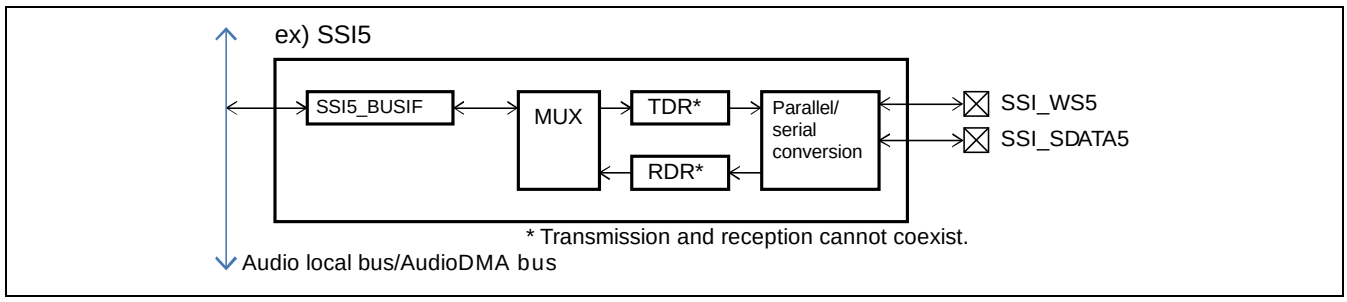

Figure 40.6 Basic Configuration (SSI5) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]

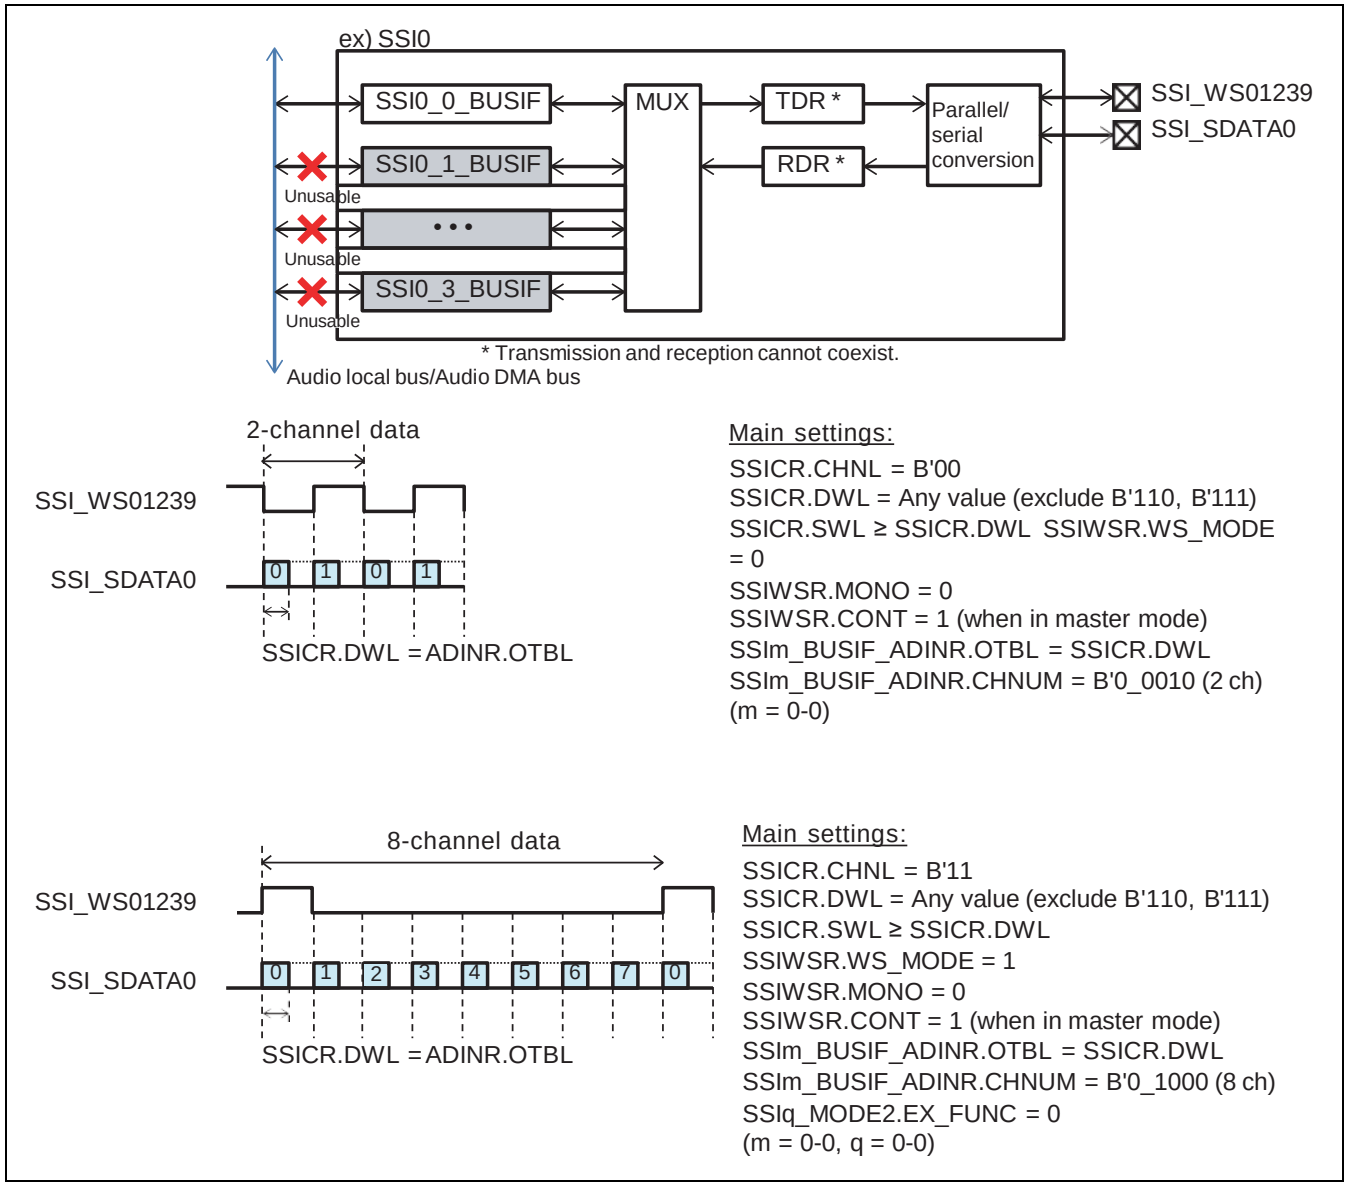

Figure 40.7 Basic Configuration (SSI0) [RZ/G2E]

40.3.3 Configuration with Multiple SSI Modules

Multichannel data transfer can be performed by using multiple SSI modules. The available combination of modules is SSI0, SSI1, and SSI2 or SSI0, SSI1, SSI2, and SSI9.

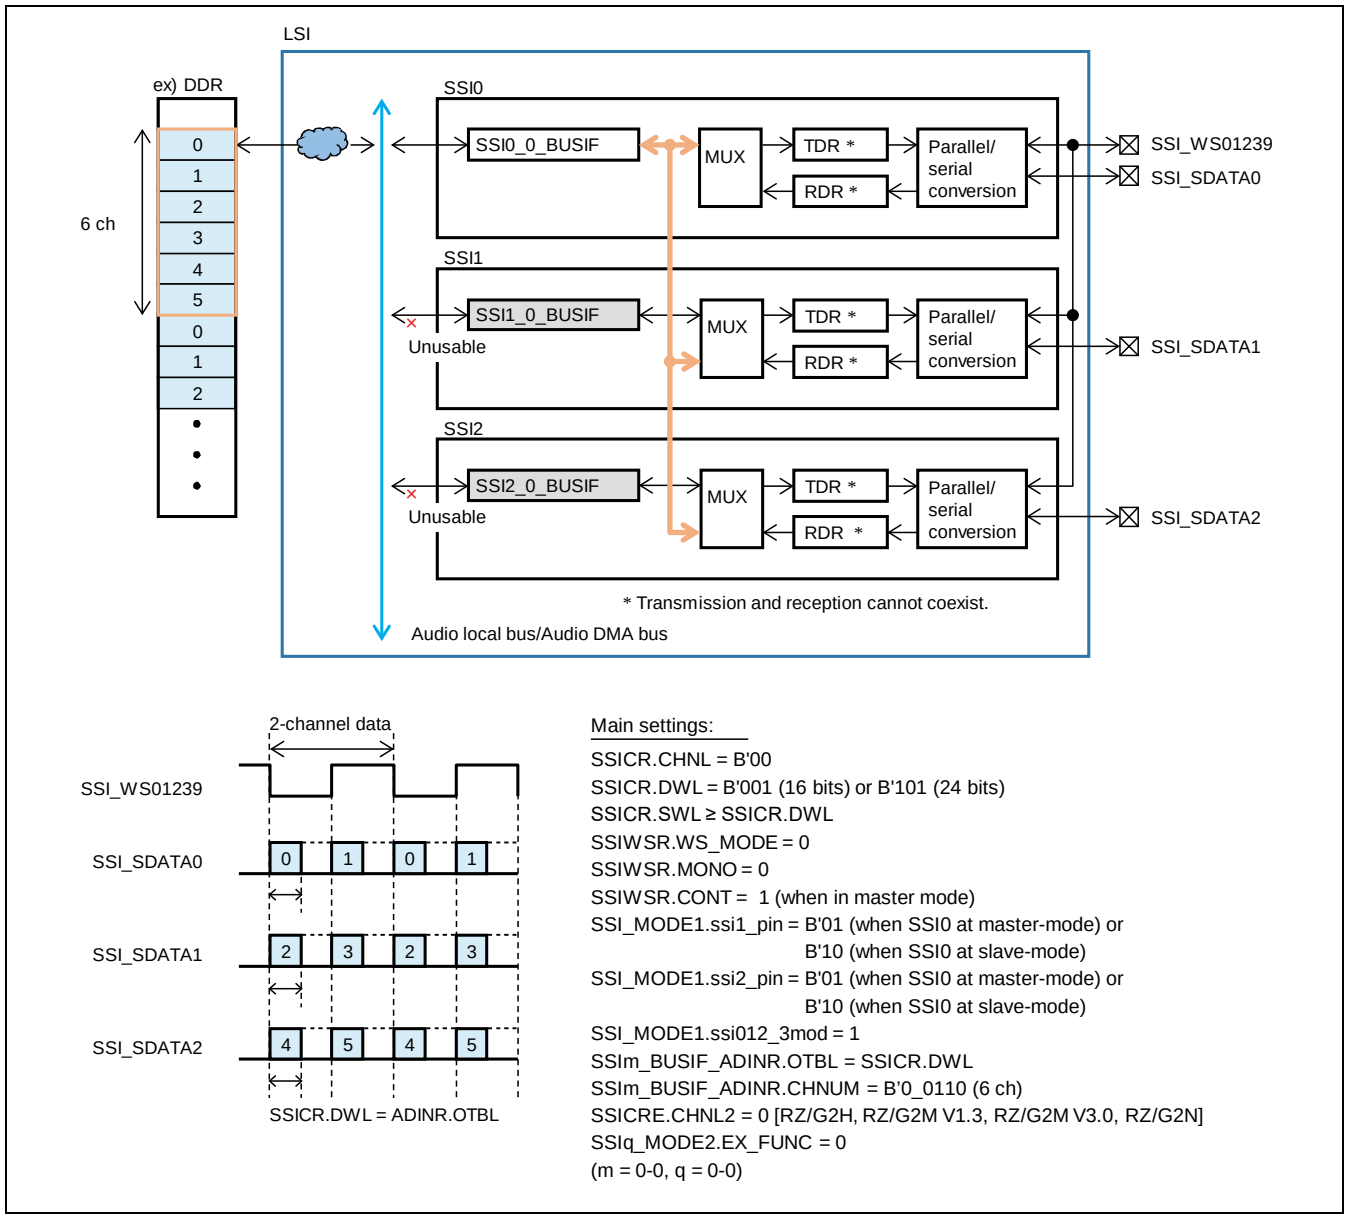

Figure 40.8 Multichannel Data Transfer (Using SSI0, SSI1 and SSI2)

Note: When the above configuration is used, SSI0-1_BUSIF to SSI0-7_BUSIF, all the BUSIFs of SSI1and SSI2 cannot be used. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

When the above configuration is used, SSI0-1_BUSIF to SSI0-3_BUSIF, all the BUSIFs of SSI1and SSI2 cannot be used. [RZ/G2E]

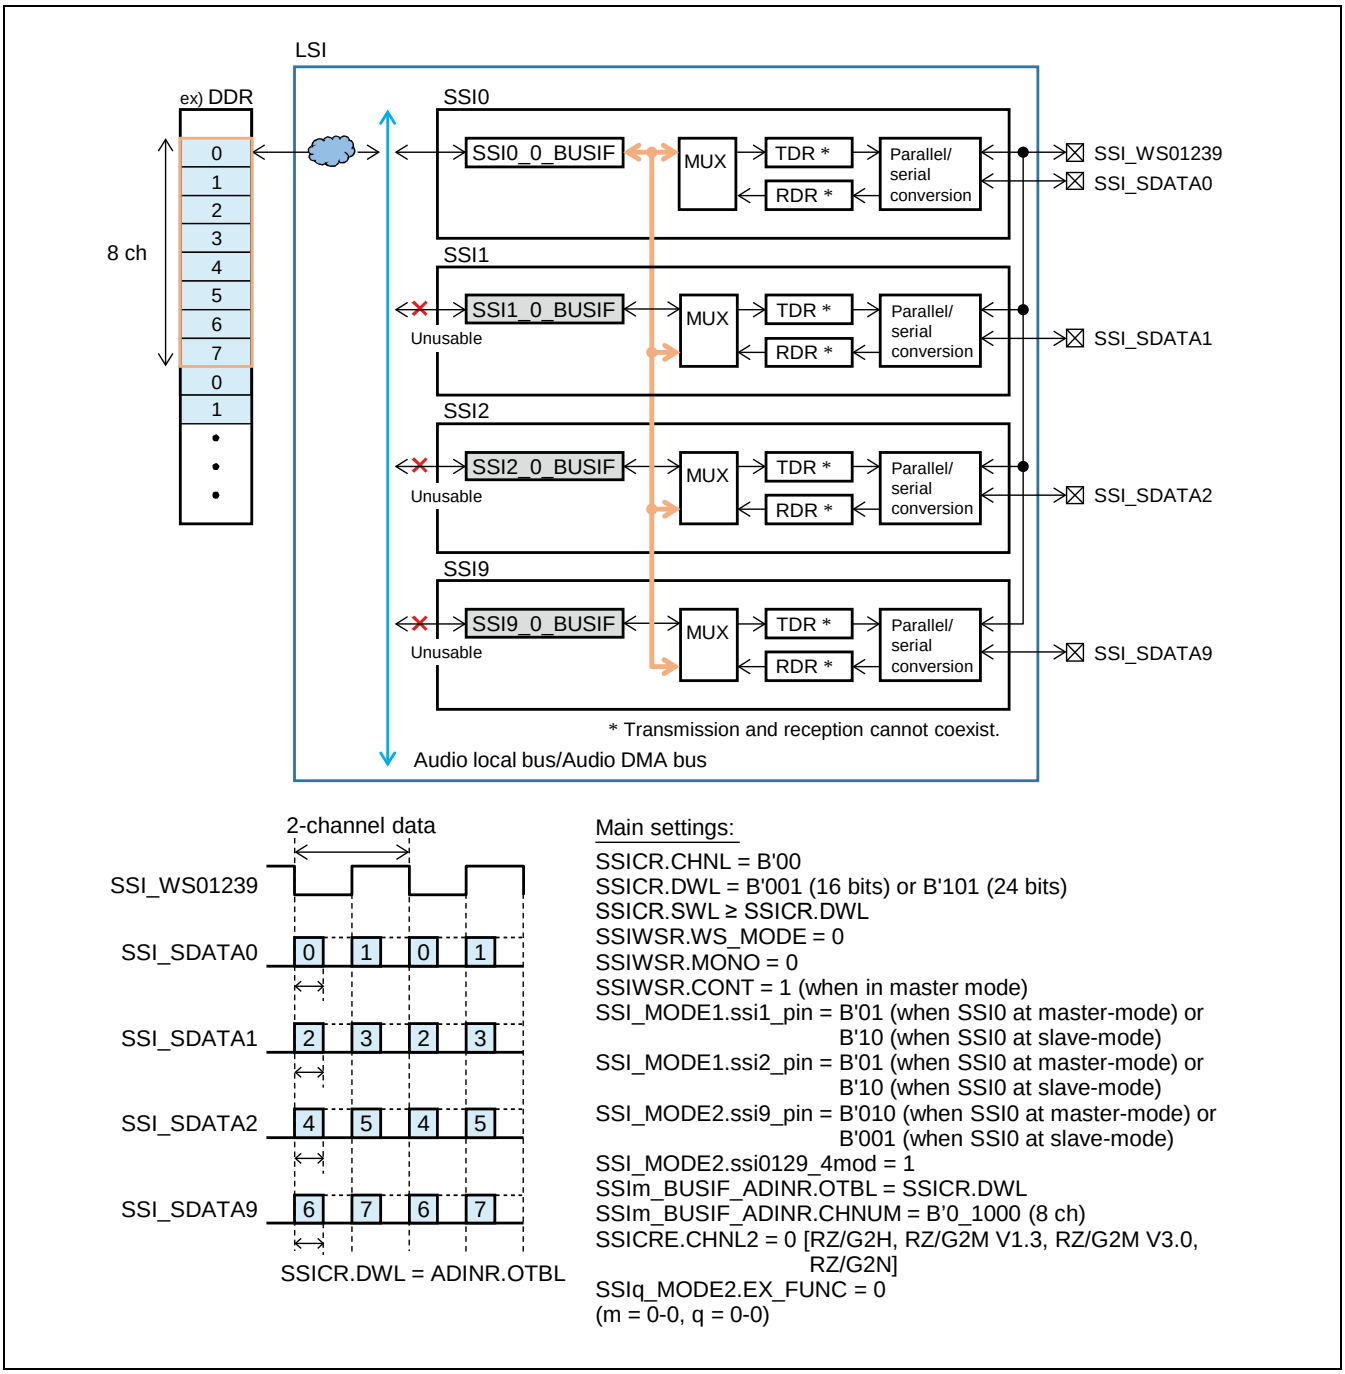

Figure 40.9 Multichannel Data Transfer (Using SSI0, SSI1, SSI2 and SSI9)

Note: When the above configuration is used, SSI0-1_BUSIF to SSI0-7_BUSIF, all the BUSIFs of SSI1, SSI2, and SSI9 cannot be used. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

When the above configuration is used, SSI0-1_BUSIF to SSI0-3_BUSIF, all the BUSIFs of SSI1, SSI2, and SSI9 cannot be used. [RZ/G2E]

40.3.4 TDM Format Extension Function (TDM Extend Mode) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The TDM format extension function allows operation with 8-channel data in the serial bus and 6-channel data inside the LSI, or operation with 6-channel data in the serial bus and 8-channel data inside the LSI. This function is supported by SSI0, SSI1, SSI2, SSI3, SSI4 and SSI9.

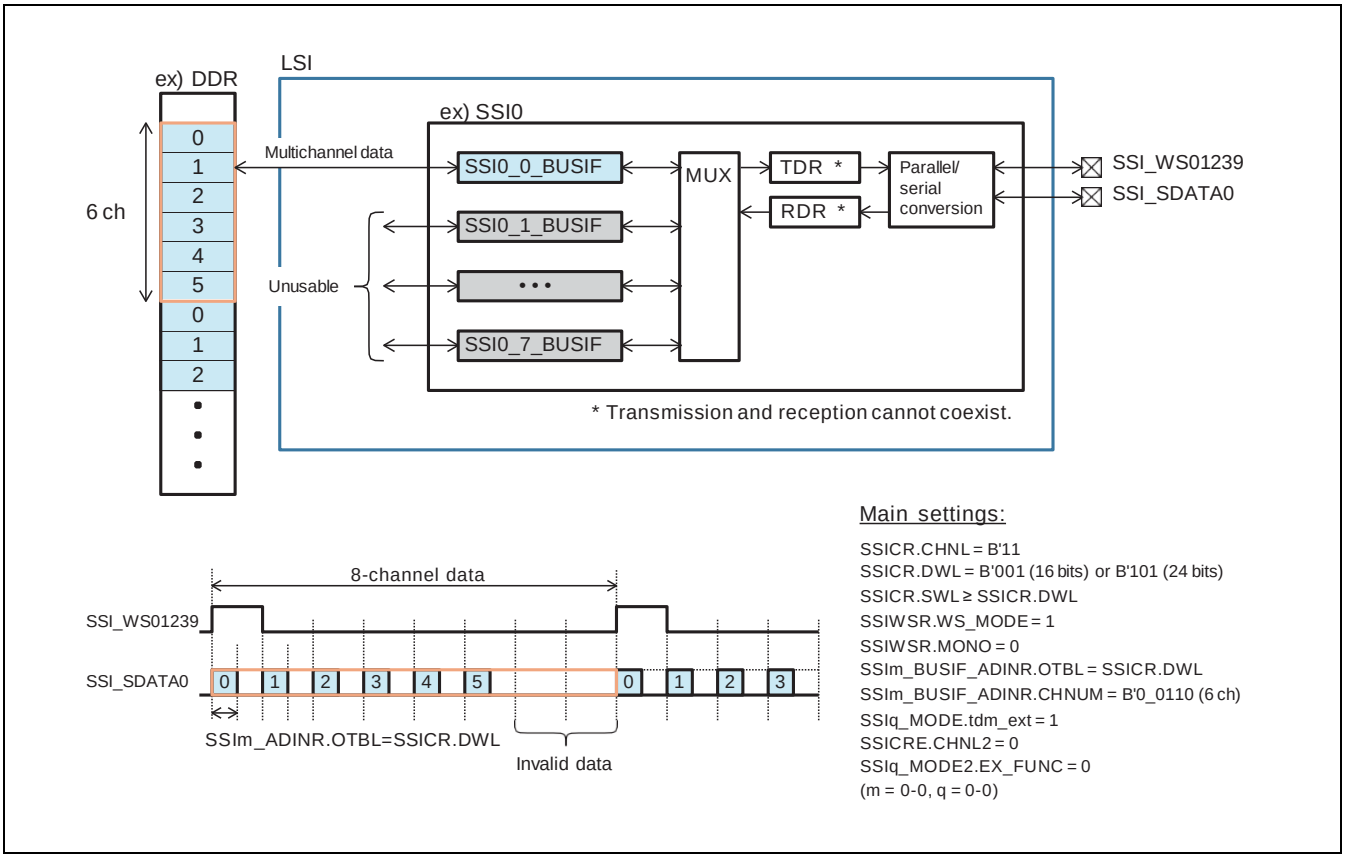

Figure 40.10 TDM Extend Mode Operation with 8-channel Data in Serial Bus and 6-channel Data Inside the LSI (SSI0)

Note: When the above configuration is used, SSI0-1_BUSIF to and SSI0-7_BUSIF cannot be used.

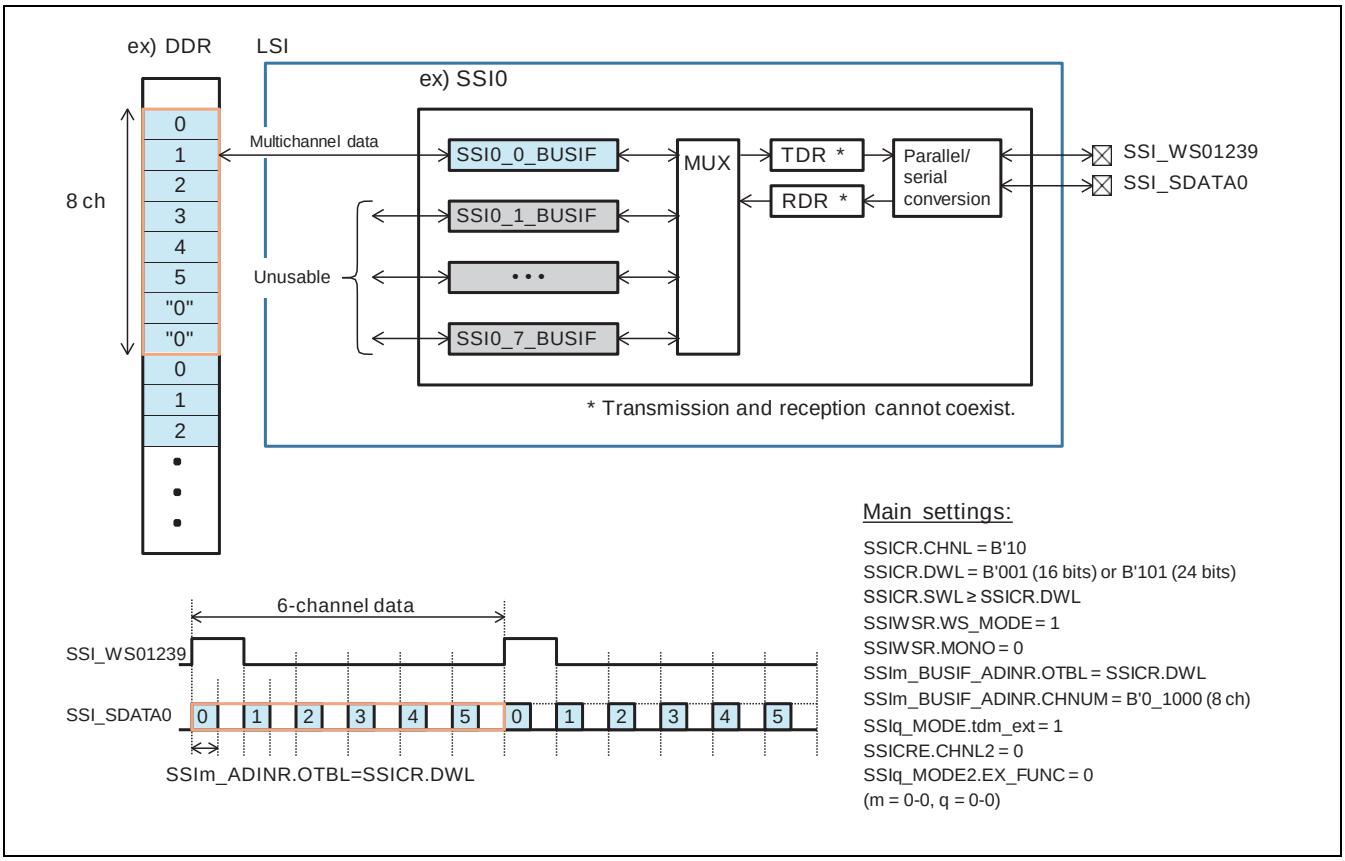

Figure 40.11 TDM Extend Mode Operation with 6-channel Data in Serial Bus and 8-channel Data Inside the LSI (SSI0)

Note: When the above configuration is used, SSI0-1_BUSIF to SSI0-7_BUSIF cannot be used.

40.3.5 TDM Format Extension Function (TDM Extend Mode) [RZ/G2E]

The TDM format extension function allows operation with 8-channel data in the serial bus and 6-channel data inside the LSI, or operation with 6-channel data in the serial bus and 8-channel data inside the LSI. This function is supported by SSI0, SSI1, SSI2, SSI3, SSI4 and SSI9.

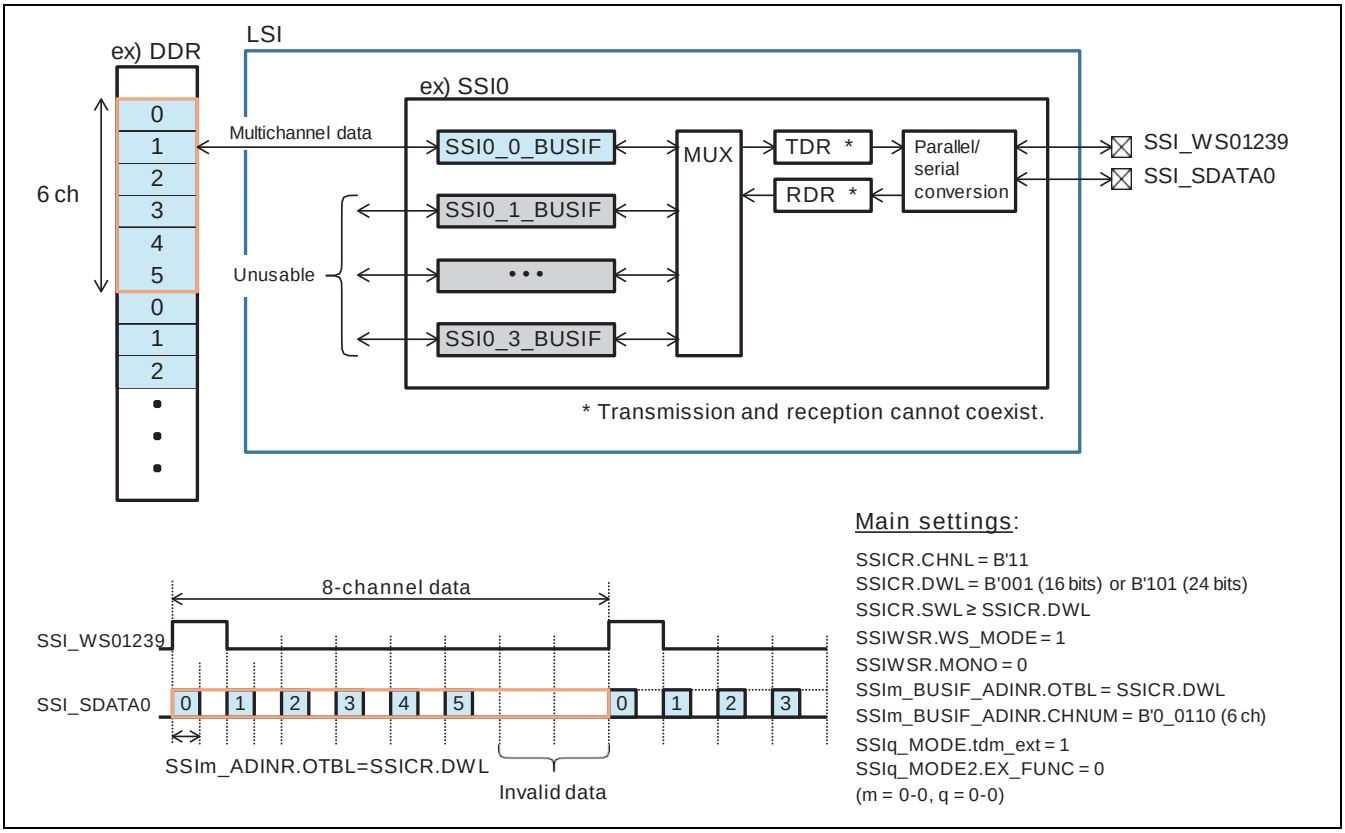

Figure 40.12 TDM Extend Mode Operation with 8-channel Data in Serial Bus and 6-channel Data Inside the LSI (SSI0)

Note: When the above configuration is used, SSI0-1_BUSIF to and SSI0-3_BUSIF cannot be used.

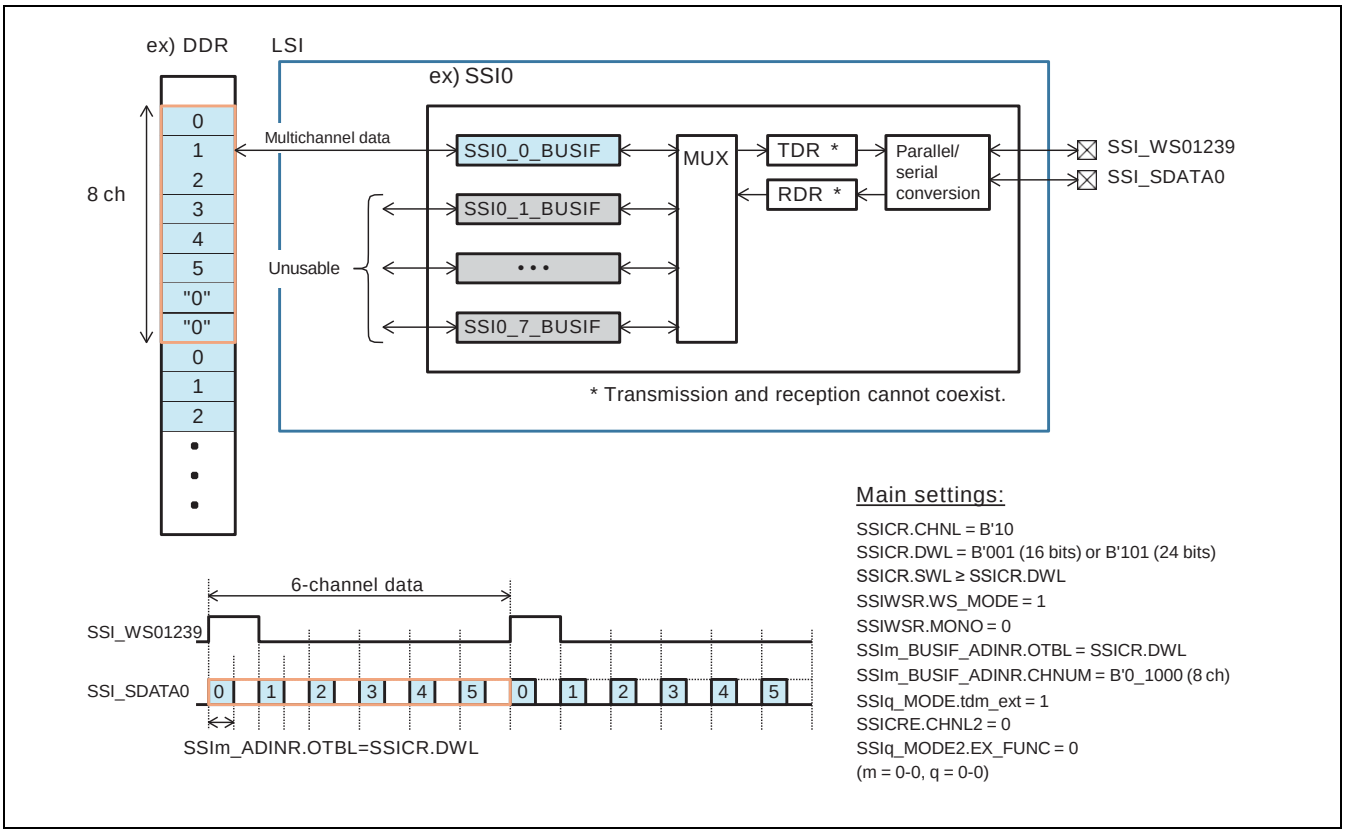

Figure 40.13 TDM Extend Mode Operation with 6-channel Data in Serial Bus and 8-channel Data Inside the LSI (SSI0)

Note: When the above configuration is used, SSI0-1_BUSIF to SSI0-3_BUSIF cannot be used.

40.3.6 TDM Format Split Function (TDM Split Mode) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The TDM format split function (TDM split mode) allows connecting four independent monaural or stereo data inside the LSI and outputting the data in the TDM format, and splitting TDM format input data into four independent monaural or stereo data and distributing the data inside the LSI. This function allows TDM-8ch or TDM-4ch. This function is supported by SSI0, SSI1, SSI2, SSI3, SSI4 and SSI9.

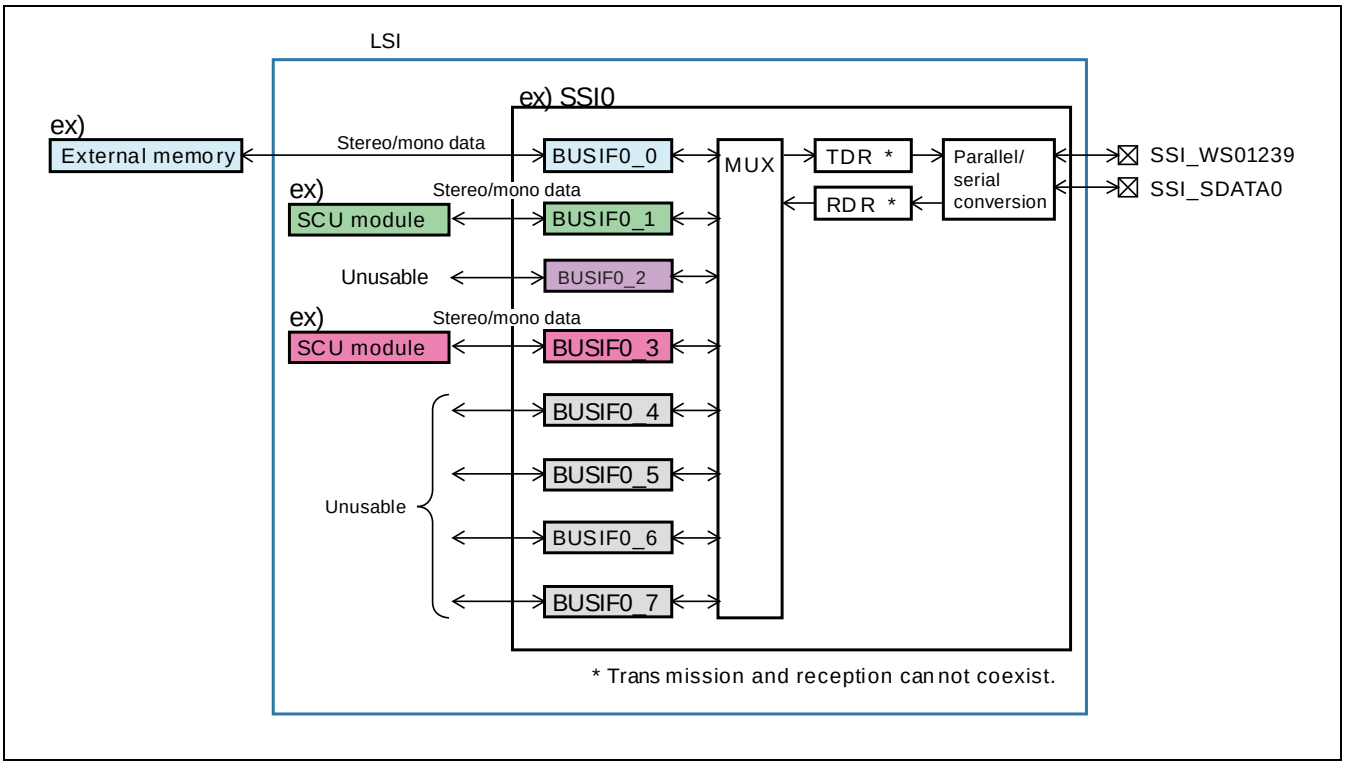

Figure 40.14 TDM Split Mode

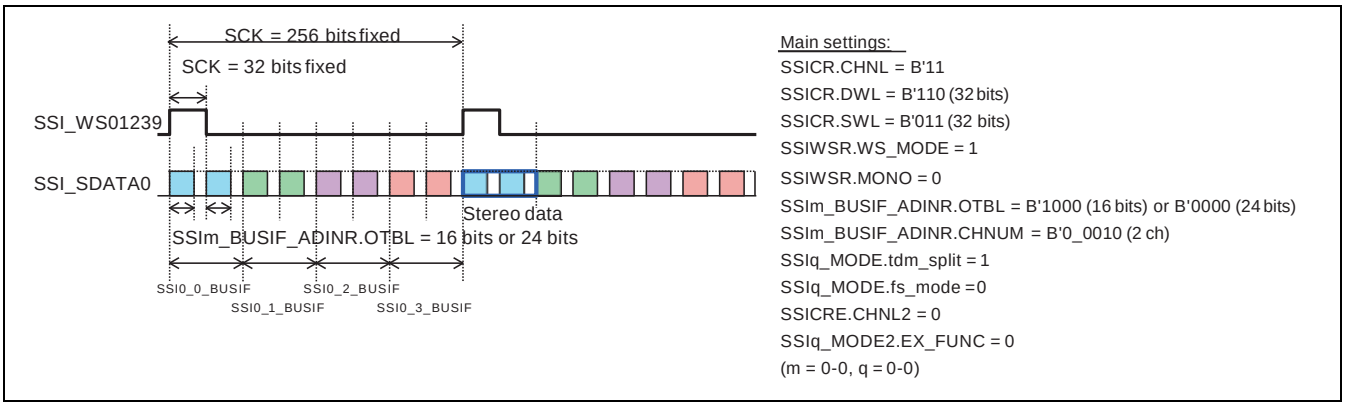

Figure 40.15 TDM Split Mode (Stereo × 4)

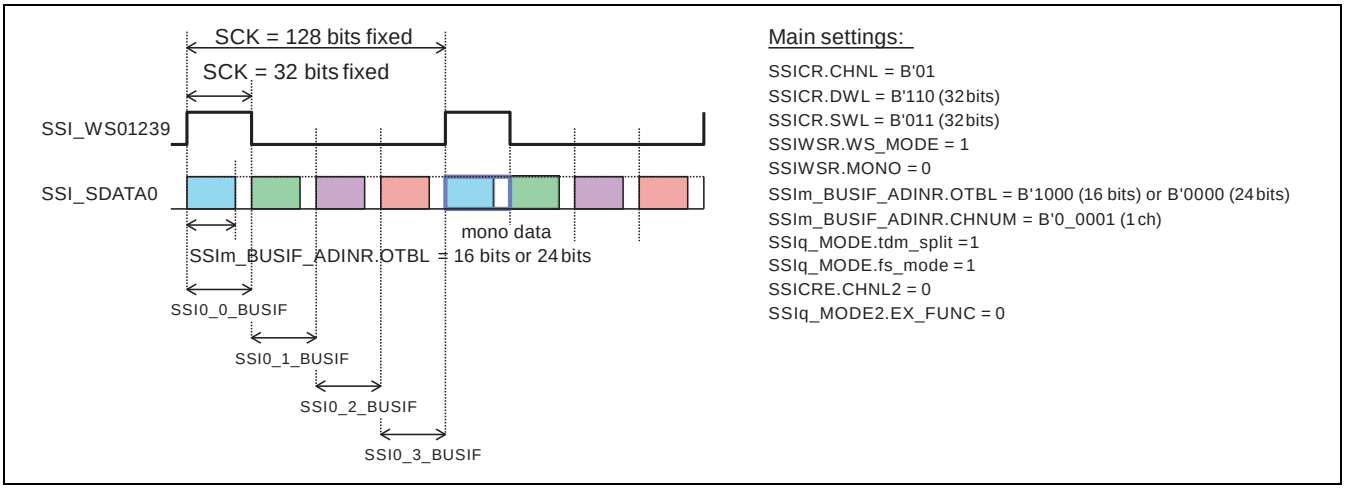

Figure 40.16 TDM Split Mode (Monaural × 4)

Notes: 1. The SWL and DWL bits in SSICR should be fixed at 32-bit setting.
2. Transmission and reception cannot coexist.
3. Data input to BUSIFn 0 to 3 (n = 0, 1, 2, 3, 4, 9) should be operated synchronously with the SSI sampling frequency (WS signal cycle).
4. Setting of SSIm_BUSIF_ADINR.OTBL = B’1000 (16bit) and SSIm_BUSIF_ADINR.OTBL = B’0000 (24bit) cannot coexist within the same SSI.

40.3.7 TDM Format Split Function (TDM Split Mode) [RZ/G2E]

The TDM format split function (TDM split mode) allows connecting four independent monaural or stereo data inside the LSI and outputting the data in the TDM format, and splitting TDM format input data into four independent monaural or stereo data and distributing the data inside the LSI. This function allows TDM-8ch or TDM-4ch. This function is supported by SSI0, SSI1, SSI2, SSI3, SSI4 and SSI9.

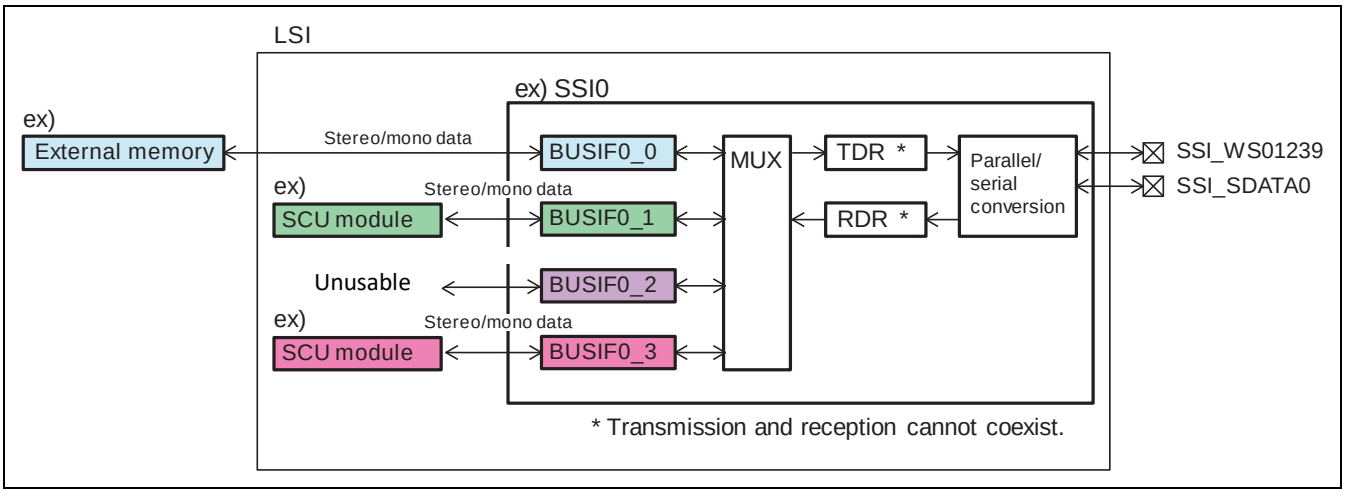

Figure 40.17 TDM Split Mode

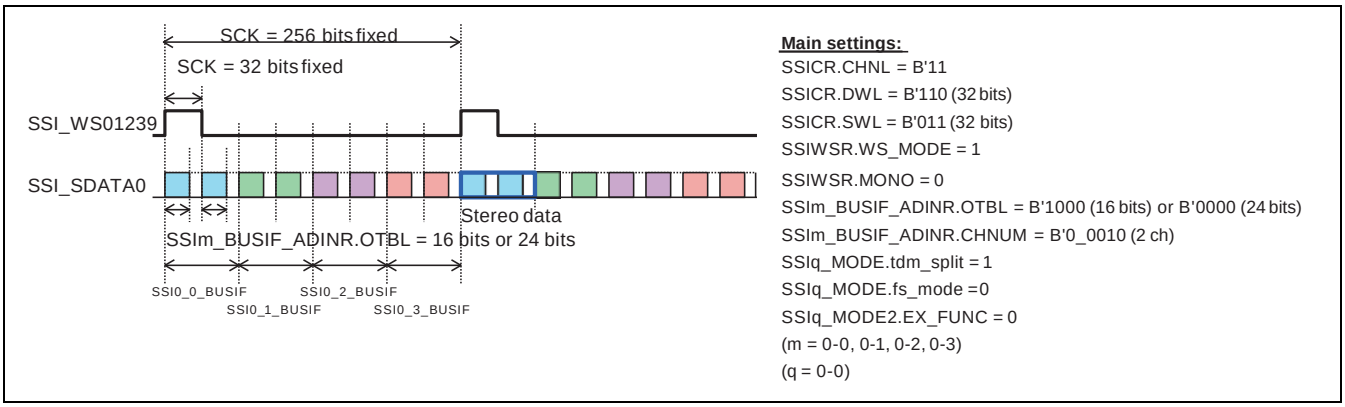

Figure 40.18 TDM Split Mode (Stereo × 4)

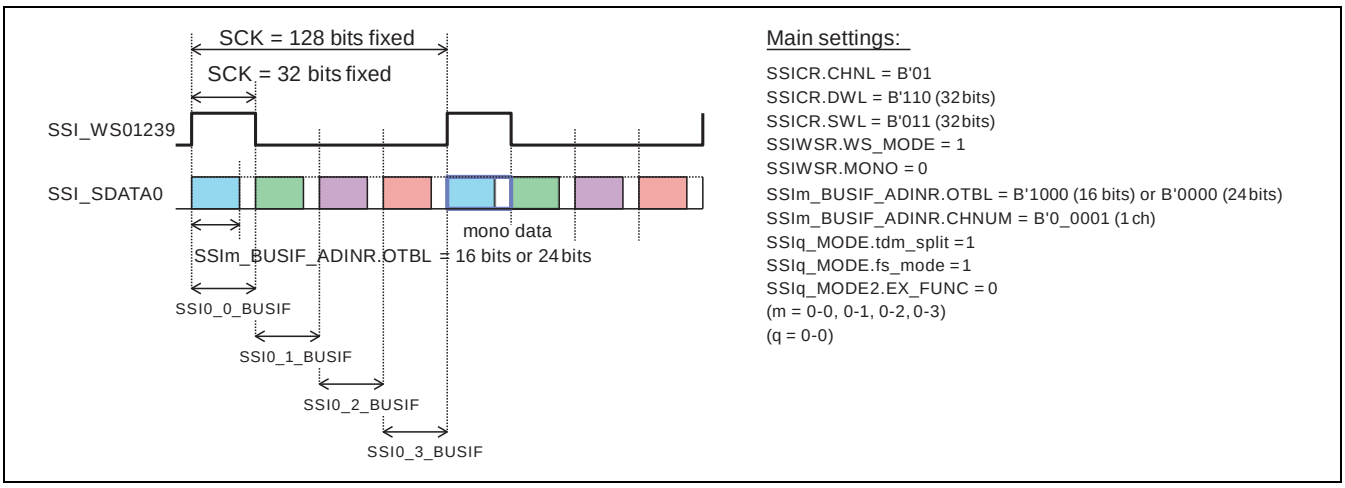

Figure 40.19 TDM Split Mode (Monaural × 4)

Notes: 1. The SWL and DWL bits in SSICR should be fixed at 32-bit setting.
2. Transmission and reception cannot coexist.
3. Data input to BUSIFn 0 to 3 (n = 0, 1, 2, 3, 4, 9) should be operated synchronously with the SSI sampling frequency (WS signal cycle).
4. Setting of SSIm_BUSIF_ADINR.OTBL = B’1000 (16bit) and SSIm_BUSIF_ADINR.OTBL = B’0000 (24bit) cannot coexist within the same SSI.

40.3.8 TDM Format 16ch Function (TDM 16ch Mode) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The TDM format 16ch function (TDM 16ch mode) is similar to basic function. It is correspondence to TDM-16channel.

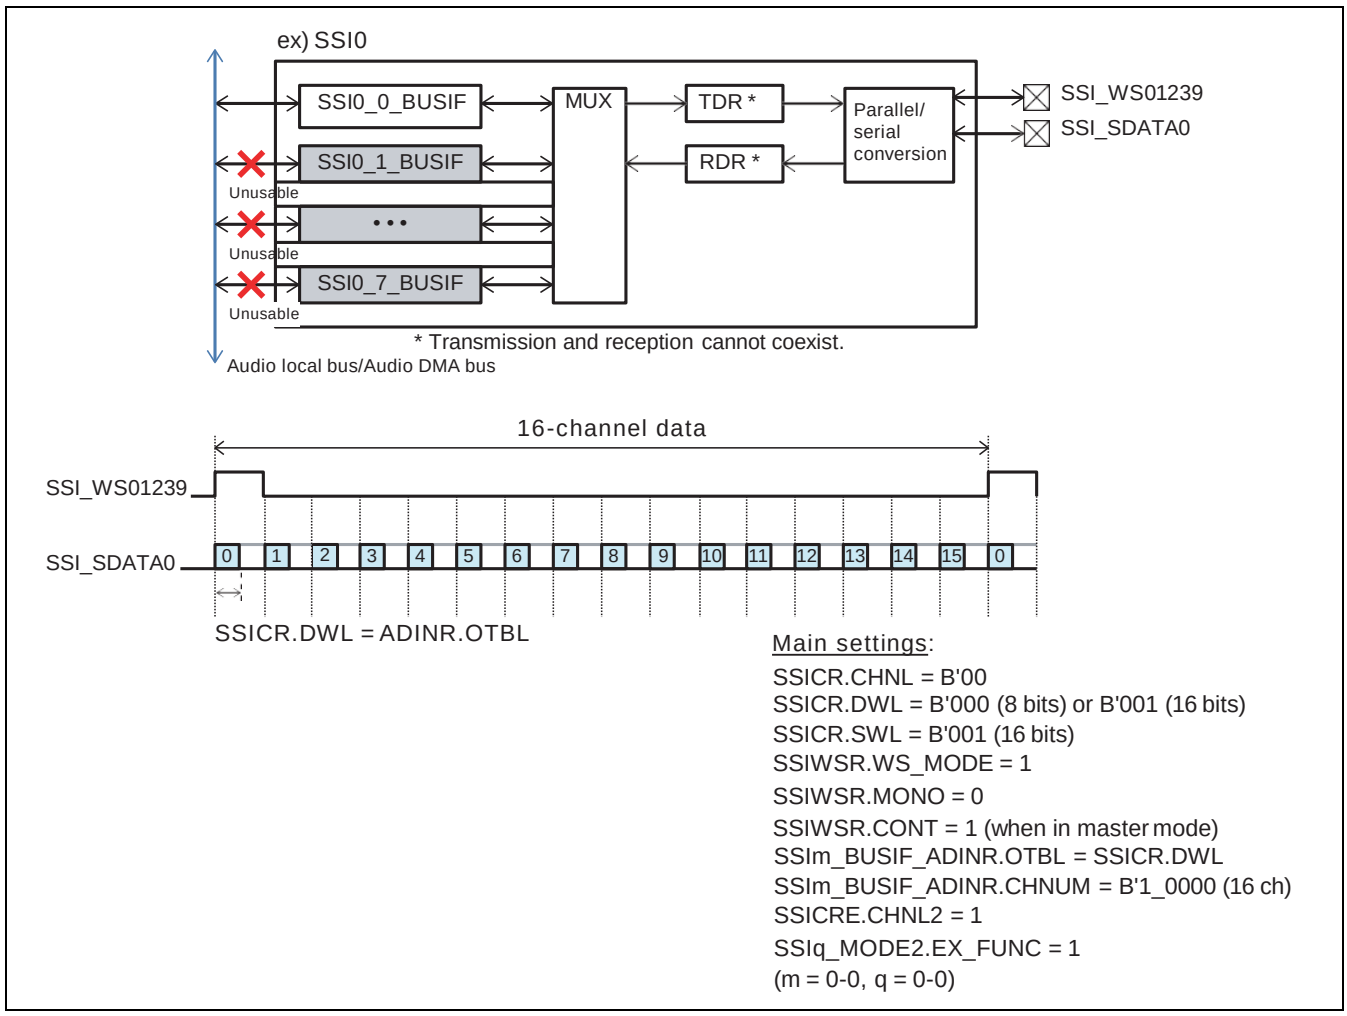

Figure 40.20 TDM 16ch Mode

40.3.9 TDM Format Extend Split Function (TDM Ex-Split Mode) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The TDM format extend split function (TDM ex-split mode) allows connecting eight independent stereo or multi data inside the LSI and outputting the data in the TDM format, and splitting TDM format input data into eight independent stereo or multi data and distributing the data inside the LSI. This function allows TDM-16ch or TDM-8ch (TDM-6ch, 4ch are not supported). This function is supported by SSI0, SSI1, SSI2, SSI3, SSI4 and SSI9. Setting to share place in the stream data with multiple BUSIF channels is prohibited. For example, when BUSIF0-0 used as 6channel, BUSIF0-1 and BUSIF0-2 cannot be used.

Notes: 1. Transmission and reception cannot coexist.
2. Data input to BUSIFn 0 to 3 (n = 0, 1, 2, 3, 4, 9) should be operated synchronously with the SSI sampling frequency (WS signal cycle).
3. Another setting of SSIm_BUSIF_ADINR.OTBL cannot coexist within the same SSI.
(ex. Setting of SSIm_BUSIF_ADINR.OTBL = B'1000 (16bit) and SSIm_BUSIF_ADINR.OTBL = B'0000 (24bit) cannot coexist within the same SSI.)

40.3.11 SSI Pin Connections

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

Multiple SSI modules (in combinations of SSI0, SSI1, SSI2, SSI3, and SSI9, combination of SSI3, SSI4, and SSI9, and combination of SSI7 and SSI8) can operate in synchronization with sharing of the same SSI_SCK and SSI_WS signals. Figure 40.26 to Figure 40.30 show how to connect the pins for each combination of SSIs.

In the case of the combination of SSI0, SSI1, SSI2, SSI3, and SSI9, SSI0 as the master should start transfer first thus allowing output on SSI_WS01239 and SSI_SCK01239, after which SSI1, SSI2, SSI3, and SSI9 as the slaves should be used. If the master-side transfer is stopped by setting the CONT bit in SSIWSR to 0, the slave-side SSI1, SSI2, SSI3, and SSI9 should be stopped because output through SSI_WS01239 is not possible. This also applies to the master and slaves in the combination of SSI3, SSI4, and SSI9, and to the master and slave in the combination of SSI7 and SSI8.

[RZ/G2E]

Multiple SSI modules (in combinations of SSI0, SSI1, SSI2, SSI3, and SSI9, combination of SSI3, SSI4, and SSI9, and combination of SSI7 and SSI8) can operate in synchronization with sharing of the same SSI_SCK and SSI_WS signals. Figure 40.31 to Figure 40.35 show how to connect the pins for each combination of SSIs.

In the case of the combination of SSI0, SSI1, SSI2, SSI3, and SSI9, SSI0 as the master should start transfer first thus allowing output on SSI_WS01239 and SSI_SCK01239, after which SSI1, SSI2, SSI3, and SSI9 as the slaves should be used. If the master-side transfer is stopped by setting the CONT bit in SSIWSR to 0, the slave-side SSI1, SSI2, SSI3, and SSI9 should be stopped because output through SSI_WS01239 is not possible. This also applies to the master and slaves in the combination of SSI3, SSI4, and SSI9, and to the master and slave in the combination of SSI7 and SSI8.

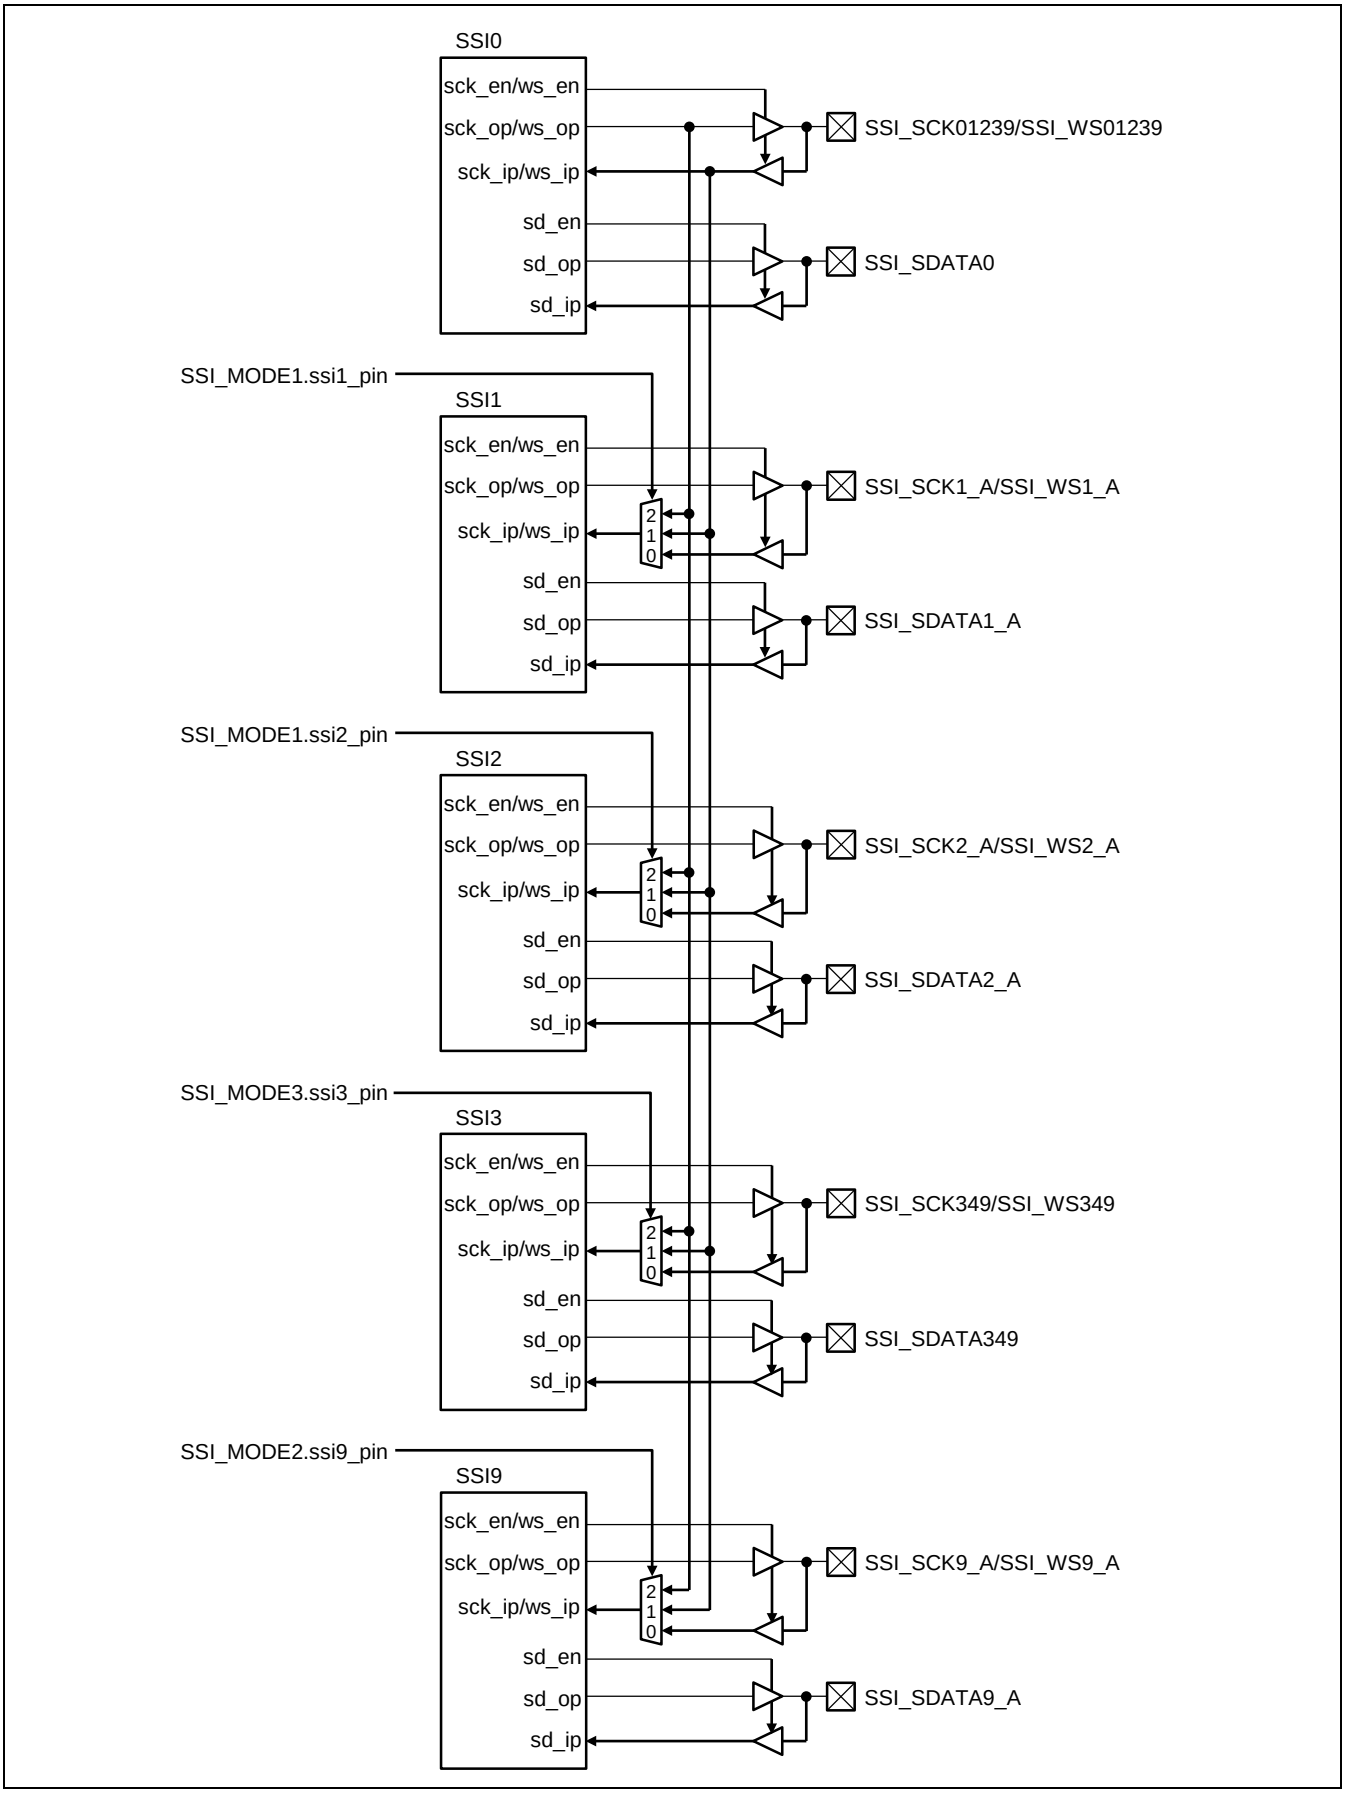

Figure 40.26 Pin Connections for Combination of SSI0, SSI1, SSI2, SSI3, and SSI9 (Group A) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

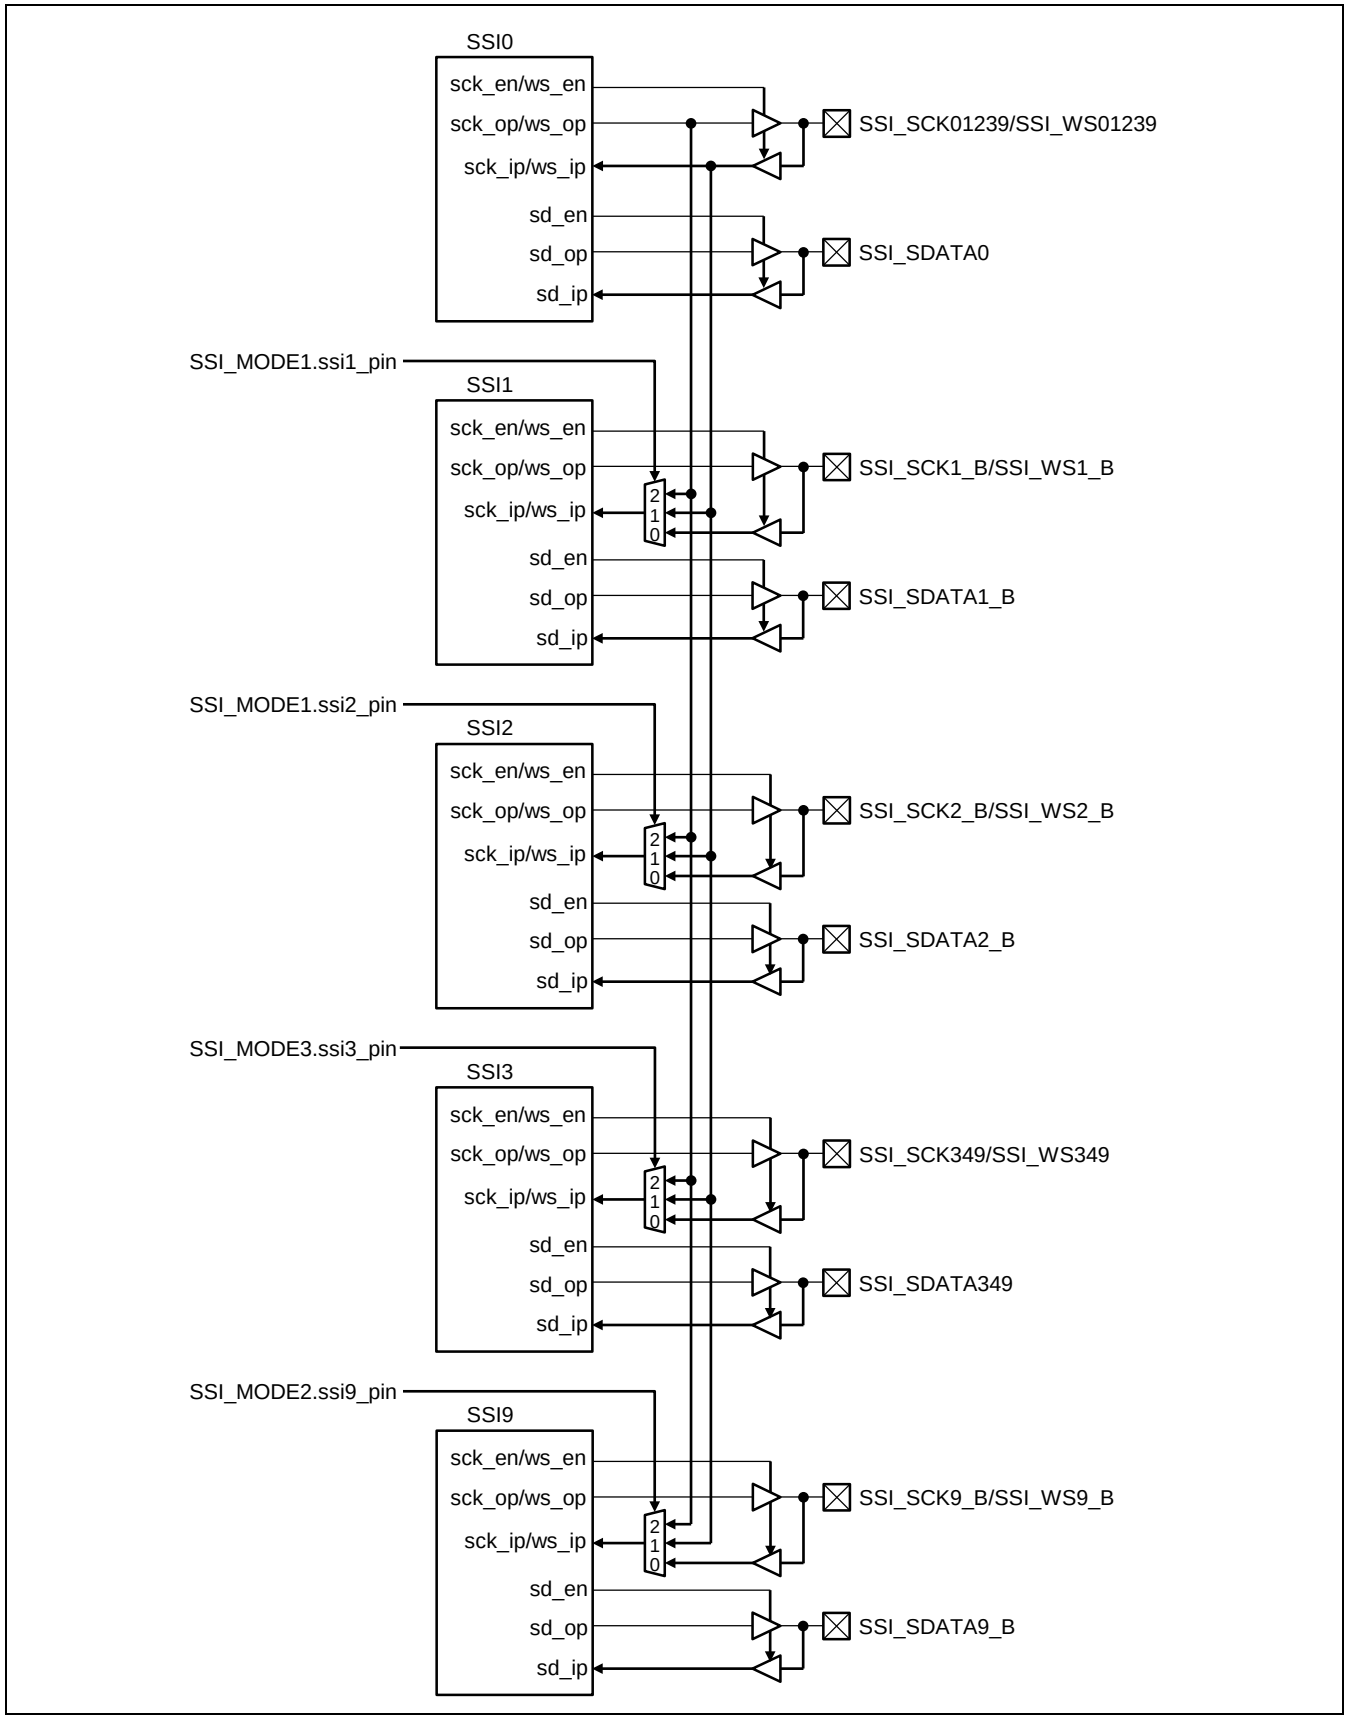

Figure 40.27 Pin Connections for Combination of SSI0, SSI1, SSI2, SSI3, and SSI9 (Group B) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

40.3.12 HDMI Signal Selection [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

SSIU selects SSI signals (SSI_SCK, SSI_WS, and SSI_SDATA (up to from four SSIs)) that is transmitted to HDMI-IF.

SSI_SCK and SSI_WS is generated from one SSI. Selectable SSIs for SSI_SDATA depend on which SSI is selected for SSI_SCK and SSI_WS. For example, in case that SSI_SCK and SSI_WS from SSI0 are selected, SSI_SDATA is data from SSI0, SSI1, SSI2, SSI3, or SSI9.

Section 40.2.42 and section 40.2.43 and Table 40.7 explain selectable combination of SSIs.

Only stereo data format is supported. Selected SSI has to perform at master-mode.

Table 40.7 Selectable combination of SSIs

40.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

40.4.1 Note on Transfer

If an underflow or overflow occurs, stop the transfer and restart it.

Do not stop serial clock (SCK) and word select (WS) signals during data transfer. Confirm that SSISR.IDST = 1 before stopping SCK and WS signals.

In case of transmission at slave mode, it is necessary that WS signal is stable. Data transmission at slave mode should be started after more than two frames period since WS signal is entered and is stable.

In case of multiple SSI modules and case that one SSI works at master mode and the others do at slave mode, data transfer should be started after more than two frames period since registers of SSI at master mode are set.

41. Serial Sound Interface (SSI)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

41.1 Overview

The serial sound interface (hereinafter referred to as the "SSI") is a transceiver module designed to send or receive audio data interfacing with a variety of devices offering I2S format. It also supports multi-channel mode in addition to other common formats.

41.1.1 Features

The SSI has the following features:

- Number of channels: Maximum of four (when a multichannel format is specified).
- The SSI module can serve as both a transmitter and a receiver.
- Asynchronous transfer takes place between the data buffer and the shift register.
- Only the MSB first data alignment is supported.
- A value as the dividing ratio for the clock used by the serial bus interface is selectable.
- Controlling of data transmission or reception with DMAC or interrupt requests is possible.
- TDM format is supported.
- The frequency range of SCK signal is from 297.3 kHz to 12.5MHz at master mode, and from 297.3 kHz to 15.1 MHz at slave mode.
- The WS continue function by which operation can be performed without stopping WS signal is supported.
- Monaural mode (8 bits or 16 bits) is supported.
- In monaural mode, WS signal pulse width can be changed (short or long frame).
- If the sampling clock frequency is switched during transfer, it will be notified of the CPU with interrupts (a function to detect switching frequency).
- Operating mode: non-compressed mode (Not support compressed mode).
- Supports versatile serial audio formats (I2S/left justified/right justified).
- Supports master/slave functions.
- Programmable word clock, bit clock generation functions.

41.1.2 Block Diagram

Figure 41.1 shows a block diagram of a single SSI module.

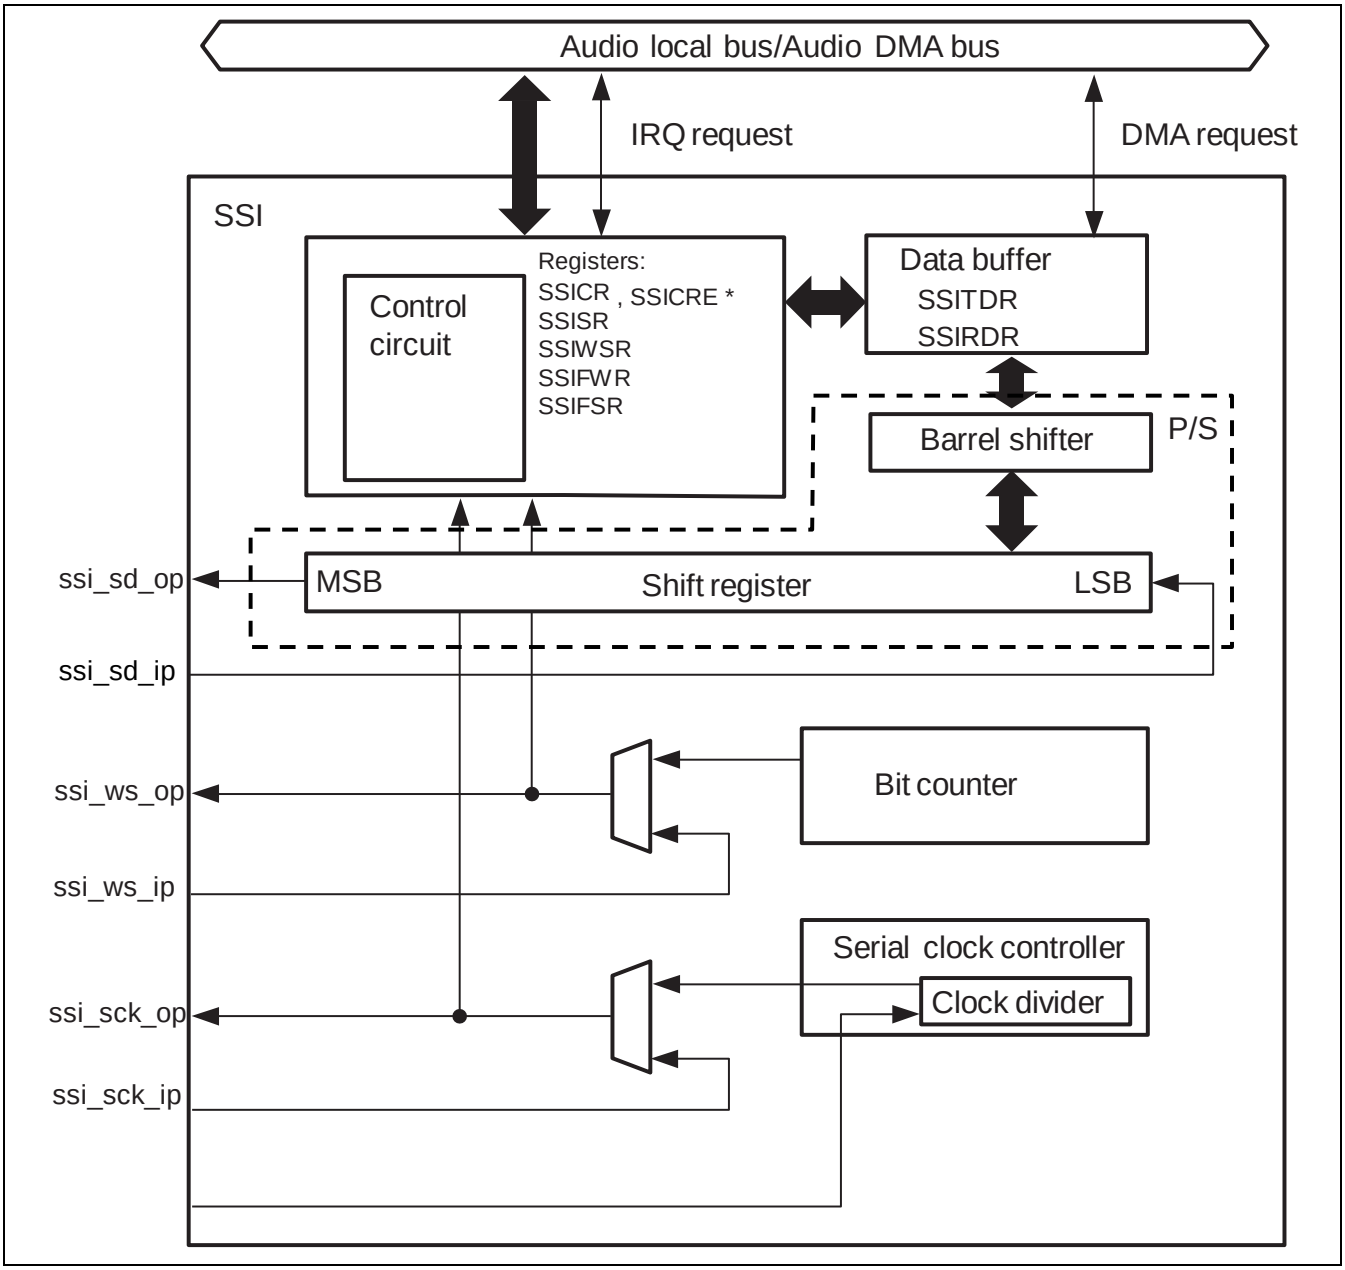

Figure 41.1 Block Diagram of SSI

Note: * SSICRE is available RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N

41.1.3 External Pins

No external pins

41.1.4 Register Configuration

The SSI has the following registers. Note that the module numbers are basically omitted from the register names in the text.

Table 41.1 Register Configurations

						Second Generation RZ/G Series Products

Notes: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

1. For this register, bits 26 and 27 are readable/writable bits, although the others are read-only bits. For details, refer to section 41.2.2 Status Register (SSISRn).
2. For this register, bits 14 and 15 are readable/writable bits, although the others are read-only bits. For details, refer to section 41.2.7 FS Status Register (SSIFSRn).
3. H'EC54_1xxx and H'EC24_1xxx are used with PIO access and audio-DMAC, respectively.

41.1.5 Connected Module

Table 41.2 Connected Module

Module name	Connected module name	Function of connected module
SSI	APMU	Access the Register
	PFC	Select External pins
	CPG	Output Clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-AP	Control to interrupt
	SSIU	Serial Sound Interface Unit
	ADG	Output Clocks for Audio module
	SCU	Sampling Rate Converter Unit
	Audio-DMAC	Control Direct Memory Access for Audio module
	Audio-DMACpp	Control Direct Memory Access for Audio modules connected to the audio local bus

41.2 Register Description

[Legend for Register Descriptions]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. The write value should always be 0.

41.2.1 Control Register (SSICRn)

Note: n = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

SSICR is a readable/writable 32-bit register that controls the IRQ, selects the polarity status, and sets operating mode.

Bit	Bit Name	Initial Value	R/W	Description
31	FORCE	B'0	R/W	Fixed The bit should always be set to 1.
30	—	B'0	R	Reserved The read value is 0. The write value should always be 0.
29	FIEN	B'0	R/W	Frequency Switching Detection Interrupt Enable 0: Frequency switching detection interrupt is disabled. 1: Frequency switching detection interrupt is enabled.
28	DMEN	B'0	R/W	DMA Enable Enables or disables the DMA request. 0: DMA request is disabled. 1: DMA request is enabled.
27	UIEN	B'0	R/W	Underflow Interrupt Enable 0: Underflow interrupt is disabled. 1: Underflow Interrupt is enabled.

Bit	Bit Name	Initial Value	R/W	Description
26	OIEN	B’0	R/W	Overflow Interrupt Enable 0: Overflow interrupt is disabled. 1: Overflow interrupt is enabled.
25	IIEN	B’0	R/W	Idle Mode Interrupt Enable 0: Idle mode interrupt is disabled. 1: Idle mode interrupt is enabled.
24	DIEN	B’0	R/W	Data Interrupt Enable 0: Data interrupt is disabled. 1: Data interrupt is enabled.
23, 22	CHNL[1:0]	B’00	R/W	Channels These bits set the number of channels in each system word. When the stereo format or multi-channel format is used (WS_MODE = 0, MONO = 0, and WIDTH = B'0_0000 in the WS Mode Register): B’00: A system word has one channel. B’01: A system word has two channels. B’10: A system word has three channels. B’11: A system word has four channels. When the TDM format is used (WS_MODE = 1, MONO = 0, and WIDTH = B'0_0000 in the WS Mode Register): B’00: Setting prohibited * B’01: A TDM frame consists of four system words. B’10: A TDM frame consists of six system words. B’11: A TDM frame consists of eight system words. * In case of CHNL = B'00 and SSICREm.CHNL2 = 1, a TDM frame consists of sixteen system words. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] When the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'0_0001 to B'1_1111 in the WS Mode Register): B’00: A monaural frame consists of one system word. B’01: Setting prohibited B’10: Setting prohibited B’11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
21 to 19	DWL[2:0]	B’000	R/W	Data Word Length These bits set the number of bits in a data word. When the stereo format or multi-channel format (WS_MODE = 0, MONO = 0, and WIDTH = B'0_0000 in the WS Mode Register) or TDM format (WS_MODE = 1, MONO = 0, and WIDTH = B'0_0000 in the WS Mode Register) is used: B’000: 8 bits B’001: 16 bits B’010: 18 bits B’011: 20 bits B’100: 22 bits B’101: 24 bits B’110: 32 bits B’111: Setting prohibited When the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'0_0001 to B'1_1111 in the WS Mode Register): B’000: 8 bits B’001: 16 bits Other than above: Setting prohibited
18 to 16	SWL[2:0]	B’000	R/W	System Word Length These bits set the number of bits in a system word. When the stereo format or multi-channel format (WS_MODE = 0, MONO = 0, and WIDTH = B'0_0000 in the WS Mode Register) or TDM format (WS_MODE = 1, MONO = 0, and WIDTH = B'0_0000 in the WS Mode Register) is used: B’000: 8 bits B’001: 16 bits B’010: 24 bits B’011: 32 bits B’100: 48 bits B’101: 64 bits B’110: 128 bits B’111: 256 bits When the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'0_0001 to B'1_1111 in the WS Mode Register): B’000: 16 bits B’001: 32 bits B’010: 48 bits B’011: 64 bits B’100: 96 bits B’101: 128 bits B’110: 256 bits B’111: 512 bits
15	SCKD	B’0	R/W	Serial Bit Clock Direction 0: Serial bit clock is input, slave mode. 1: Serial bit clock is output, master mode. Note: (SCKD, SWSD) = (0, 0) or (1, 1) can be set to SSI0 to SSI7 and SSI9. To SSI8, only (SCKD, SWSD) = (0, 0) can be set. Other settings are prohibited.

Bit	Bit Name	Initial Value	R/W	Description
14	SWSD	B'0	R/W	Serial WS Direction 0: Serial word select is input, slave mode. 1: Serial word select is output, master mode. Note: (SCKD, SWSD) = (0, 0) or (1, 1) can be set to SSI0 to SSI7 and SSI9. To SSI8, only (SCKD, SWSD) = (0, 0) can be set. Other settings are prohibited.
13	SCKP	B'0	R/W	Serial Bit Clock Polarity 0: SSI_WS and SSI_SDATA change at the SSI_SCK falling edge (sampled at the SCK rising edge). 1: SSI_WS and SSI_SDATA change at the SSI_SCK rising edge (sampled at the SCK falling edge).

	SCKP = 0	SCKP = 1
SSI_SDATA input sampling timing at the time of reception (TRMD = 0)	SSI_SCK rising edge	SSI_SCK falling edge
SSI_SDATA output change timing at the time of transmission (TRMD = 1)	SSI_SCK falling edge	SSI_SCK rising edge
SSI_WS input sampling timing at the time of slave mode (SWSD = 0)	SSI_SCK rising edge	SSI_SCK falling edge
SSI_WS output change timing at the time of master mode (SWSD = 1)	SSI_SCK falling edge	SSI_SCK rising edge

Bit	Bit Name	Initial Value	R/W	Description
12	SWSP	B'0	R/W	Serial WS Polarity The value of this bit must not be changed when the SSI module enable (EN) bit in this register is set to 1. • When the stereo format or multi-channel format is used (WS_MODE = 0, MONO = 0, and WIDTH = B'0_0000 in the WS Mode Register): 0: SSI_WS is low for 1st channel, high for 2nd channel. 1: SSI_WS is high for 1st channel, low for 2nd channel. • When the TDM format is used (WS_MODE = 1, MONO = 0, and WIDTH = B'0_0000 in the WS Mode Register): 0: The SYNC pulse is high over the period of system word 1, and low otherwise. 1: The SYNC pulse is low for over the period of system word 1, and high otherwise. • When the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'0_0001 to B'1_1111 in the WS Mode Register): 0: WS pulse is high over the period specified with the WIDTH bits in the WS Mode Register, and low otherwise. 1: WS pulse is low over the period specified with the WIDTH bits in the WS Mode Register, and high otherwise.
11	SPDP	B'0	R/W	Serial Padding Polarity 0: Padding bits are low. 1: Padding bits are high. Padding bits are low when MUEN = 1. (The mute function takes priority.)

Bit	Bit Name	Initial Value	R/W	Description
10	SDTA	B'0	R/W	Serial Data Alignment This bit should be set to 0 when the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'0_0001 to B'1_1111 in the WS Mode Register). 0: Transmitting and receiving in the order of serial data and padding bits. 1: Transmitting and receiving in the order of padding bits and serial data.
9	PDTA	B'0	R/W	Parallel Data Alignment When the length of data word is 32, 16 or 8 bits, this configuration field has no meaning. This bit should be set to 0 when the monaural format is used (WS_MODE = 1, MONO = 1, and WIDTH = B'0_0001 to B'1_1111 in the WS Mode Register). This bit applies to SSIRDR in receive mode and SSITDR in transmit mode. 0: Parallel data (SSITDR, SSIRDR) is left-aligned. 1: Parallel data (SSITDR, SSIRDR) is right-aligned. DWL = 000 (with a data word length of 8 bits), the PDTA setting is ignored. All data bits in SSIRDR or SSITDR are used on the audio serial bus. Four data words are transmitted or received at each 32-bit access. The first data word is derived from bits 7 to 0, the second from bits 15 to 8, the third from bits 23 to 16 and the last data word is derived from bits 31 to 24. DWL = B'001 (with a data word length of 16 bits), the PDTA setting is ignored. All data bits in SSIRDR or SSITDR are used on the audio serial bus. Two data words are transmitted or received at each 32-bit access. The first data word is derived from bits 15 to 0 and the second data word is derived from bits 31 to 16. DWL = B'010, B'011, B'100, B'101 (with a data word length of 18, 20, 22 or 24 bits), PDTA = 0 (left-aligned) The data bits used in SSIRDR or SSITDR are the following: Bits 31 down to (32 minus the number of bits in the data word length specified by DWL). That is, if DWL = B'011, the data word length is 20 bits; therefore, bits 31 to 12 in either SSIRDR or SSITDR are used. All other bits are ignored or reserved. DWL = B'010, B'011, B'100, B'101 (with a data word length of 18, 20, 22 or 24 bits), PDTA = 1 (right-aligned) The data bits used in SSIRDR or SSITDR are the following: Bits (the number of bits in the data word length specified by DWL minus 1) to 0 i.e. if DWL = B'011, then DWL = 20 and bits 19 to 0 are used in either SSIRDR or SSITDR. All other bits are ignored or reserved. DWL = B'110 (with a data word length of 32 bits), the PDTA setting is ignored. All data bits in SSIRDR or SSITDR are used on the audio serial bus.
8	DEL	B'0	R/W	Serial Data Delay 0: One clock cycle delay between SSI_WS and SSI_SDATA 1: No delay between SSI_WS and SSI_SDATA
7	—	B'0	R	Reserved The read value is 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	CKDV[2:0]	B'000	R/W	Serial Oversampling Clock Division Ratio Set the ratio between oversampling clock, CLK_FS, and the serial bit clock. These bits are ignored if SCKD = 0. The serial bit clock is used in the shift register and is provided on the SSI_SCK module pin. B'000: Serial bit clock frequency = oversampling clock frequency/1 B'001: Serial bit clock frequency = oversampling clock frequency/2 B'010: Serial bit clock frequency = oversampling clock frequency/4 B'011: Serial bit clock frequency = oversampling clock frequency/8 B'100: Serial bit clock frequency = oversampling clock frequency/16 B'101: Serial bit clock frequency = oversampling clock frequency/6 B'110: Serial bit clock frequency = oversampling clock frequency/12 B'111: Setting prohibited CKDV = 000 is invalid when WS_MODE = 1 or CONT = 1 in the WS Mode Register.
3	MUEN	B'0	R/W	Serial Data Output Disable 0: Module is not muted. 1: Module is muted. Note: This bit can be used to stop output (low output) or to enable output. However, the operation is not synchronized with the change of SSI_WS.
2	—	B'0	R	Reserved The read value is 0. The write value should always be 0.
1	TRMD	B'0	R/W	Transmit/Receive Mode Select 0: Module is in receive mode. 1: Module is in transmit mode.
0	EN	B'0	R/W	SSI Module Enable 0: Module is disabled. 1: Module is enabled. When changing EN bit, do not change other bits.

41.2.2 Status Register (SSISRn)

Note: n = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

SSISR consists of status flags indicating the operational status of the SSI module and bits indicating the current channel numbers and word numbers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	DMRQ	UIRQ	OIRQ	IIRQ	DIRQ	—	—	—	—	—	—	—	—
Initial value:	—	—	—	0	0	0	—	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R/WC0	R/WC0	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CHNO[1:0]		SWNO	IDST
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	1	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	Undefined	R	Reserved The read value is not guaranteed. The write value should always be 0.
28	DMRQ	B'0	R	DMA Request Status Flag This status flag allows the CPU to recognize the value of the DMA request pin on the SSI module. • TRMD = 0 (receive mode) If DMRQ = 1, the SSIRDR has unread data. If SSIRDR is read, DMRQ = 0 until there is new unread data. • TRMD = 1 (transmit mode) If DMRQ = 1, SSITDR requires data to be written to continue the transmission to the audio serial bus. Once data is written to SSITDR, DMRQ = 0 until it requires further transmit data.

Bit	Bit Name	Initial Value	R/W	Description
27	UIRQ	B'0	R/WC0	Underflow Error Interrupt Status Flag This status flag indicates that data was supplied at a lower rate than was required. In either case, this bit is set to 1 regardless of the value of the UIEN bit and can be cleared by writing 0 to this bit. If UIRQ = 1 and UIEN = 1, an interrupt occurs. • TRMD = 0 (receive mode) If UIRQ = 1, SSIRDR was read before there was new unread data indicated by the DMRQ or DIRQ bit. This can lead to the same received data being stored twice by the host leading to potential corruption of multi-channel data. • TRMD = 1 (transmit mode) If UIRQ = 1, SSITDR did not have data written to it before it was required for transmission. This will lead to the same data being transmitted once more and a potential corruption of multi-channel data. This is more serious error than a receive mode underflow as the output SSI data results in error. Note: When underflow error occurs, the current data in the data buffer of this module is transmitted until the next data is filled.
26	OIRQ	B'0	R/WC0	Overflow Error Interrupt Status Flag This status flag indicates that data was supplied at a higher rate than was required. In either case this bit is set to 1 regardless of the value of the OIEN bit and can be cleared by writing 0 to this bit. If OIRQ = 1 and OIEN = 1, an interrupt occurs. • TRMD = 0 (receive mode) If OIRQ = 1, SSIRDR was not read before there was new unread data written to it. This will lead to the loss of a data and a potential corruption of multi-channel data. Note: When overflow error occurs, the current data in the data buffer of this module is overwritten by the next incoming data from the SSI interface. • TRMD = 1 (transmit mode) If OIRQ = 1, SSITDR had data written to it before it was transferred to the shift register. This will lead to the loss of a data and a potential corruption of multi-channel data.
25	IIRQ	Undefined	R	Idle Mode Interrupt Status Flag This interrupt status flag indicates whether the SSI module is in idle state. This bit is set regardless of the value of the IIEN bit to allow polling. "Idle state" refers to the state where the serial bus has been stopped after activation of the SSI. The interrupt can be masked by clearing IIEN, but cannot be cleared by writing to this bit. If IIRQ = 1 and IIEN = 1, an interrupt occurs. 0: The SSI module is not in idle state. 1: The SSI module is in idle state.

Bit	Bit Name	Initial Value	R/W	Description
24	DIRQ	B'0	R	Data Interrupt Status Flag This status flag indicates that the module has data to be read or requires data to be written. In either case this bit is set to 1 regardless of the value of the DIEN bit to allow polling. The interrupt can be masked by clearing DIEN, but cannot be cleared by writing to this bit. If DIRQ = 1 and DIEN = 1, an interrupt occurs. • TRMD = 0 (receive mode) 0: No unread data in SSIRDR 1: Unread data in SSIRDR • TRMD = 1 (transmit mode) 0: Transmit buffer is full. 1: Transmit buffer is empty and requires data to be written to SSITDR.
23 to 4	—	Undefined	R	Reserved The read value is not guaranteed. The write value should always be 0.
3, 2	CHNO[1:0]	B'00	R	Channel Number These bits indicate the current channel number. However, if the length of data words is 8 or 16 bits, the value of these bits is meaningless. B'00: 1st channel B'01: 2nd channel B'10: 2nd channel B'11: 4th channel • TRMD = 0 (receive mode) CHNO indicates which channel the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register. • TRMD = 1 (transmit mode) CHNO indicates which channel is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR. These bits cannot be used when WS_MODE = 1 or CONT = 1 in the WS Mode Register.
1	SWNO	B'1	R	System Word Number This status bit indicates the current word number. However, if the length of data words is 8 or 16 bits, the value of this bit is meaningless. • TRMD = 0 (receive mode) SWNO indicates which system word the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register, regardless of whether SSIRDR has been read. • TRMD = 1 (transmit mode) SWNO indicates which system word is required to be written to SSITDR. This value will change as the data is copied to the shift register, regardless of whether the data is written to SSITDR. This bit cannot be used when WS_MODE = 1 or CONT = 1 in the WS Mode Register.

Bit	Bit Name	Initial Value	R/W	Description
0	IDST	Undefined	R	Idle Mode Status Flag This status flag indicates that the serial bus activity has stopped. This bit is cleared if EN = 1 and the serial bus are currently active. This bit is automatically set to 1 under the following conditions. • SSI = Master transmitter (SWSD = 1 and TRMD = 1) This bit is set to 1 when the EN bit is cleared and data written in SSITDR has been output from the serial data input/output pin (SSI_SDATA). • SSI = Master receiver (SWSD = 1 and TRMD = 0) This bit is set to 1 when the EN bit is cleared and transfer of the current system word is completed. • SSI = Slave transmitter/receiver (SWSD = 0) This bit is set to 1 when the EN bit is cleared and transfer of the current system word is completed. Note: If an external device stops the serial bus clock before transfer of the current system word is completed, this bit is not set.

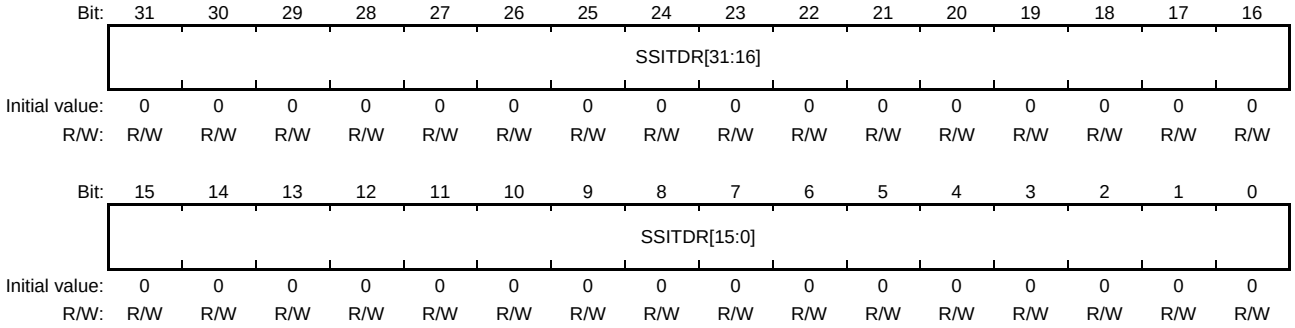
41.2.3 Transmit Data Register (SSITDRn)

Note: n = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

SSITDR is a 32-bit register that holds data to be transmitted.

Data written to this register is transferred to the shift register upon transmission request. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR. The data in the buffer can be accessed by reading this register.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SSITDR[31:0]	All 0	R/W	Transmit Data Data transmitted from SSI.

41.2.4 Receive Data Register (SSIRDRn)

Note: n = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

SSIRDR is a 32-bit register that stores receive messages.

Data in this register is transferred from the shift register each time data word is received. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved The read value is 0. The write value should always be 0.
0	CHNL2	B’0	R/W	Extension bit of SSICRn.CHNL[1:0] 0: Default value 1: A TDM frame consists of sixteen system words. In this case, SSICRn.CHNL should be set B'00.

41.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

41.3.1 Bus Format

The SSI module can operate as a transmitter or a receiver and can be configured into many serial bus formats in either mode.

The bus format can be selected from one of the four major modes shown in Table 41.3.

Table 41.3 Bus Format for SSI Module

	SSICR																		SSIWSR			SSICRE *
	TRMD	SCKD	SWSD	EN	MUEN	DIEN	IIEN	OIEN	UIEN	DEL	PDTA	SDTA	SPDP	SWSP	SCKP	SWL[2:0]	DWL[2:0]	CHNL[1:0]	WS_MODE	MONO	CONT	CHNL2
Slave receiver	0	0	0	Control bits							Configuration bits								WS mode bits			Control bits
Slave transmitter	1	0	0																			
Master receiver	0	1	1																			
Master transmitter	1	1	1																			

Note: * [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] only available.

(1) Slave receiver

This mode allows the module to receive serial data from another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of the SSI module, operation is not guaranteed.

(2) Slave transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of the SSI module, operation is not guaranteed.

(3) Master receiver

This mode allows the module to receive serial data from another device. The clock and word select signals are internally derived from the CLK_FS input clock. The format of these signals is defined in the configuration fields of the SSI module. If the incoming data does not follow the configured format, operation is not guaranteed.

(4) Master transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signals are internally derived from the CLK_FS input clock. The format of these signals is defined in the configuration fields of the SSI module.

(5) Setting for each format

Table 41.4 shows the setting for each format:

Table 41.4 Setting for Each Format

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

	SSICR	SSIWSR			SSICRE
Format	**CHNL[1:0]**	**WS_MODE**	**MONO**	**WIDTH[4:0]**	**CHNL2**
Stereo format	B'00	0	0	B'0_0000	B'0
Multi-channel format	B'01/B'10/B'11	0	0	B'0_0000	B'0
Monaural format	B'00	1	1	B'0_0001 to B'1_1111	B'0
TDM format	B'00/B'01/B'10/B'11 *	1	0	B'0_0000	B'0/1 *

Note: * SSICR.CHNL[1:0] should be set B'00 to when SSICRE.CHNL2 = 1.

[RZ/G2E]

	SSICR	SSIWSR		
Format	**CHNL[1:0]**	**WS_MODE**	**MONO**	**WIDTH[4:0]**
Stereo format	B'00	0	0	B'0_0000
Multi-channel format	B'01/B'10/B'11	0	0	B'0_0000
Monaural format	B'00	1	1	B'0_0001 to B'1_1111
TDM format	B'00/B'01/B'10/B'11 *	1	0	B'0_0000

(6) Configuration bits (related to word length)

There are many configurations the SSI module supports, but only some of the combinations are shown below for the I2S, left-aligned, and right-aligned formats.

Figure 41.2 and Figure 41.3 demonstrate the supported I2S format both with and without padding. Padding occurs when the data word length is smaller than the system word length.

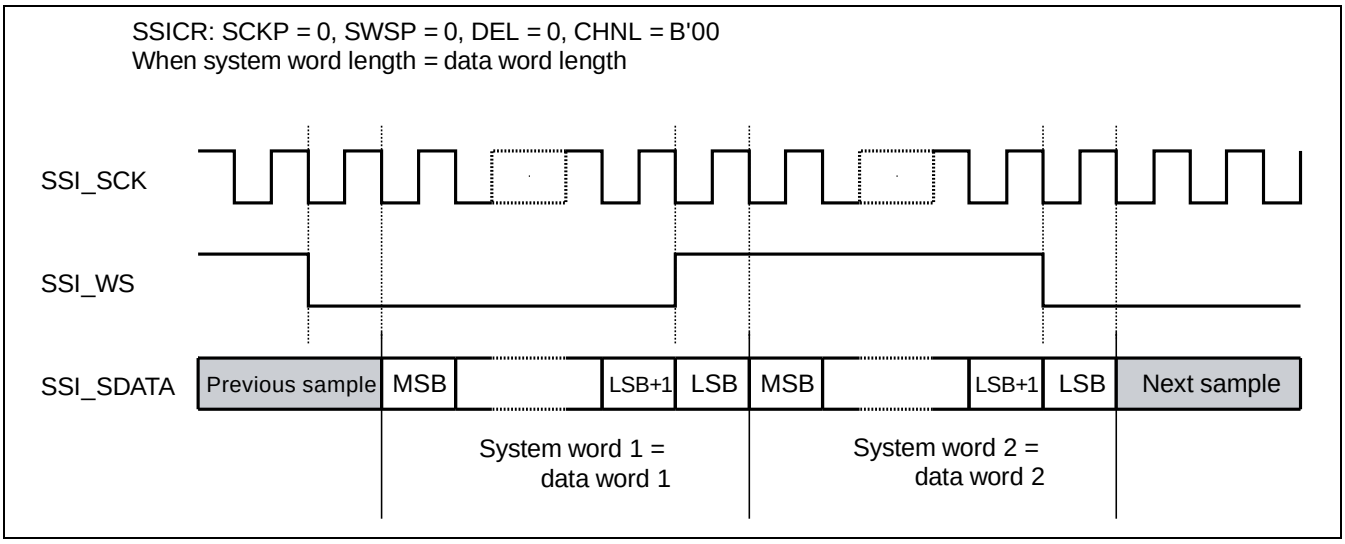

Figure 41.2 I2S Format (without Padding)

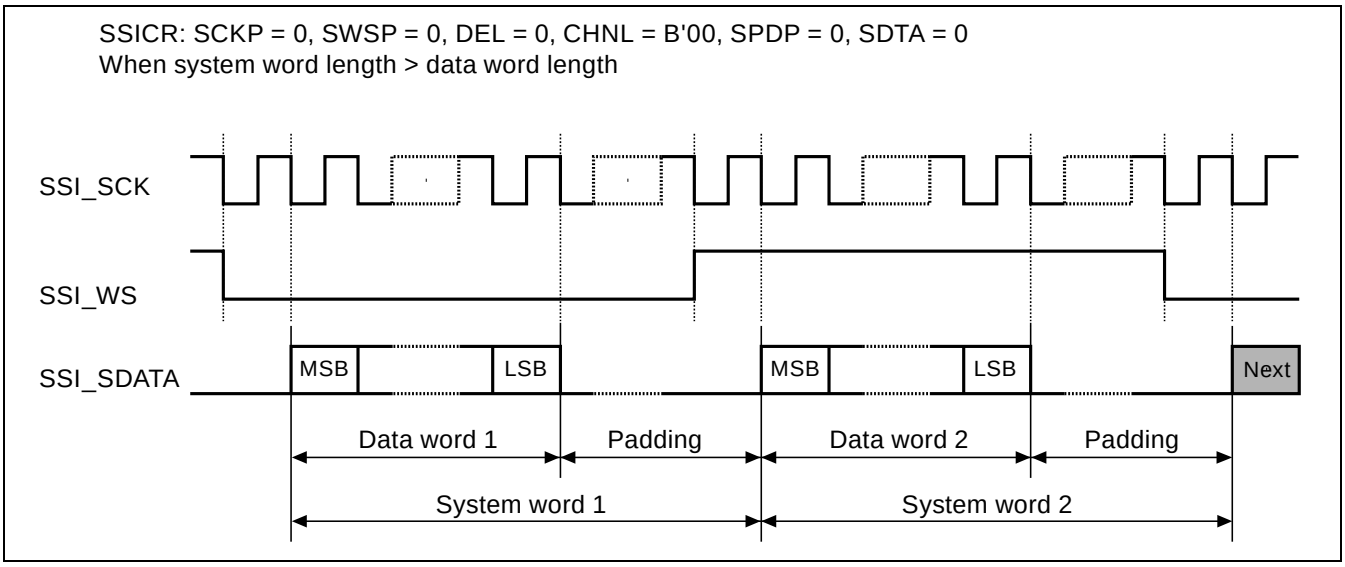

Figure 41.3 I2S Format (with Padding)

Figure 41.4 shows the left-aligned format and Figure 41.5 shows the right-aligned format. Padding is assumed in both cases, but may not be present in a final implementation if the system word length equals the data word length.

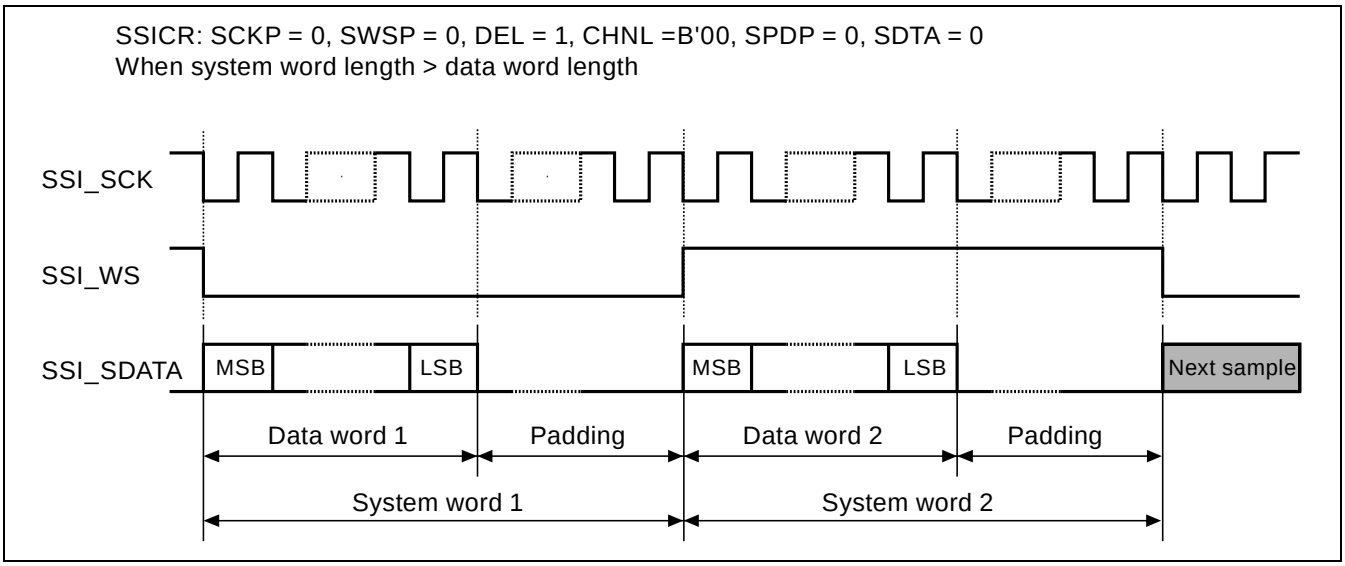

Figure 41.4 Left-Aligned Format
(Transmitting and Receiving in the Order of Serial Data and Padding Bits)

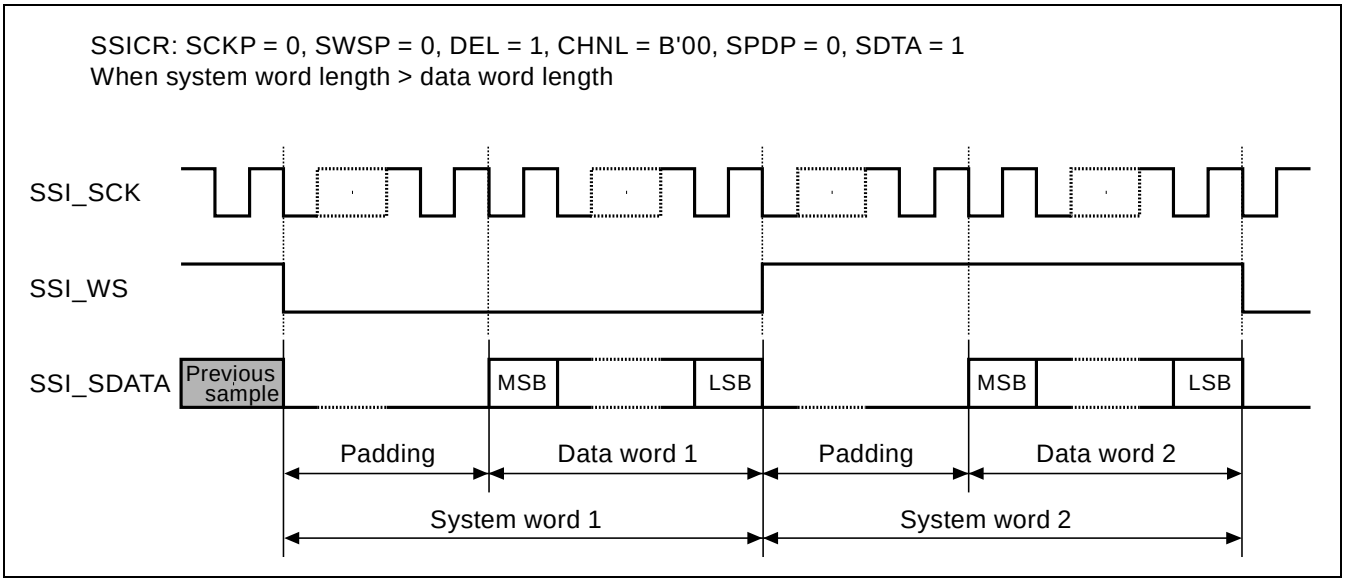

Figure 41.5 Right-Aligned Format
(Transmitting and Receiving in the Order of Padding Bits and Serial Data)

(7) Multi-channel formats

Some devices extend the definition of the I2S format and allow more than two channels to be transferred within two system words.

The SSI module supports the transfer of two, three, and four channels by using the CHNL, SWL and DWL bits only when the system word length (SWL) is greater than or equal to the data word length (DWL) multiplied by channels (CHNL).

Table 41.5 shows the number of padding bits for each of the valid setting. If setting is not valid, "—" is indicated instead of a number.

Table 41.5 The Number of Padding Bits for Each Valid Setting

Padding Bits Per System Word			DWL[2:0]	B'000	B'001	B'010	B'011	B'100	B'101	B'110
CHNL [1:0]	Decoded Channels per System Word	SWL [2:0]	Decoded Word Length	8	16	18	20	22	24	32

When the SSI module acts as a transmitter, each word written to SSITDR is transmitted to the serial audio bus in the order they are written. When the SSI module acts as a receiver, each word received by the serial audio bus is read in the order received from SSIRDR.

Figure 41.6 to Figure 41.8 show how two, three and four channels are transferred to the serial audio bus. Note that there are no padding bits in the first example, the second example is left-aligned and the third is right-aligned. This selection is arbitrary and is just for demonstration purposes only.

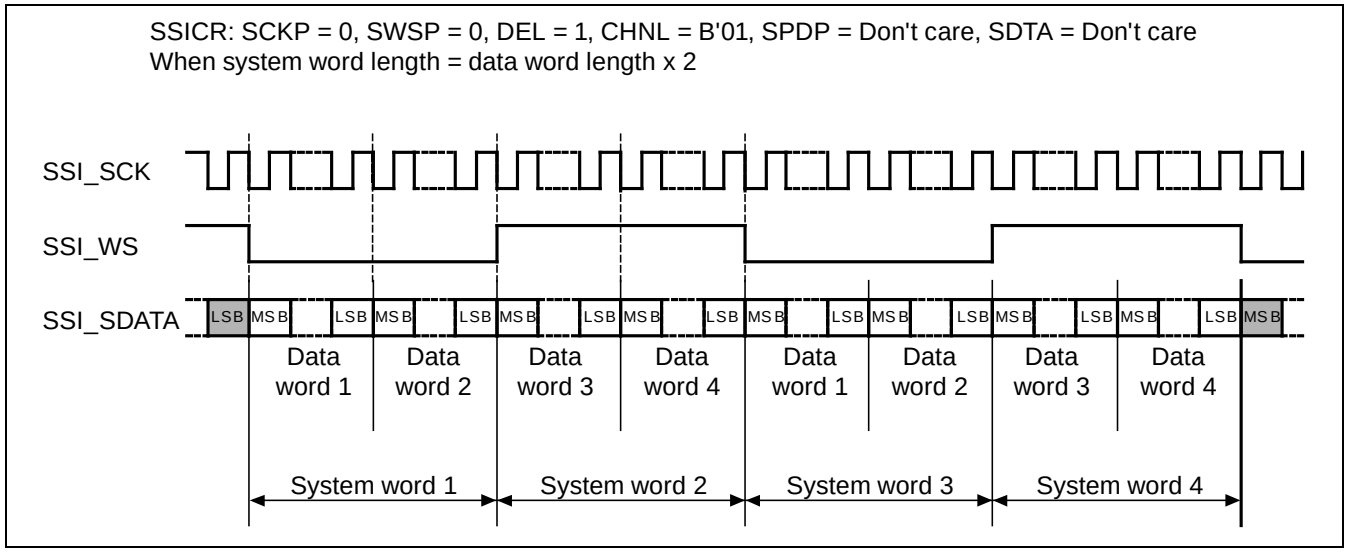

Figure 41.6 Multi-Channel Format (Two Channels without Padding)

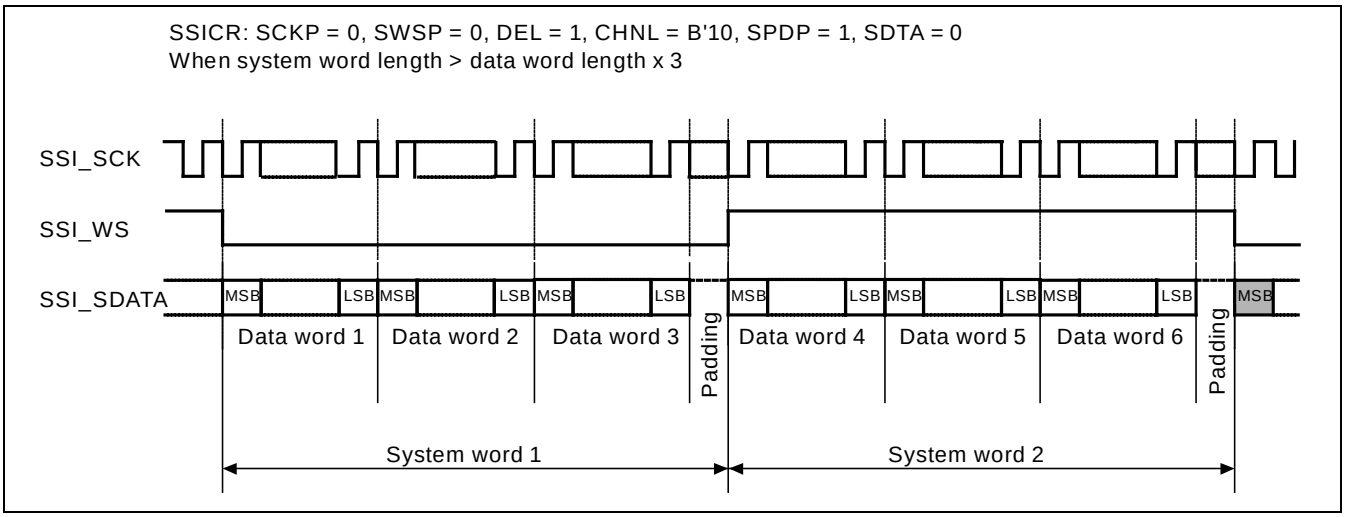

Figure 41.7 Multi-Channel Format (Three Channels with High Padding)

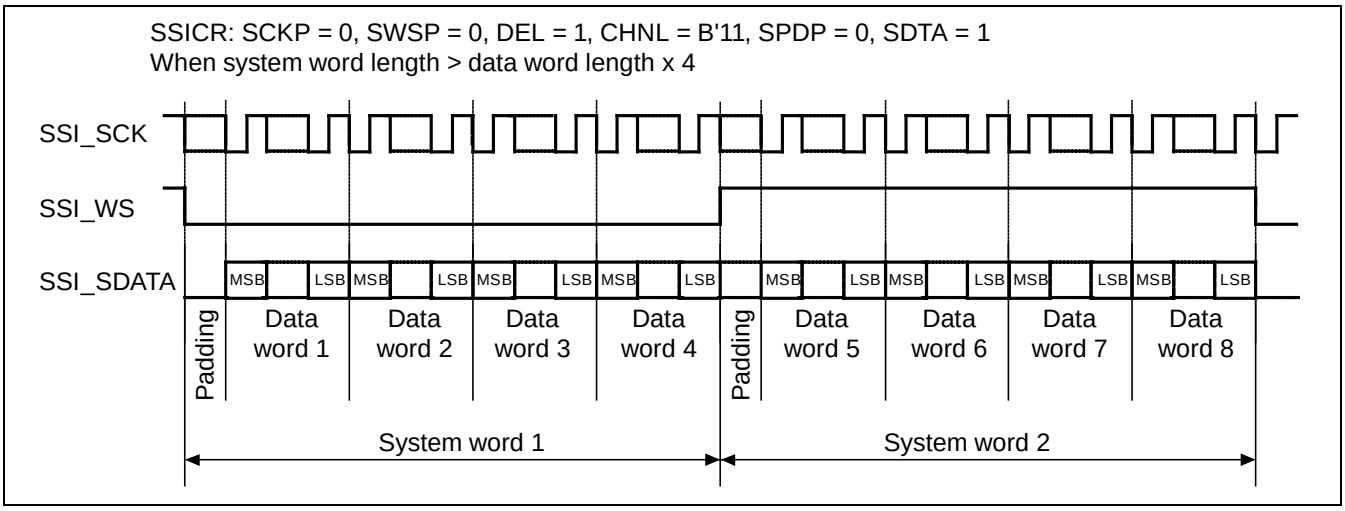

Figure 41.8 Multi-Channel Format (Four Channels; Transmitting and Receiving in the Order of Padding Bits and Serial Data; with Padding)

(8) TDM formats

The TDM format is used for connecting the SSI with a multi-channel device which supports TDM. The TDM format is set by using the WS_MODE and MONO bits in SSIWSR. When the SWSP bit in SSICR is 0 with the TDM format, SSI_WS is driven high over the period of system word 1, and pulled low otherwise. When the SWSP bit is 1, SSI_WS is pulled low over the period of system word 1, and driven high otherwise. The pulses generated on the SSI_WS signal are referred to as SYNC pulses.

Figure 41.9 and Figure 41.10 show the TDM formats without padding and with padding.

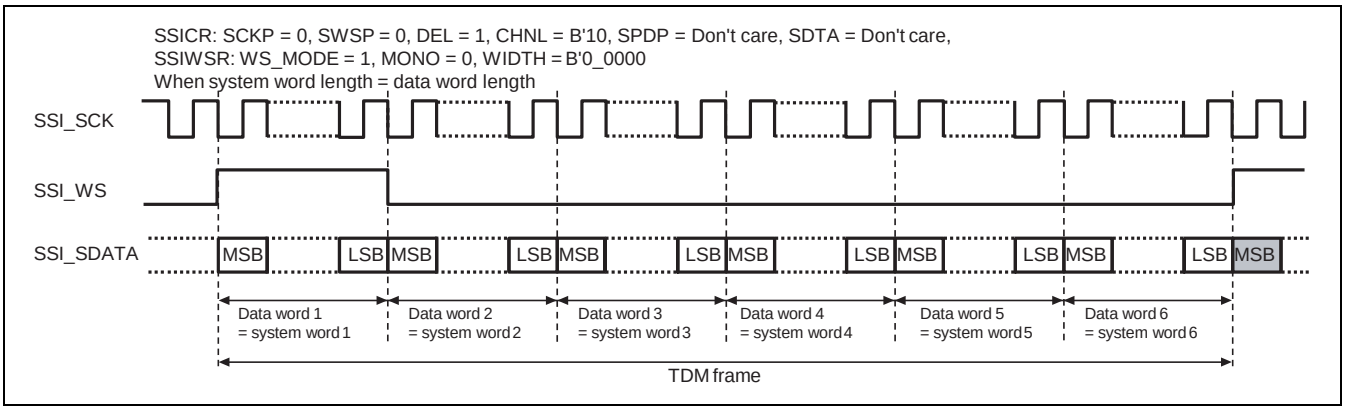

Figure 41.9 TDM Format (Six System Words, without Padding)

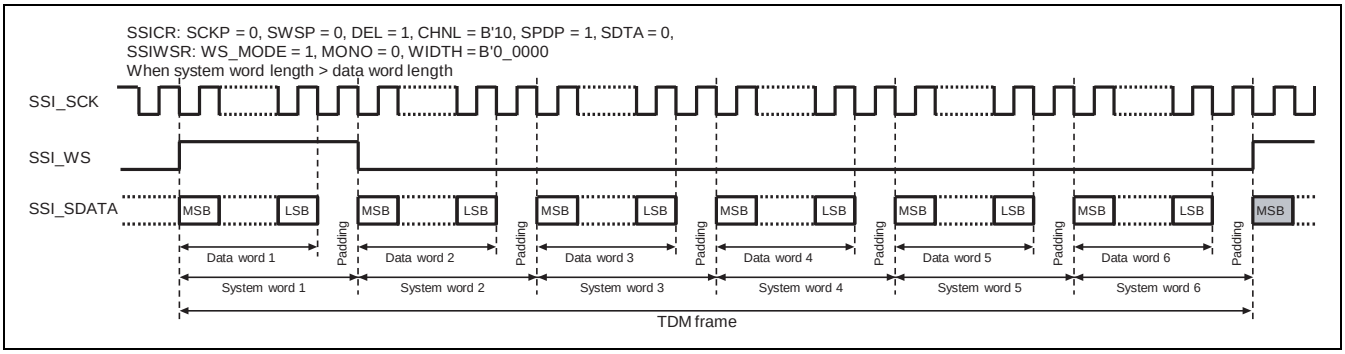

Figure 41.10 TDM Format (Six System Words, with Padding)

The following describes operation in each mode:

(a) Master transmitter

By a transfer start trigger (setting the EN bit in the control register to 1), a transfer of system word 1 begins synchronously with the SYNC pulses.

By a transfer stop trigger (setting the EN bit in the control register to 0), a transfer is stopped at the end of the currently-transferred system word and the SDATA signal is output according to the SPDP setting in SSICR (when SPDP = 0, a low-level signal is output).

If transmit data is not ready in the SSI module during transmission, an underflow will occur. When an underflow occurs, data to be output for the SYNC pulses cannot be determined. Therefore, stop and reconfigure the transfer.

(b) Master receiver

By a transfer start trigger (setting the EN bit in the control register to 1), a reception of system word 1 data begins at the point where the SSI module recognizes a SYNC pulse.

By a transfer stop trigger (setting the EN bit in the control register to 0), a reception is stopped at the end of the currently-transferred system word.

The receive data register should not be read when it does not have data. If read, an underflow will occur. When an underflow occurs, stop and reconfigure the transfer.

The receive data should not be written to before read. If written to, an overflow will occur. When an overflow occurs, stop and reconfigure the transfer.

(c) Slave transmitter

By a transfer start trigger (setting the EN bit in the control register to 1), a transfer of system word 1 begins synchronously with the SYNC pulses.

By a transfer stop trigger (setting the EN bit in the control register to 0), a transfer is stopped at the end of the currently-transferred system word and the SDATA signal is output according to the SPDP setting in SSICR (when SPDP = 0, a low-level signal is output).

If transmit data is not ready in the SSI module during transmission, an underflow will occur. When an underflow occurs, data to be output for SYNC pulses cannot be determined. Therefore, stop and re-set the transfer.

Transfers cannot be performed if the SCK signal and SYNC pulses are not provided to the SSI module during transfer.

(d) Slave receiver

By a transfer start trigger (setting the EN bit in the control register to 1), a reception of system word 1 data begins at the point where the SSI module recognizes a SYNC pulse.

By a transfer stop trigger (setting the EN bit in the control register to 0), a reception is stopped at the end of the currently-transferred system word.

The receive data should not be read when it does not have data. If read, an underflow will occur. When an underflow occurs, stop and reconfigure the transfer.

The receive data register should not be written to before read. If written to, an overflow will occur. When an overflow occurs, stop and reconfigure the transfer.

Transfer cannot proceed if the SCK signal and SYNC pulses are not being provided to the SSI module during transfer.

(9) Monaural format

The monaural format is set by using the WS_MODE and MONO bits in SSIWSR. The available data lengths are 8 bits and 16 bits. When the SWSP bit in SSICR is 0 and the monaural format is selected, SSI_WS is driven high over the period from bit 1 to bit 31, and pulled low otherwise. When the SWSP bit is 1, SSI_WS is pulled low over the period from bit 1 to bit 31, and driven high otherwise. The pulses generated as the SSI_WS signal are referred to as SYNC pulses. The width of the SYNC pulses can be set to a value in bits between 1 and 31 by using the WIDTH bits in SSIWSR. The setting must be smaller than the system word length (SSICR.SWL). In the monaural format, the system word length is equal to one monaural frame period.

Figure 41.11 shows the left-aligned monaural format and Figure 41.12 shows the monaural format with a delay of one bit-period.

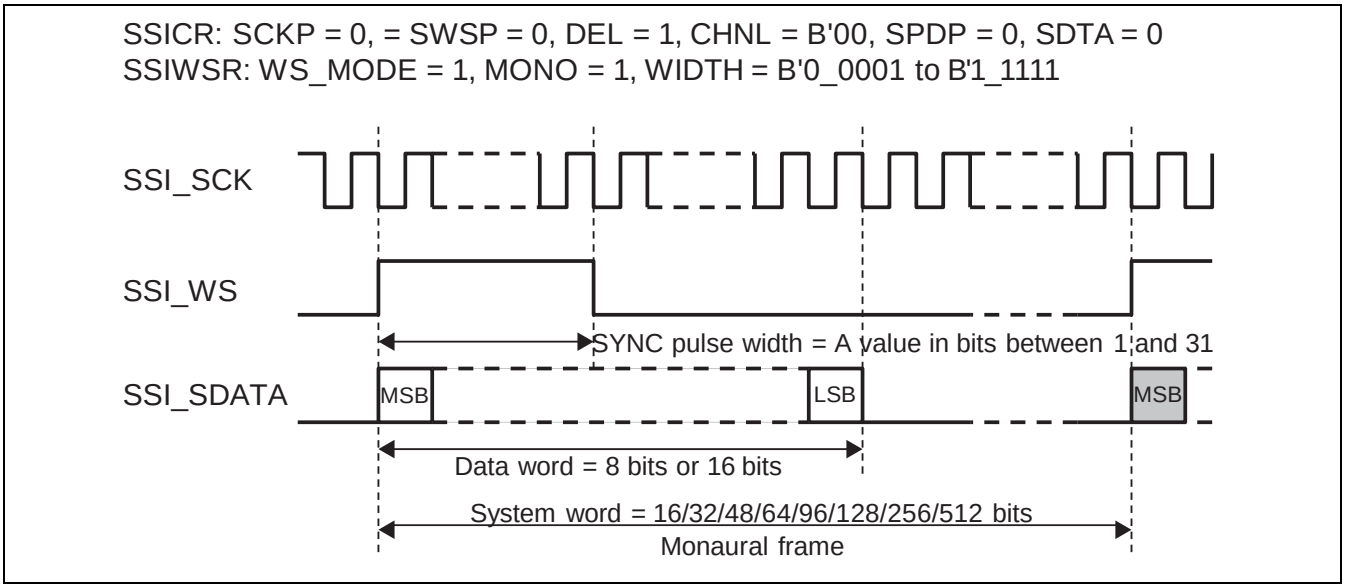

Figure 41.11 Monaural Format (Left-Aligned)

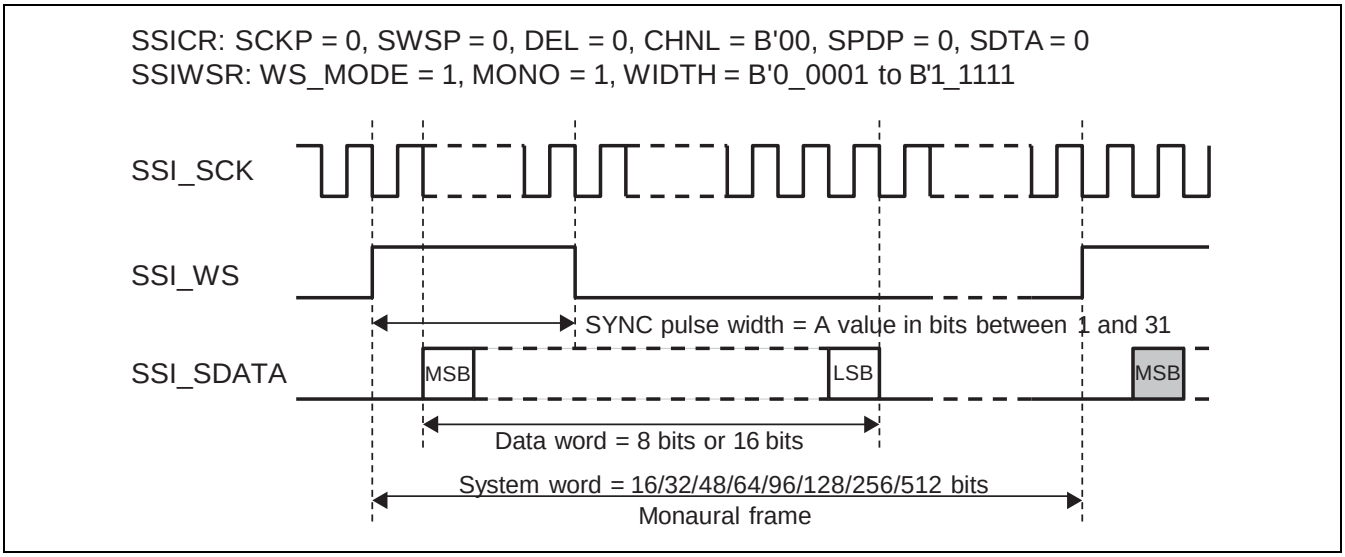

Figure 41.12 Monaural Format (with 1-bit Delay)

(10) Configuration bits

Several more configuration bits are shown below. These bits are not mutually exclusive, but some combinations may not be useful for any other device.

These configuration bits are described below with reference to Figure 41.13, Basic Sample Format.

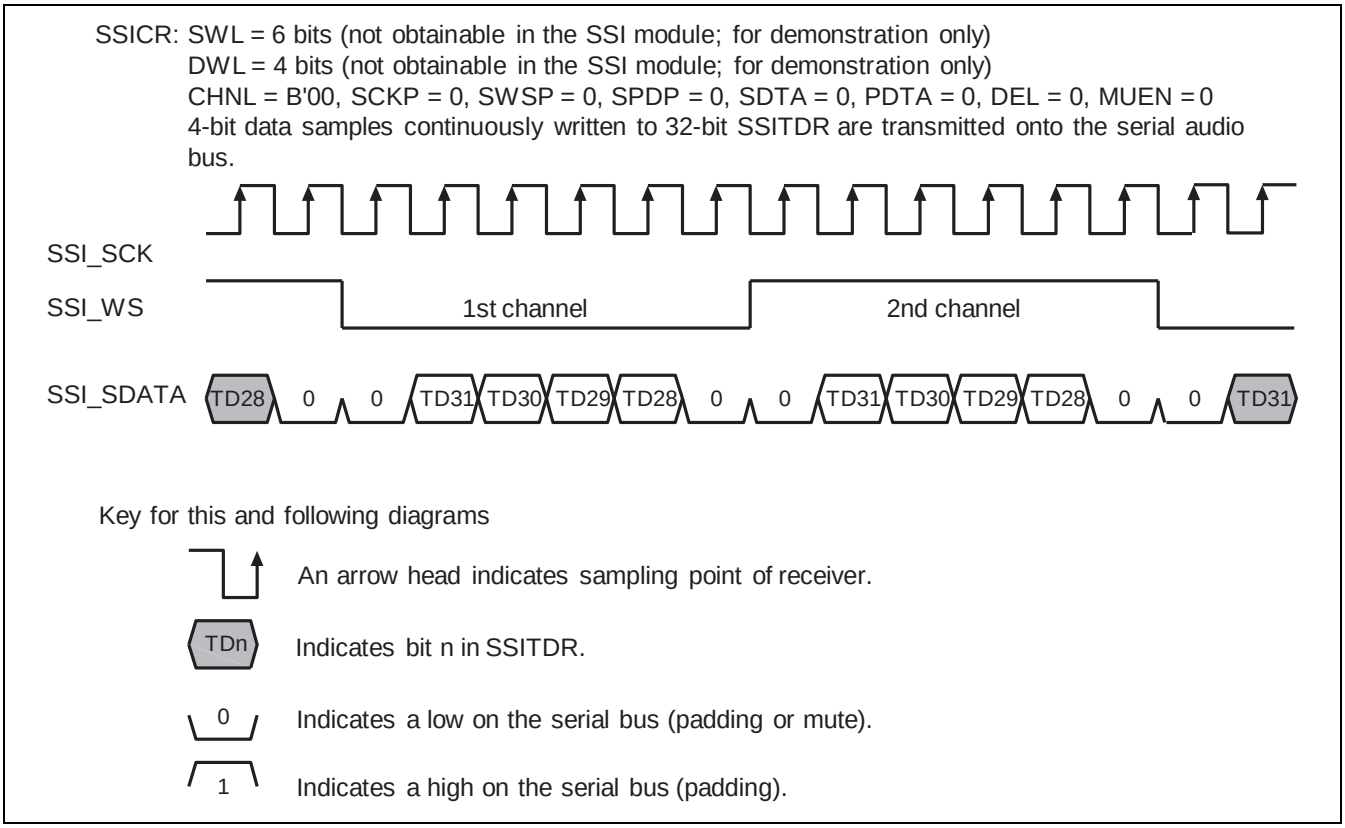

Figure 41.13 Basic Sample Format
(Transmit Mode with Example System/Data Word Length)

Figure 41.13 uses a system word length of 6 bits and a data word length of 4 bits. These settings are not possible with the SSI module but are used only for clarification of the other configuration bits.

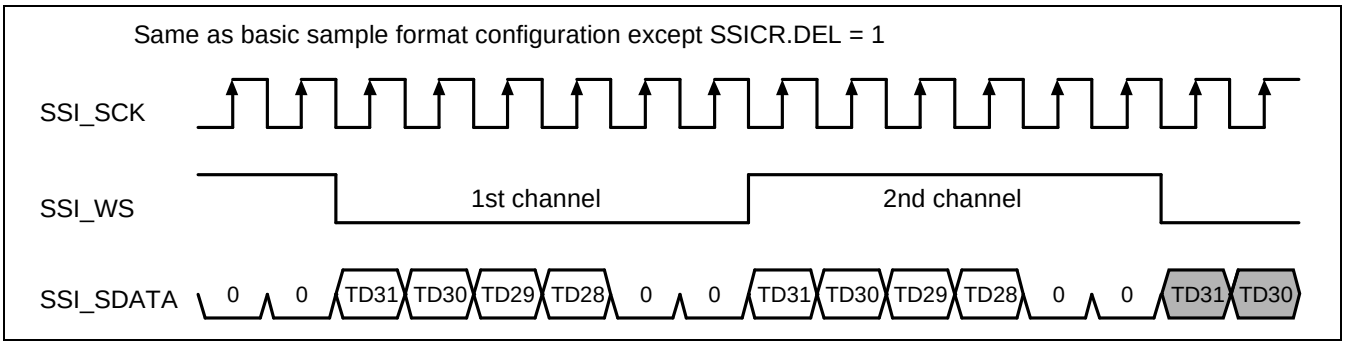

Figure 41.19 Transmitting and Receiving in the Order of Serial Data and Padding Bits; without Delay

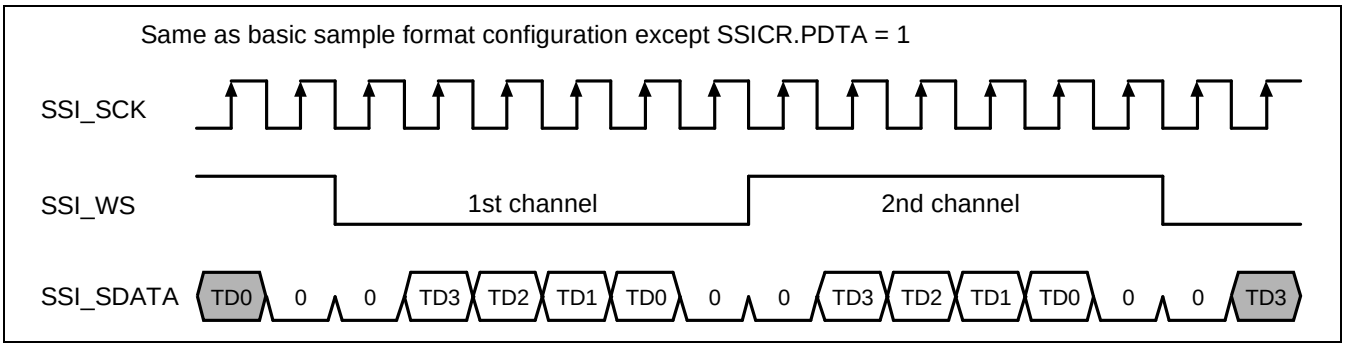

Figure 41.20 Parallel Right-Aligned with Delay

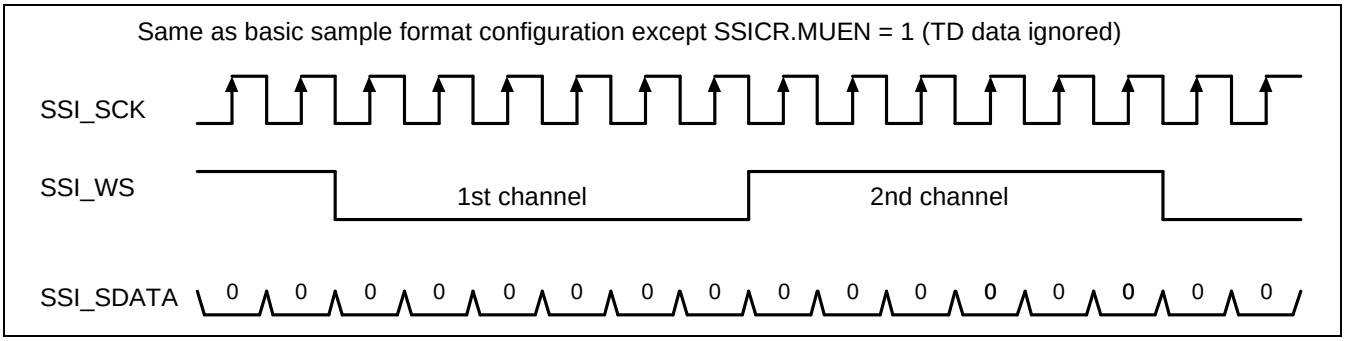

Figure 41.21 Mute Enabled

(11) WS continue function

The WS continue function is used to output SSI_WS signal continuously regardless of whether data transfer is enabled or disabled. The WS continue function can be set by using the CONT bit in SSIWSR. This function can be combined with master mode only. When this function is enabled, the SSI_WS signal continues to operate even if the EN bit in SSICR is cleared to 0 (stopping a transfer). When this function is disabled, the SSI_WS signal operates synchronously with the EN bit.

Figure 41.22 and Figure 41.23 show operations when the WS continue function is enabled and disabled, respectively.

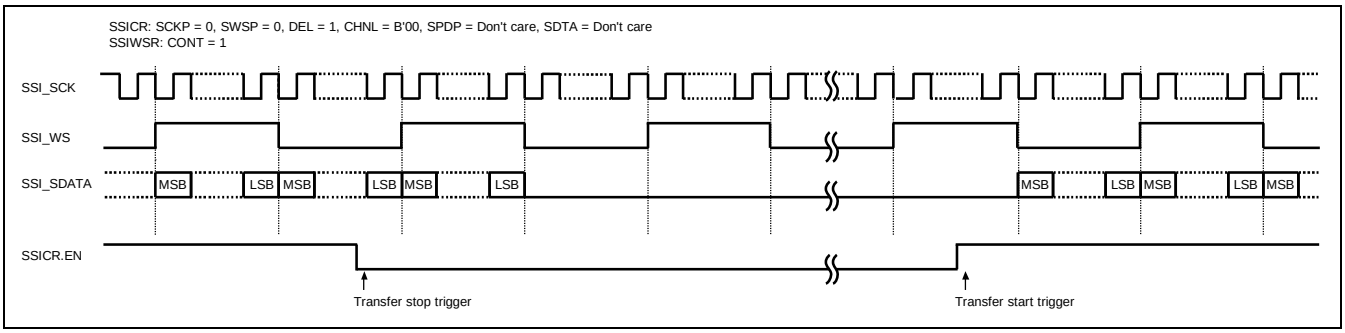

Figure 41.22 WS Continue Function Operation (When the Function is Enabled)

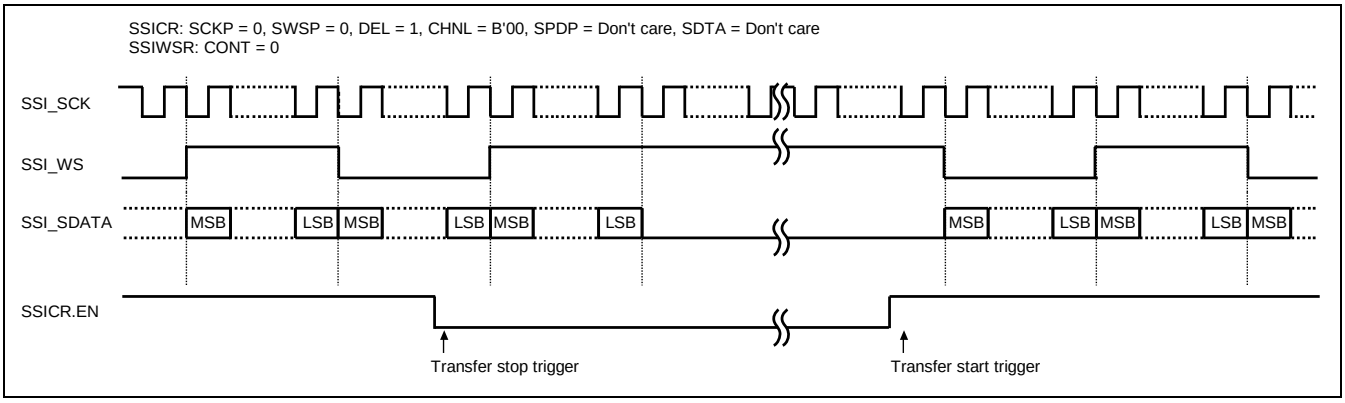

Figure 41.23 WS Continue Function Operation (When the Function is Disabled)

(12) Bit alignment in transferred data

Figure 41.24 to Figure 41.36 show the bit alignment in transmit or receive data. Only the MSB first alignment is available. The waveforms in Figure 41.24 to Figure 41.36 are setting examples without delay (SSICR.DEL is set to 1, the number of bits specified with SSICR.DWL is the same as that specified with SSICR.SWL).

41.3.2 Operating Modes

There are three modes of operation: configuration, module enabled and module disabled. Figure 41.37 shows how the module enters each of these modes.

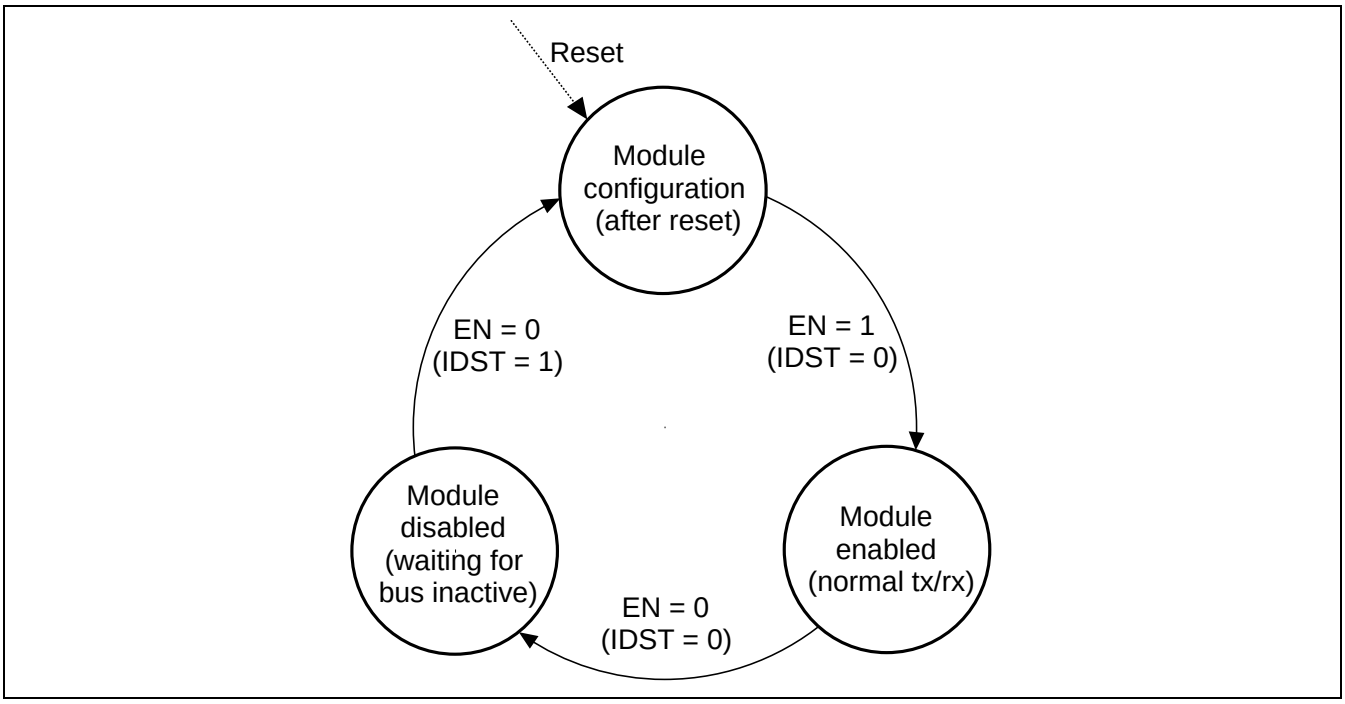

Figure 41.37 Operating Modes

(1) Configuration mode

This mode is entered after the module is released from reset. All required configuration fields in the control register should be defined in this mode, before the SSI module is enabled by setting the EN bit.

Setting the EN bit causes the module to enter the module enabled mode.

(2) Module enabled mode

Operation of the module in this mode is dependent on the operating mode selected. For details, refer to section 41.3.3 Transmit Operation and section 41.3.4 Receive Operation.

41.3.3 Transmit Operation

Transmission can be controlled either by DMA or interrupt.

DMA control is preferred to reduce the processor load. In DMA control mode, the processor will only receive interrupts if there is an underflow or overflow of data or the DMAC has finished its transfer.

The alternative method is using the interrupts that the SSI module generates to supply data as required. This mode has a higher interrupt load as the module is only double buffered and will require data to be written at least every system word period.

When disabling the module, the SSI clock* must remain present until the SSI module is in idle state, indicated by the SSISR.IIRQ bit.

Figure 41.38 shows the transmit operation in DMA control mode, and Figure 41.39 shows the transmit operation in interrupt control mode.

Note: * Input clock from the SSI_SCK pin when SCKD = 0.
Input clock from the CLK_FS pin when SCKD = 1.

Use the flowcharts in Figure 41.38 and Figure 41.39 when bits ind9 to ind0, which are covered in the description of SSI Mode Register 0 (SSI_MODE0) in Section 40, Serial Sound Interface Unit (SSIU), are set to 1 (independent SSI transfer).

(1) Transmission using DMA controller

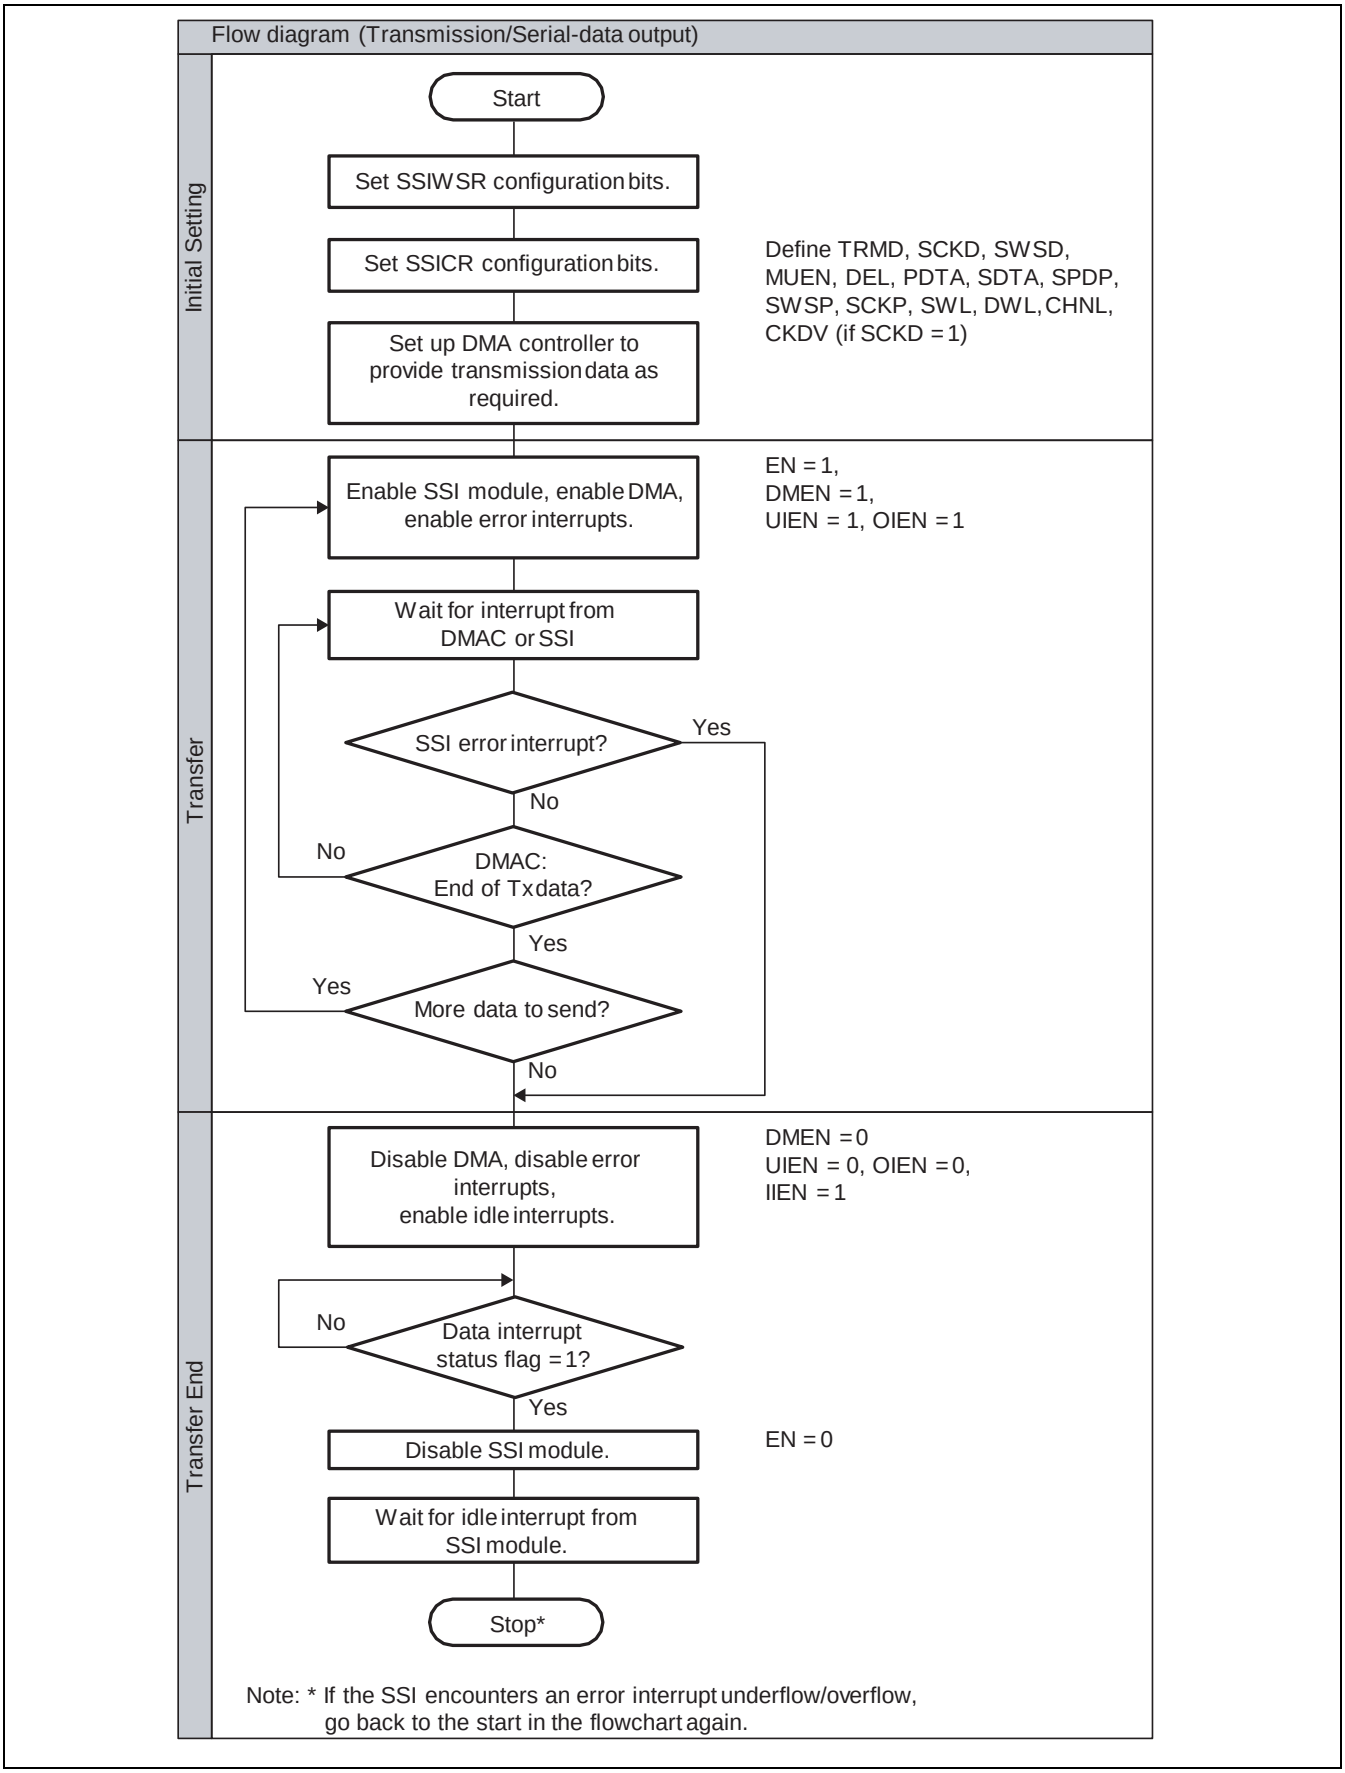

Figure 41.38 Transmission Using DMA Controller

(2) Transmission using interrupt data flow control

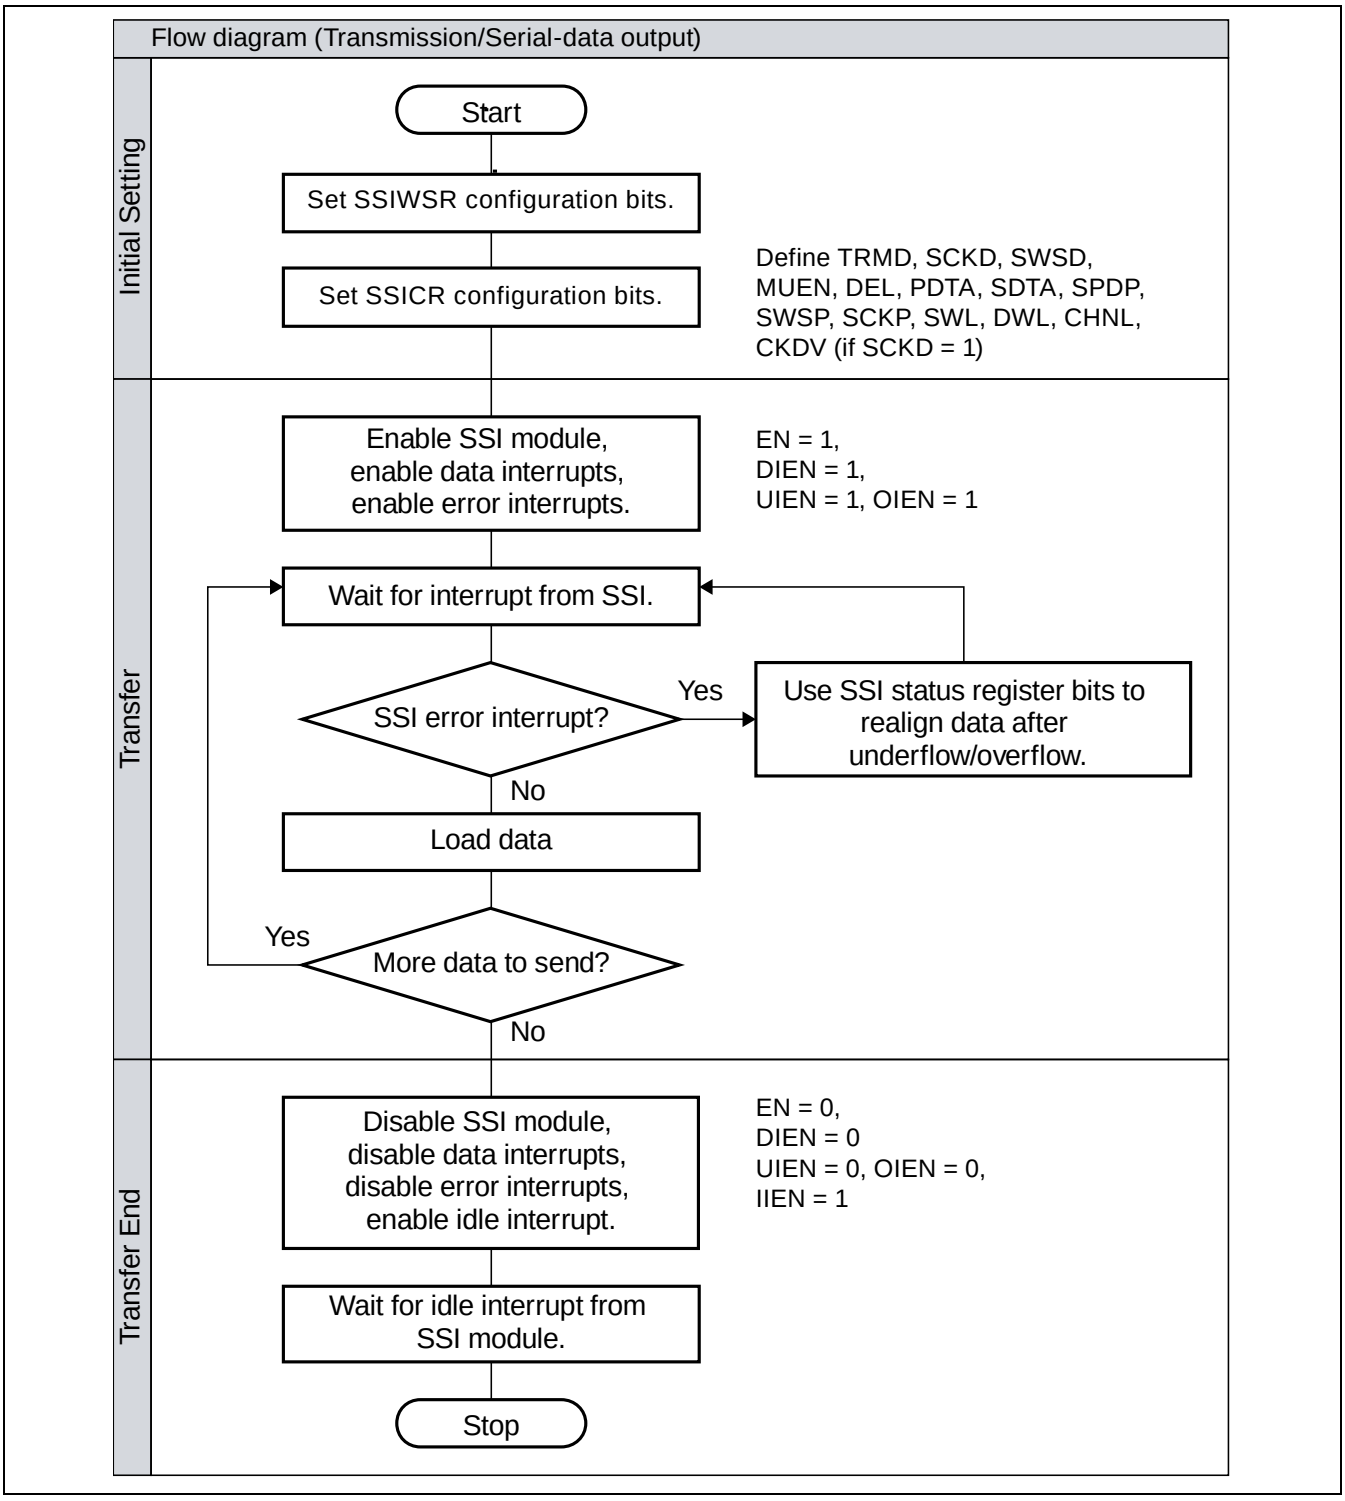

Figure 41.39 Transmission Using Interrupt Data Flow Control

41.3.4 Receive Operation

Like transmission, reception can be controlled either by DMA or interrupt.

Figure 41.40 and Figure 41.41 show the flow of operation.

When disabling the SSI module, the SSI clock* must be kept supplied until the SSISR.IIRQ bit is in idle state.

Note: * Input clock from the SSI_SCK pin when SCKD = 0.
Input clock from the CLK_FS pin when SCKD = 1.

Use the flowcharts in Figure 41.40 and Figure 41.41 when bits ind9 to ind0, which are covered in the description of SSI Mode Register 0 (SSI_MODE0) in Section 40, Serial Sound Interface Unit (SSIU), are set to 1 (independent SSI transfer).

(1) Reception using DMA controller

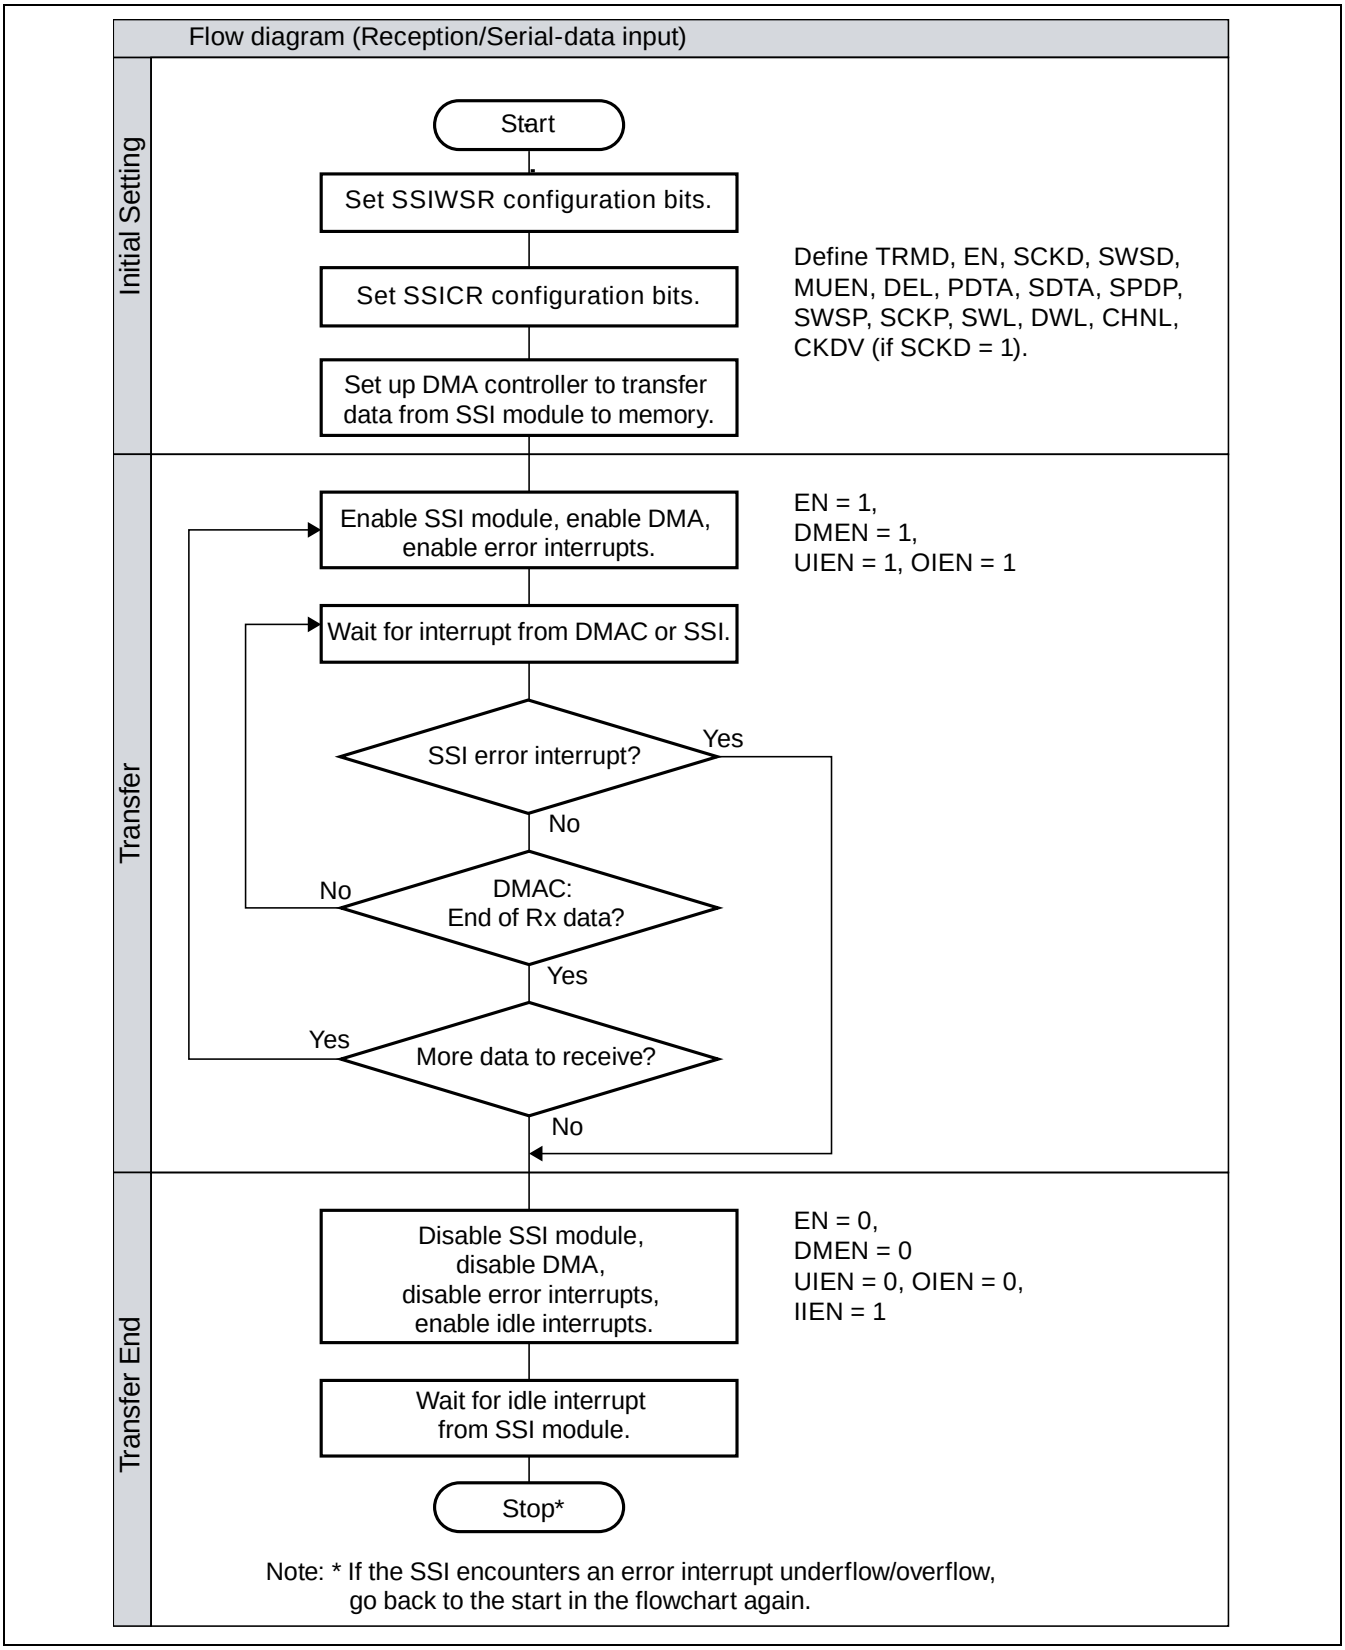

Figure 41.40 Reception Using DMA Controller

(2) Reception using interrupt data flow control

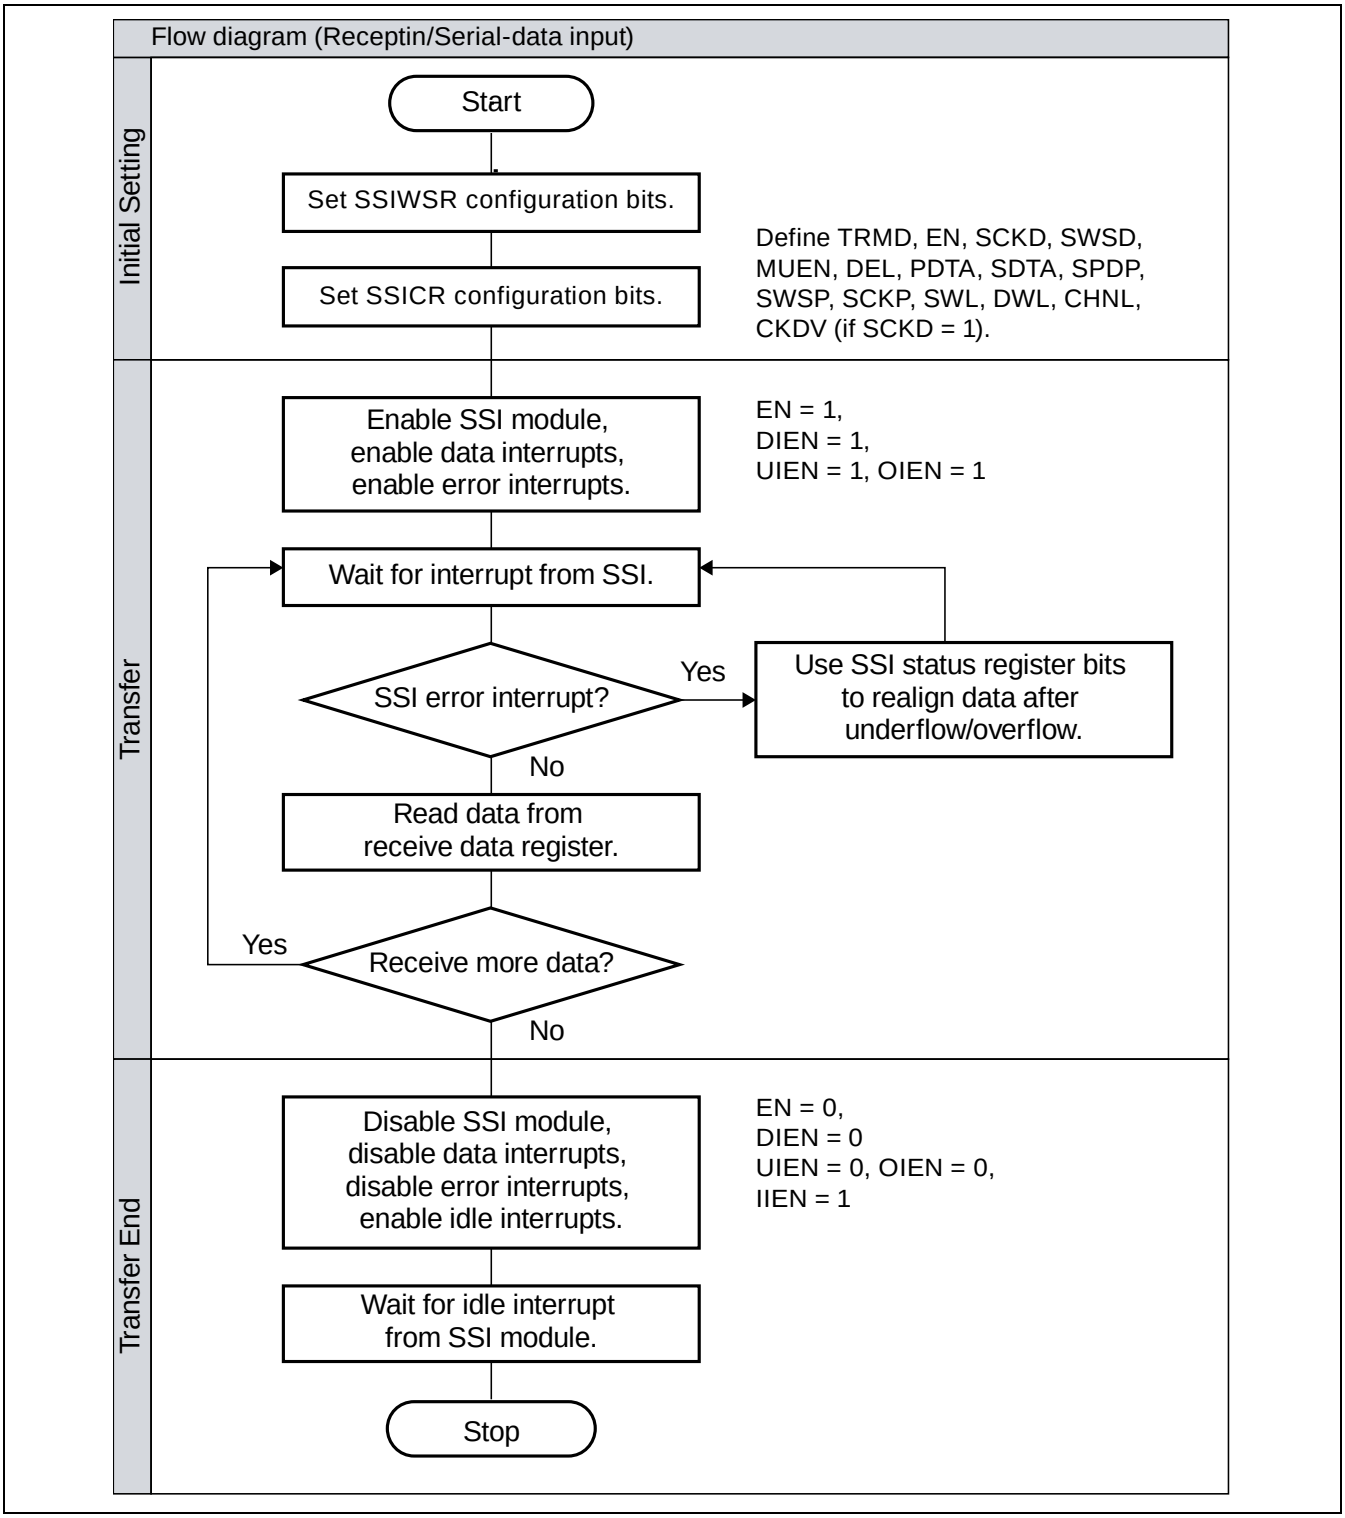

Figure 41.41 Reception Using Interrupt Data Flow Control

41.3.5 Serial Bit Clock Control

This function is used to control and select which clock is used for the serial bus interface.

If the serial clock direction is set to input (SSICR.SCKD = 0), the SSI module is in clock slave mode and the shift register uses the bit clock that was input to the SSI_SCK pin.

If the serial clock direction is set to output (SSICR.SCKD = 1), the SSI module is in clock master mode, and the shift register uses the bit clock that is input from the CLK_FS pin or the bit clock that is obtained by dividing the input from the CLK_FS pin. In the latter case, the clock input from the CLK_FS pin is divided by the ratio in the serial oversampling clock divide ratio (CKDV) in SSICR and used as the bit clock in the shift register.

In either case, the SSI_SCK pin output is the same as the bit clock.

41.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

41.4.1 Limitations from Overflow during Receive DMA Operation

If an overflow occurs while the receive DMA is in operation, the module should be restarted. The receive buffer in the SSI consists of 32-bit registers that share the L and R channels. Therefore, data to be received at the L channel may sometimes be received at the R channel if an overflow occurs, for example, under the following condition: the control register (SSICR) has a 32-bit setting for both data word length (DWL2 to DWL0) and system word length (SWL2 to SWL).

If an overflow is confirmed with the overflow error interrupt or overflow error status flag (SSISR. OIRQ), write 0 to the EN and DMEN bits in SSICR to disable DMA in the SSI module, thus stopping the operation (In this case, the controller setting should also be stopped). After this, write 0 to the OIRQ bit in SSISR to clear the overflow status, set DMA again and restart the transfer.

41.4.2 Limitations on Combinations of Modes Related to Common Pins to SSI7 and SSI8

Table 41.6 shows the available combinations of operating modes for SSI7 and SSI8. Operating modes can be set with the control registers for the SSI7 and SSI8 (SSICR).

Table 41.6 Usable Operating Mode Combinations for SSI7 and SSI8

	Operating Mode		Operating Mode of External Device		
No.	**SSI7**	**SSI8**	**SSI7 Side**	**SSI8 Side**	**Function**
1	Slave	Slave	Master	Slave	SSI7 and SSI8 operate synchronously with SSI_WS78 and SSI_SCK78 input.
			Slave	Master	
			Slave	Slave	
2	Master	Slave	Slave	Slave	SSI8 and an external device operate synchronously with WS and SCK of SSI7.
3	Slave	Master	—	—	Setting prohibited
4	Master	Master	—	—	Setting prohibited

There are the following limitations on the operating mode combinations shown in Table 41.6.

For No. 1, SSI_WS78 and SSI_SCK78 should be input before either of SSI7 or SSI8 starts data transfer.

For No. 2, the SSI7 as the master should start transfer first thus allowing SSI_WS78 and SSI_SCK78 to be output, and then the SSI8 as the slave should be used. If the master-side transfer is stopped with the CONT bit in SSIWSR being 0, the slave-side SSI8 should be stopped because SSI_WS78 is not output.

41.4.3 Limitations on Slave Mode Operation

When this LSI is used in slave mode, in ending a data transfer process, data transfer on this LSI should be stopped (SSICR.EN = 0) before the input word selection signal (SSI_WS) is stopped.

In slave mode, data transfer is stopped by clearing the EN bit in SSICR (setting to stop transfer) and detecting the falling edge of the word selection signal (SSI_WS). If the input word selection signal is stopped first, the falling edge of the word selection signal cannot be detected and data transfer cannot be ended successfully.

In case of transmission at slave mode, it is necessary that WS signal is stable. Data transmission at slave mode should be started after more than two frames period since WS signal is entered and is stable.

In case of multiple SSI modules and case that one SSI works at master mode and the others do at slave mode, data transfer should be started after more than two frames period since registers of SSI at master mode are set.

41.4.4 Limitations on Changes to Settings

The SSI_SCK and SSI_WS signals are not guaranteed immediately after changes of the WS mode bit in the WS Mode Register (SSIWSR) and configuration bits in the control register (SSICR). Settings must not be changed dynamically if this would affect any connected device.

41.4.5 Stopping or Resuming Transmission

Follow the procedure below to stop or resume transmission.

Stopping transmission:

1. Set the DMEN bit in SSICR to 0 for stopping transmission.
2. Wait for SSISR.DIRQ = 1 by using polling or interrupts.
3. Set the EN bit in SSICR to 0 to stop transmission.
4. Check that SSISR.IDST is 1.

Resuming transmission:

Set DMEN and EN bits in SSICR to 1 for resuming transmission (The DMEN bit should be set to 1 at the same time of or before setting the EN bit).

41.4.6 Stable period of SCK and WS

The period during which SCK signal and WS signal stabilizes is shown below. It is assumed that the clock supplied from ADG is stable.

SCK signal (when SSI is used in the master mode)

1. Set the SSICR (exclude EN bit) register.
2. Wait count end to setting value of SSICR.CKDV (counted by CLK_FS).
3. SCK signal is stable.

WS signal (when SSI is used in the master mode)

1. Set the SSIWSR and SSICR (exclude EN bit) register.
2. Wait 2 frames.
3. WS signal is stable.

41.4.7 About CLK_FS input clock

For details on generation and selection of master clock signal, see section 42. Audio Clock Generator (ADG).

42. Audio Clock Generator (ADG)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

42.1 Overview

The audio clock generator (ADG) selects and supplies the necessary clock for the SSIU, EAVB-IF, SCU module. It also divides the frequency of the selected clock and sends it outside the chip.

42.1.1 Features

- Selects the clock signal from the AUDIO_CLKA, AUDIO_CLKB, AUDIO_CLKC pin or the internal clock and supplies it to the SSIU, EAVB-IF, SCU module.
- The frequency of the clock signals from the AUDIO_CLKA, AUDIO_CLKB, and AUDIO_CLKC pins and the internal clock can be divided before use.
- The divided clock can be output through the AUDIO_CLKOUT, AUDIO_CLKOUT1, AUDIO_CLKOUT2 and AUDIO_CLKOUT3 pins.
- Generate the Media Clock Recovery for EAVB-IF module.

Note: The presence or absence of pins depends on the product. For details, see Table 42.1.

42.2 Register Description

[Legend for Register Description]

Initial value: Register value after a reset.

—: Undefined value

R/W: Bit or field is readable and writable. The written value can be read.

R/WC1: The bit or field is readable and writable. Writing 1 to the bit initializes the bit.

All registers are accessed in longword units.

42.2.1 BRGA Baud Rate Setting Register (BRRA)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: BRRA is a 32-bit readable/writable register that specifies the baud rate for ACLK_A (see Table 42.4).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CKS[1:0]		BRRA[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.
9, 8	CKS[1:0]	B'00	R/W	These bits specify the clock source for the on-chip baud rate generator. B'00: ACLK_A B'01: ACLK_A/4 B'10: ACLK_A/16 B'11: ACLK_A/64
7 to 0	BRRA[7:0]	H'FF	R/W	These bits specify the division ratio. For details, see Table 42.4.

Table 42.4 Division Ratio for BRGA

BRGA Operating Clock (CKS[1], CKS[0])	Division Ratio BRRA (N = 0 to 255)	Calculating Formula
ACLK_A	1/2, 1/4, 1/6, ..., 1/512	1 / (2(N + 1))
ACLK_A/4	1/8, 1/16, 1/24, ..., 1/2048	1 / (8(N + 1))
ACLK_A/16	1/32, 1/64, 1/96, ..., 1/8192	1 / (32(N + 1))
ACLK_A/64	1/128, 1/256, 1/384, ..., 1/32768	1 / (128(N + 1))

Note: Use the output of BRGA in less than 25 MHz.

42.2.2 BRGB Baud Rate Setting Register (BRRB)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: BRRB is a 32-bit readable/writable register that specifies the baud rate for ACLK_B (see Table 42.5).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CKS[1:0]		BRRB[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.
9, 8	CKS[1:0]	B'00	R/W	These bits specify the clock source for the on-chip baud rate generator. B'00: ACLK_B B'01: ACLK_B/4 B'10: ACLK_B/16 B'11: ACLK_B/64
7 to 0	BRRB[7:0]	H'FF	R/W	These bits specify the division ratio. For details, see Table 42.5.

Table 42.5 Division Ratio for BRGB

BRGB Operating Clock (CKS[1], CKS[0])	Division Ratio BRRB (N = 0 to 255)	Calculating Formula
ACLK_B	1/2, 1/4, 1/6, ..., 1/512	1 / (2(N + 1))
ACLK_B/4	1/8, 1/16, 1/24, ..., 1/2048	1 / (8(N + 1))
ACLK_B/16	1/32, 1/64, 1/96, ..., 1/8192	1 / (32(N + 1))
ACLK_B/64	1/128, 1/256, 1/384, ..., 1/32768	1 / (128(N + 1))

Note: Use the output of BRGB in less than 25 MHz.

42.2.3 BRG Clock Select Register (BRGCKR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: BRGCKR selects the clocks input to and output from the ADG.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BRGCKR_31	—	—	—	—	—	—	—	—	BRGCKR_22	BRGCKR_21	BRGCKR_20	—	BRGCKR_18	BRGCKR_17	BRGCKR_16
Initial value:	0	0	1	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	BRGCKR_31	B'0	R/W	This bit selects the clock signal output to the AUDIO_CLKOUT, AUDIO_CLKOUT1, AUDIO_CLKOUT2, AUDIO_CLKOUT3 or external pin. 0: BRGA output clock 1: BRGB output clock
30 to 23	—	H'46	R	Reserved The initial value is always read from these bits. The write value should always be the initial value.
22	BRGCKR_22	B'0	R/W	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
21	BRGCKR_21	B'0		These bits select the clock signal input to the BRGA.
20	BRGCKR_20	B'0		B'000: AUDIO_CLKA B'001: AUDIO_CLKB B'01x: S0D4ϕ (200 MHz) B'100: AUDIO_CLKC B'101: Fixed at 0 B'11x: Fixed at 0 x = Don't care [RZ/G2E] These bits select the clock signal input to the BRGA. B'000: AUDIO_CLKA B'001: AUDIO_CLKB B'01x: ZA2ϕ (200 MHz) B'100: AUDIO_CLKC B'101: Fixed at 0 B'11x: Fixed at 0 x = Don't care
19	—	B'0	R	Reserved The initial value is always read from this bit. The write value should always be the initial value.

Bit	Bit Name	Initial Value	R/W	Description
18	BRGCKR_18	B'0	R/W	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
17	BRGCKR_17	B'0		These bits select the clock signal input to the BRGB.
16	BRGCKR_16	B'0		B'000: AUDIO_CLKA
				B'001: AUDIO_CLKB
				B'01x: S0D4ϕ (200 MHz)
				B'100: AUDIO_CLKC
				B'101: Fixed at 0
				B'11x: Fixed at 0
				x = Don't care
				[RZ/G2E]
				These bits select the clock signal input to the BRGB.
				B'000: AUDIO_CLKA
				B'001: AUDIO_CLKB
				B'01x: ZA2ϕ (200 MHz)
				B'100: AUDIO_CLKC
				B'101: Fixed at 0
				B'11x: Fixed at 0
				x = Don't care
15 to 0	—	All 0	R	Reserved
				The initial value is always read from these bits. The write value should always be the initial value.

42.2.4 Audio Clock Select Register 0 (AUDIO_CLK_SEL0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: AUDIO_CLK_SEL0 selects the clocks for the SSIU (for SSI0 to SSI3).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

42.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

The following sections give examples of setting the ADG registers in two cases.

(1) Supplying SSI with Audio Clock

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The following procedure can be used to divide the internal clock (S0D4ϕ: 200 MHz) by d'18 and supply the resulting BRGB clock (11.111 MHz) to SSI.

If the procedure is applied before starting SSI3, steps 1 to 5 can be executed in any order.

1. Set BRRB so that the frequency division ratio should be d'18.
2. Select internal clock (S0D4ϕ) as the clock to be input to BRGB using BRGCKR.
3. Select the BRGB output clock as SSI3 clock using AUDIO_CLK_SEL0.
4. Release the ADG from the module standby state using RMSTPCR9 or SMSTPCR9 of the CPG module.
5. Release SSI3 from the module standby state using RMSTPCR10 or SMSTPCR10 of the CPG module.

[RZ/G2E]

The following procedure can be used to divide the internal clock (ZA2ϕ in the case of 200 MHz) by d'18 and supply the resulting BRGB clock (11.111 MHz) to SSI.

If the procedure is applied before starting SSI3, steps 1 to 5 can be executed in any order.

1. Set BRRB so that the frequency division ratio should be d'18.
2. Select internal clock (ZA2ϕ in the case of 200 MHz) as the clock to be input to BRGB using BRGCKR.
3. Select the BRGB output clock as SSI3 clock using AUDIO_CLK_SEL0.
4. Release the ADG from the module standby state using RMSTPCR9 or SMSTPCR9 of the CPG module.
5. Release SSI3 from the module standby state using RMSTPCR10 or SMSTPCR10 of the CPG module.

Table 42.6 Setting Example 1

Register Name	Address	Setting Value	Description
BRRB	H'EC5A_0004	H'0000_0008	Divided by d'18
BRGCKR	H'EC5A_0008	H'2302_0000	[RZ/G2H, RZ/G2M V1.3, RZ/G RZ/G2M V3.0, RZ/G2N] Selects S0D4ϕ as the clock to be input to BRGB. [RZ/G2E] Selects ZA2ϕ as the clock to be input to BRGB.
AUDIO_CLK_SEL0	H'EC5A_000C	H'2000_0000	Selects the BRGB output clock as the clock to be output to SSI3.
RMSTPCR9* or SMSTPCR9*	H'E615_0984 H'E615_0994	Set bit 22.	Releases the ADG from the module standby state.
RMSTPCR10* or SMSTPCR10*	H'E615_0988 H'E615_0998	Set bits 12 to 0.	Releases the SSI3 from the module standby state.

Note: * CPG register is enabled by writing the inverse of the value to CPGWPR register.

(2) The function of avb_counter8

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The avb_counter8 is a clock generator. The avb_counter8 has dividers which operates with S0D1ϕ clock. The avb_counter8 has eight output clocks. The avb_counter8 has the internal counter and the setting registers (“AVB clock divider comparison value register 0 (AVB_CLK_DIV0)” to “AVB clock divider comparison value register 7 (AVB_CLK_DIV7)”). The internal counter and setting registers consist of Integral field of 12 bits, and Fractional field of 6 bits. The increment value of the internal counter is H’40. This increment value is fixation. The output clock is toggled when the value of the internal counter becomes beyond the value of AVB_CLK_DIV*.comp_value (* = 0 to 7). After that, the internal counter subtracts the value of AVB_CLK_DIV*. comp_value (* = 0 to 7) and continues operation. In addition, note setting up AVB_CLK_DIV*.comp_value (* = 0 to 7) after setting AVB_CLK_CONFIG.div_en_com.

[RZ/G2E]

The avb_counter8 is a clock generator. The avb_counter8 has dividers which operates with ZA8ϕ clock. The avb_counter8 has eight output clocks. The avb_counter8 has the internal counter and the setting registers (“AVB clock divider comparison value register 0 (AVB_CLK_DIV0)” to “AVB clock divider comparison value register 7 (AVB_CLK_DIV7)”). The internal counter and setting registers consist of Integral field of 12 bits, and Fractional field of 6 bits. The increment value of the internal counter is H’40. This increment value is fixation. The output clock is toggled when the value of the internal counter becomes beyond the value of AVB_CLK_DIV*.comp_value (* = 0 to 7). After that, the internal counter subtracts the value of AVB_CLK_DIV*. comp_value(* = 0 to 7) and continues operation. In addition, note setting up AVB_CLK_DIV*.comp_value(* = 0 to 7) after setting AVB_CLK_CONFIG.div_en_com.

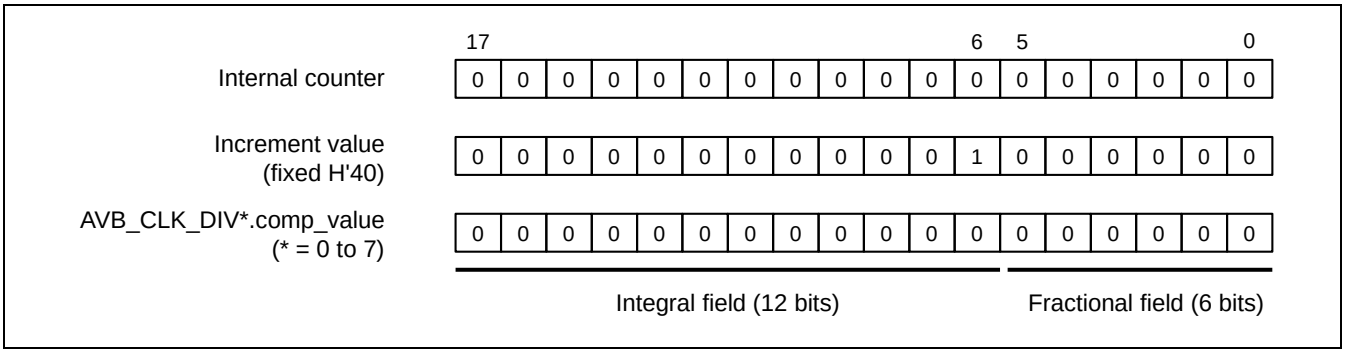

Figure 42.3 Structure of the internal counter and setting registers

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

Table 42.7 The example of the setting of AVB_CLK_DIV*.comp_value (* = 0 to 7)

AVB_CLK_DIV*.comp_value (* = 0 to 7)(Hex)	Integral field (dec)	Fractional field (dec)	Frequency of output clock (MHz)
00413	16	19	24.545
00412	16	18	24.568
00411	16	17	24.592

Frequency of the output clock [MHz]

= 1 / (((Integral field value * 1.25ns) * 64 + (Fractional field value * 1.25ns)) / 32)

(S0D1ϕ clock = 800 MHz(1.25ns))

[RZ/G2E]

Table 42.8 The example of the setting of AVB_CLK_DIV*.comp_value (* = 0 to 7)

AVB_CLK_DIV*.comp_value (* = 0 to 7)(Hex)	Integral field (dec)	Fractional field (dec)	Frequency of output clock (MHz)
0030F	12	15	24.521
0030E	12	14	24.552
0030D	12	13	24.584

Frequency of the output clock [MHz]

= 1 / (((Integral field value * 1.67ns) * 64 + (Fractional field value * 1.67ns)) / 32)

(ZA8ϕ clock = 600 MHz(1.67ns))

42.4 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

42.4.1 Note on using AUDIO_CLK and Input/Output timing signal in stable condition

AUDIO_CLK and Input/Output timing signal should be in a stable state before starting transfer of related audio modules. When Input/Output timing signal counts the number of divider register setting, it becomes stable.

42.4.2 Note on using ZA2ϕ

When ADG use ZA2ϕ, it can not apply SSCG. For details, refer to 8.2.20 [RZ/G2E]

43. Sampling Rate Converter Unit (SCU)

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

43.1 Overview

The SCU has ten SRC modules (six for high-sound-quality type; four for general-sound-quality type) that are useful for synchronization of asynchronous data, which is necessary for data transfer with external memory or external devices. It also provides the functions to change the number of channels, perform mixing, and control the volume.

Note: When the SRCs are not in use, configure the system with the same clock sources for AUDIO CLOCK that is input to ADG, and INIC™ or devices for I2S that are connected to external modules, and all thus operate at the same sampling frequency.

43.1.1 Features

(1) Sampling Rate Converter (SRC)

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

- Asynchronous sampling rate conversion is available
- Supports resolutions up to 24 bits
- High-sound-quality type (THD + N* is -132 dB) and general-sound-quality type (THD + N* is -96 dB)
- Automatically generates antialiasing filter coefficients
- Four modules support one, two, four, six, or eight channels, and six modules support one or two channels.

Note: * Total harmonic distortion plus noise

[RZ/G2E]

- Asynchronous sampling rate conversion is available
- Supports resolutions up to 24 bits
- High-sound-quality type (THD + N* is -132 dB) and general-sound-quality type (THD + N* is -96 dB)
- Automatically generates antialiasing filter coefficients
- Two modules support one, two, four, six, or eight channels, and eight modules support one or two channels.

Note: * Total harmonic distortion plus noise

(2) Channel Transfer Unit (CTU)

- Downmixing and splitter functions
  - Conversion of eight input channels into two output channels
  - Conversion of six input channels into two output channels
  - Conversion of two input channels into four sets of two output channels
  - Conversion of one input channel into eight sets of one output channel
  - No conversion

(3) Mixer (MIX)

- Mixing (adds) two to four sources into one
- Ratio for adding sources is selectable
- Ratio is dynamically changeable

- Mixing with volume ramp is available (ramp period is selectable)

(4) Digital Volume and Mute Function (DVC)

- Volume control function including digital volume, volume ramp, and zero-crossing mute
- The digital volume function is specified by a 24-bit fixed-point value within the range from 0 to 8 times (mute or -120 to 18 dB)
- The volume ramp function can be used for soft mute, fade-in, fade-out, or desired volume adjustment
- The volume ramp period can be changed within the sampling range from the 0th to 23rd power of 2
- The zero-crossing mute function silences the sound at the zero-crossing point of the audio data

The CTU, MIX, and DVC functional blocks are collectively called "CMD".

43.1.2 Block Diagram

Figure 43.1 shows the SCU block diagram.

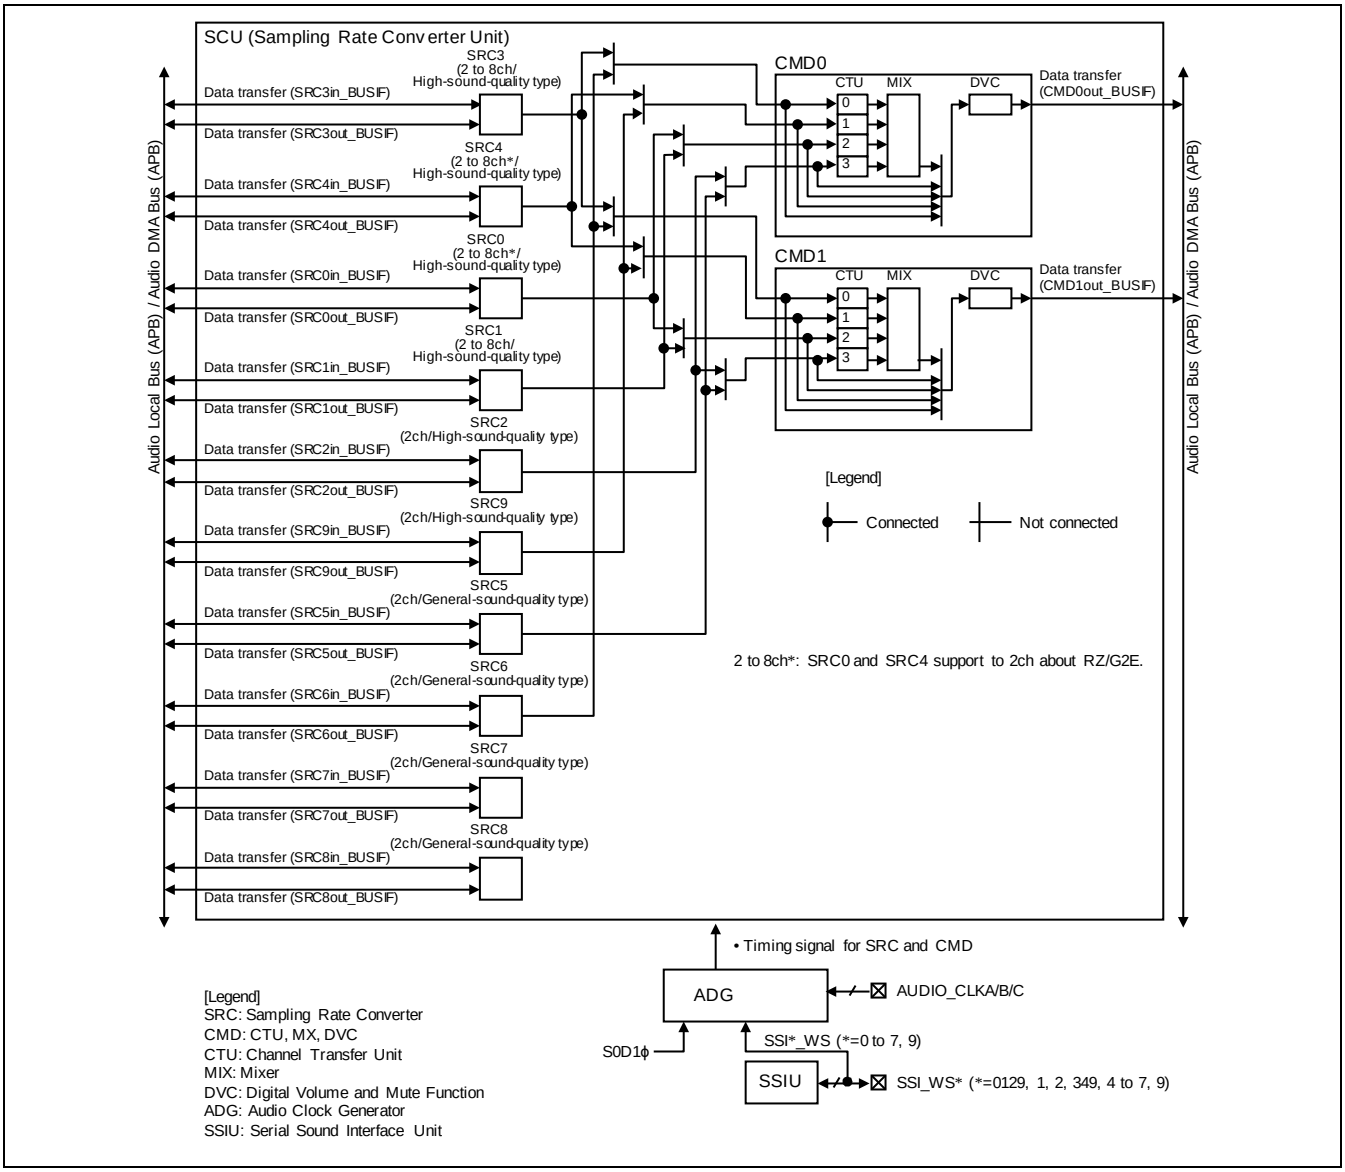

Figure 43.1 Block Diagram of SCU

43.1.3 External Pins

There's no external pin of this module.

43.1.4 Register Configuration

Table 43.1 shows the register configuration. Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. Access the register as a longword (32 bits). Operation cannot be guaranteed if the register is not accessed as a longword.

Table 43.1 Register Configuration

Notes: m = 0 to 9; n = 00, 01, 02, 03, 10, 11, 12, or 13; p = 0 or 1

* H'EC00_xxxx is the address for transferring by Audio-DMAC. H'EC30_xxxx is the address for transferring by Audio-DMACpp.

** This register is just what to show the initial value here, but, set a value according to 43.2.23 by all means when you use it.

43.1.5 Connected Module

Table 43.2 Connected modules

Module name	Connected module name	Function of connected module
Sampling Rate Converter Unit	APMU	Access the Register
	PFC	Select External pins
	CPG	Output Clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-AP	Control to interrupt
	SSIU	Serial Sound Interface Unit
	SSI	Serial Sound Interface
	ADG	Output Clocks for Audio module
	Audio-DMACpp	Control Direct Memory Access for Audio modules connected to the audio local bus
	Audio-DMAC	Control Direct Memory Access for Audio module

43.2 Register Description

Legend for Register Description

Initial value:	Register value after a reset. H'xxxx represents a hexadecimal number. Others are represented in binary numbers.
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R:	Read-only. The write value should always be 0.
R/WC0:	Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
W:	Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.
—/W:	Write-only. The read value is undefined.

All access to registers is made in longword units.

43.2.1 SRCm(in/out)_BUSIF_MODE Register (SRCm(in/out)_BUSIF_MODE)

Note: m = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm (in/out)_BUSIF_MODE sets the initial setting for the bus interface.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	sft_dir	sft_num			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	dma
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	sft_dir	B'0	R/W	src*m*(in/out)_busif_shift_dir Selects the bit-shift direction for position adjustment of the valid SRC*m*(in/out)_BUSIF input and output data. 0: Shift to left. 1: Shift to right.
19 to 16	sft_num	H'0	R/W	src*m*(in/out)_busif _shift_num Selects the bit-shift count for position adjustment of the valid SRC*m*(in/out)_BUSIF input and output data. B'0000: 0 bit B'0001: 1 bit B'0010: 2 bits B'0011: 3 bits B'0100: 4 bits B'0101: 5 bits B'0110: 6 bits B'0111: 7 bits B'1000: 8 bits B'1001: 9 bits B'1010: 10 bits B'1011: 11 bits B'1100: 12 bits B'1101: 13 bits B'1110: 14 bits B'1111: 15 bits
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	dma	B'1	R/W	src*m*(in/out)_busif _dma Selects the access type for SRC*m*(in/out)_BUSIF. 0: PIO access (setting prohibited) 1: DMA access Be sure to specify the DMA access.

43.2.2 SRCm_BUSIF_DALIGN Register (SRCm_BUSIF_DALIGN)

Note: m = 0, 1, 3, or 4 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
m = 1 and 3 [RZ/G2E]

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm_BUSIF_DALIGN determines the initial settings of the SRCm route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	place7			—	place6			—	place5			—	place4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	place3			—	place2			—	place1			—	place0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	place7	H'7	R/W	Changes the stream data order. These bits are used for the 8-channel setting. **For the 6- or less-channel setting, the initial value should not be changed.** The data order is changed before input to the SRC. Selects the input-side data to be output to place 7 on the output side. B'000: Data at input-side place 0 is sent to output-side place 7. B'001: Data at input-side place 1 is sent to output-side place 7. B'010: Data at input-side place 2 is sent to output-side place 7. B'011: Data at input-side place 3 is sent to output-side place 7. B'100: Data at input-side place 4 is sent to output-side place 7. B'101: Data at input-side place 5 is sent to output-side place 7. B'110: Data at input-side place 6 is sent to output-side place 7. B'111: Data at input-side place 7 is sent to output-side place 7.
27	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
26 to 24	place6	H'6	R/W	Changes the stream data order. These bits are used for the 8-channel setting. **For the 6- or less-channel setting, the initial value should not be changed.** The data order is changed before input to the SRC. Selects the input-side data to be output to place 6 on the output side. B'000: Data at input-side place 0 is sent to output-side place 6. B'001: Data at input-side place 1 is sent to output-side place 6. B'010: Data at input-side place 2 is sent to output-side place 6. B'011: Data at input-side place 3 is sent to output-side place 6. B'100: Data at input-side place 4 is sent to output-side place 6. B'101: Data at input-side place 5 is sent to output-side place 6. B'110: Data at input-side place 6 is sent to output-side place 6. B'111: Data at input-side place 7 is sent to output-side place 6.
23	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	place5	H'5	R/W	Changes the stream data order. These bits are used for the 6- or more-channel setting. **For the 4- or less-channel setting, the initial value should not be changed.** The data order is changed before input to the SRC. Selects the input-side data to be output to place 5 on the output side. B'000: Data at input-side place 0 is sent to output-side place 5. B'001: Data at input-side place 1 is sent to output-side place 5. B'010: Data at input-side place 2 is sent to output-side place 5. B'011: Data at input-side place 3 is sent to output-side place 5. B'100: Data at input-side place 4 is sent to output-side place 5. B'101: Data at input-side place 5 is sent to output-side place 5. B'110: Data at input-side place 6 is sent to output-side place 5. B'111: Data at input-side place 7 is sent to output-side place 5.
19	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	place4	H'4	R/W	Changes the stream data order. These bits are used for the 6- or more-channel setting. **For the 4- or less-channel setting, the initial value should not be changed.** The data order is changed before input to the SRC. Selects the input-side data to be output to place 4 on the output side. B'000: Data at input-side place 0 is sent to output-side place 4. B'001: Data at input-side place 1 is sent to output-side place 4. B'010: Data at input-side place 2 is sent to output-side place 4. B'011: Data at input-side place 3 is sent to output-side place 4. B'100: Data at input-side place 4 is sent to output-side place 4. B'101: Data at input-side place 5 is sent to output-side place 4. B'110: Data at input-side place 6 is sent to output-side place 4. B'111: Data at input-side place 7 is sent to output-side place 4.
15	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	place3	H'3	R/W	Changes the stream data order. These bits are used for the 4- or more-channel setting. **For the 2- or less-channel setting, the initial value should not be changed.** The data order is changed before input to the SRC. Selects the input-side data to be output to place 3 on the output side. B'000: Data at input-side place 0 is sent to output-side place 3. B'001: Data at input-side place 1 is sent to output-side place 3. B'010: Data at input-side place 2 is sent to output-side place 3. B'011: Data at input-side place 3 is sent to output-side place 3. B'100: Data at input-side place 4 is sent to output-side place 3. B'101: Data at input-side place 5 is sent to output-side place 3. B'110: Data at input-side place 6 is sent to output-side place 3. B'111: Data at input-side place 7 is sent to output-side place 3.
11	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	place2	H'2	R/W	Changes the stream data order. These bits are used for the 4- or more-channel setting. **For the 2- or less-channel setting, the initial value should not be changed.** The data order is changed before input to the SRC. Selects the input-side data to be output to place 2 on the output side. B'000: Data at input-side place 0 is sent to output-side place 2. B'001: Data at input-side place 1 is sent to output-side place 2. B'010: Data at input-side place 2 is sent to output-side place 2. B'011: Data at input-side place 3 is sent to output-side place 2. B'100: Data at input-side place 4 is sent to output-side place 2. B'101: Data at input-side place 5 is sent to output-side place 2. B'110: Data at input-side place 6 is sent to output-side place 2. B'111: Data at input-side place 7 is sent to output-side place 2.
7	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	place1	H'1	R/W	Changes the stream data order. The data order is changed before input to the SRC. Selects the input-side data to be output to place 1 on the output side. B'000: Data at input-side place 0 is sent to output-side place 1. B'001: Data at input-side place 1 is sent to output-side place 1. B'010: Data at input-side place 2 is sent to output-side place 1. B'011: Data at input-side place 3 is sent to output-side place 1. B'100: Data at input-side place 4 is sent to output-side place 1. B'101: Data at input-side place 5 is sent to output-side place 1. B'110: Data at input-side place 6 is sent to output-side place 1. B'111: Data at input-side place 7 is sent to output-side place 1.
3	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	place0	H'0	R/W	Changes the stream data order. The data order is changed before input to the SRC. Selects the input-side data to be output to place 0 on the output side. B'000: Data at input-side place 0 is sent to output-side place 0. B'001: Data at input-side place 1 is sent to output-side place 0. B'010: Data at input-side place 2 is sent to output-side place 0. B'011: Data at input-side place 3 is sent to output-side place 0. B'100: Data at input-side place 4 is sent to output-side place 0. B'101: Data at input-side place 5 is sent to output-side place 0. B'110: Data at input-side place 6 is sent to output-side place 0. B'111: Data at input-side place 7 is sent to output-side place 0.

43.2.3 SRCn_BUSIF_DALIGN Register (SRCn_BUSIF_DALIGN)

Note: n = 2, 5, 6, 7, 8, or 9 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
n = 0, 2, 4, 5, 6, 7, 8, or 9 [RZ/G2E]

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCn_BUSIF_DALIGN determines the initial settings of the SRCn route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	place1	—	—	—	place0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	place1	B'1	R/W	Changes the stream data order. The data order is changed before input to the SRC. Selects the input-side data to be output to place 1 on the output side. 0: Data at input-side place 0 is sent to output-side place 1. 1: Data at input-side place 1 is sent to output-side place 1.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	place0	B'0	R/W	Changes the stream data order. The data order is changed before input to the SRC. Selects the input-side data to be output to place 0 on the output side. 0: Data at input-side place 0 is sent to output-side place 0. 1: Data at input-side place 1 is sent to output-side place 0.

43.2.4 SRCm_MODE Register (SRCm_MODE)

Note: m = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm_MODE determines the initial settings of the SRCm route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	sync_out	sync_in	—	—	—	—	—	—	—	uf_data
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	src
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	sync_out	B'0	R/W	src*m*out_sync Selects how to treat data in the SRC output buffer. 0: Asynchronous SRC 1: Synchronous SRC
24	sync_in	B'0	R/W	src*m*in_sync Selects how to treat data in the SRC input buffer. 0: Asynchronous SRC 1: Synchronous SRC
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	uf_data	B'0	R/W	src*m*_uf_data_sel Selects how to treat data when an underflow occurs in the SRC input buffer. 0: Data before the underflow occurs is output. 1: All 0s are output.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	src	B'0	R/W	src*m*_src Selects whether to use SRC*m*. 0: SRC*m* is not used. 1: SRC*m* is used.

Notes: 1. Set one of sync_in and sync_out bits, when SRCm is used in synchronous mode by setting SRCMD bit in SRCm_SRCCR register.
2. If sync_out is set in synchronous mode, data should directly transmit to memory. (Data should not transmit throughout CMD.)

43.2.5 SRCm Control Register (SRCm_CONTROL)

Note: m = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm_CONTROL starts or stops transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	start_ out	—	—	—	start_ in
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	start_out	B'0	R/W	SRC*m*out_start_flag Starts or stops transfer via SRC*m*. 0: Stops transfer. 1: Starts transfer.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	start_in	B'0	R/W	SRC*m*in_start_flag Starts or stops transfer via SRC*m*. 0: Stops transfer. 1: Starts transfer.

Note: When CMD is used with route SRC0, SRC1, SRC2, SRC3, SRC4, SRC5, SRC6 or SRC9 SRCmout_start_flag should be set to 0 to stop transfer. When CMD is not used with route SRC0, SRC1, SRC2, SRC3, SRC4, SRC5, SRC6 or SRC9, or when route SRC7 or SRC8 is used, SRCmin_start_flag and SRCmout_start_flag should be set simultaneously.

43.2.6 SRCm Status Register (SRCm_STATUS)

Note: m = 0 to 6, 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm_STATUS indicates the state of each SRC. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SRC*m* interrupt enable register, interrupt signals are not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	dvc1	—	—	—	dvc0	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	uf_srco	of_srco	—	—	of_srci	uf_srci	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	dvc1	B'0	R	dvc1 Indicates the state of the DVC1_DVUSR register collectively. The state information is used only for the interrupt signal that is enabled by DVC1_DVIER.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	dvc0	B'0	R	dvc0 Indicates the state of the DVC0_DVUSR register collectively. The state information is used only for the interrupt signal that is enabled by DVC0_DVIER.
23 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	uf_srco	B'0	R	under_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1.
12	of_srco	B'0	R	over_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9	of_srci	B'0	R	over_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1.
8	uf_srci	B'0	R	under_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

43.2.7 SRCn Status Register (SRCn_STATUS)

Note: n = 7 and 8

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCn_STATUS indicates the state of each SRC. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SRCn interrupt enable register, interrupt signals are not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	uf_srco	of_srco	—	—	of_srci	uf_srci	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	uf_srco	B'0	R	under_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1.
12	of_srco	B'0	R	over_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	of_srci	B'0	R	over_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1.
8	uf_srci	B'0	R	under_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

43.2.8 SRCm Interrupt Enable Register 0 (SRCm_INT_ENABLE0)

Note: m = 0 to 6, 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm_INT_ENABLE0 enables or disables output of interrupts corresponding to the states indicated in the SRCm status register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	dvc1_ie	—	—	—	dvc0_ie	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	uf_srco_ie	of_srco_ie	—	—	of_srci_ie	uf_srci_ie	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	dvc1_ie	B'0	R/W	dvc1_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	dvc0_ie	B'0	R/W	dvc0_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
23 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	uf_srco_ie	B'0	R/W	under_flow_srcout_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
12	of_srco_ie	B'0	R/W	over_flow_srcout_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	of_srci_ie	B'0	R/W	over_flow_srcin_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.

Bit	Bit Name	Initial Value	R/W	Description
8	uf_srci_ie	B'0	R/W	under_flow_srcin_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

43.2.9 SRCn Interrupt Enable Register 0 (SRCn_INT_ENABLE0)

Note: n = 7 and 8

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCn_INT_ENABLE0 enables or disables output of interrupts corresponding to the states indicated in the SRCn status register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	uf_srco_ie	of_srco_ie	—	—	of_srci_ie	uf_srci_ie	—	—	—	—	—	—	—	—

R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	uf_srco_ie	B'0	R/W	under_flow_srcout_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
12	of_srco_ie	B'0	R/W	over_flow_srcout_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	of_srci_ie	B'0	R/W	over_flow_srcin_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
8	uf_srci_ie	B'0	R/W	under_flow_srcin_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

43.2.10 CMDn out_BUSIF_MODE Register (CMDn out_BUSIF_MODE)

Note: n = 0, 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CMDn out_BUSIF_MODE sets the initial setting for the bus interface

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	sft_dir	sft_num			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	dma
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	sft_dir	B'0	R/W	cmd*n*out_busif_shift_dir Selects the bit-shift direction for position adjustment of the valid CMD*n*out_BUSIF input and output data. 0: Shift to left. 1: Shift to right.
19 to 16	sft_num	H'0	R/W	cmd*n*out_busif_shift_num Selects the bit-shift count for position adjustment of the valid CMD*n*out_BUSIF input and output data. B'0000: 0 bit B'0001: 1 bit B'0010: 2 bits B'0011: 3 bits B'0100: 4 bits B'0101: 5 bits B'0110: 6 bits B'0111: 7 bits B'1000: 8 bits B'1001: 9 bits B'1010: 10 bits B'1011: 11 bits B'1100: 12 bits B'1101: 13 bits B'1110: 14 bits B'1111: 15 bits
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	dma	B'1	R/W	CMDnout_busif _dma Selects the access type for CMDnout_BUSIF. 0: PIO access (setting prohibited) 1: DMA access Be sure to specify the DMA access.

43.2.11 CMDn_BUSIF_DALIGN Register (CMDn_BUSIF_DALIGN)

Note: n = 0, 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CMDn_BUSIF_DALIGN determines the initial settings of the CMDn route.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	place7	H'7	R/W	Changes the stream data order. These bits are used for the 8-channel setting. **For the 6- or less-channel setting, the initial value should not be changed.** The data order is changed after output from the CMD. Selects the input-side data to be output to place 7 on the output side. B'000: Data at input-side place0 is sent to output-side place7. B'001: Data at input-side place1 is sent to output-side place7. B'010: Data at input-side place2 is sent to output-side place7. B'011: Data at input-side place3 is sent to output-side place7. B'100: Data at input-side place4 is sent to output-side place7. B'101: Data at input-side place5 is sent to output-side place7. B'110: Data at input-side place6 is sent to output-side place7. B'111: Data at input-side place7 is sent to output-side place7.
27	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	place6	H'6	R/W	Changes the stream data order. These bits are used for the 8-channel setting. **For the 6- or less-channel setting, the initial value should not be changed.** The data order is changed after output from the CMD. Selects the input-side data to be output to place 6 on the output side. B'000: Data at input-side place0 is sent to output-side place6. B'001: Data at input-side place1 is sent to output-side place6. B'010: Data at input-side place2 is sent to output-side place6. B'011: Data at input-side place3 is sent to output-side place6. B'100: Data at input-side place4 is sent to output-side place6. B'101: Data at input-side place5 is sent to output-side place6. B'110: Data at input-side place6 is sent to output-side place6. B'111: Data at input-side place7 is sent to output-side place6.

Bit	Bit Name	Initial Value	R/W	Description
23	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	place5	H'5	R/W	Changes the stream data order. These bits are used for the 6- or more-channel setting. **For the 4- or less-channel setting, the initial value should not be changed.** The data order is changed after output from the CMD. Selects the input-side data to be output to place 5 on the output side. B'000: Data at input-side place0 is sent to output-side place5. B'001: Data at input-side place1 is sent to output-side place5. B'010: Data at input-side place2 is sent to output-side place5. B'011: Data at input-side place3 is sent to output-side place5. B'100: Data at input-side place4 is sent to output-side place5. B'101: Data at input-side place5 is sent to output-side place5. B'110: Data at input-side place6 is sent to output-side place5. B'111: Data at input-side place7 is sent to output-side place5.
19	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	place4	H'4	R/W	Changes the stream data order. These bits are used for the 6- or more-channel setting. **For the 4- or less-channel setting, the initial value should not be changed.** The data order is changed after output from the CMD. Selects the input-side data to be output to place 4 on the output side. B'000: Data at input-side place0 is sent to output-side place4. B'001: Data at input-side place1 is sent to output-side place4. B'010: Data at input-side place2 is sent to output-side place4. B'011: Data at input-side place3 is sent to output-side place4. B'100: Data at input-side place4 is sent to output-side place4. B'101: Data at input-side place5 is sent to output-side place4. B'110: Data at input-side place6 is sent to output-side place4. B'111: Data at input-side place7 is sent to output-side place4.
15	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	place3	H'3	R/W	Changes the stream data order. These bits are used for the 4- or more-channel setting. **For the 2- or less-channel setting, the initial value should not be changed.** The data order is changed after output from the CMD. Selects the input-side data to be output to place 3 on the output side. B'000: Data at input-side place0 is sent to output-side place3. B'001: Data at input-side place1 is sent to output-side place3. B'010: Data at input-side place2 is sent to output-side place3. B'011: Data at input-side place3 is sent to output-side place3. B'100: Data at input-side place4 is sent to output-side place3. B'101: Data at input-side place5 is sent to output-side place3. B'110: Data at input-side place6 is sent to output-side place3. B'111: Data at input-side place7 is sent to output-side place3.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	place2	H'2	R/W	Changes the stream data order. These bits are used for the 4- or more-channel setting. **For the 2- or less-channel setting, the initial value should not be changed.** The data order is changed after output from the CMD. Selects the input-side data to be output to place 2 on the output side. B'000: Data at input-side place0 is sent to output-side place2. B'001: Data at input-side place1 is sent to output-side place2. B'010: Data at input-side place2 is sent to output-side place2. B'011: Data at input-side place3 is sent to output-side place2. B'100: Data at input-side place4 is sent to output-side place2. B'101: Data at input-side place5 is sent to output-side place2. B'110: Data at input-side place6 is sent to output-side place2. B'111: Data at input-side place7 is sent to output-side place2.
7	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	place1	H'1	R/W	Changes the stream data order. The data order is changed after output from the CMD. Selects the input-side data to be output to place 1 on the output side. B'000: Data at input-side place0 is sent to output-side place1. B'001: Data at input-side place1 is sent to output-side place1. B'010: Data at input-side place2 is sent to output-side place1. B'011: Data at input-side place3 is sent to output-side place1. B'100: Data at input-side place4 is sent to output-side place1. B'101: Data at input-side place5 is sent to output-side place1. B'110: Data at input-side place6 is sent to output-side place1. B'111: Data at input-side place7 is sent to output-side place1.
3	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	place0	H'0	R/W	Changes the stream data order. The data order is changed after output from the CMD. Selects the input-side data to be output to place 0 on the output side. B'000: Data at input-side place0 is sent to output-side place0. B'001: Data at input-side place1 is sent to output-side place0. B'010: Data at input-side place2 is sent to output-side place0. B'011: Data at input-side place3 is sent to output-side place0. B'100: Data at input-side place4 is sent to output-side place0. B'101: Data at input-side place5 is sent to output-side place0. B'110: Data at input-side place6 is sent to output-side place0. B'111: Data at input-side place7 is sent to output-side place0.

43.2.12 CMDn_ROUTE_SELECT Register (CMDn_ROUTE_SELECT)

Note: n = 0, 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

[, RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]

Function: CMDn_ROUTE_SELECT selects the sound route for each CMD (CTU, MIX, and DVC). Refer to figures Figure 43.1 and Figure 43.11 for the sound routes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	synco_cmd[3]	B'0	R/W	synco_cmd[3] Selects how to treat the CMD output data timing. Refer to Figure 43.11 CMD Block Diagram. 0: CMD output data timing 1: Synchronous SRC output data timing (Only when sync_out = 1 in SRCm_MODE register)
26 to 24	synco_cmd[2:0]	H'0	R/W	synco_cmd[2:0] Selects SRC for CMD output data timing. If synco_cmd[3] = 0, these bits are ignored. B'000: SRC0 B'001: SRC1 B'010: SRC2 B'011: SRC3 B'100: SRC4 B'101: SRC5 B'110: SRC6 B'111: SRC9
23 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	cmd_case	H'0	R/W	cmd*n*_case_sel Selects the route in CMD*n*. B'000: Input audio data0 to 3 → CTU → MIX → DVC route is used. B'001: Input audio data0 (from SRC3 or SRC6) → DVC route is used. B'010: Input audio data1 (from SRC4 or SRC9) → DVC route is used. B'011: Input audio data2(from SRC0 or SRC1) → DVC route is used. B'100: Input audio data3 (from SRC2 or SRC5) → DVC route is used. Others: Setting prohibited.
15	cmdin_ctu1	B’0	R/W	cmd*n*in_ctu1_sel Selects SRC for Input audio data1 of CMD*n*. 0: SRC4 route is used. 1: SRC9 route is used.
14 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	cmdin_ctu0	B’0	R/W	cmd*n*in_ctu0_sel Selects SRC for Input audio data0 of CMD*n*. 0: SRC3 route is used. 1: SRC6 route is used.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	cmdin_ctu3	B’0	R/W	cmd*n*in_ctu3_sel Selects SRC for Input audio data3 of CMD*n*. 0: SRC2 route is used. 1: SRC5 route is used.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	cmdin_ctu2	B’0	R/W	cmd*n*in_ctu2_sel Selects SRC for Input audio data2 of CMD*n*. 0: SRC0 route is used. 1: SRC1 route is used.

43.2.13 CMDn Control Register (CMDn_CONTROL)

Note: n = 0, 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CMDn_CONTROL starts or stops transfer.

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	of_cmd1o	B'0	R/WC1	over_flow_cmd1out Indicates the state of the CMD1out output buffer. 0: Normal operation 1: An overflow has occurred.
28	of_cmd0o	B'0	R/WC1	over_flow_cmd0out Indicates the state of the CMD0out output buffer. 0: Normal operation 1: An overflow has occurred.
27, 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	of_src9o	B'0	R/WC1	over_flow_src9out Indicates the state of the SRC9out output buffer. 0: Normal operation 1: An overflow has occurred.
24	of_src8o	B'0	R/WC1	over_flow_src8out Indicates the state of the SRC8out output buffer. 0: Normal operation 1: An overflow has occurred.
23	of_src7o	B'0	R/WC1	over_flow_src7out Indicates the state of the SRC7out output buffer. 0: Normal operation 1: An overflow has occurred.
22	of_src6o	B'0	R/WC1	over_flow_src6out Indicates the state of the SRC6out output buffer. 0: Normal operation 1: An overflow has occurred.

Bit	Bit Name	Initial Value	R/W	Description
21	of_src5o	B'0	R/WC1	over_flow_src5out Indicates the state of the SRC5out output buffer. 0: Normal operation 1: An overflow has occurred.
20	of_src4o	B'0	R/WC1	over_flow_src4out Indicates the state of the SRC4out output buffer. 0: Normal operation 1: An overflow has occurred.
19	of_src3o	B'0	R/WC1	over_flow_src3out Indicates the state of the SRC3out output buffer. 0: Normal operation 1: An overflow has occurred.
18	of_src2o	B'0	R/WC1	over_flow_src2out Indicates the state of the SRC2out output buffer. 0: Normal operation 1: An overflow has occurred.
17	of_src1o	B'0	R/WC1	over_flow_src1out Indicates the state of the SRC1out output buffer. 0: Normal operation 1: An overflow has occurred.
16	of_src0o	B'0	R/WC1	over_flow_src0out Indicates the state of the SRC0out output buffer. 0: Normal operation 1: An overflow has occurred.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	uf_src9i	B'0	R/WC1	under_flow_src9in Indicates the state of the SRC9in input buffer. 0: Normal operation 1: An underflow has occurred.
8	uf_src8i	B'0	R/WC1	under_flow_src8in Indicates the state of the SRC8in input buffer. 0: Normal operation 1: An underflow has occurred.
7	uf_src7i	B'0	R/WC1	under_flow_src7in Indicates the state of the SRC7in input buffer. 0: Normal operation 1: An underflow has occurred.
6	uf_src6i	B'0	R/WC1	under_flow_src6in Indicates the state of the SRC6in input buffer. 0: Normal operation 1: An underflow has occurred.
5	uf_src5i	B'0	R/WC1	under_flow_src5in Indicates the state of the SRC5in input buffer. 0: Normal operation 1: An underflow has occurred.

Bit	Bit Name	Initial Value	R/W	Description
4	uf_src4i	B'0	R/WC1	under_flow_src4in Indicates the state of the SRC4in input buffer. 0: Normal operation 1: An underflow has occurred.
3	uf_src3i	B'0	R/WC1	under_flow_src3in Indicates the state of the SRC3in input buffer. 0: Normal operation 1: An underflow has occurred.
2	uf_src2i	B'0	R/WC1	under_flow_src2in Indicates the state of the SRC2in input buffer. 0: Normal operation 1: An underflow has occurred.
1	uf_src1i	B'0	R/WC1	under_flow_src1in Indicates the state of the SRC1in input buffer. 0: Normal operation 1: An underflow has occurred.
0	uf_src0i	B'0	R/WC1	under_flow_src0in Indicates the state of the SRC0in input buffer. 0: Normal operation 1: An underflow has occurred.

43.2.15 SCU_SYSTEM Interrupt Enable Register 0 (SCU_SYSTEM_INT_ENABLE0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SCU_SYSTEM_INT_ENABLE0 enables or disables output of interrupts corresponding to the states indicated in the SCU_SYSTEM status register 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	uf_src0i_ie	B'0	R/W	under_flow_src0in_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.

43.2.16 SCU_SYSTEM Status Register 1 (SCU_SYSTEM_STATUS1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SCU_SYSTEM_STATUS1 indicates the internal buffer state in synchronous mode. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SYSTEM interrupt enable register 1, interrupt signals are not output.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INTIFSEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	fast_ijc_en	B'0	R/W	fast_ijc Enable It can diminish convergence time to input frequency deflection. 0: Reserved 1: It can be gradual decrease of convergence time. This function is valid if SRCm_SRCCR Register SRCMD = 0 (Asynchronous SRC).
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 20	fast_ijc_setting[7:4]	H'0	R/W	The period that to recognize “stable” by ijc_fsi calculator. This bit should be set to H'2. (Only when fast_ijc_en = 1, as bit 31)
19 to 16	fast_ijc_setting[3:0]	H'0	R/W	The period that to rerun calculation by ijc_fsi calculator. This bit should be set to H'4. (Only when fast_ijc_en = 1, as bit 31)
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INTIFSEN	B'0	R/W	INTIFS Value Setting Enable This bit controls the INTIFS bit of SRCm_IFSVR register. This bit is effective only in asynchronous SRC Mode (bit SRCMD in SRCm_SRCCR register is 0) 0: Disables INTIFS bit of SRCm_IFSVR register 1: Enables INTIFS bit of SRCm_IFSVR register Basically, this bit should be set to 1.

43.2.22 SRCm IFS Value Setting Register (SRCm_IFSVR)

Note: m = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm_IFSVR is a 32-bit readable/writable register that sets the value of INTIFS. The INTIFS is the initial value of FSI of sampling rate conversion function. SRC detects input sampling rate and output sampling rate automatically. By doing this, it calculates the FSI value so that the below formula is satisfied.

Fin/Fout ≈ FSI/FSO

The INTIFS value is used for the initial value of FSI. If this setting is disabled (INTIFSEN bit of SRCm_IFSCR register is 0), SRC will use FSO for initial value of FSI.

INTIFS = Fin × FSO/Fout

Note: Fin: Input sampling frequency
Fout: Output sampling frequency
FSI: Input sampling rate
FSO: Output sampling rate (Fixed value: 2^{22} = H'040_0000)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	INTIFS[27:16]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTIFS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	INTIFS[27:0]	H'000_0000	R/W	Initial Value of FSI These bits set initial value of FSI. These bits should be set the ratio of input and output sampling-rate within the range of the restriction decided from channel number. Example: Fin = 32 kHz Fout = 44.1 kHz FSI = 2^{22} × 32000 / 44100 = 3043485 = H'02E_709D For the setting value examples, seeTable 43.10.

Note: When SRCm is used in synchronous mode (SRCMD bit in SRCm_SRCCR register is 1), INTIFS can change without SRC initialization. On the operating state, INTIFS can change within 1%.
However, the change of the SRC conversion rate means that it will set jitter by manual operation. Evaluate sound quality, and use this function as far as you judged sound quality is no problem.
If on the occasion of the change more than 1%, it should do SRC initialization (cf. section 43.3.5(1)(d)) after changing INTIFS.

43.2.23 SRCm SRC Control Register (SRCm_SRCCR)

Note: m = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm_SRCCR is a 32-bit readable/writable register that controls the operation of sampling rate converter.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

43.2.64 MIXp Software Reset Register (MIXp_SWRSR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_SWRSR is a 32-bit readable/writable register that controls operation/reset of the MIX internal circuits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SWRST	B'1	R/W	Software Reset While this bit is 0, the MIX internal circuits are put in the reset state. MIXp_* registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: Resets the MIX 1: Operating state

43.2.65 MIXp MIX Initialization Register (MIXp_MIXIR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MIXIR is a 32-bit readable/writable register that initializes the operation of the MIX internal circuits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	B'1	R/W	Initialization of Processing When this bit is set to 1, the MIX processing is initialized. This bit should be cleared to 0 after it was set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

43.2.66 MIXp Audio Information Register (MIXp_ADINR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_ADINR is a 32-bit readable/writable register that selects channel number.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CHNUM[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM[3:0]	H'0	R/W	Channel Number These bits set the output data channel number B'0000: 0 (None) B'0001: 1 channel B'0010: 2 channels B'0011: Reserved B'0100: 4 channels B'0101: Reserved B'0110: 6 channels B'0111: Reserved B'1000: 8 channels B'1001 to B'1111: Reserved

43.2.67 MIXp MIX Mode Register (MIXp_MIXMR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MIXMR is a 32-bit readable/writable register that controls the mix mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MIX MODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXMODE	B'0	R/W	MIX Mode This bit controls the mix mode. 0: Selects volume step mixer 1: Selects volume ramp mixer

43.2.68 MIXp MIX Volume Period Register (MIXp_MVPDR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MVPDR is a 32-bit readable/writable register that sets the value of the change of the volume a sample.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MXPDUP[3:0]				—	—	—	—	MXPDDW[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	MXPDUP[3:0]	H'0	R/W	MIX Period for Volume Up These bits set the decibel value that changed by one sample for volume up. And when MIXMODE bit of MIXp_MIXMR register is 1, this setting can be used. B'0000: 128 dB / 1 sample B'0001: 64 dB / 1 sample B'0010: 32 dB / 1 sample B'0011: 16 dB / 1 sample B'0100: 8 dB / 1 sample B'0101: 4 dB / 1 sample B'0110: 2 dB / 1 sample B'0111: 1 dB / 1 sample B'1000: 0.5 dB / 1 sample B'1001: 0.25 dB / 1 sample B'1010: 0.125 dB / 1 sample B'1011 to B'1111: Reserved
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	MXPDDW[3:0]	H'0	R/W	MIX Period for Volume Down These bits set the decibel value that changed by one sample for volume down. And when MIXMODE bit of MIXp_MIXMR register is 1, this setting can be used. B'0000: -128 dB / 1 sample B'0001: -64 dB / 1 sample B'0010: -32 dB / 1 sample B'0011: -16 dB / 1 sample B'0100: -8 dB / 1 sample B'0101: -4 dB / 1 sample B'0110: -2 dB / 1 sample B'0111: -1 dB / 1 sample B'1000: -0.5 dB / 1 sample B'1001: -0.25 dB / 1 sample B'1010: -0.125 dB / 1 sample B'1011 to B'1111: Reserved

43.2.69 MIXp MIX Decibel A Register (MIXp_MDBAR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MDBAR is a 32-bit readable/writable register that sets the decibel (gain level) of system A.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MIXDBA[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBA[9:0]	H'000	R/W	dB of System A These bits control the decibel (gain level) of system A. The value can select 1024 points from 0 dB to -∞ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	……	……	……
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	……	……
.....	.....	.....	H'3FE	4.1×10^{-7}	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	-∞

The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14.

43.2.70 MIXp MIX Decibel B Register (MIXp_MDBBR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MDBBR is a 32-bit readable/writable register that sets the decibel (gain level) of system B.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MIXDBB[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBB[9:0]	H'000	R/W	dB of System B These bits control the decibel (gain level) of system B. The value can select 1024 points from 0 dB to -∞ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	……	……	……
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	……	……
.....	.....	.....	H'3FE	4.1×10^{-7}	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	-∞

The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14.

43.2.71 MIXp MIX Decibel C Register (MIXp_MDBCR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MDBCR is a 32-bit readable/writable register that sets the decibel (gain level) of system C.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MIXDBC[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBC[9:0]	H'000	R/W	dB of System C These bits control the decibel (gain level) of system C. The value can select 1024 points from 0 dB to -∞ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	……	……	……
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	……	……
.....	.....	.....	H'3FE	4.1×10^{-7}	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	-∞

The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14.

43.2.72 MIXp MIX Decibel D Register (MIXp_MDBDR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MDBDR is a 32-bit readable/writable register that sets the decibel (gain level) of system D.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MIXDBD[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBD[9:0]	H'000	R/W	dB of System D These bits control the decibel (gain level) of system D. The value can select 1024 points from 0 dB to -∞ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	……	……	……
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	……	……
.....	.....	.....	H'3FE	4.1×10^{-7}	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	-∞

The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14.

43.2.73 MIXp MIX Decibel Enable Register (MIXp_MDBER)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MDBER is a 32-bit readable/writable register that controls the dB value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MIX DBEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXDBEN	B'0	R/W	MIX dB Enable This bit controls the dB value that sets in MIXp_MDBAR, MIXp_MDBBR, MIXp_MDBCR and MIXp_MDBDR registers. 0: Disables the setting of dB 1: Enables the setting of dB

43.2.74 MIXp MIX Status Register (MIXp_MIXSR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: MIXp_MIXSR is a 32-bit readable register that indicates the status of the volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MRPSTS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MRPSTS	H'0	R	MIX Volume Ramp Status These bits indicate the volume ramp status of mix operation. B'00: Level of volume ramp is stable B'01: Volume ramp down B'10: Volume ramp up Others: Setting prohibited.

43.2.75 DVCp Software Reset Register (DVCp_SWRSR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_SWRSR is a 32-bit readable/writable register that controls operation/reset of the DVC internal circuits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SWRST	B'1	R/W	Software Reset While this bit is 0, the DVC internal circuits are put in the reset state. DVCp_* registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: Resets the DVC 1: Operating state

43.2.76 DVCp DVU Initialization Register (DVCp_DVUIR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_DVUIR is a 32-bit readable/writable register that initializes the operation of the DVC internal circuits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	B'1	R/W	Initialization of Processing When this bit is set to 1, the DVC processing is initialized. This bit should be cleared to 0 after it was set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

43.2.77 DVCp Audio Information Register (DVCp_ADINR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_ADINR is a 32-bit readable/writable register that selects channel number and bit length of output audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	OTBL[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CHNUM[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL[4:0]	H'00	R/W	Bit Length of Output Audio Data. These bits set the bit length of output audio data. B'0_0000: 24 bits B'0_0001: Reserved B'0_0010: 22 bits B'0_0011: Reserved B'0_0100: 20 bits B'0_0101: Reserved B'0_0110: 18 bits B'0_0111: Reserved B'0_1000: 16 bits B'0_1001 to 0_1111: Reserved B'1_0000: 8 bits B'1_0001 to 1_1111: Reversed
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	CHNUM[3:0]	H'0	R/W	Channel Number These bits set the output data channel number B'0000: 0 (None) B'0001: 1 channel B'0010: 2 channels B'0011: Reserved B'0100: 4 channels B'0101: Reserved B'0110: 6 channels B'0111: Reserved B'1000: 8 channels B'1001 to B'1111: Reserved

43.2.78 DVCp DVU Control Register (DVCp_DVUCR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_DVUCR is a 32-bit readable/writable register that selects the mode of function to operate.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VVMD	—	—	—	VRMD	—	—	—	ZCMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	VVMD	B'0	R/W	Select Digital Volume Value Mode This bit selects the digital volume value function. 0: Sleep the digital volume value function 1: Use the digital volume value function
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRMD	B'0	R/W	Select Volume Ramp Mode This bit selects the volume ramp function. 0: Sleep the volume ramp function 1: Use the volume ramp function
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ZCMD	B'0	R/W	Select Zero Cross Mute Mode This bit selects the zero cross mute function. 0: Sleep the zero cross mute function 1: Use the zero cross mute function

43.2.79 DVCp Zero Cross Mute Control Register (DVCp_ZCMCR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_ZCMCR is a 32-bit readable/writable register that controls the operation of the zero cross mute function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ZCEN7	ZCEN6	ZCEN5	ZCEN4	ZCEN3	ZCEN2	ZCEN1	ZCEN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ZCEN7	B'0	R/W	Zero Cross Mute Enable for Channel 7 This bit controls the operation of the zero cross mute function for channel 7. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
6	ZCEN6	B'0	R/W	Zero Cross Mute Enable for Channel 6 This bit controls the operation of the zero cross mute function for channel 6. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
5	ZCEN5	B'0	R/W	Zero Cross Mute Enable for Channel 5 This bit controls the operation of the zero cross mute function for channel 5. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
4	ZCEN4	B'0	R/W	Zero Cross Mute Enable for Channel 4 This bit controls the operation of the zero cross mute function for channel 4. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
3	ZCEN3	B'0	R/W	Zero Cross Mute Enable for Channel 3 This bit controls the operation of the zero cross mute function for channel 3. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function

Bit	Bit Name	Initial Value	R/W	Description
2	ZCEN2	B'0	R/W	Zero Cross Mute Enable for Channel 2 This bit controls the operation of the zero cross mute function for channel 2. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
1	ZCEN1	B'0	R/W	Zero Cross Mute Enable for Channel 1 This bit controls the operation of the zero cross mute function for channel 1. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function
0	ZCEN0	B'0	R/W	Zero Cross Mute Enable for Channel 0 This bit controls the operation of the zero cross mute function for channel 0. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function

43.2.80 DVCp Volume Ramp Control Register (DVCp_VRCTR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_VRCTR is a 32-bit readable/writable register that controls the operation of the volume ramp function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	VREN7	VREN6	VREN5	VREN4	VREN3	VREN2	VREN1	VREN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	VREN7	B'0	R/W	Volume Ramp Enable for Channel 7 This bit controls the operation of the volume ramp function for channel 7. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
6	VREN6	B'0	R/W	Volume Ramp Enable for Channel 6 This bit controls the operation of the volume ramp function for channel 6. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
5	VREN5	B'0	R/W	Volume Ramp Enable for Channel 5 This bit controls the operation of the volume ramp function for channel 5. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
4	VREN4	B'0	R/W	Volume Ramp Enable for Channel 4 This bit controls the operation of the volume ramp function for channel 4. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
3	VREN3	B'0	R/W	Volume Ramp Enable for Channel 3 This bit controls the operation of the volume ramp function for channel 3. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
2	VREN2	B'0	R/W	Volume Ramp Enable for Channel 2 This bit controls the operation of the volume ramp function for channel 2. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function

Bit	Bit Name	Initial Value	R/W	Description
1	VREN1	B'0	R/W	Volume Ramp Enable for Channel 1 This bit controls the operation of the volume ramp function for channel 1. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function
0	VREN0	B'0	R/W	Volume Ramp Enable for Channel 0 This bit controls the operation of the volume ramp function for channel 0. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function

Note: All of these bits should be set to 1 when VRMD bit of DVCp_DVUCR register is 1.

43.2.81 DVCp Volume Ramp Period Register (DVCp_VRPDR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_VRPDR is a 32-bit readable/writable register that controls.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	VRPDUP[4:0]	H'00	R/W	Volume Ramp Period for Volume Up B'0_0000: 1 [sample] (128 dB/1 step) B'0_0001: 2 [sample] (64 dB/1 step) B'0_0010: 4 [sample] (32 dB/1 step) B'0_0011: 8 [sample] (16 dB/1 step) B'0_0100: 16 [sample] (8 dB/1 step) B'0_0101: 32 [sample] (4 dB/1 step) B'0_0110: 64 [sample] (2 dB/1 step) B'0_0111: 128 [sample] (1 dB/1 step) B'0_1000: 256 [sample] (0.5 dB/1 step) B'0_1001: 512 [sample] (0.25 dB/1 step) B'0_1010: 1024 [sample] (0.125 dB/1 step) B'0_1011: 2048 [sample] (0.125 dB/2 steps) B'0_1100: 4096 [sample] (0.125 dB/4 steps) B'0_1101: 8192 [sample] (0.125 dB/8 steps) B'0_1110: 16384 [sample] (0.125 dB/16 steps) B'0_1111: 32768 [sample] (0.125 dB/32 steps) B'1_0000: 65536 [sample] (0.125 dB/64 steps) B'1_0001: 131072 [sample] (0.125 dB/128 steps) B'1_0010: 262144 [sample] (0.125 dB/256 steps) B'1_0011: 524288 [sample] (0.125 dB/512 steps) B'1_0100: 1048576 [sample] (0.125 dB/1024 steps) B'1_0101: 2097152 [sample] (0.125 dB/2048 steps) B'1_0110: 4194304 [sample] (0.125 dB/4096 steps) B'1_0111: 8388608 [sample] (0.125 dB/8192 steps) B'1_1000 to B'1_1111: Reserved

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	VRPDDW[4:0]	H'00	R/W	Volume Ramp Period for Volume Down B'0_0000: 1 [sample] (-128 dB/1 step) B'0_0001: 2 [sample] (-64 dB/1 step) B'0_0010: 4 [sample] (-32 dB/1 step) B'0_0011: 8 [sample] (-16 dB/1 step) B'0_0100: 16 [sample] (-8 dB/1 step) B'0_0101: 32 [sample] (-4 dB/1 step) B'0_0110: 64 [sample] (-2 dB/1 step) B'0_0111: 128 [sample] (-1 dB/1 step) B'0_1000: 256 [sample] (-0.5 dB/1 step) B'0_1001: 512 [sample] (-0.25 dB/1 step) B'0_1010: 1024 [sample] (-0.125 dB/1 step) B'0_1011: 2048 [sample] (-0.125 dB/2 steps) B'0_1100: 4096 [sample] (-0.125 dB/4 steps) B'0_1101: 8192 [sample] (-0.125 dB/8 steps) B'0_1110: 16384 [sample] (-0.125 dB/16 steps) B'0_1111: 32768 [sample] (-0.125 dB/32 steps) B'1_0000: 65536 [sample] (-0.125 dB/64 steps) B'1_0001: 131072 [sample] (-0.125 dB/128 steps) B'1_0010: 262144 [sample] (-0.125 dB/256 steps) B'1_0011: 524288 [sample] (-0.125 dB/512 steps) B'1_0100: 1048576 [sample] (-0.125 dB/1024 steps) B'1_0101: 2097152 [sample] (-0.125 dB/2048 steps) B'1_0110: 4194304 [sample] (-0.125 dB/4096 steps) B'1_0111: 8388608 [sample] (-0.125 dB/8192 steps) B'1_1000 to B'1_1111: Reserved

43.2.82 DVCp Volume Ramp Decibel Register (DVCp_VRDBR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_VRDBR is a 32-bit readable/writable register that sets the decibel (gain level) of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	VRDB[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VRDB[9:0]	H'000	R/W	dB of Volume Ramp These bits control the decibel (gain level) of volume ramp. The value can select 1024 points from 0 dB to -∞ dB at intervals of 0.125 dB.

Value	[time]	[dB]	Value	[time]	[dB]
H'000	1	0	……	……	……
.....	.....	.....	H'091	0.125	-18.125
H'031	0.5	-6.125	.....	……	……
.....	.....	.....	H'3FE	4.1×10^{-7}	-127.75
H'061	0.25	-12.125	H'3FF	0 (Mute)	-∞

The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14.

43.2.83 DVCp Volume Ramp Wait Time Register (DVCp_VRWTR)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_VRWTR is a 32-bit readable/writable register that sets the standby time to start the operation of the volume ramp function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VRWT[23:16]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VRWT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VRWT[23:0]	H'00_0000	R/W	Volume Ramp Wait Time These bits set the standby time to adjust the start timing of operation of the volume ramp function when the setting of DVCp_VRDBR register is changed. If the internal counter of the DVC logic reached to the value of these bits, the volume ramp function starts to operate to change the volume to target volume of DVCp_VRDBR register.

43.2.84 DVCp Volume Value Setting 0 Register (DVCp_VOL0R)

Note: p = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_VOL0R is a 32-bit readable/writable register that sets digital volume value for channel 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	VOLVAL0[23:16]

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	VRSTS_LEVEL	VRSTS_MUTE	VRSTS[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	ALLZSTS	B'0	R	All-Channel Zero Cross Mute Status 0: Not all-channel zero cross mute state 1: All-channel zero cross mute state Note: The state is determined only based on the channels for which the zero cross mute function is set.
23	ZSTS7	B'0	R	Zero Cross Mute Status of Channel 7 This bit indicates the zero cross mute status of channel 7. 0: Not mute status 1: Mute status
22	ZSTS6	B'0	R	Zero Cross Mute Status of Channel 6 This bit indicates the zero cross mute status of channel 6. 0: Not mute status 1: Mute status
21	ZSTS5	B'0	R	Zero Cross Mute Status of Channel 5 This bit indicates the zero cross mute status of channel 5. 0: Not mute status 1: Mute status
20	ZSTS4	B'0	R	Zero Cross Mute Status of Channel 4 This bit indicates the zero cross mute status of channel 4. 0: Not mute status 1: Mute status
19	ZSTS3	B'0	R	Zero Cross Mute Status of Channel 3 This bit indicates the zero cross mute status of channel 3. 0: Not mute status 1: Mute status

Bit	Bit Name	Initial Value	R/W	Description
18	ZSTS2	B'0	R	Zero Cross Mute Status of Channel 2 This bit indicates the zero cross mute status of channel 2. 0: Not mute status 1: Mute status
17	ZSTS1	B'0	R	Zero Cross Mute Status of Channel 1 This bit indicates the zero cross mute status of channel 1. 0: Not mute status 1: Mute status
16	ZSTS0	B'0	R	Zero Cross Mute Status of Channel 0 This bit indicates the zero cross mute status of channel 0. 0: Not mute status 1: Mute status
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRSTS_LEVEL	B'0	R	Volume Ramp Level Status 0: The volume ramp level is not the level specified by the DVCp_VRDBR register. (VRSTS is not 011.) 1: The volume ramp level is the level specified by the DVCp_VRDBR register. (VRSTS is 011.)
3	VRSTS_MUTE	B'1	R	Volume Ramp Mute Status 0: Not mute status 1: Mute status
2 to 0	VRSTS[2:0]	H'0	R	Volume Ramp Status These bits indicate the volume ramp status. B'000: Mute status B'001: Volume ramp down B'010: Volume ramp up B'011: The volume ramp level is the level specified by the DVCp_VRDBR register. B'100: Volume of input data is maintained (Volume is 1-time) B'101~111: Reserved bits

43.2.94 DVCp Interrupt Enable Register (DVCp_DVIER)

Note: p = 0, 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: DVCp_DVIER enables or disables output of interrupts corresponding to the states indicated in the DVCp_DVUSR register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	ALLZSTS_ie	B'0	R/W	allzsts_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
23	ZSTS7_ie	B'0	R/W	zsts7_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
22	ZSTS6_ie	B'0	R/W	zsts6_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
21	ZSTS5_ie	B'0	R/W	zsts5_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
20	ZSTS4_ie	B'0	R/W	zsts4_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
19	ZSTS3_ie	B'0	R/W	zsts3_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
18	ZSTS2_ie	B'0	R/W	zsts2_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
17	ZSTS1_ie	B'0	R/W	zsts1_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.

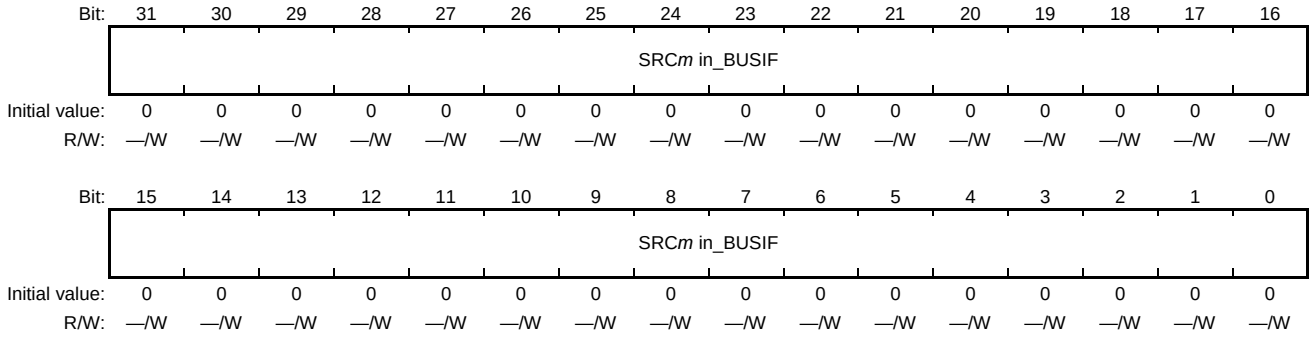
Bit	Bit Name	Initial Value	R/W	Description
16	ZSTS0_ie	B'0	R/W	zsts0_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRSTS_LEVEL_ie	B'0	R/W	vrsts_level_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
3	VRSTS_MUTE_ie	B'0	R/W	vrsts_mute_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

43.2.95 SRCm in Write Data Register (SRCm in_BUSIF)

Note: m = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm in_BUSIF are window registers in which data is stored during data transfer via SRCm in_BUSIF. These registers are used for transmission.



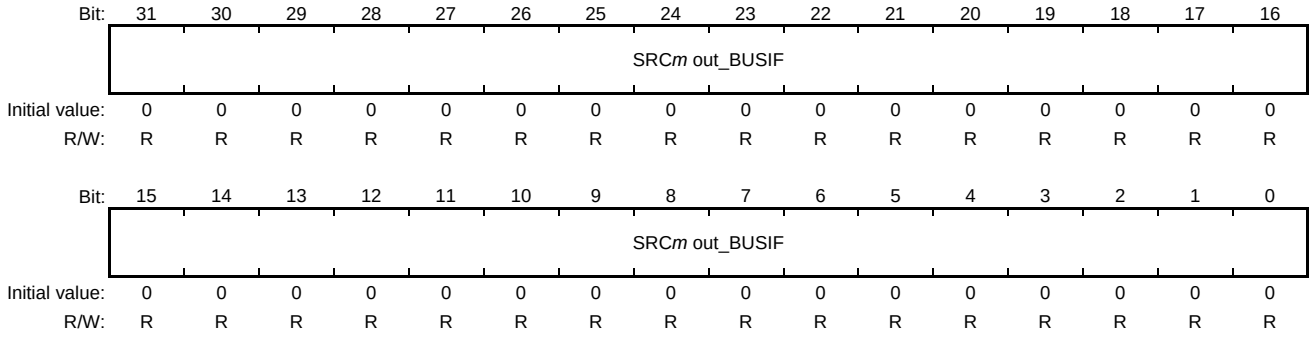
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCm in_BUSIF	All 0	—/W	These bits are a window register in which data is stored during data transfer via SRCmin_BUSIF. This register is used for transmission.

43.2.96 SRCm out Read Data Register (SRCm out_BUSIF)

Note: m = 0 to 9

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: SRCm out_BUSIF are window registers in which data is stored during data transfer via SRCm out_BUSIF. These registers are used for reception.



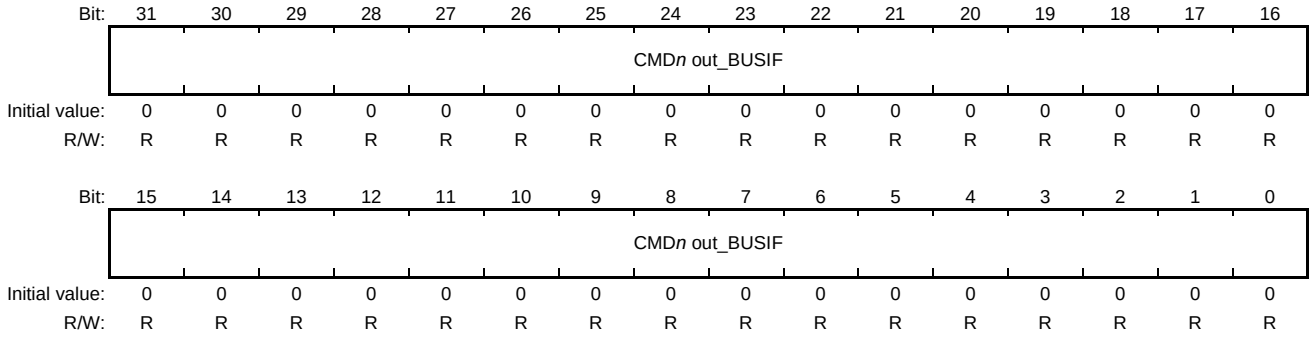
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCm out_BUSIF	All 0	R	These bits are a window register in which data is stored during data transfer via SRCmout_BUSIF. This register is used for reception.

43.2.97 CMDn out Read Data Register (CMDn out_BUSIF)

Note: n = 0 or 1

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CMDn out_BUSIF are window registers in which data is stored during data transfer via CMDn out_BUSIF. These registers are used for reception.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CMD*n* out_BUSIF	All 0	R	These bits are a window register in which data is stored during data transfer via CMD*n*out_BUSIF. This register is used for reception.

43.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

43.3.1 Procedure for Initializing the SCU

Figures Figure 43.2 and Figure 43.3 show the procedure for initializing the SCU. For details on the register settings, refer to section 43.2, Register Description.

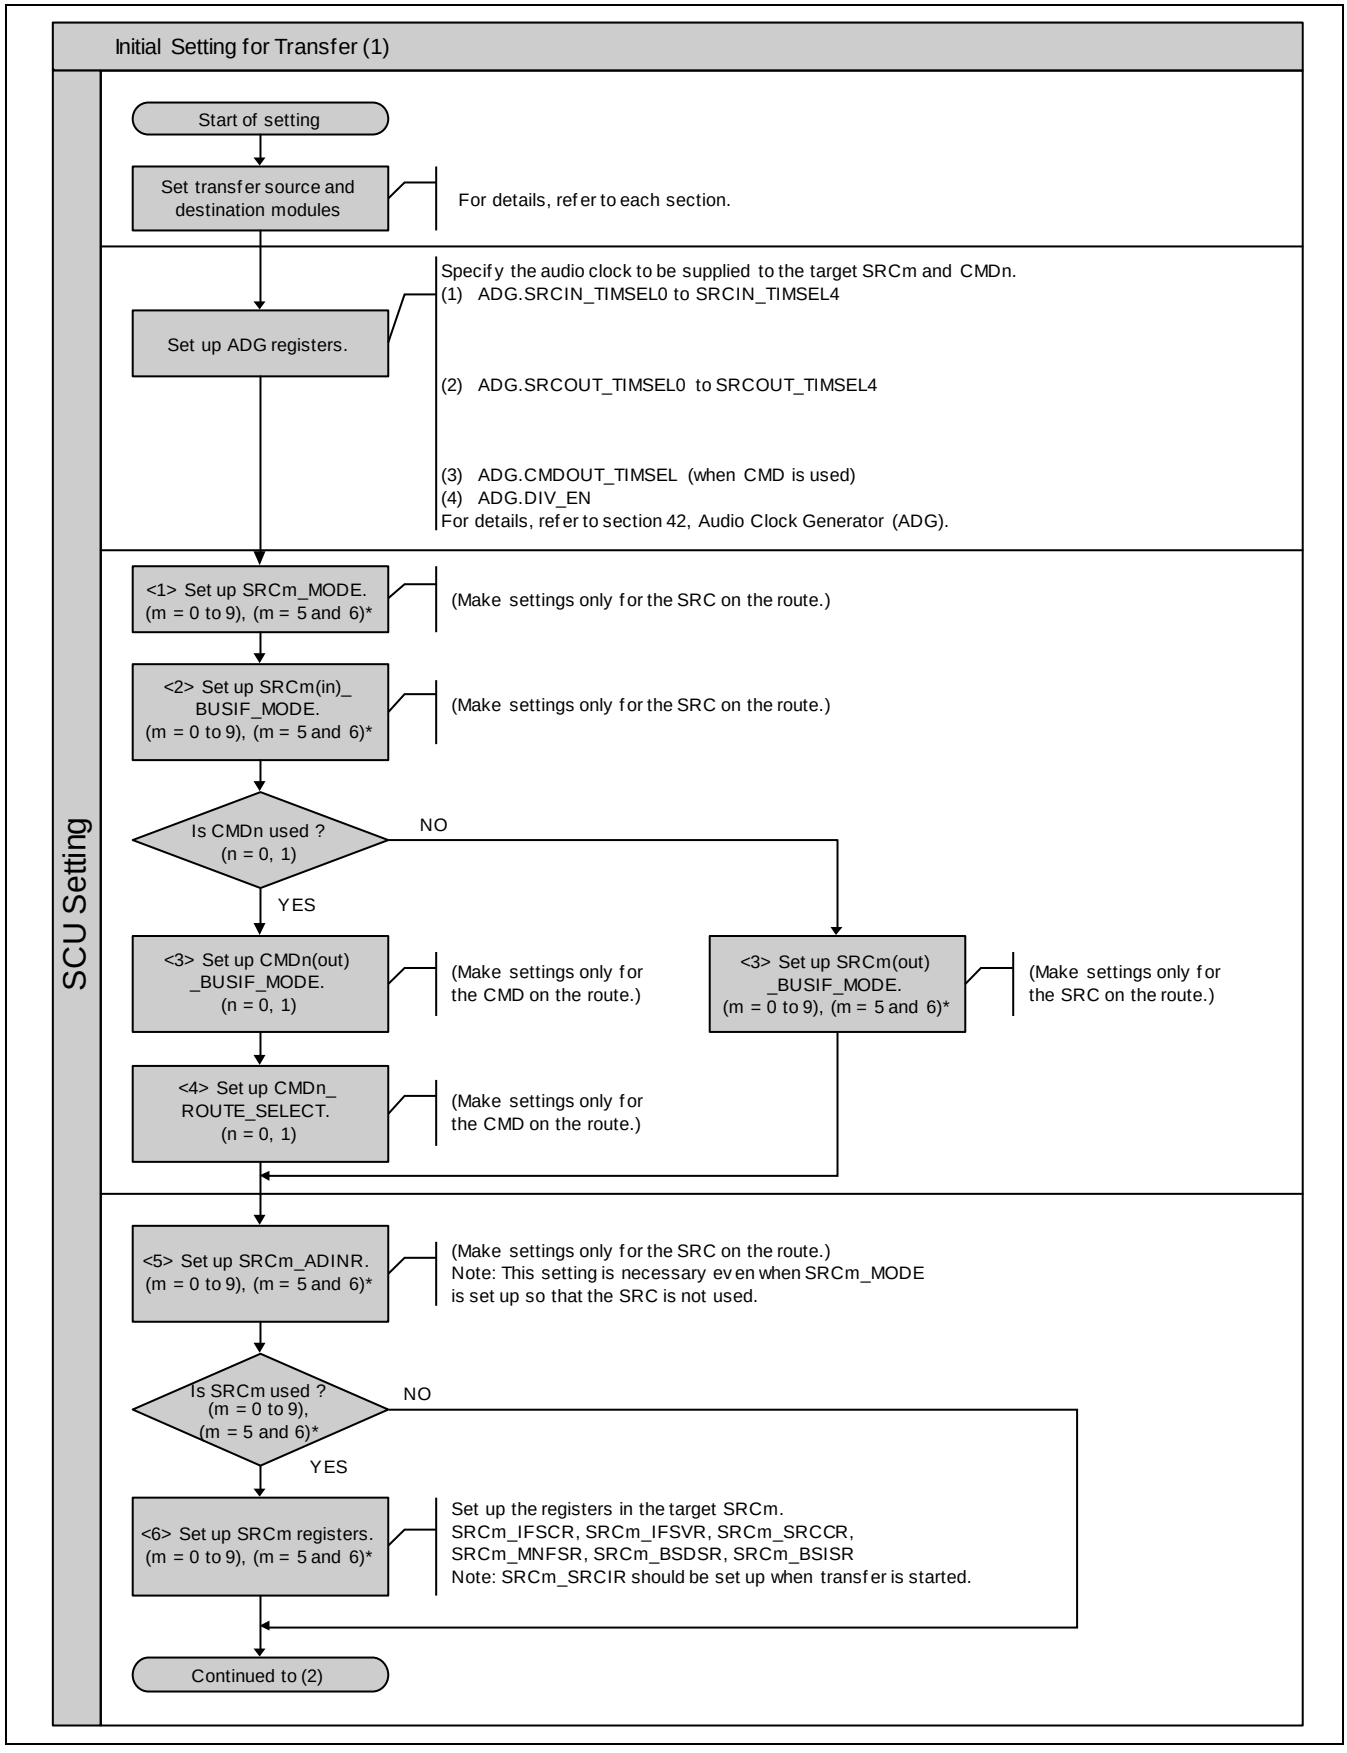


Figure 43.2 Procedure for Initializing the SCU (1)

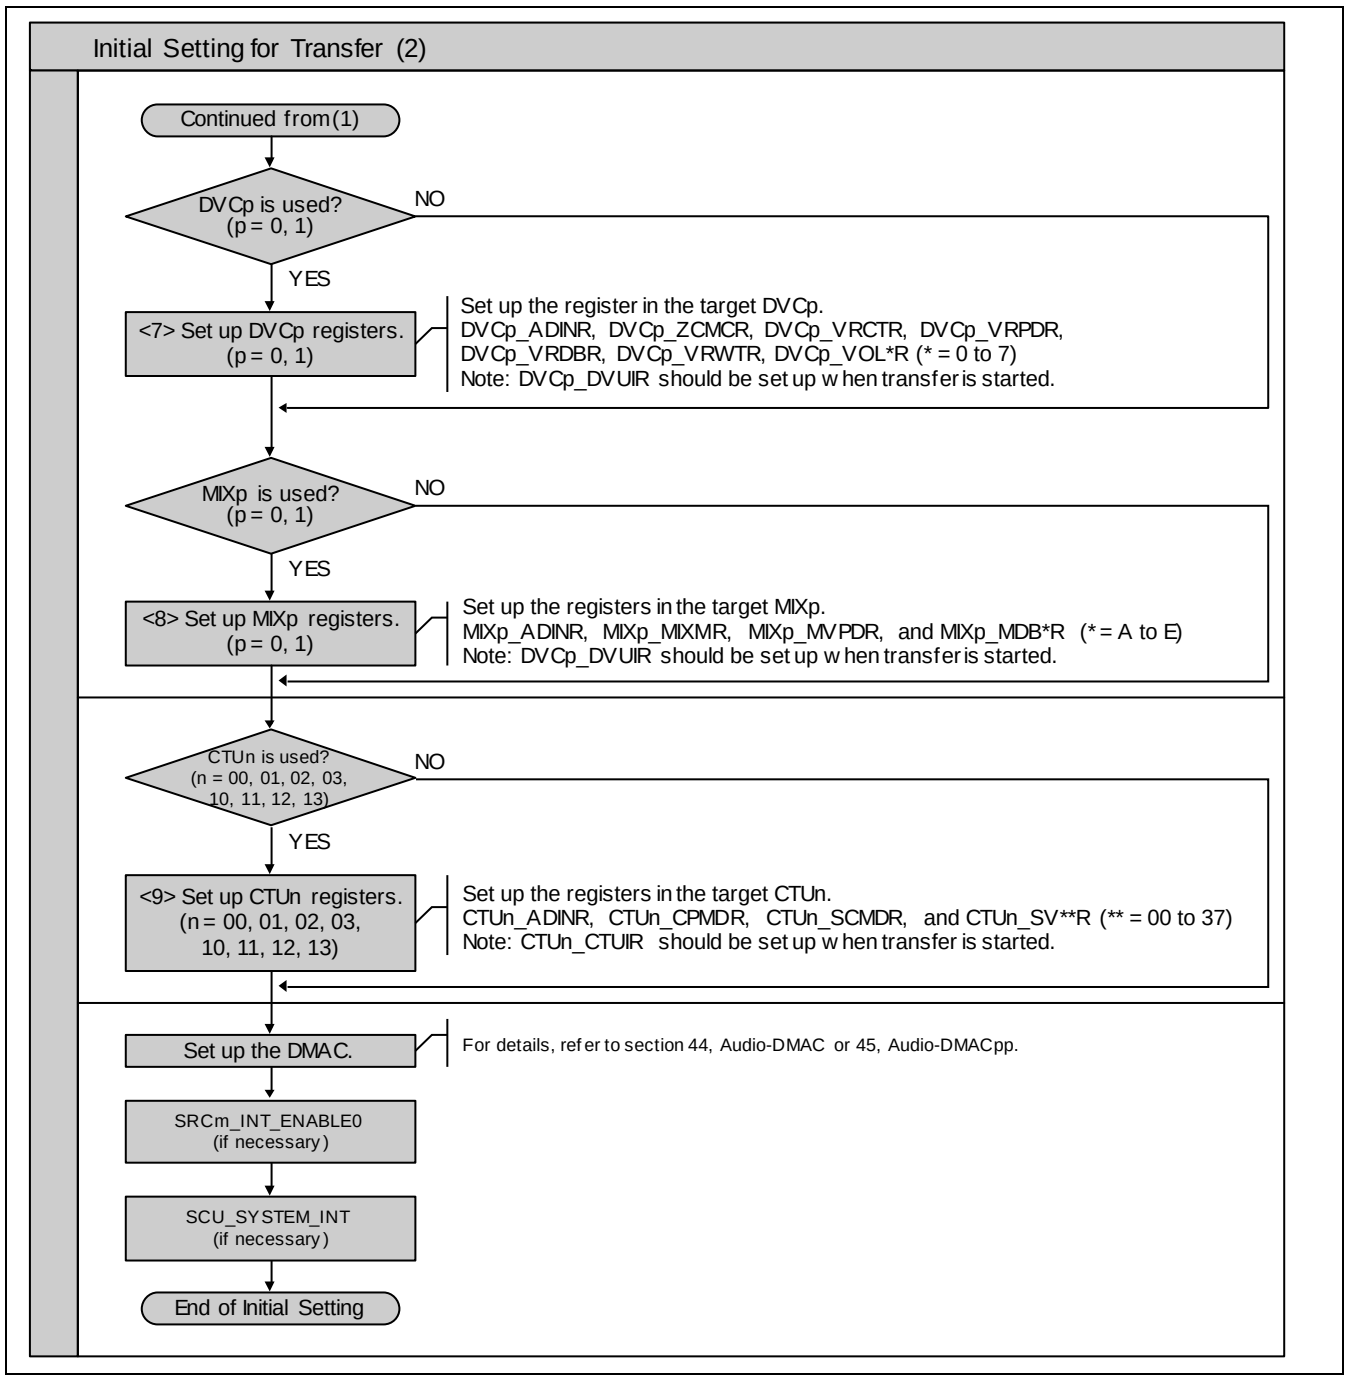

Figure 43.3 Procedure for Initializing the SCU (2)

43.3.2 Procedure for Starting and Stopping Transfer by the SCU

Figure 43.4 shows the procedure for starting and stopping the transfer by the SCU. For details on the register settings, refer to section 43.2, Register Description.

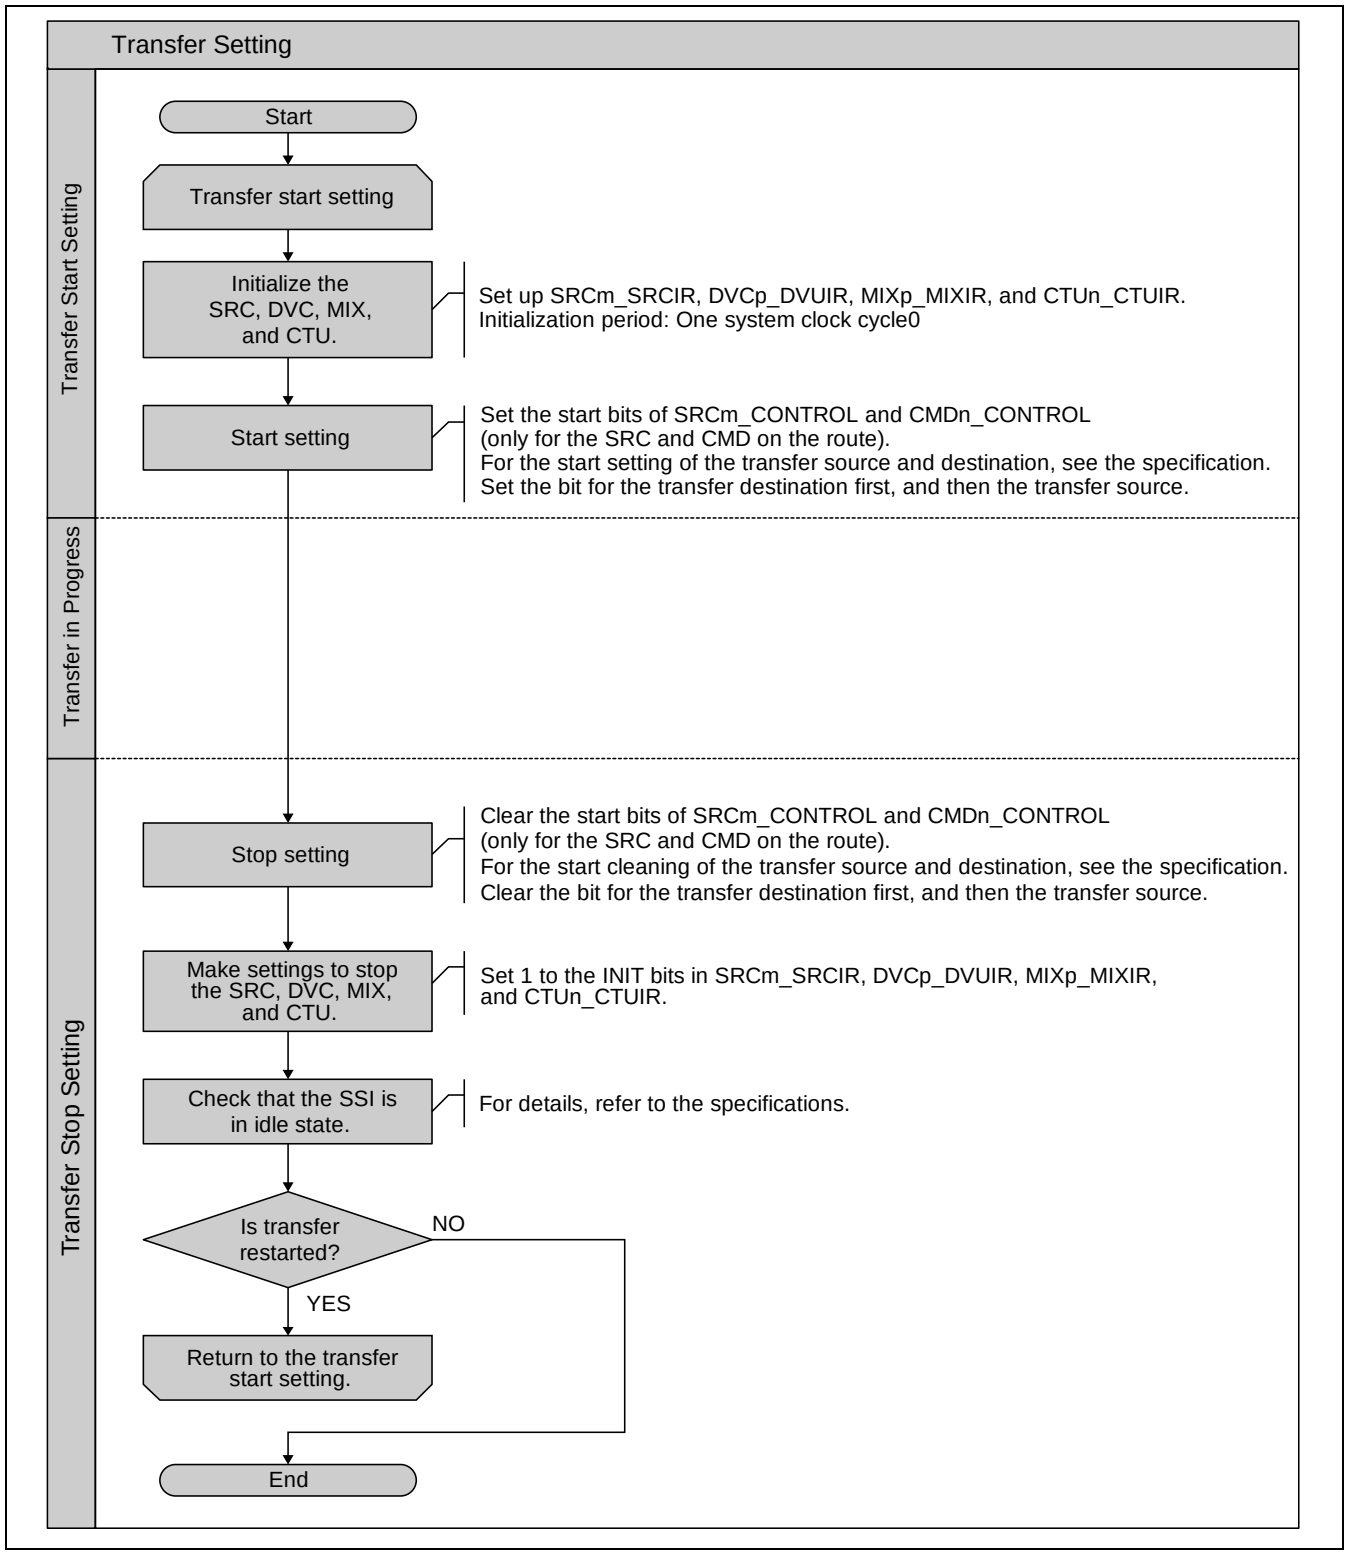

Figure 43.4 Procedure for Starting and Stopping Transfer by the SCU

43.3.3 Data Format for Data Transfer BUSIF

Table 43.3 shows the data formats handled in the SCU. When writing or reading data through the data transfer BUSIF (SRCm in_BUSIF, SRCm out_BUSIF, or CMDn out_BUSIF), align data to match the appropriate data format from those in table Table 43.3. Data alignment can be changed through the SRCm(in/out)_BUSIF_MODE, SRCm_MODE register or CMDnout_BUSIF_MODE register (see section 43.2.4, SRCm_MODE Register (SRCm_MODE) or section 43.2.10, CMDn out_BUSIF_MODE Register (CMDn out_BUSIF_MODE)).

Table 43.3 Data Formats Handled in the SCU

*1. LSB is changeable, depends on stereo data width.

24-bit stereo data, multichannel data	17 to 23-bit stereo data, multichannel data	16-bit stereo data, multichannel data	9- to 15-bit stereo data, multichannel data	8-bit stereo data	16-bit monaural data	8-bit monaural data	
Notes: 1. Write 0 to the "x" bits in the table when writing data through the data transfer SRCm in_BUSIF. When reading data through the SRCm out_BUSIF or CMDn out_BUSIF, ignore the values read from these bits.
2. In the 8-bit stereo data format, (Lch/1) and (Rch/1) indicate the data pair to be processed first and (Lch/2) and (Rch/2) indicate the next data pair to be processed.
3. Only the MSB-first data formats can be used in the SRU.

43.3.4 Changing Data Order in Channel Units

The data order can be changed in channel units in the SCU immediately before input to the SRC and immediately after output from the CMD. Table 43.4 and Table 43.5 show the data places in each data format. Use SRCm_BUSIF_DALIGN or SRCn_BUSIF_DALIGN to change the order before input to the SRC (see section 43.2.2, SRCm_BUSIF_DALIGN Register (SRCm_BUSIF_DALIGN) or section 43.2.3, SRCn_BUSIF_DALIGN Register (SRCn_BUSIF_DALIGN). Use CMDn_BUSIF_DALIGN to change the order immediately after output from the CMD (see section 43.2.11, CMDn_BUSIF_DALIGN Register (CMDn_BUSIF_DALIGN)). Table 43.4 and Table 43.5 show the data places when these registers are set to the initial values.

Table 43.4 Data Places in Each Data Format (1)

43.3.5 SRC Block

The SRC is a block for implementing the sampling rate conversion function, which can convert asynchronous sampling rates.

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

- Asynchronous sampling rate conversion is available
- Supports resolutions up to 24 bits
- High-sound-quality type (THD + N* is -132 dB) and general-sound-quality type (THD + N* is -96 dB)
- Automatically generates antialiasing filter coefficients
- Four modules support one, two, four, six, or eight channels, and six modules support one or two channels.

Note: * Total harmonic distortion plus noise

[RZ/G2E]

- Asynchronous sampling rate conversion is available
- Supports resolutions up to 24 bits
- High-sound-quality type (THD + N* is -132 dB) and general-sound-quality type (THD + N* is -96 dB)
- Automatically generates antialiasing filter coefficients
- Two modules support one, two, four, six, or eight channels, and eight modules support one or two channels.

Note: * Total harmonic distortion plus noise

Figure 43.5 shows the SRC block diagram.

The "Input audio data" in the figure indicates the data before SRC processing is applied. The "Output audio data" indicates the data after SRC processing is applied.

The "Input data timing" is a signal to show the sampling period for the input audio data. The "Output data timing" is a signal to show the sampling period for the output audio data. When CMD is used in the route, the output data timing signal is the same signal as the output data timing signal used in the CMD.

In synchronous mode specified by setting the SRCMD bit in the SRCm_SRCCR register, when the sync_in bit in the SRCm_MODE register is set to 1, the SRCm doesn't need the input data timing signal, and when the sync_out bit in the SRCm_MODE register is set to 1, the SRCm doesn't need the output data timing signal.

Before using the SRC function, be sure to specify the sampling rate through the SRCm IFS value setting register (see section 43.2.22, SRCm IFS Value Setting Register (SRCm_IFSVR).

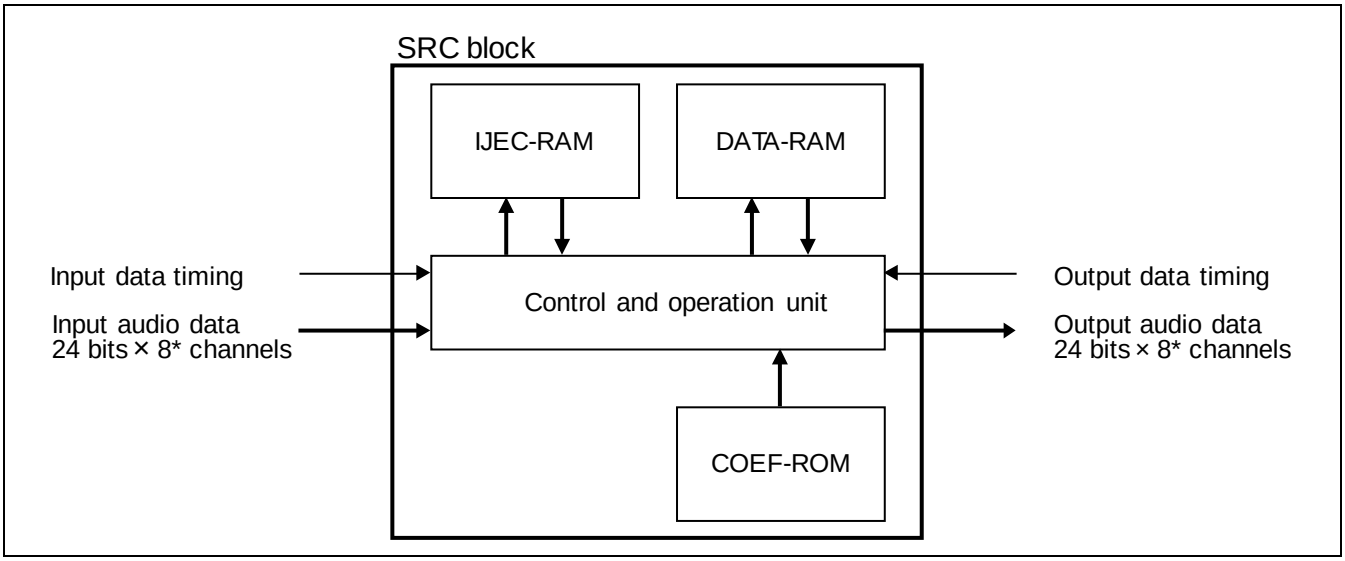

Figure 43.5 SRC Block Diagram

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] Table 43.6 shows the SRC functions.

Table 43.6 SRC Functions

Item		Performance			
Type of SRC		Asynchronous/ Synchronous SRC			
Channel number		1 or 2	4	6	8
Sampling rate of input source	SRC0	8k to 192k [Hz]	8k to 192k [Hz]	8k to 192k [Hz]	8k to 192k [Hz]
	SRC1, SRC3, SRC4	8k to 192k [Hz]	8k to 192k [Hz]	8k to 128k [Hz]	8k to 96k [Hz]
	SRC2, SRC9	8k to 192k [Hz]	—	—	—
	SRC5 to SRC8	8k to 192k [Hz]	—	—	—
Sampling rate of output source	SRC0	8k to 192k [Hz]	8k to 192k [Hz]	8k to 192k [Hz]	8k to 192k [Hz]
	SRC1, SRC3, SRC4	8k to 192k [Hz]	8k to 192k [Hz]	8k to 128k [Hz]	8k to 96k [Hz]
	SRC2, SRC9	8k to 192k [Hz]	—	—	—
	SRC5 to SRC8	8k to 192k [Hz]	—	—	—
Ratio of input and output sampling rates (FSO/FSI ratio)	SRC0	6 to 1/6 [times]	6 to 1/4 [times]	6 to 1/4 [times]	6 to 1/4 [times]
	SRC1, SRC3, SRC4	6 to 1/6 [times]	6 to 1/4 [times]	6 to 1/2 [times]	6 to 1/2 [times]
	SRC2, SRC9	6 to 1/6 [times]	—	—	—
	SRC5 to SRC8	6 to 1/6 [times]	—	—	—
Sound quality (THD+N)	SRC0 to SRC4, SRC9	-132 dB (for high-quality type)			
	SRC5 to SRC8	-96 dB (for general-quality type)			

[RZ/G2E] Table 43.7 shows the SRC functions.

Table 43.7 SRC Functions

Item		Performance			
Type of SRC		Asynchronous/ Synchronous SRC			
Channel number		1 or 2	4	6	8
Sampling rate of input source	SRC1, SRC3	8k to 192k [Hz]	8k to 192k [Hz]	8k to 128k [Hz]	8k to 96k [Hz]
	SRC0, SRC2, SRC4, SRC9	8k to 192k [Hz]	—	—	—
	SRC5 to SRC8	8k to 192k [Hz]	—	—	—
Sampling rate of output source	SRC1, SRC3	8k to 192k [Hz]	8k to 192k [Hz]	8k to 128k [Hz]	8k to 96k [Hz]
	SRC0, SRC2, SRC4, SRC9	8k to 192k [Hz]	—	—	—
	SRC5 to SRC8	8k to 192k [Hz]	—	—	—
Ratio of input and output sampling rates (FSO/FSI ratio)	SRC1, SRC3	6 to 1/6 [times]	6 to 1/4 [times]	6 to 1/2 [times]	6 to 1/2 [times]
	SRC0, SRC2, SRC4, SRC9	6 to 1/6 [times]	—	—	—
	SRC5 to SRC8	6 to 1/6 [times]	—	—	—
Sound quality (THD+N)	SRC0 to SRC4, SRC9	-132 dB (for high-quality type)			
	SRC5 to SRC8	-96 dB (for general-quality type)			

Table 43.8 and 43.9 show the IJEC RAM and DATA RAM buffer size settings and the latencies.

Latency is different by setting of channel number.

Select the combination of settings BUFDATA[10:0] bits in SRCm_BSDSR/ SRCn_BSDSR register and IJECSIZE[8:0] bits in SRCm_BSISR register from Table 43.8 and 43.9. Operation cannot be guaranteed if the register is not set as specified combination.

Output delay depends on FSO/FSI ratio and it is calculated from following formula.

Output delay [Output sample] = (Processing delay) × (FSO/FSI ratio) + (Logic delay*)

*Logic delay = 3[Output sample]

Table 43.8 Combination of Register Setting Related to FSO/FSI Ratio and Channel, Latency [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

(1) Register Setting Procedure

The following describes the SRC register setting procedures. The register should be used according to the following procedures.

(a) SRC Processing Procedure

Figure 43.6 shows the processing procedure of SRC.

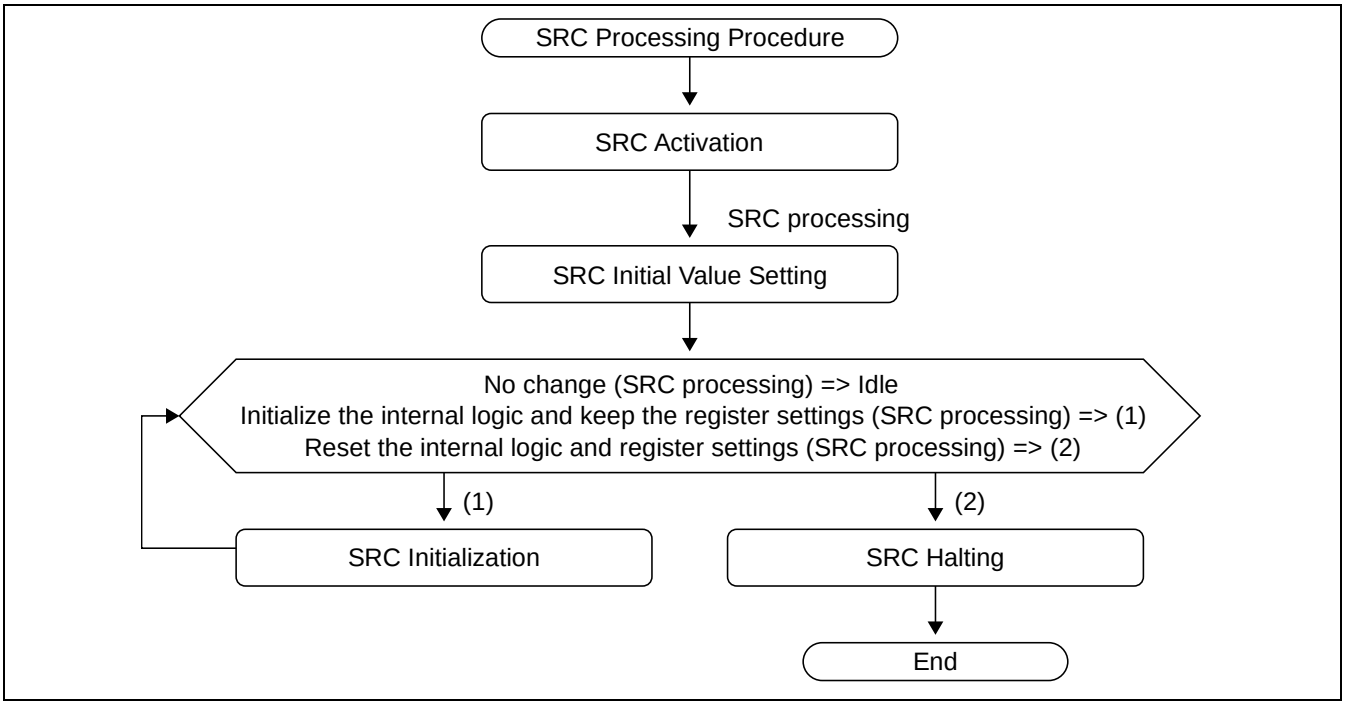

Figure 43.6 SRC Processing Procedure

(b) SRC Activation

Figure 43.7 shows the SRC activation flowchart. When the SRC is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate SRC. When reset the SRC function, all registers are initialized. If the SRC function was initialized by a hardware reset, it doesn't need to initialize the SRC function by software reset.

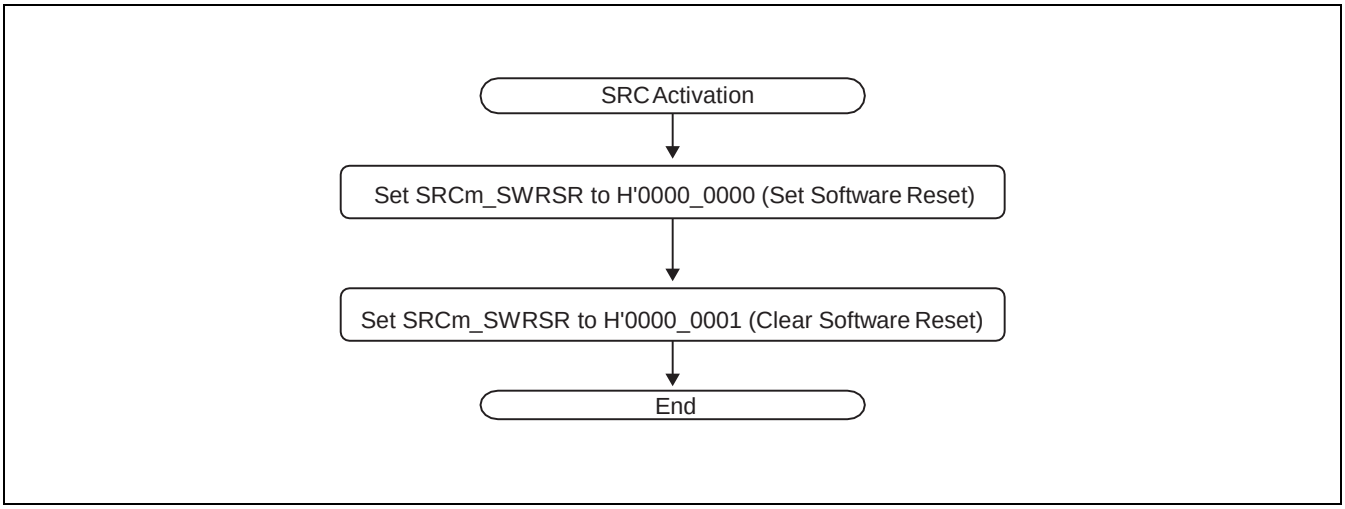

Figure 43.7 SRC Activation Flowchart

(c) SRC Initial Value Setting

Figure 43.8 shows the flowchart of the SRC initial value setting. Before operate SRC function, the initial values should be set.

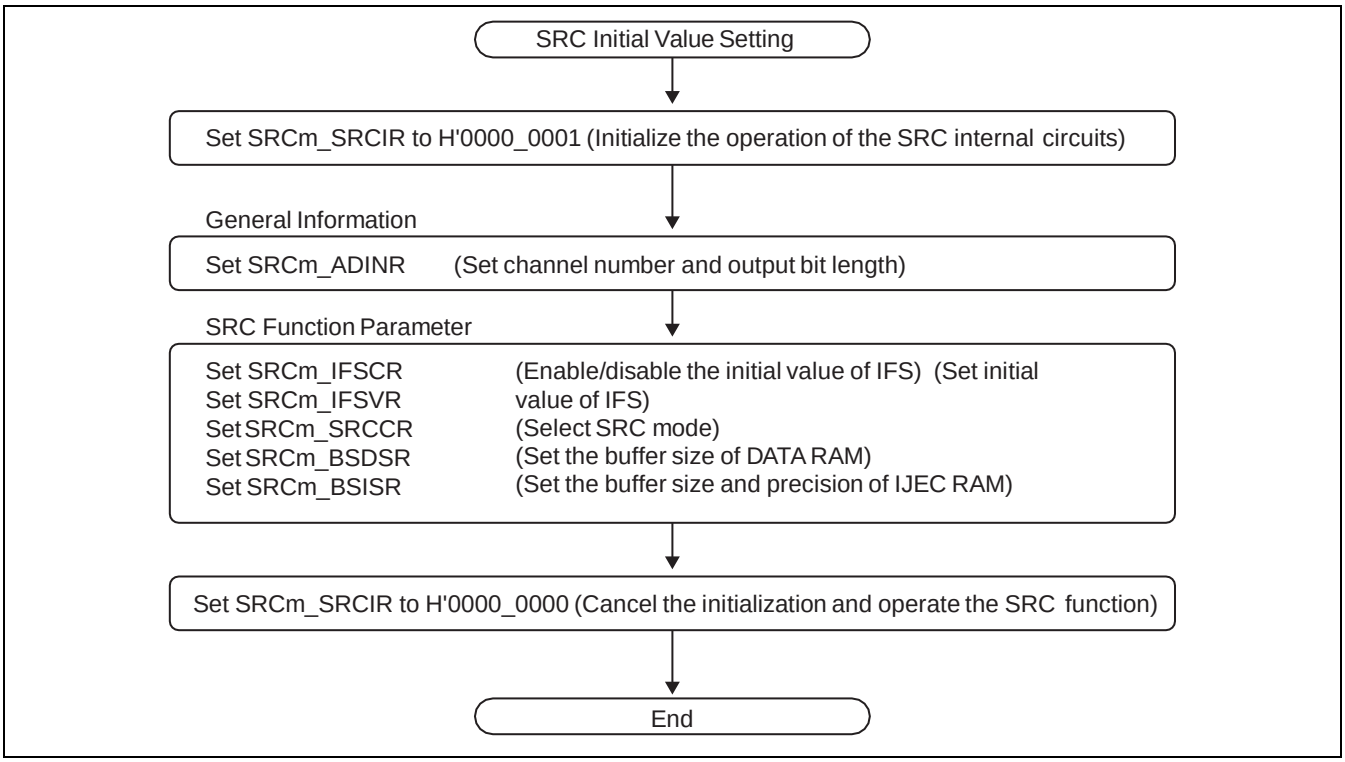

Figure 43.8 SRC Initial Value Setting Flowchart

(d) SRC Initialization

Figure 43.9 shows the SRC initialization flowchart. SRCm_SRCIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP. And also it is necessary to provide the input and output timing signal.

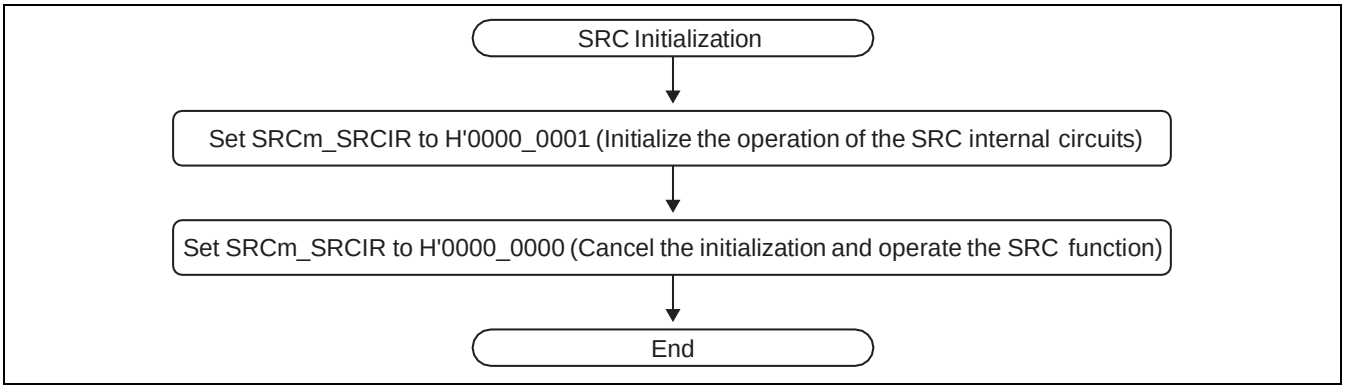

Figure 43.9 SRC Initialization Flowchart

(e) SRC Halting

Figure 43.10 shows the flowchart of SRC halting. When SRC is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the SRC function, it is necessary to confirm the register settings and operation of peripheral IP.

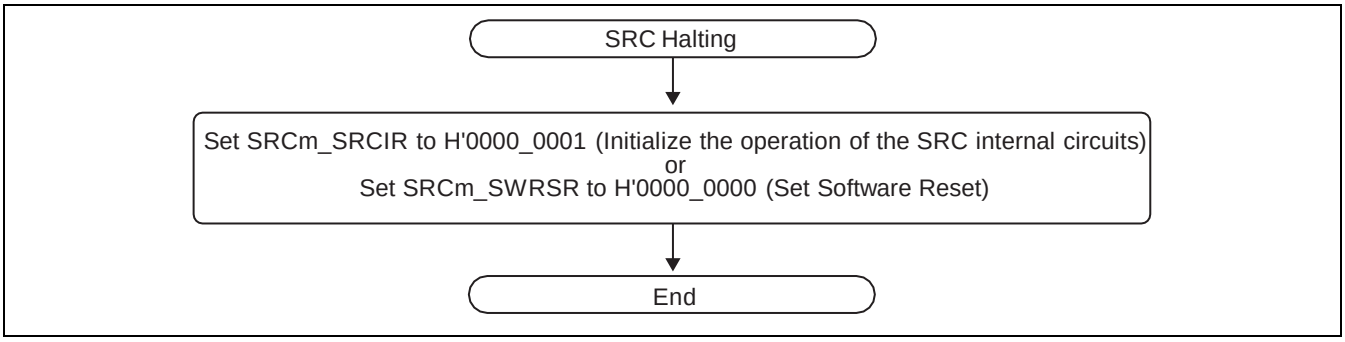

Figure 43.10 SRC Halting Flowchart

43.3.6 CMD Block

The CMD is a block for implementing the channel transfer unit (CTU block), mixing (MIX block), and digital volume and mute (DVC block) functions. Figure 43.11 shows the CMD block diagram.

The "Input audio data 0" to "Input audio data 3" in the figure indicate the data before the CMD function is applied. The "Output audio data" indicates the data after the CMD function is applied.

The "Output data timing" is a signal to show the sampling period for the output audio data. In addition, give the same signals to CMD output timing signal and output data timing signal used in the SRC.

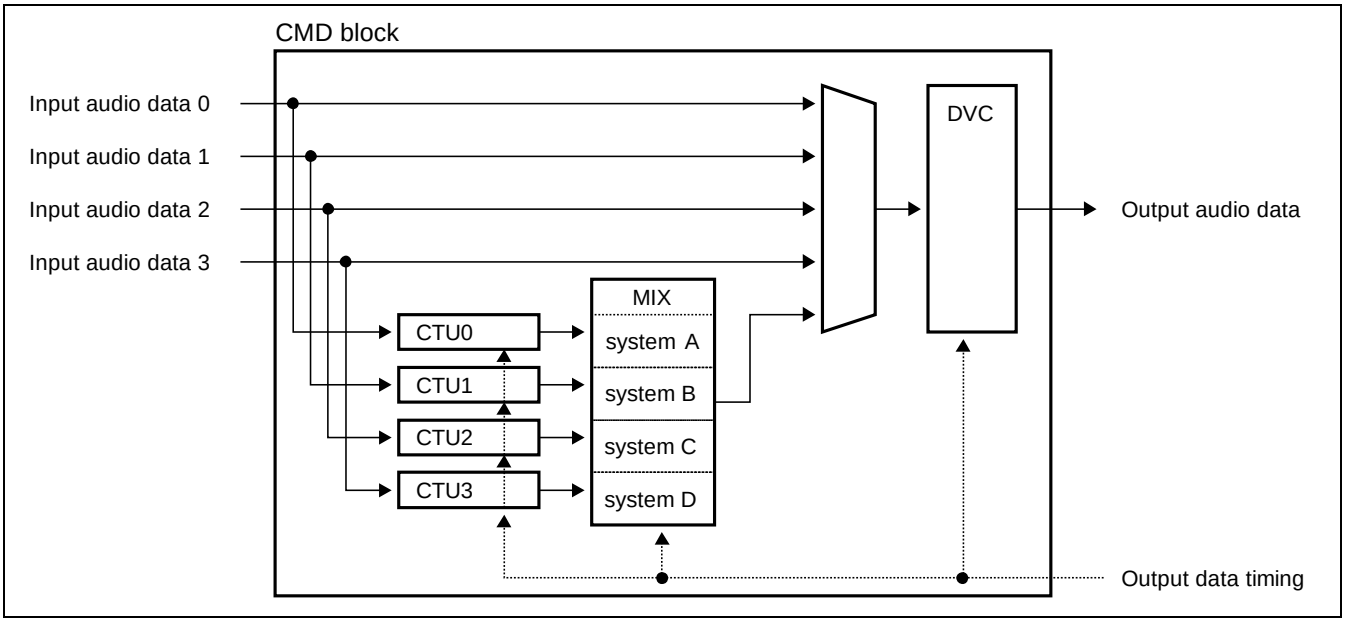

Figure 43.11 CMD Block Diagram

43.3.7 Functional Blocks in CMD

(1) CTU Block

The CTU is a block for implementing channel transfer unit functions such as downmixing and splitter functions.

- Downmixing and splitter functions
  - Conversion of eight input channels into two output channels
  - Conversion of six input channels into two output channels
  - Conversion of two input channels into four sets of two output channels
  - Conversion of one input channel into eight sets of one output channel
  - No conversion

The settings of the Scale Value e00 to Scale Value e37 registers are calculated by using the following formula (signed bits are excluded):

Setting (decimal) = $10^X \times 4194304$

X = (value in dB) / 20

(a) Register Setting Procedure

The following describes the CTU register setting procedures. The register should be used according to the following procedures.

- CTU Processing Procedure
  Figure 43.12 shows the processing procedure of CTU.

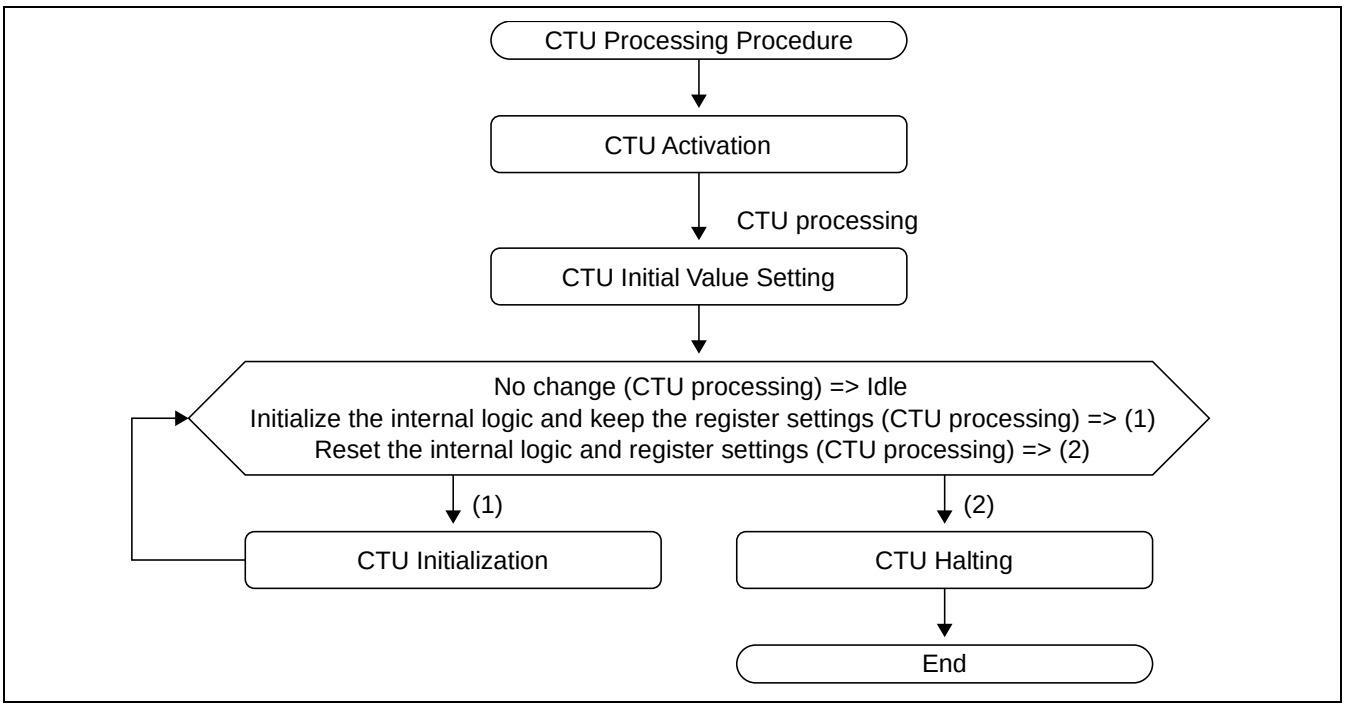

Figure 43.12 CTU Processing Procedure

- CTU Activation
  Figure 43.13 shows the CTU activation flowchart. When the CTU is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate CTU. When reset the CTU function, all registers are initialized. If the CTU function was initialized by a hardware reset, it doesn't need to initialize the CTU function by software reset.

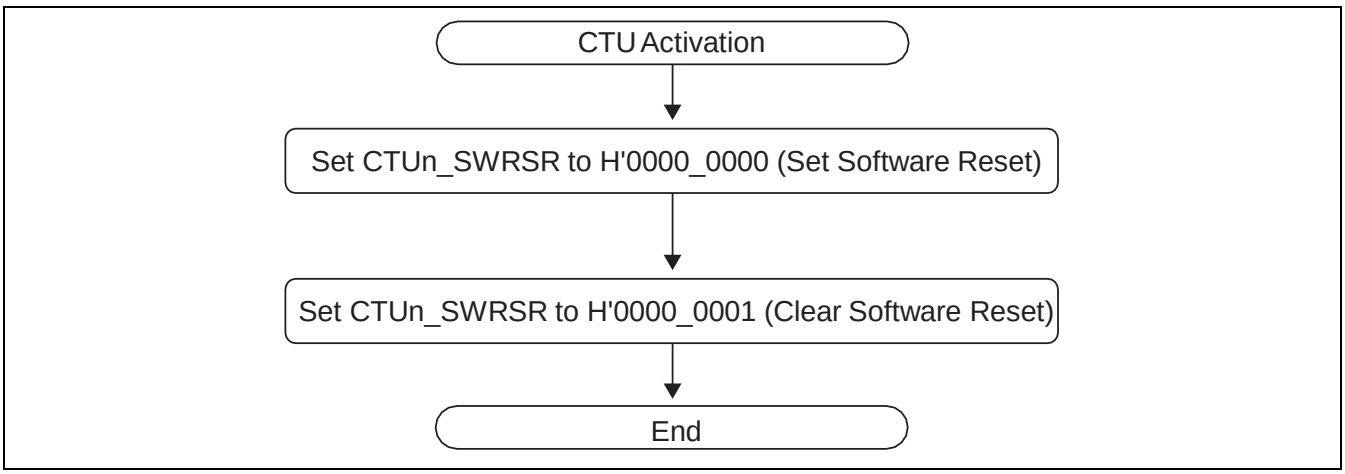

Figure 43.13 CTU Activation Flowchart

- CTU Initial Value Setting

  Figure 43.14 shows the flowchart of the CTU initial value setting. Before operate CTU function, the initial values should be set. After set the register setting and cancel the initialization, CTU module starts the operation.

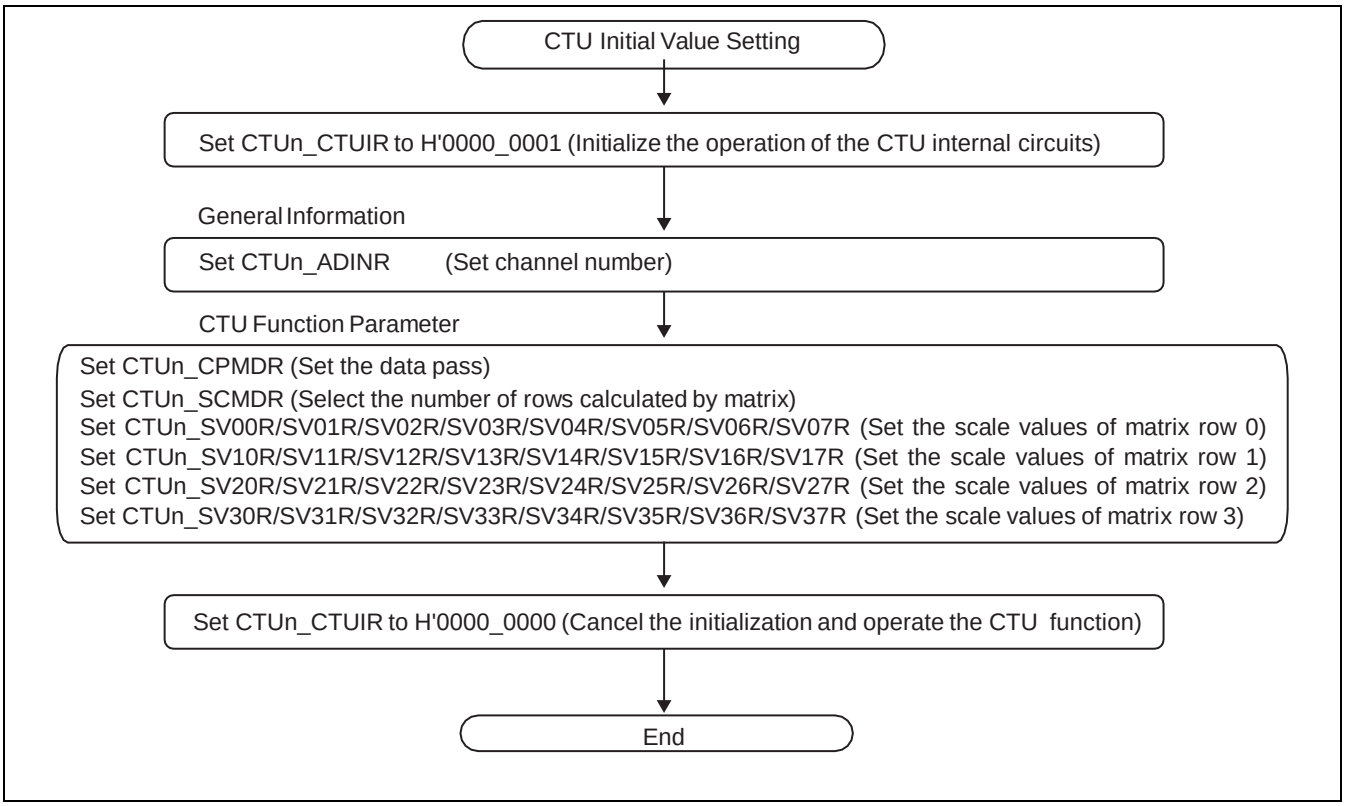

Figure 43.14 CTU Initial Value Setting Flowchart

- CTU Initialization

  Figure 43.15 shows the CTU initialization flowchart. CTUn_CTUIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

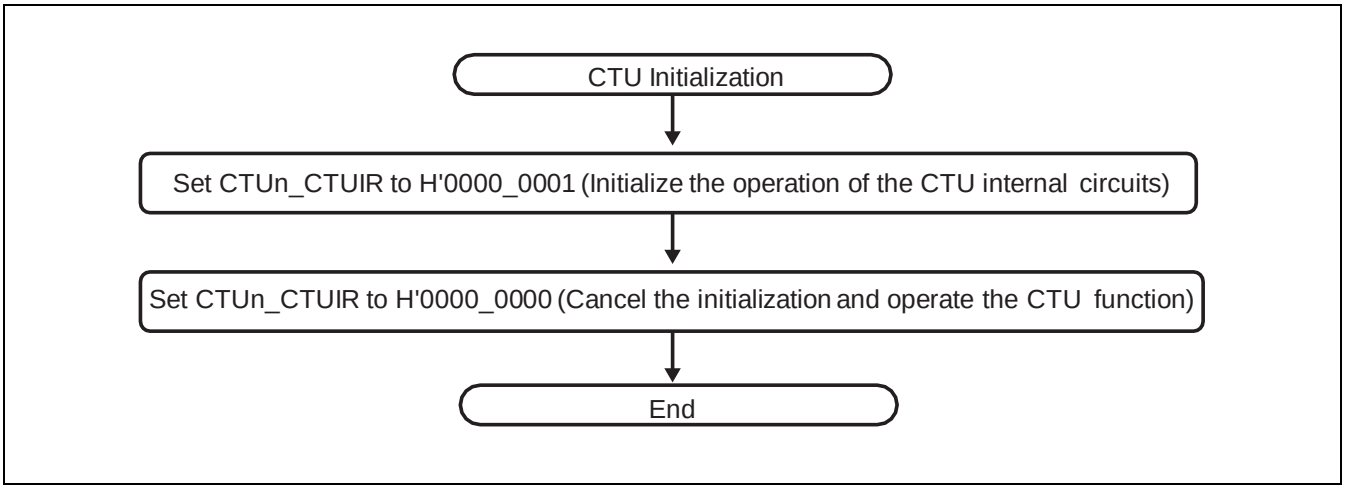

Figure 43.15 CTU Initialization Flowchart

- CTU Halting

  Figure 43.16 shows the flowchart of CTU halting. When CTU is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the CTU function, it is necessary to confirm the register settings and operation of peripheral IP.

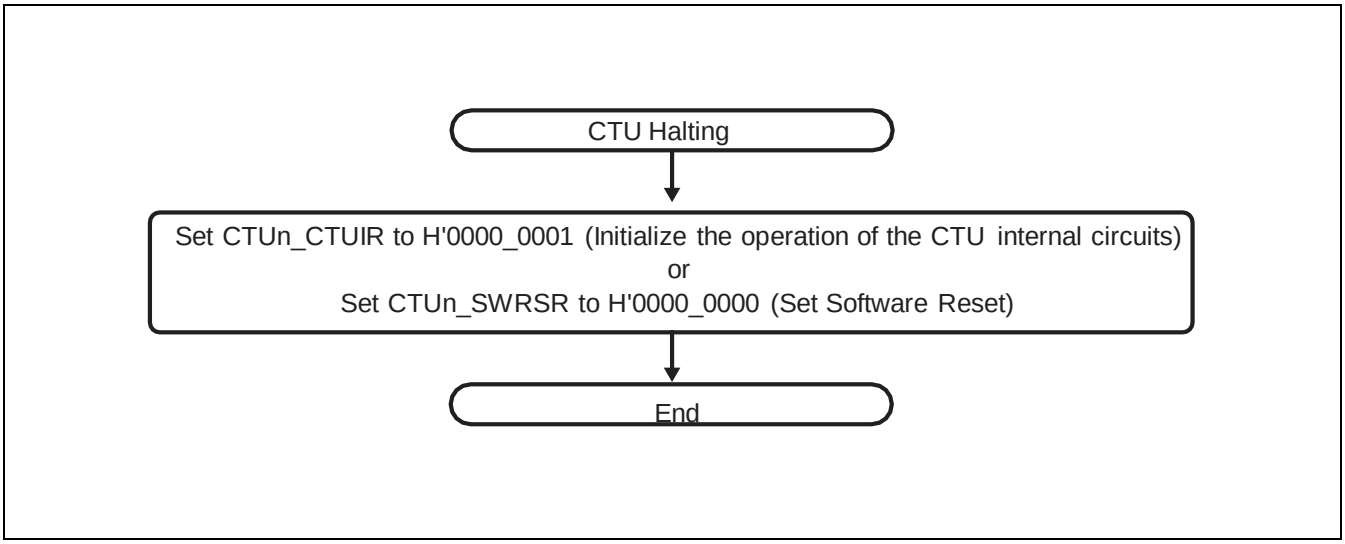

Figure 43.16 CTU Halting Flowchart

- CTU – Example

  The channel conversion executes the linear transformation (matrix operation) as follows.

$$\begin{pmatrix} y_0 \\ y_1 \\ y_2 \\ y_3 \\ y_4 \\ y_5 \\ y_6 \\ y_7 \end{pmatrix} = \begin{pmatrix} e_{00} & e_{01} & e_{02} & e_{03} & e_{04} & e_{05} & e_{06} & e_{07} \\ e_{10} & e_{11} & e_{12} & e_{13} & e_{14} & e_{15} & e_{16} & e_{17} \\ e_{20} & e_{21} & e_{22} & e_{23} & e_{24} & e_{25} & e_{26} & e_{27} \\ e_{30} & e_{31} & e_{32} & e_{33} & e_{34} & e_{35} & e_{36} & e_{37} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix} \times \begin{pmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \\ x_6 \\ x_7 \end{pmatrix}$$

x_i : Input data of channel i (i = 0 to 7)
y_i: Output data of channel i (i = 0 to 7)
e_j: CTUn_SVjR.SVEj (j = 00, 01, 02, 03, 04, 05, 06, 07,
10, 11, 12, 13, 14, 15, 16, 17,

Figure 43.17 2 channels fold-down (Lt/Rt Downmix)

(2) MIX Block

The MIX block is for mixing (adding) streams from two to four audio data sources into a single stream.

- Ratio for adding sources is selectable
- Ratio is dynamically changeable
- Mixing with volume ramp is available (ramp period is selectable)

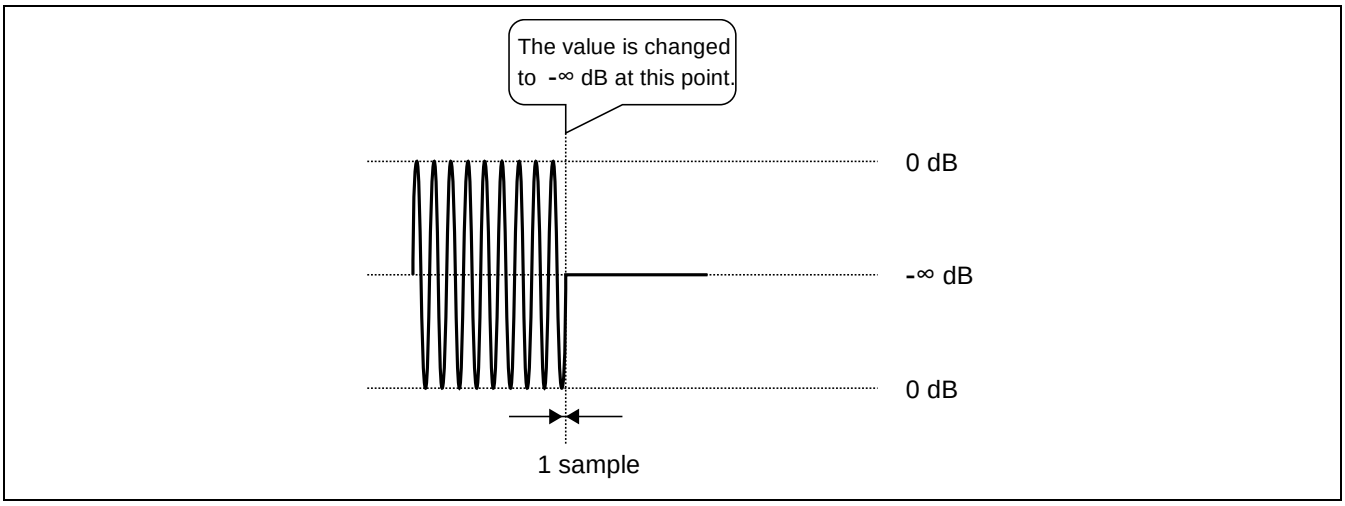

Figure 43.18 Step Processing

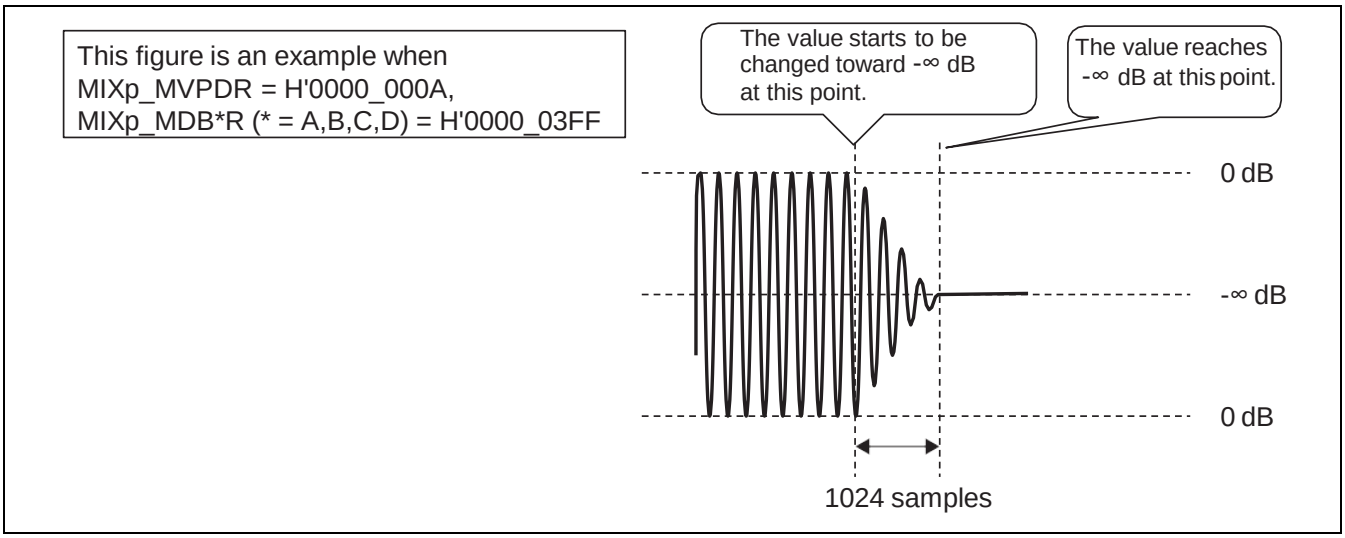

Figure 43.19 Ramp Processing

Table 43.11 to Table 43.14 show the settings of the MIX decibel register and the corresponding levels in decibels.

(a) Register Setting Procedure

The following describes the MIX register setting procedures. The register should be used according to the following procedures.

- MIX Processing Procedure
  Figure 43.20 shows the processing procedure of MIX.

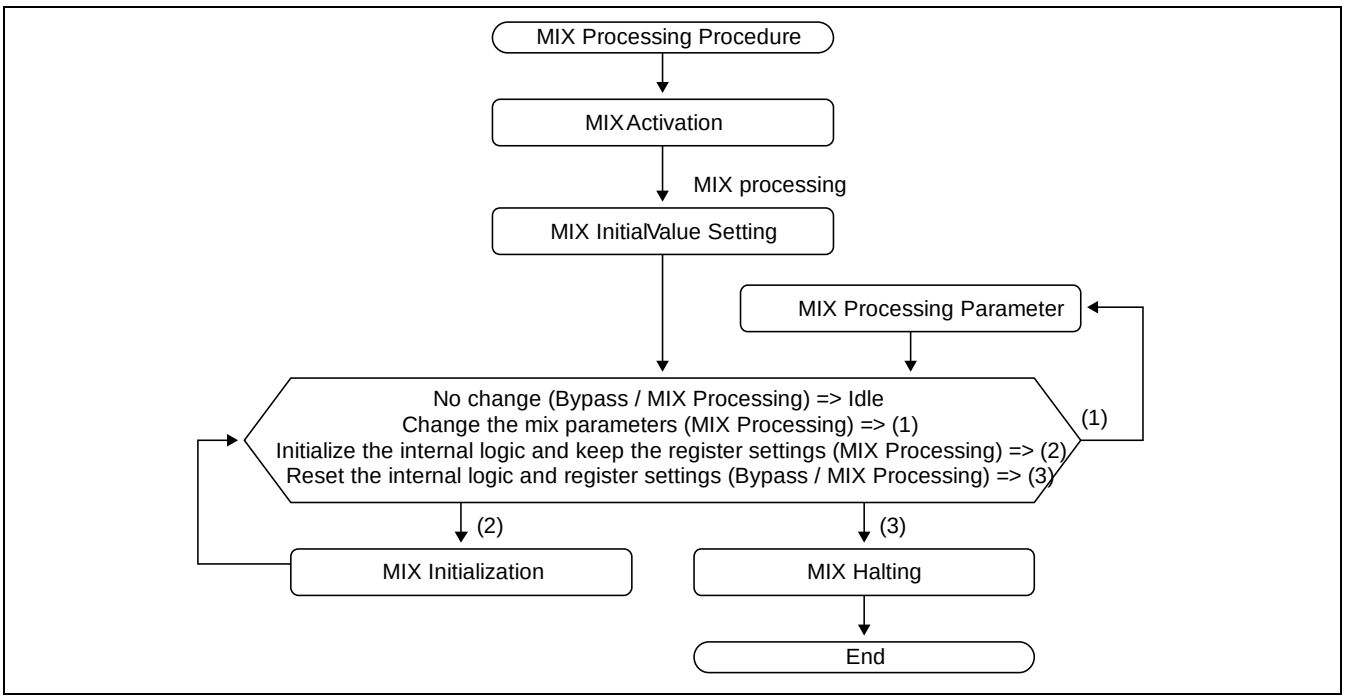

Figure 43.20 MIX Processing Procedure

- MIX Activation
  Figure 43.21 shows the MIX activation flowchart. When the MIX is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate MIX. When reset the MIX function, all registers are initialized. If the MIX function was initialized by a hardware reset, it doesn't need to initialize the MIX function by software reset.

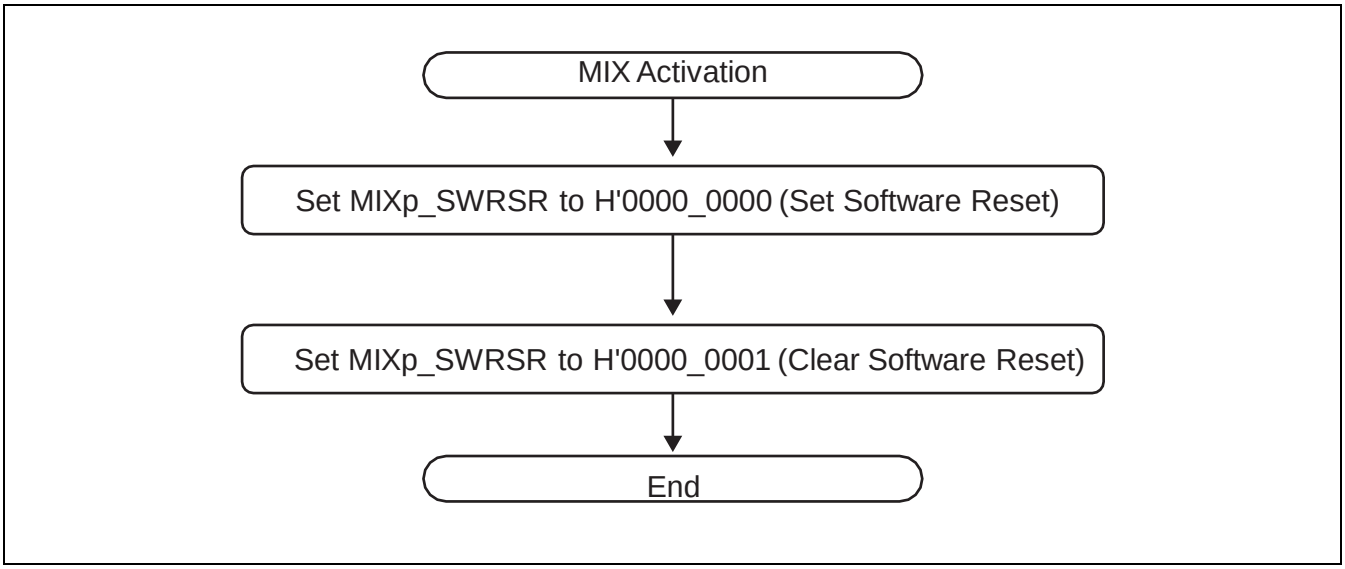

Figure 43.21 MIX Activation Flowchart

- MIX Initial Value Setting

  Figure 43.22 shows the flowchart of the MIX initial value setting. Before operate MIX function, the initial values should be set. After set the register setting and cancel the initialization, MIX module changes the volume of each system by volume step to the dB value of MIXp_MDBAR and MIXp_MDBBR and MIXp_MDBCR and MIXp_MDBDR regardless of MIXp_MIXMR setting.

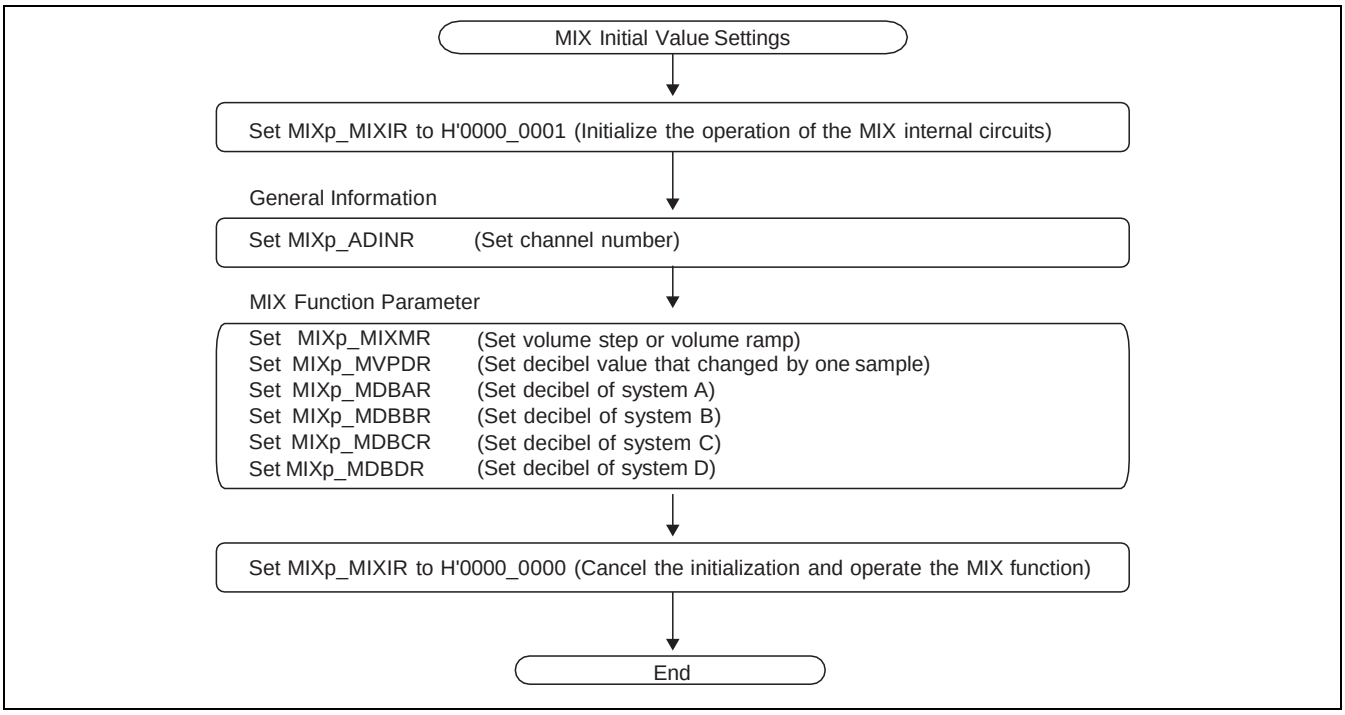

Figure 43.22 MIX Initial Value Setting Flowchart

- MIX Processing Parameter

  Figure 43.23 shows the MIX processing parameter flowchart. Before change the parameter of decibel for each system, the setting of the MIXp_MDBER should be disables. After that set the decibels of MIXp_MDBAR and MIXp_MDBBR and MIXp_MDBCR and MIXp_MDBDR and enables the MIXp_MDBER for reflect the decibel setting to the MIX processing.

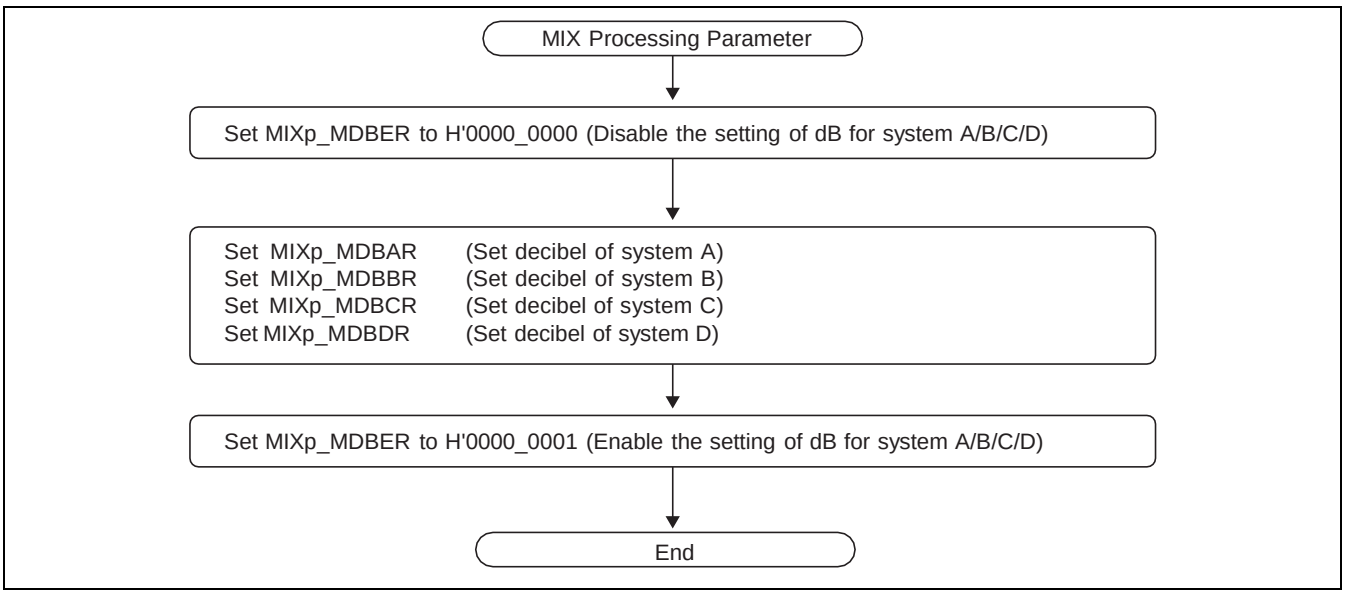

Figure 43.23 MIX Processing Parameter Flowchart

- MIX Initialization

  Figure 43.24 shows the MIX initialization flowchart. MIXp_MIXIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

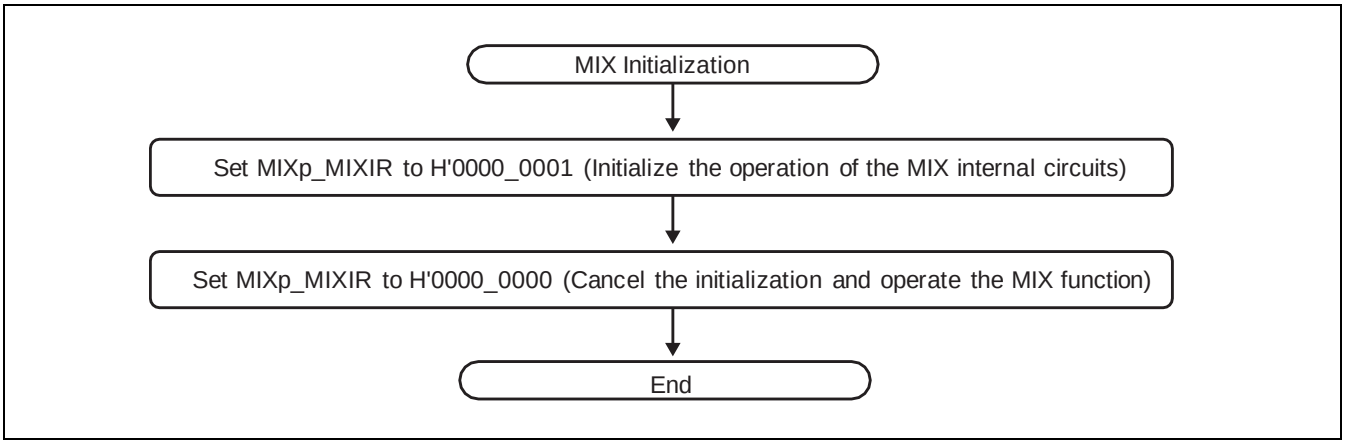

Figure 43.24 MIX Initialization Flowchart

- MIX Halting

  Figure 43.25 shows the flowchart of MIX halting. When MIX is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the MIX function, it is necessary to confirm the register settings and operation of peripheral IP.

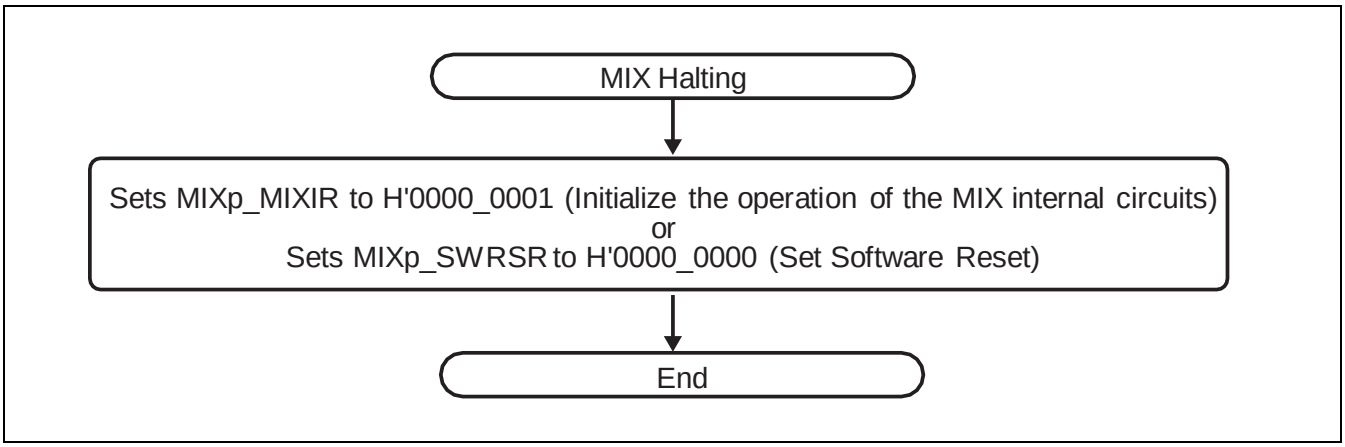

Figure 43.25 MIX Halting Flowchart

(3) DVC Block

The DVC is a block for implementing the volume and mute functions.

- Volume control function including digital volume, volume ramp, and zero-crossing mute
- The digital volume function is specified by a 24-bit fixed-point value within the range from 0 to 8 times (mute or -120 to 18 dB)
- The volume ramp function can be used for soft mute, fade-in, fade-out, or desired volume adjustment
- The volume ramp period can be changed within the sampling range from the 0th to 23rd power of 2
- The zero-crossing mute function silences the sound at the zero-crossing point of the audio data

Table 43.15 shows the DVC functions.

Table 43.15 DVC Functions

Item	Performance
Digital volume	Range: -120 dB to 18 dB (9.5×10^{-7} times to 8 times)
Volume ramp	Volume ramp is used for many kinds of operation (soft mute, fade-in, fade-out, and volume adjustment by ramp) Ramp period: 2^0/fso to 2^{23}/fso Examples: (1/fso: -128 dB/1 step) (2/fso: -64 dB/1 step) (4/fso: -32 dB/1 step) : (128/fso: -1 dB/1 step) (256/fso: -0.5 dB/1 step) (512/fso: -0.25 dB/1 step) (1024/fso: -0.125 dB/1 step) (2048/fso: -0.125 dB/2 steps) (4096/fso: -0.125 dB/4 steps) : (8388608/fso: -0.125 dB/8192 steps)
Zero-crossing mute	Mute the signal at zero-crossing point

The settings and corresponding values for the volume ramp are the same as those listed in Table 43.11 to Table 43.14.

The settings and corresponding values for the digital volume are calculated by using the following formula:

Setting (decimal) = $10^X \times 1048576$

X = (value in dB) / 20

(a) Register Setting Procedure

The following describes the DVC register setting procedures. The register should be used according to the following procedures.

- DVC Processing Procedure
  Figure 43.26 shows the processing procedure of DVC.

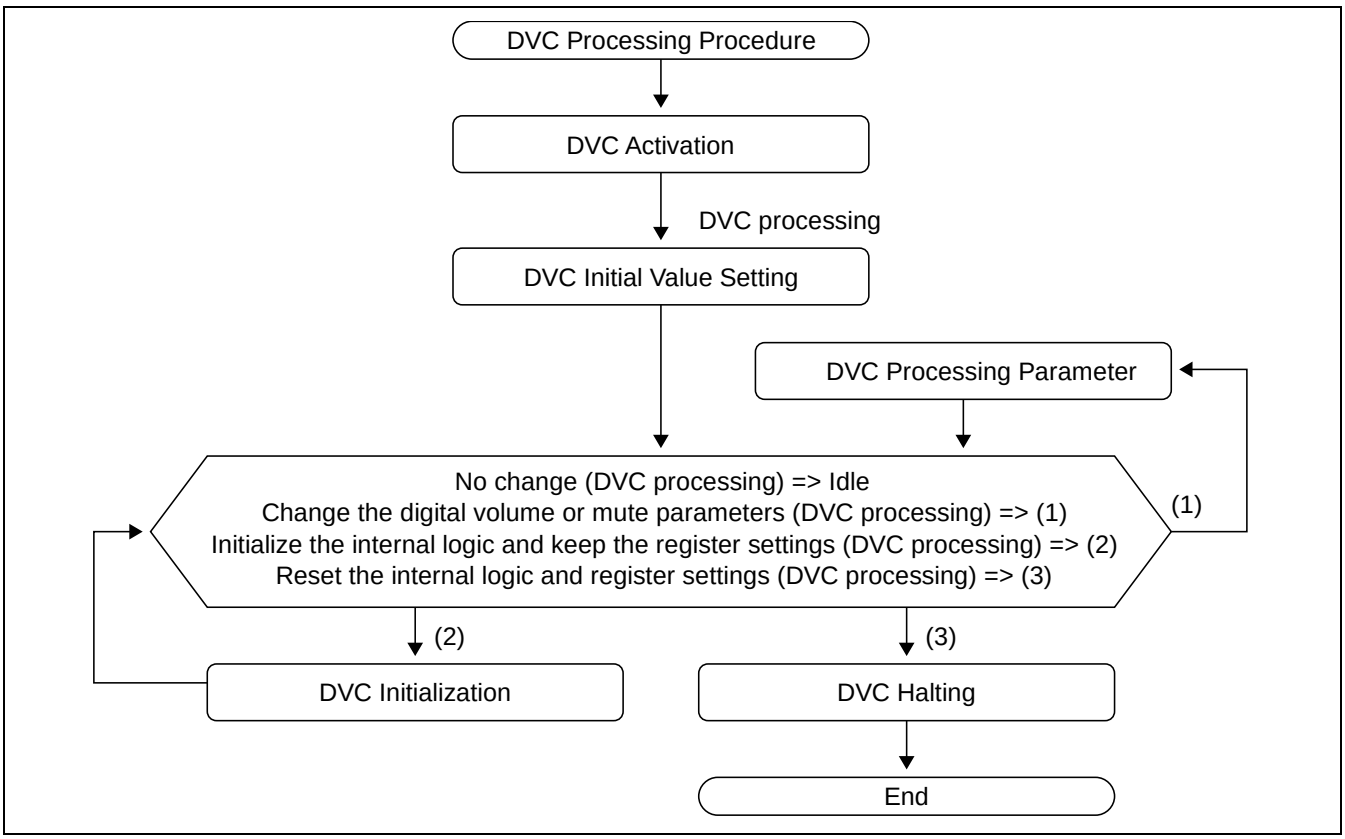

Figure 43.26 DVC Processing Procedure

- DVC Activation
  Figure 43.27 shows the DVC activation flowchart. When the DVC is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate DVC. When reset the DVC function, all registers are initialized. If the DVC function was initialized by a hardware reset, it doesn't need to initialize the DVC function by software reset.

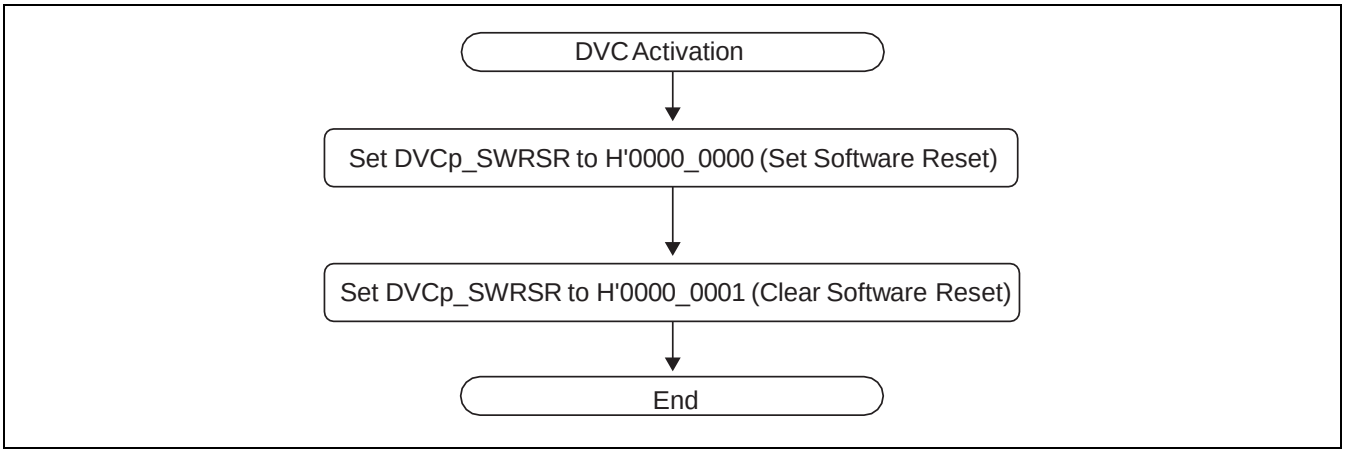

Figure 43.27 DVC Activation Flowchart

- DVC Initial Value Setting

  Figure 43.28 shows the flowchart of the DVC initial value setting. Before operate DVC function, the initial values should be set.

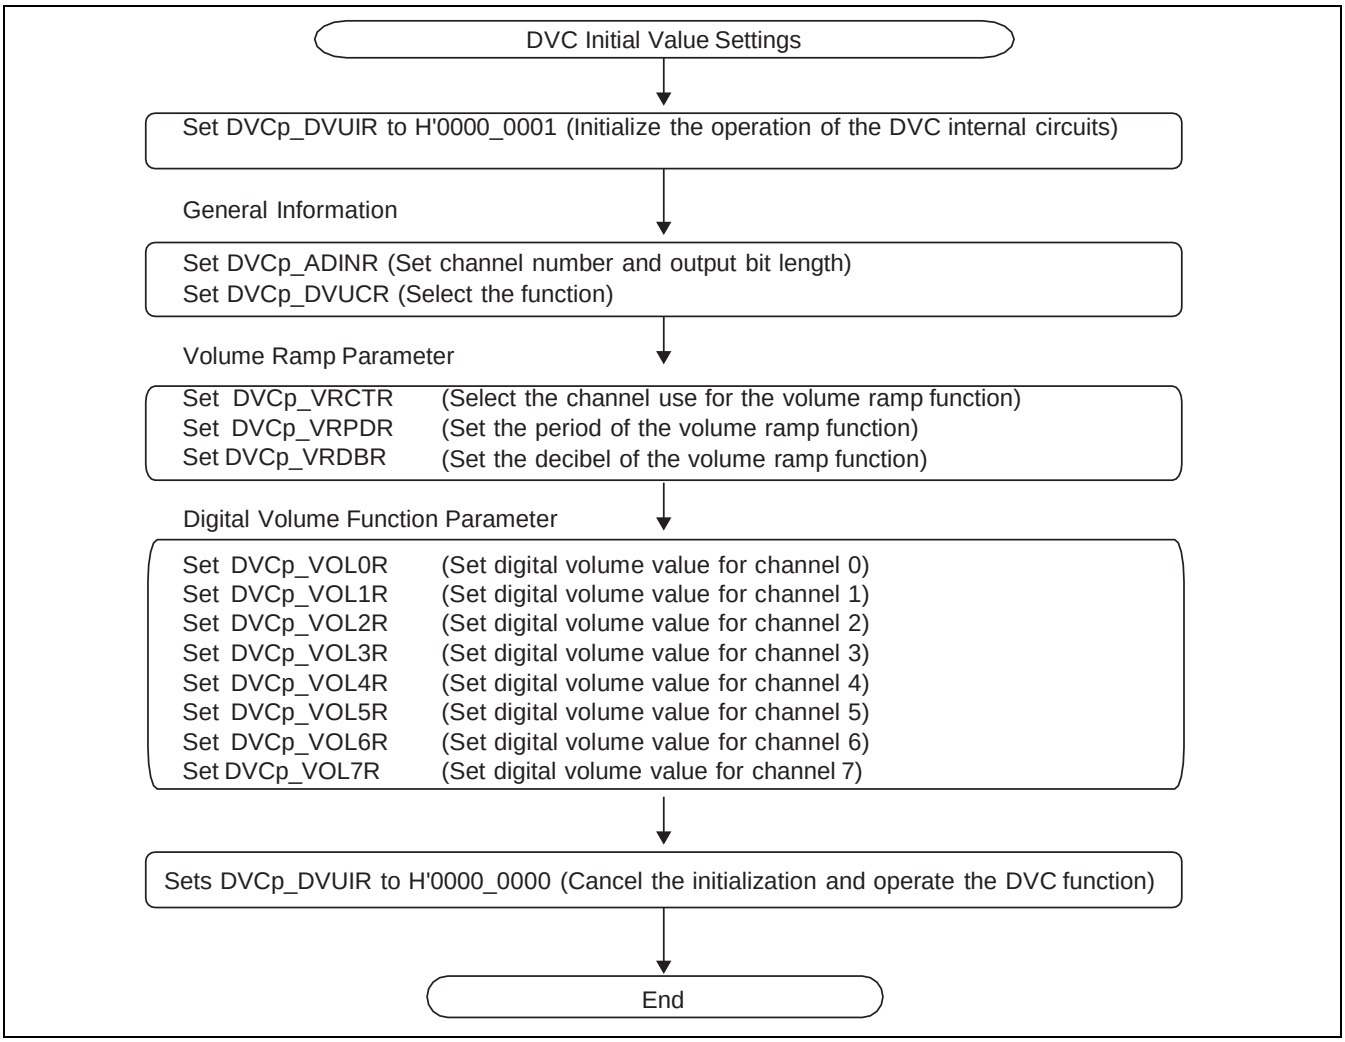

Figure 43.28 DVC Initial Value Setting Flowchart

- DVC Processing Parameter

  Figure 43.29 shows the DVC processing parameter flowchart. When DVC is processing, user can control the zero cross mute and the volume ramp and the digital volume value or by changing the setting value of registers. Before change the parameter of each function, the setting of DVCp_DVUER should be disables. After that set the setting of each function and enables the DVCp_DVUER for reflect the register setting to the DVC processing.

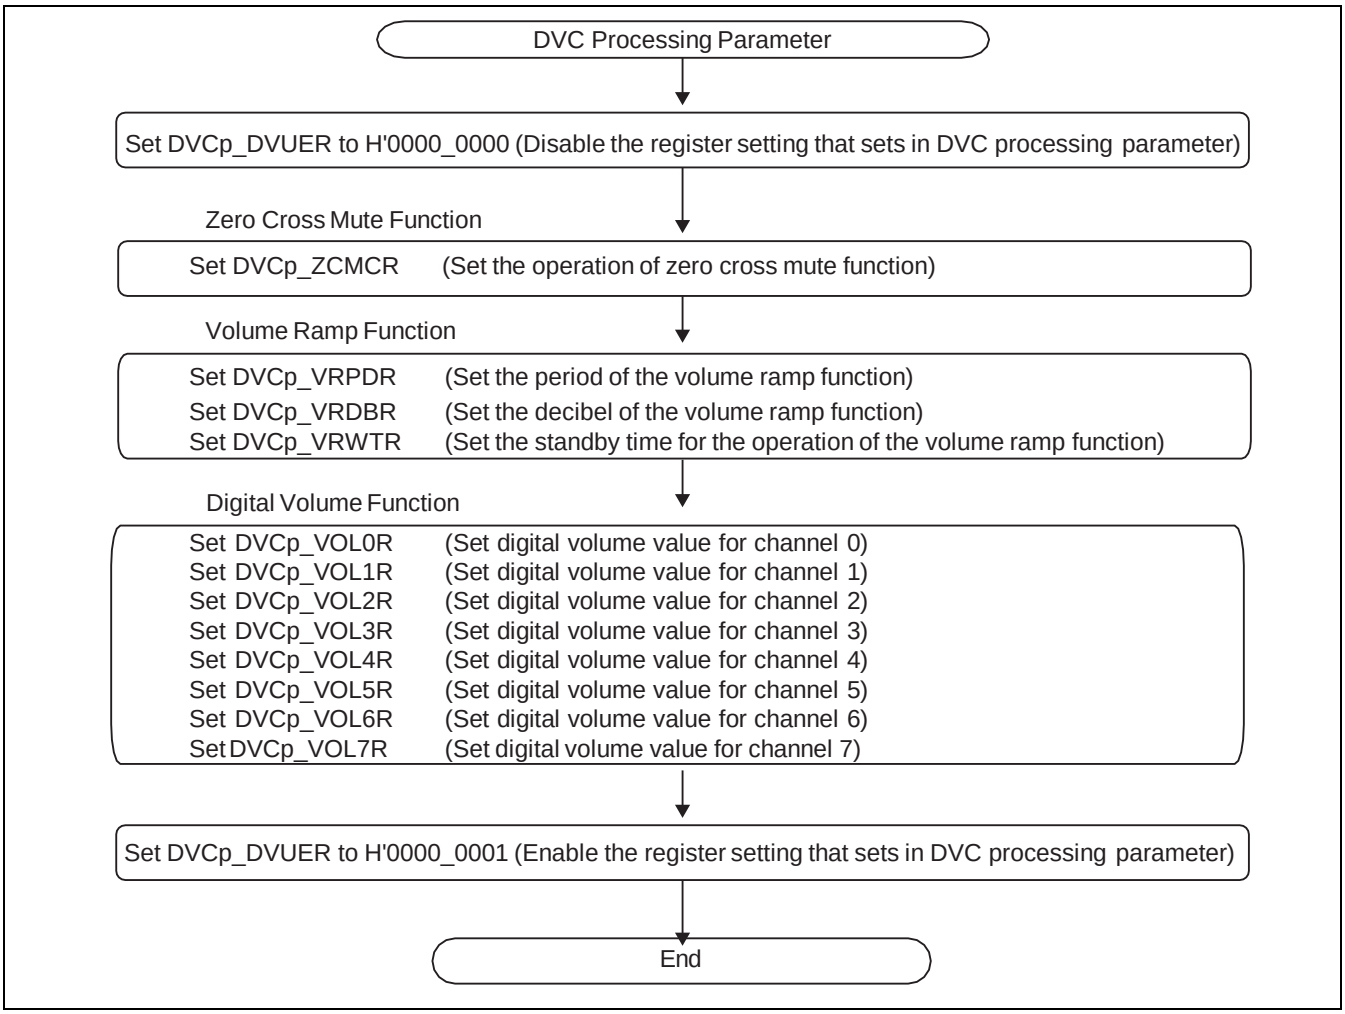

Figure 43.29 DVC Processing Parameter Flowchart

- DVC Initialization

  Figure 43.30 shows the flowchart of DVC Initialization. DVCp_DVUIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

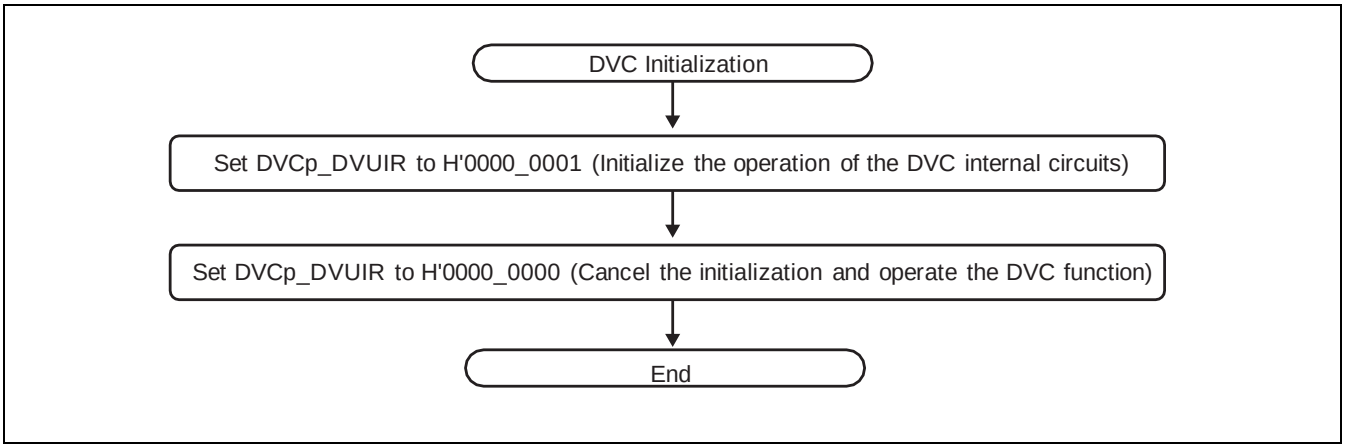

Figure 43.30 DVC Initialization Flowchart

- DVC Halting

  Figure 43.31 shows the flowchart of DVC halting. When DVC is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the DVC function, it is necessary to confirm the register settings and operation of peripheral IP.

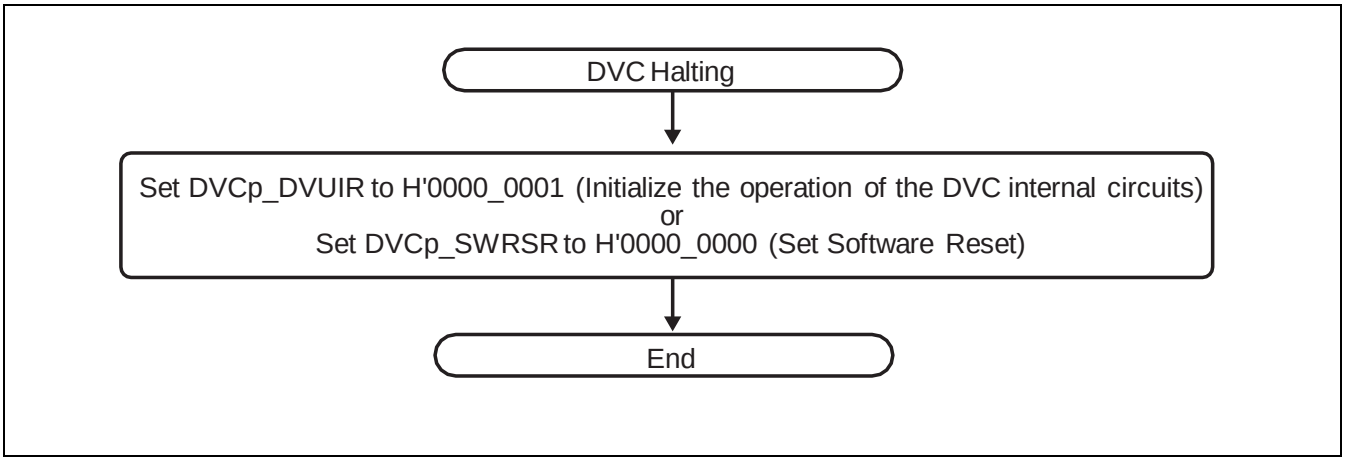

Figure 43.31 DVC Halting Flowchart

43.3.8 Input Data Timing and Output Data Timing

When using the SRC or CMD, the input data timing and output data timing should be specified. For details of the settings, refer to section 42, Audio Clock Generator (ADG).

43.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

43.4.1 Notes on Fixed Value related to SCU registers

The fixed value is needed for these bits in the SCU registers.
It is necessary to change from the initial value to the specific fixed value for the bits of the registers on Table 43.17.
Setting other value is prohibited.

Table 43.16 Fixed Value for the SCU Registers without any condition

Section	Bit Number	Fixed Value
43.2.23 SRCm SRC Control Register	16	B'1
	12	B'1
	8	B'1
	4	B'1
43.2.21 SRCm IFS Control Register	0	B'1
43.2.22 SRCm IFS Value Setting Register	27 to 0	The value of FSI should be calculated into them. A calculate method can be found in that section.
43.2.24 SRCm Buffer Size DATA RAM Setting Register	26 to 16	Depends on your needs. *
43.2.25 SRCn Buffer Size DATA RAM Setting Register	26 to 16	Depends on your needs. *
43.2.26 SRCm Buffer Size IJEC RAM Setting Register	21 to 16	H'10
	8 to 0	Depends on your needs. *

Note: * The fixed value depends on your needs. Refer to the explanation in those section or related table.

Table 43.17 Fixed Value for the SCU Registers with some condition

Section	Bit Number	Fixed Value	Condition
43.2.5 SRCm Control Register	4	B'0	A condition is described in a note of that section. Refer to that note.
43.2.21 SRCm IFS Control Register	23 to 20	H'2	Only when fast_ijc_en = 1, as bit 31
	19 to 16	H'4	Only when fast_ijc_en = 1, as bit 31
43.2.80 DVCp Volume Ramp Control Register	7 to 0	H'FF	VRMD bit of DVCp_DVUCR register is 1.

43.4.2 Note on generation and selection of timing signal

For details on generation and selection of timing signals, see section 42. Audio Clock Generator (ADG).

44. Direct Memory Access Controller for Audio (Audio-DMAC)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

44.1 Overview

This LSI includes a direct memory access controller for audio (audio-DMAC). The audio-DMAC can be used in place of the CPU to handle high-speed data transfer to and from an external memory, the on-chip memory, memory-mapped external devices, or on-chip peripheral modules.

44.1.1 Features

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

- Up to 32 channels are available.

[RZ/G2E]

- Up to 16 channels are available.

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]

- 1-T byte physical address space
- Transfer data length: Byte, word (2 bytes), long-word (4 bytes), 8 bytes, 16 bytes, 32 bytes, and 64 bytes
- Maximum number of transfer times: 16,777,215
- Address mode: Dual address mode
- Transfer requests:

  Requests from on-chip peripheral modules or auto requests can be selected. The following modules can issue on-chip peripheral module requests.

  SSI0 to SSI9, SCU0 to SCU9
- Selectable bus modes:

  Normal speed mode or slow mode can be selected for each channel.
- Either fixed priority or round-robin arbitration can be selected for use in arbitration among the transfer channels.
- Interrupt request:

  The audio-DMAC can be set up to generate an interrupt request for the CPU upon completion of transfer under the control of one stage of the descriptor memory, at the end of the data transfer, in response to an MMU error, and in response to an address error.
- Descriptor memory function:

  Up to 128 sets of the settings for the source address register, destination address register, and transfer count register are available (if use of the descriptor memory is only enabled for one channel) for use in setting up consecutive DMA transfers (the memory can hold register values for up to 256 stages of transfer when the external memory is selected). An infinite repeat mode is also available.

Figure 44.1 shows the block diagram of the audio-DMAC.

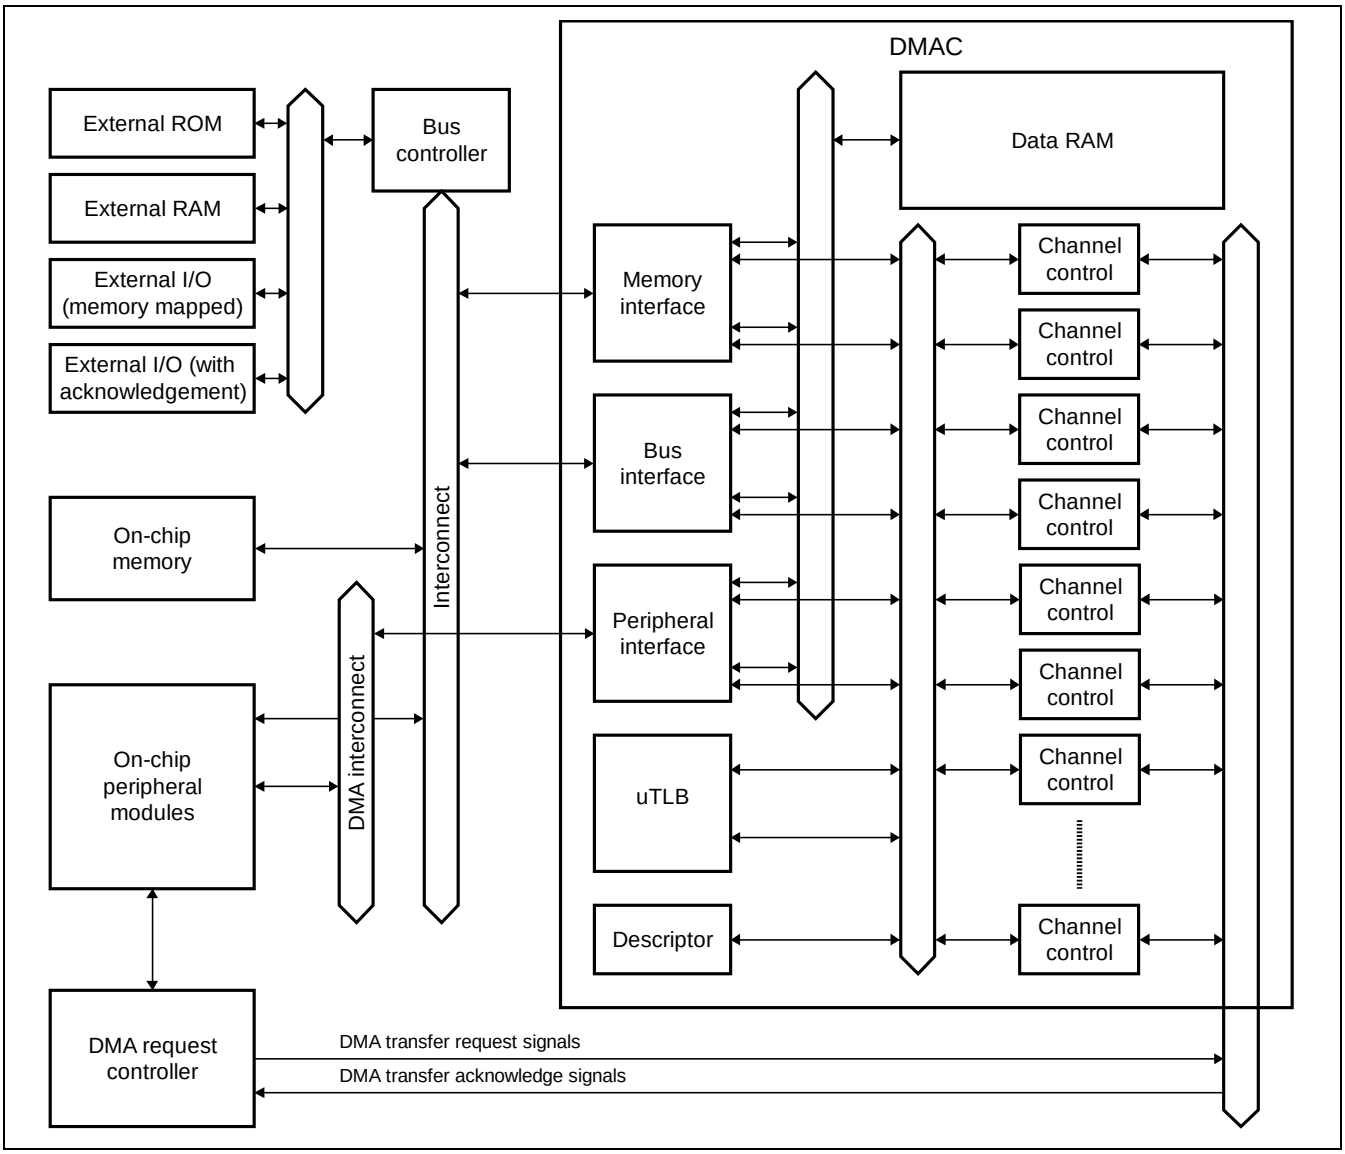

Figure 44.1 Block Diagram of the Audio-DMAC

44.1.2 External Pins

There are no external pins relevant to the audio-DMAC.

44.1.3 Register Configuration

Table 44.1 lists the registers of the audio-DMAC. Table 44.2 shows the register states of the audio-DMAC in each operating mode.

Note: The number of the audio-DMAC channels and the registers in use depend on the product:
32 channels for the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 (registers for both the higher- and lower-numbered sets of channels 0 to 15 and 16 to 31 are in use)

Table 44.1 Register Configuration of the Audio-DMAC

44.1.4 Connected Modules

Table 44.3 shows the connected modules to Audio-DMAC. As for the feature of the connected modules, refer to the chapter of each modules.

Table 44.3 Connected Modules

Module name	Connected module name	Function of connected module
Direct Memory Access Controller for Audio (Audio-DMAC)	CPG	Output clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-SYS	Control to interrupt
	IPMMU	UTLB function
	Audio AXI Main Bus	MEM I/F-128bit, BUS I/F-64bit connection
	Audio AXI DMAC Bus	PERI I/F-64bit connection
	D-REQ synchronous	DMA request and RACK handshake

44.2 Register Description

44.2.1 DMA Interrupt Status Register for Lower-Numbered Channels (DMAISTA_L)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMAISTA_L is a 32-bit readable register that indicates the states of the interrupt signals for each of the lower-numbered channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

1	I1	B'0	R	Interrupt State in Channel 1 0: An interrupt is not present. 1: An interrupt is present.
0	I0	B'0	R	Interrupt State in Channel 0 0: An interrupt is not present. 1: An interrupt is present.

44.2.2 DMA Interrupt Status Register for Higher-Numbered Channels (DMAISTA_U)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

DMAISTA_U is a 32-bit readable register that indicates the states of the interrupt signals for each of the higher-numbered channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	I31	B'0	R	Interrupt State in Channel 31 0: An interrupt is not present. 1: An interrupt is present.
14	I30	B'0	R	Interrupt State in Channel 30 0: An interrupt is not present. 1: An interrupt is present.
13	I29	B'0	R	Interrupt State in Channel 29 0: An interrupt is not present. 1: An interrupt is present.
12	I28	B'0	R	Interrupt State in Channel 28 0: An interrupt is not present. 1: An interrupt is present.
11	I27	B'0	R	Interrupt State in Channel 27 0: An interrupt is not present. 1: An interrupt is present.
10	I26	B'0	R	Interrupt State in Channel 26 0: An interrupt is not present. 1: An interrupt is present.
9	I25	B'0	R	Interrupt State in Channel 25 0: An interrupt is not present. 1: An interrupt is present.
8	I24	B'0	R	Interrupt State in Channel 24 0: An interrupt is not present. 1: An interrupt is present.
7	I23	B'0	R	Interrupt State in Channel 23 0: An interrupt is not present. 1: An interrupt is present.

Bit	Bit Name	Initial Value	R/W	Descriptions
6	I22	B'0	R	Interrupt State in Channel 22 0: An interrupt is not present. 1: An interrupt is present.
5	I21	B'0	R	Interrupt State in Channel 21 0: An interrupt is not present. 1: An interrupt is present.
4	I20	B'0	R	Interrupt State in Channel 20 0: An interrupt is not present. 1: An interrupt is present.
3	I19	B'0	R	Interrupt State in Channel 19 0: An interrupt is not present. 1: An interrupt is present.
2	I18	B'0	R	Interrupt State in Channel 18 0: An interrupt is not present. 1: An interrupt is present.
1	I17	B'0	R	Interrupt State in Channel 17 0: An interrupt is not present. 1: An interrupt is present.
0	I16	B'0	R	Interrupt State in Channel 16 0: An interrupt is not present. 1: An interrupt is present.

44.2.3 DMA Secure Control Register for Lower-Numbered Channels (DMASEC_L)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMASEC_L is a 32-bit readable/writable register that controls the security attribute of each of the lower-numbered channels. Only the initiator in the secure mode can change the setting of this register.
Only secure access is allowed to registers of channels with the secure mode setting. The following registers are protected by the secure mode.
DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

44.2.4 DMA Secure Control Register Higher-Numbered Channels (DMASEC_H)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMASEC_H is a 32-bit readable/writable register that controls the security attribute of each of the higher-numbered channels. Only the initiator in the secure mode can change the setting of this register.
Only secure access is allowed to registers of channels with the secure mode setting. The following registers are protected by the secure mode.
DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

44.2.5 DMA Operation Register for Lower-Numbered Channels (DMAOR_L)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMAOR_L is a 16-bit readable/writable register that enables DMA transfer on all lower-numbered channels and specifies the method used to determine the priority levels for all lower-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]		—	—	—	—	—	AE	—	DME
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/(W)*	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PR[1:0]	B’00	R/W	Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. B’00: Fixed CH0 > CH1 > ... > CH11 > CH15 B’11: Round-robin priority Other than above: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	AE	B’0	R/(W)*	Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: An audio-DMAC address error interrupt is not present. [Clearing condition] Writing CAE = 0 after reading CAE = 1 1: An audio-DMAC address error interrupt being generated during DMA transfer.
1	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
0	DME	B'0	R/W	DMA Master Enable Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_L must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels. 0: Disables DMA transfers on all channels 1: Enables DMA transfers on all channels

Note: * Writing 0 is possible to clear the flag.

44.2.6 DMA Operation Register for Higher-Numbered Channels (DMAOR_U)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

DMAOR_U is a 16-bit readable/writable register that enables DMA transfer on all higher-numbered channels and specifies the method used to determine the priority levels for all higher-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]		—	—	—	—	—	AE	—	DME

R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/(W)*	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PR[1:0]	B’00	R/W	Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. B’00: Fixed CH16 > CH17 > ... > CH30 > CH31 [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] B’11: Round-robin priority Other than above: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	AE	B’0	R/(W)*	Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: An audio-DMAC address error interrupt is not present. [Clearing condition] Writing CAE = 0 after reading CAE = 1 1: An audio-DMAC address error interrupt being generated during DMA transfer.
1	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
0	DME	B'0	R/W	DMA Master Enable Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_U must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels. 0: Disables DMA transfers on all channels 1: Enables DMA transfers on all channels

44.2.7 DMA Channel Clear Register for Lower-Numbered Channels (DMACHCLR_L)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMACHCLR_L is a 32-bit writable register that initializes each of the lower-numbered channels.
When a bit of this register is set, the state of the corresponding channel is completely initialized.
This includes initialization of the following registers.
DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
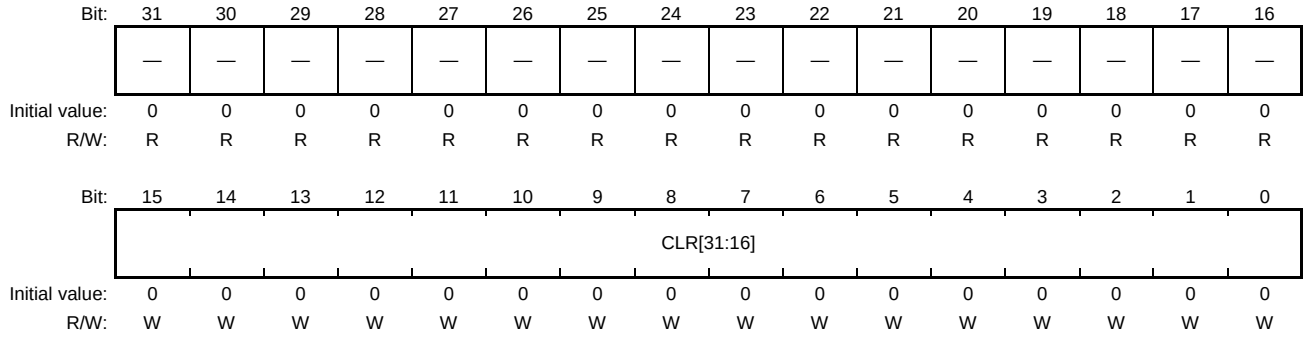
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	CLR[15:0]	All 0	W	Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[0] 0: Ignored 1: All registers for channel 0 are cleared. CLR[1] 0: Ignored 1: All registers for channel 1 are cleared. CLR[2] 0: Ignored 1: All registers for channel 2 are cleared. ... CLR[12] 0: Ignored 1: All registers for channel 12 are cleared. CLR[13] 0: Ignored 1: All registers for channel 13 are cleared. CLR[14] 0: Ignored 1: All registers for channel 14 are cleared. CLR[15] 0: Ignored 1: All registers for channel 15 are cleared. When writing to this register, confirm that the DE bit is set to 0.

44.2.8 DMA Channel Clear Register for Higher-Numbered Channels (DMACHCLR_U)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

DMACHCLR_U is a 32-bit writable register that initializes each of the higher-numbered channels.
When a bit of this register is set, the state of the corresponding channel is completely initialized.
This includes initialization of the following registers.
DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFCR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	CLR[31:16]	All 0	W	Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[16] 0: Ignored 1: All registers for channel 16 are cleared. CLR[17] 0: Ignored 1: All registers for channel 17 are cleared. ... CLR[25] 0: Ignored 1: All registers for channel 25 are cleared. CLR[26] 0: Ignored 1: All registers for channel 26 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[27] 0: Ignored 1: All registers for channel 27 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[28] 0: Ignored 1: All registers for channel 28 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[29] 0: Ignored 1: All registers for channel 29 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[30] 0: Ignored 1: All registers for channel 30 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[31] 0: Ignored 1: All registers for channel 31 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] When writing to this register, confirm that the DE bit is set to 0.

44.2.9 DPRAM Secure Control Register for Lower-Numbered Channels (DMADPSEC_L)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMADPSEC_L is a 32-bit readable/writable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SA[8:0]	H'000	R/W	Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SM[8:0]	H'000	R/W	Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 44.4.

44.2.11 DMA Source Address Registers 0 to 31 (DMASAR_0 to DMASAR_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMASAR is a 32-bit readable/writable register that specifies the source address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next source address.
When the address mode is incrementation, sources in memory only have byte boundaries. For details, refer to Table 44.4.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SAR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SAR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

44.2.12 DMA Destination Address Registers 0 to 31 (DMADAR_0 to DMADAR_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMADAR is 32-bit readable/writable register that specify the destination address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next destination address.
When the address mode is incremented, destinations in memory only have byte boundaries. For details, refer to Table 44.4.

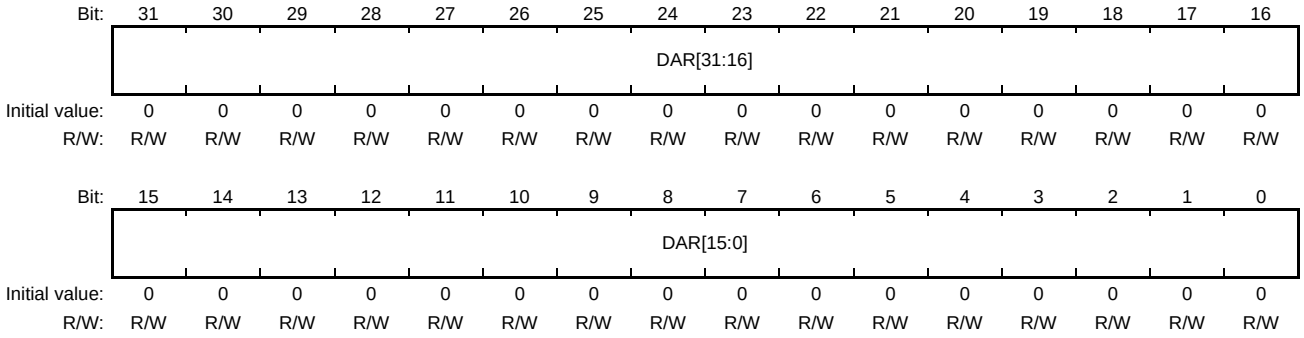

Table 44.4 SAR/DAR Address Restriction

Resource Selection	Address Mode	Restriction
Auto request	Incrementation	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/DAR, Reception/SAR	All	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/SAR, Reception/DAR	Incrementation	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size

44.2.13 DMA Transfer Count Registers 0 to 31 (DMATCR_0 to DMATCR_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMATCR is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'0000_0001 and 16,777,215 (the maximum) when the setting is H'00FF_FFFF. During a DMA transfer, this register indicates the remaining number of rounds of transfer.
The audio-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in reading.
The eight higher-order bits of DMATCR are always read as 0, and the write value should always be 0.

44.2.14 DMA Transfer Count Registers B_0 to 31 (DMATCRB_0 to DMATCRB_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMATCRB is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'0000_0001 and 16,777,215 (the maximum) when the setting is H'00FF_FFFF. During a DMA transfer, this register indicates the remaining number of rounds of transfer.
The audio-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in writing.
The eight higher-order bits of DMATCRB are always read as 0, and the write value should always be 0.

44.2.15 DMA Transfer Size Registers 0 to 31 (DMATSR_0 to DMATSR_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMATSR is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'0000_0001, 4,294,967295 bytes when the setting is H'FFFF_FFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'0000_0000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.
The audio-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the read transfer size.

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/(W)*	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31	CAE	B'0	R/(W)*	Channel Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the CAE bit, write 0 to the CAE bit after reading 1 from it or clear the AE bit in DMAOR. Clearing the CAE bit clears the channel address error bits for all channels. 0: An audio-DMAC address error interrupt is not present. [Clearing condition] Writing CAE = 0 after reading CAE = 1 1: An audio-DMAC address error interrupt being generated during DMA transfer.
30	CAIE	B'0	R/W	Channel Address Error Interrupt Enable Enables or disables the generation of interrupt requests for the CPU when address errors occur. When the CAIE bit is set to 1, if the CAE bit is also set, an interrupt (DEI 0 to 25) from the corresponding channel will be generated for the CPU in response to address errors. Note: An address error interrupt (DADERR) is also asserted simultaneously. See section 19, Interrupt Controller (INTC-AP) for more details. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.

Bit	Bit Name	Initial Value	R/W	Descriptions
29, 28	DPM[1:0]	B'00	R/W	Operating Mode of Descriptor Memory Enable or disable the descriptor memory and specify its operating mode. B'00: Disabled (normal use) B'01: Enabled (normal mode) B'10: Enabled (repeat mode) B'11: Enabled (read-out interrupt mode, infinite repeat mode)
27 to 25	RPT[2:0]	B'000	R/W	Descriptor Setting Update Specify the parameters to be updated from the descriptor memory. RPT[2]: Enables or disables updating of the source address register RPT[1]: Enables or disables updating of the destination address register RPT[0]: Enables or disables updating of the transfer count register 0: Disabled 1: Enabled
24, 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	DPB	B'0	R/W	Descriptor Start Specifies configuration to be loaded when transfer under control of the descriptor memory begins. This bit is cleared after the descriptor memory is read. 0: Processing starts with the values in DMASAR, DMADAR, and DMATCR. 1: Processing starts after the first set of descriptors is read out.
21, 20	TS[3:2]	B'00	R/W	DMA Transfer Size In combination with TS[1:0], these bits specify the DMA transfer size. When the transfer source or transfer destination is a register of an on-chip peripheral module for which a transfer size is specified, be sure to select the specified transfer size. For the transfer source or destination address specified by DMASAR or DMADAR, an appropriate boundary address should be set according to the transfer data size. TS[3:2] + TS[1:0] ("+" here indicates concatenation, not addition) B'0000: Transfer is in byte units. B'0001: Transfer is in word (2-byte) units. B'0010: Transfer is in longword (4-byte) units. B'0011: Transfer is in 16-byte units. B'0100: Transfer is in 32-byte units. B'0101: Transfer is in 64-byte units. B'0111: Transfer is in 8-byte units. Other than above: Setting prohibited
19	DSE	B'0	R/(W)*	Descriptor Stage End When the DSIE bit is set to 1 and the descriptor memory is enabled, the DSE bit is set to 1 on completion of the DMA transfer. This bit is not set when the DPM bit is set to 0 (descriptors are disabled). To clear the DSE bit, start by reading it as 1, and then write 0 to the bit. 0: DMA transfer is still running or has been aborted. 1: Transfer under the control of one stage of the descriptor memory has been completed.

Bit	Bit Name	Initial Value	R/W	Descriptions
18	DSIE	B’0	R/W	Descriptor Stage End Interrupt Enable Specifies whether an interrupt request is generated for the CPU on completion of transfer under the control of one stage of the descriptor memory. When this bit is set to 1, an interrupt (DEI) is generated for the CPU whenever the DSE is set to 1. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
17, 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DM[1:0]	B’00	R/W	Destination Address Mode Specify whether the DMA destination address is incremented, fixed, or decremented. The unit of transfer (transfer size) determines the size of the increment. B’00: Destination address is fixed. B’01: Destination addresses are incremented. + 1 when transfer is in byte units. + 2 when transfer is in word units. + 4 when transfer is in longword units. + 8 when transfer is in 8-byte units. + 16 when transfer is in 16-byte units. + 32 when transfer is in 32-byte units. + 64 when transfer is in 64-byte units. B’10: Destination addresses are decremented. – 1 when transfer is in byte units. – 2 when transfer is in word units. – 4 when transfer is in longword units. Setting prohibited when transfer is in 8-, 16-, 32-, or 64-byte units. B’11: Setting Prohibited
13, 12	SM[1:0]	B’00	R/W	Source Address Mode Specify whether the DMA source address is incremented, fixed, or decremented. The unit of transfer (transfer size) determines the size of the increment. B’00: Source address is fixed. B’01: Source addresses are incremented. + 1 when transfer is in byte units. + 2 when transfer is in word units. + 4 when transfer is in longword units. + 8 when transfer is in 8-byte units. + 16 when transfer is in 16-byte units. + 32 when transfer is in 32-byte units. + 64 when transfer is in 64-byte units. B’10: Source addresses are decremented. – 1 when transfer is in byte units. – 2 when transfer is in word units. – 4 when transfer is in longword units. Setting prohibited when transfer is in 8-, 16-, 32-, or 64-byte units. B’11: Setting Prohibited

Bit	Bit Name	Initial Value	R/W	Descriptions
11 to 8	RS[3:0]	B'0000	R/W	Resource Selection Specify the source of transfer requests. Only change the transfer request source while the DMA enable bit (DE) is set to 0. B'0100: Auto request B'1000: Source is selected by the DMA extended resource selector. Other than above: Settings prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	TS[1:0]	B'00	R/W	DMA Transfer Size See the description of TS[3:2] (bits 21 and 20).
2	IE	B'0	R/W	Interrupt Enable Specifies whether or not an interrupt request is generated for the CPU on completion of DMA transfer. When this bit is set to 1, an interrupt request (DEI) for the CPU is generated whenever the TE bit is set to 1. 0: Interrupt request is disabled. 1: Interrupt request is enabled.
1	TE	B'0	R/(W)*	Transfer End Flag When the descriptor memory is not in use, the TE bit is set to 1 when DMATCR becomes 0 on completion of the DMA transfer. When the descriptor memory is in use, the TE bit is set to 1 on completion of all transfers set up in the descriptor memory. The TE bit is not set to 1 in the following cases. • DMA transfer ends due to a DMA address error before DMATCR becomes 0. • DMA transfer is aborted by clearing the DE and DME bits in DMAOR. To clear the TE bit, start by reading it as 1, and then write 0 to it. When the TE bit is set to 1, transfer is not possible even if the DE bit is set to 1. 0: DMA transfer is in progress or was aborted [Clearing condition] Writing of 0 after reading of 1 1: DMA transfer ended on the specified count (TCR = 0)
0	DE	B'0	R/W	DMA Enable Enables or disables DMA transfer. In the auto request mode, a DMA transfer is started by setting the DE and DME bits in DMAOR to 1. At this time, the setting of both the AE and TE bits in DMAOR must be 0. In a peripheral module request, a DMA transfer starts if the transfer request is generated by the selected device or on-chip peripheral module after setting the DE and DME bits to 1. In this case too, the settings of both the TE and AE bits must be 0. Clearing the DE bit to 0 aborts all DMA transfer. Note: Ensure that the setting of the DE bit is actually 0 after clearing it. 0: DMA transfer is disabled. 1: DMA transfer is enabled.

Note: * Writing 0 is possible to clear the flag.

44.2.18 DMA Channel Control Register B_0 to 31 (DMACHCRB_0 to DMACHCRB_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMACHCRB is a 32-bit readable/writable register that controls the DMA transfer mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCNT[7:0]								DPTR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DRST	—	—	—	—	—	—	DTS	SLM[3:0]				PRI[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DCNT[7:0]	H'00	R/W	Number of Stages of Descriptor Memory Specify the number of stages of the descriptor memory as DCNT + 1. When the descriptor memory is enabled, a transfer end (TE) interrupt is only generated for the CPU on completion of transfer under control of the specified number of stages.
23 to 16	DPTR[7:0]	H'00	R	Descriptor Pointer This bit indicates the pointer to the next descriptor to be read. It is cleared to 0 when the last descriptor of the number of stages specified by DCNT[7:0] is read. It is also cleared to 0 when 1 is written to DRST.
15	DRST	B’0	W	Descriptor Reset Resets the descriptor pointer. Before the descriptor memory is used, the pointer must be reset by writing 1 to this bit. This bit is always read as 0.
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DTS	B’0	R/W	Total Size Transmission under Descriptor Control This bit is only effective when total size transmission is selected. 0: The TCR fields of the descriptors are used as transfer count settings. 1: The TCR fields of the descriptors are used as total size settings.

Bit	Bit Name	Initial Value	R/W	Descriptions
7 to 4	SLM[3:0]	B’0000	R/W	DMA Transfer Low-Speed Mode Specify the number of cycles of the AXI-bus clock (256.66 MHz) for the DMA transfer. One round of DMA transfer is executed in the number of cycles of the clock specified by this bit. B’0000: Normal mode B’1000: On round in 256 cycles of the clock. B’1001: On round in 512 cycles of the clock. B’1010: On round in 1024 cycles of the clock. : B’1111: On round in 32768 cycles of the clock. Other than above: Setting prohibited
3 to 0	PRI[3:0]	B’0000	R/W	Channel Request Priority Setting These bits should be written by 0.

44.2.19 DMA Buffer Control Registers 0 to 31 (DMABUFCR_0 to DMABUFCR_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMABUFCR is a 32-bit readable/writable register that controls the upper limit on buffer size in and burst unit for the SDRAM.
Use this register when the upper limit on buffering requires control.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	MBU[8:0]								
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ULB[9:0]									
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	MBU[8:0]	H'080	R/W	Maximum Burst Unit for SDRAM This register is only effective for SDRAM access, and everything other than that is under control of the transfer size (unit). Settings bigger than ULB are prohibited. Power-of-two settings are recommended. Maximum value is 256 (bytes).
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	ULB[9:0]	H'100	R/W	Upper Limit on Buffer Size This register controls the upper limit value for buffering. Power-of-two settings are recommended. Maximum value is 512 (bytes).

44.2.20 DMA Extended Resource Selectors 0 to 31 (DMARS_0 to DMARS_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMARS is a 16-bit readable/writable register that specifies the on-chip peripheral module to be the source of the DMA transfer request for the given channel. DMARS_0 specifies the source for channel 0, DMARS_1 specifies the source for channel 1 and so on.
When bits MID and RID are set to a value other than the values listed in Table 44.5, the operation of this LSI is not guaranteed. Transfer requests from the source selected in DMARS are only valid when the resource selection bits (RS[3:0]) in DMACHCR have been set to B'1000. Otherwise, even if DMARS has been set, requests from the corresponding transfer request source are not accepted.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MID[5:0]						RID[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

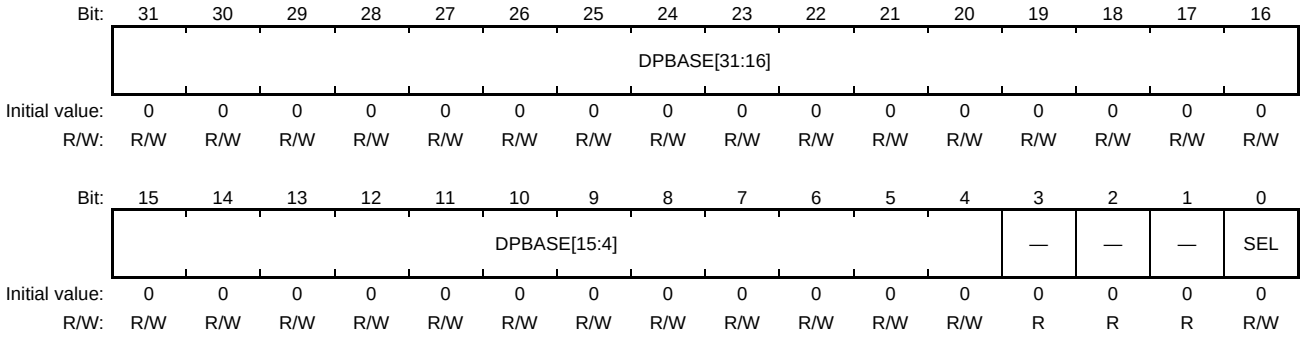
Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 2	MID[5:0]	All 0	R/W	DMA Request Source Adoption MID[5] to MID[0] (MID) See Table 44.5.
1, 0	RID[1:0]	B’00	R/W	DMA Request Source Adoption RID[5] and RID[0] (RID) See Table 44.5.

44.2.21 DMA Descriptor Base Address Registers 0 to 31 (DMADPBASE_0 to DMADPBASE_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMADPBASE specifies the base address of the descriptor memory. The address range of the descriptor memory is specified by setting this register.



Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 4	DPBASE[31:4]	All 0	R/W	Base Address of Descriptor Memory Setting example: When Built-in memory is used, [Audio-DMAC Lower]: H'EC70 A00 to H'EC70 A7F [Audio-DMAC Higher]: H'EC72 A00 to H'EC72 A7F When External memory is used, Other memory area on a 16-byte boundary
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SEL	B'0	R/W	Descriptor Memory Selection Selects the memory to be used as descriptor memory. 0: Setting Prohibited 1: Built-in memory or External memory is used.

44.2.22 DMA Descriptor Control Registers 0 to 31 (DMADPCR_0 to DMADPCR_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMADPCR is a 32-bit readable/writable register that controls the timing with which interrupts are output in read-out interrupt mode (descriptor mode 3).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DIPT[7:0]								—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DIPT[7:0]	H'00	R/W	Descriptor Read-out Interrupt Pointer The number of stages for which descriptor read-out interrupts are generated in descriptor mode 3. DIPT + 1 specifies the number of descriptor stages.
23 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

44.2.23 DMA Fixed Source Address Registers 0 to 31 (DMAFIXSAR_0 to DMAFIXSAR_31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: The availability of channels depends on the product as follows.
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
RZ/G2E: 16 channels (channels 0 to 15)

DMAFIXSAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit source address for a DMA transfer.
This register is not incremented by carrying when DMASAR overflows. And when uTLB function is effective, this register is invalid.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 0	EMID[31:0]	All 0	R	First Master ID when access to channel 16 to 31 was denied.

44.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request and on-chip peripheral module request. The bus mode can be selected from normal speed mode and slow speed mode).

44.3.1 DMA Transfer Requests

Most commonly, DMA transfer requests are generated by either the source or destination for transfer, but they can also be generated by on-chip peripheral modules that are neither the source nor the destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. The request mode is selected for each channel by DMARS.

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the audio-DMAC to automatically generate a transfer request signal internally. When the DE bit in DMACHCR and the DME bit in DMAOR are set to 1 for the target channel, the transfer begins so long as the CAE bit in DMACHCR is 0.

(2) On-Chip Peripheral Module Request Mode

This mode is in case of CHCR.RS = 1000.
In this mode, a transfer is performed at the transfer request signal of an on-chip peripheral module. The source (on-chip peripheral module) of the DMA transfer request is specified by DMARS.
When this mode is selected, if the DMA transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0), a transfer is performed upon the input of a transfer request signal.
When a transmit data empty transfer request of the SCIF is set as the transfer request, the transfer destination must be the SCIF's transmit data register. Likewise, when receive data full transfer request of the SCIF is set as the transfer request, the transfer source must be the SCIF's receive data register. These conditions also apply to the other on-chip peripheral modules.
The number of the receive FIFO triggers can be set as a transfer request depending on an on-chip peripheral module. Data needs to be read after the DMA transfer is ended, because data may be left in the receive FIFO when the receive FIFO trigger condition is not satisfied.

44.3.2 Channel Priority

When the audio-DMAC receives simultaneous transfer requests on two or more channels, it transfers data according to a predetermined priority. Two modes (fixed mode and round-robin mode) are selected by the PR[1:0] bits in DMAOR.

(1) Fixed Mode

In this mode, the priority levels among the channels remain fixed.

CH0 > CH1 > ... > CH11 > CH12, CH13 > CH14 > ... >CH25 > CH26> CH27> CH28> CH29> CH30> CH31

(2) Round-Robin Mode

In round-robin mode, each time data of one transfer unit (byte, word, long-word, 8-byte or 16-byte units) is transferred on one channel, the priority is rotated. The channel on which the transfer was just finished rotates to the bottom of the priority. The priority of round-robin mode is CH0 > CH1 > ... >CH11 > CH12> …> CH24 > CH25 > ... > CH30 > CH31 immediately after reset.

44.3.3 Slow Speed Mode

In the low-speed mode, a single round of DMA transfer is performed every time the number of clock cycles specified by the SLM bits in DMACHCRB elapse. This mode can be selected per DMA channel. Transfer on other channels can proceed after each round of transfer for a channel in the low-speed mode is completed.

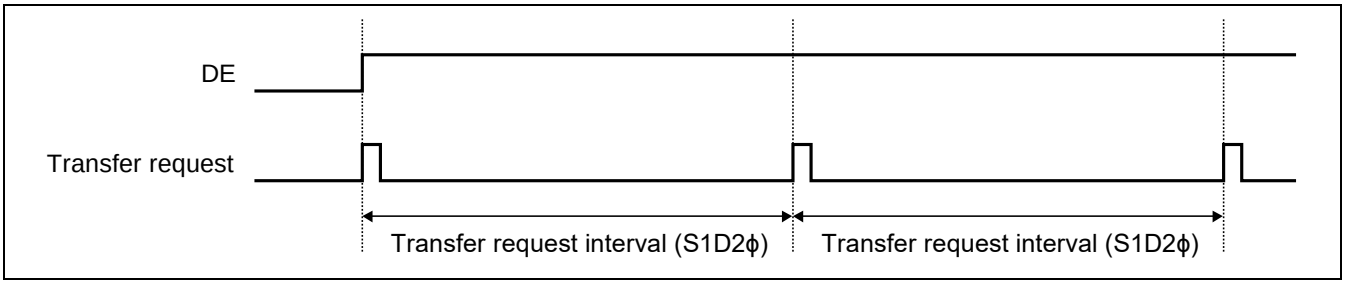

Figure 44.2 Slow Speed Mode

44.3.4 Descriptor Memory

The descriptor memory function is selected by setting the DPM[1:0] bits in DMACHCR to B'01, B'10, or B'11. When DMATCR is set to 0 and the DMA transfer is completed, the next set of settings is read, and if only a single channel is enabled, the contents defined by up to 128 stages of descriptor memory can be consecutively transferred when the built-in descriptor memory is used. External memory can also be used as the descriptor memory. In that case, the contents defined by up to 256 stages of descriptor memory can be transferred.

The following initial settings are required to use the descriptor memory.

- Set the base address of the descriptor memory for the DMA transfer in DMADPBASE.
- Set the DRST bit in DMACHCRB to reset the descriptor memory.
- Set the number of stages of the descriptor memory in the DCNT bits of DMACHCRB.

The descriptor memory is shared between all channels. Ensure that the areas of descriptor memory for use by each of the channels do not overlap.

It is necessary to arrange each stage of the descriptor memory on a 16-byte boundary.

There are two methods to activate the descriptor memory as follows.

- Specify the first DMA transfer settings in DMASAR, DMADAR, and DMATCR, and specify the subsequent settings in the descriptor memory. Then, set the DPB bit in DMACHCR to 0 to activate the descriptor memory. In this case, after completion of the transfer specified in DMASAR, DMADAR, and DMATCR, transfer continues after new settings are read from the descriptor memory. Note, however, that, when the operating mode of the descriptor memory is set to the repeat mode, the values specified in DMASAR, DMADAR, and DMATCR are not read, and the transfer starts and is repeated from the head of the descriptor memory.
- Write the DMA transfer settings to the descriptor memory, and write 1 to the DPB bit in DMACHCR to activate the descriptor memory. In this case, the DMA transfer starts from the first settings in the descriptor memory.

There are three operating modes of the descriptor memory, which can be selected by setting the DPM bits in DMACHCR.
For details on these operating modes, see the descriptions of each operating mode in this section.

(1) Configuration of Descriptor Memory

Figure 44.3 shows the configuration of the built-in descriptor memory.
The capacity of the built-in descriptor memory is 16 bytes per stage × 128 stages.

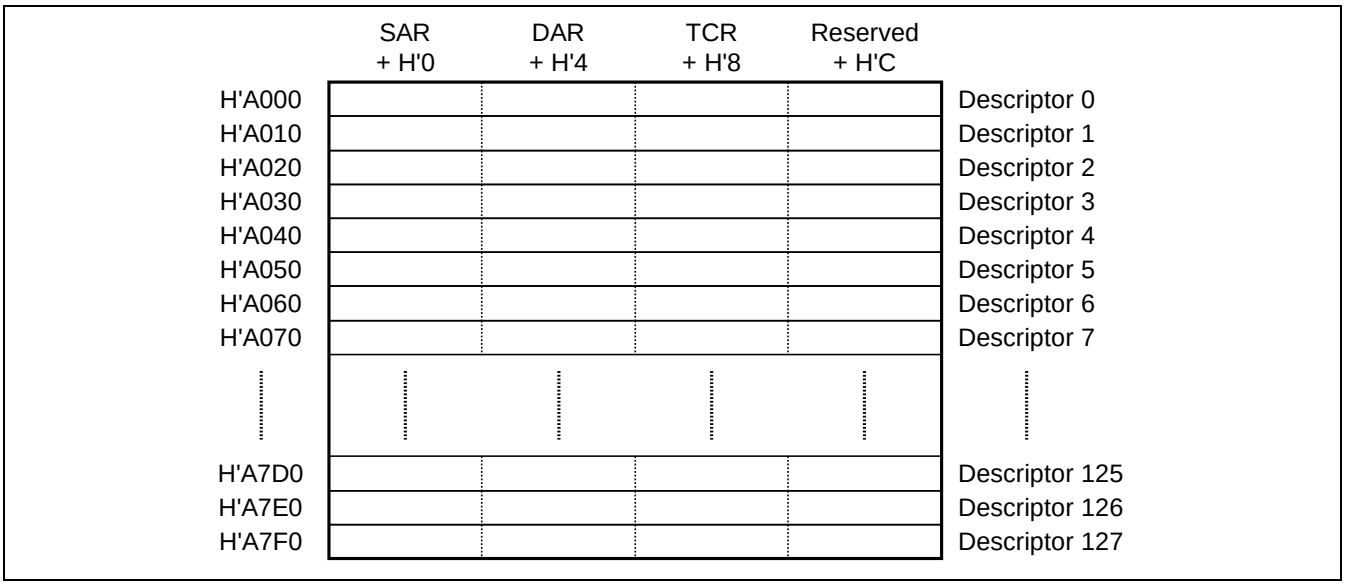

Figure 44.3 Configuration of Built-in Descriptor Memory

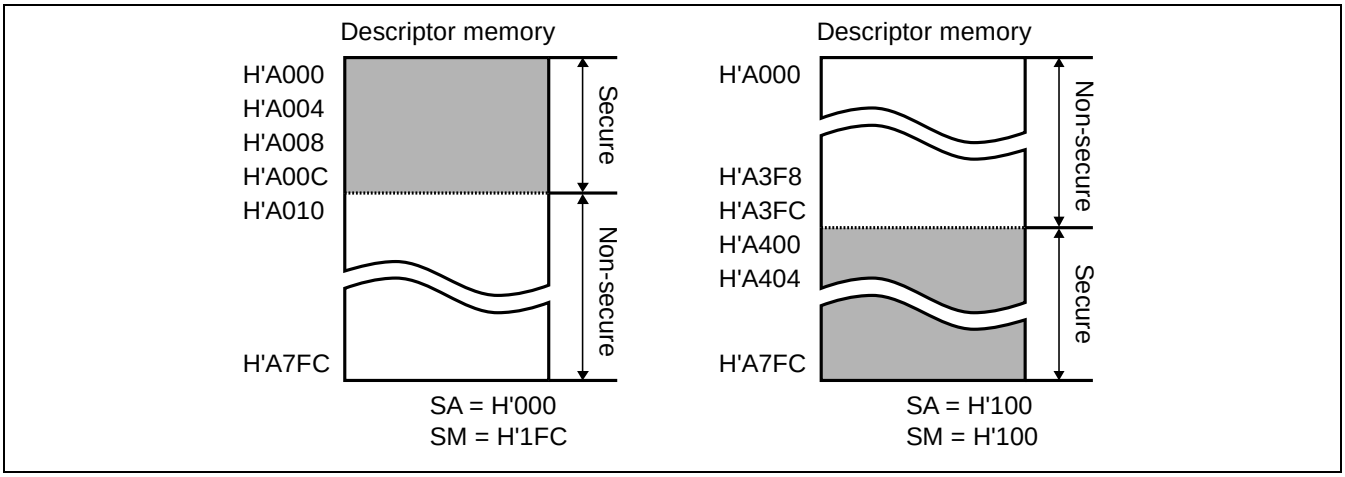

Figure 44.4 Example of DMADPSEC Setting

(2) Flow of Updating from Descriptor Memory

The RPT bits in DMACHCR can be used to specify which registers are to be updated from the descriptor memory.
The DPTR bits in DMACHCRB are incremented when updating from the descriptor memory is completed. If the DPTR value matches the DCNT value, the DPTR value is reset to 0.
This flow is automatically processed by hardware.

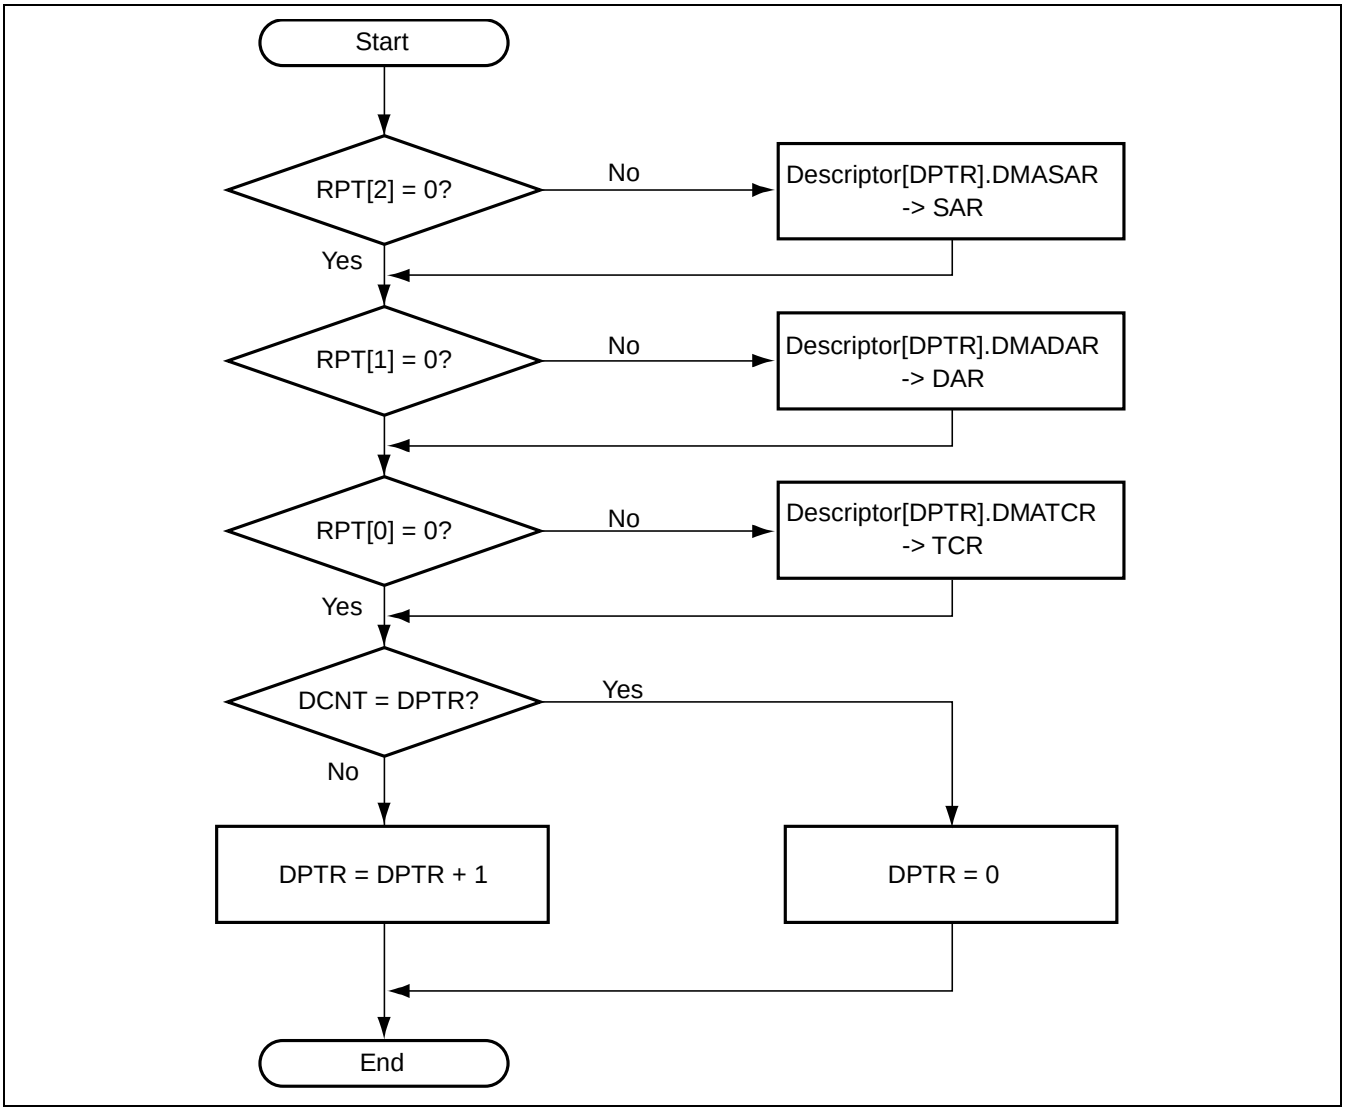

Figure 44.5 Flow of Updating from Descriptor Memory

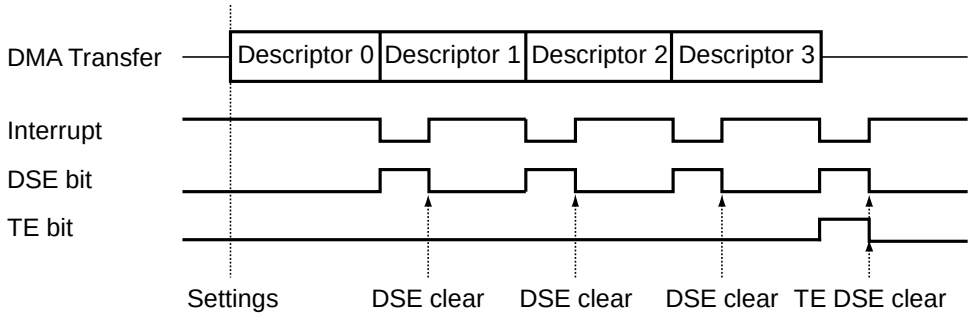
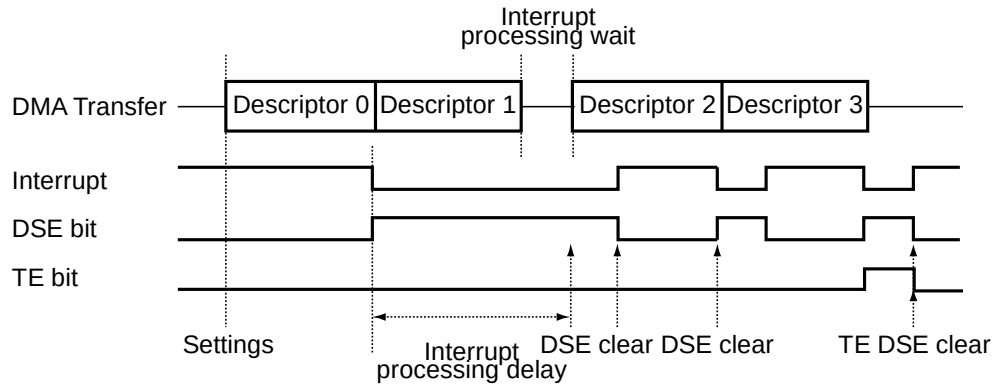
(3) Operating Mode 1 of Descriptor Memory

Set the DPM bits in DMACHCR to B'01 to select operating mode 1 (normal mode). This mode allows consecutive transfer under control of the descriptor memory.
In this mode, the DMA transfer is complete when the TE bit in DMACHCR is set to 1 after transfer under control of the number of stages of the descriptor memory specified in the DCNT bits in DMACHCRB.
When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.
Figure 44.6 is an example of transfer when operating mode 1 is selected and the TE and DSE bits are set to 1.
Figure 44.7 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 1 is selected and the TE and DSE bits are set to 1.
Figure 44.8 is an example of transfer when operating mode 1 is selected and the TE bit is set to 1.
In each example, there are four descriptor stages.



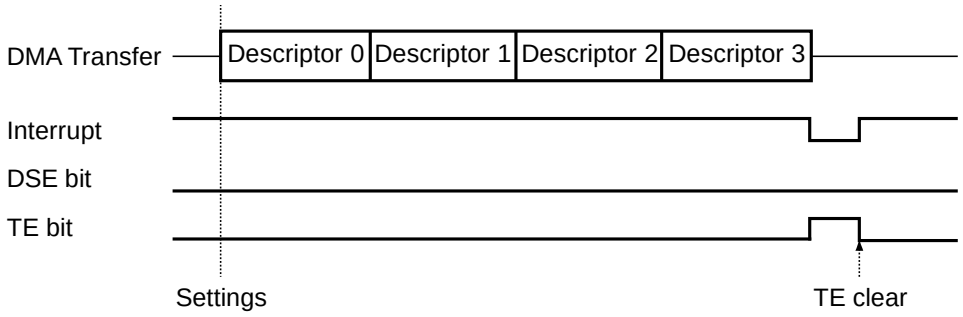
Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DPB = B'1, DSIE = B'1, IE = B'1).DMACHCRB (DRST = B'1).

Figure 44.6 Operating Mode 1 (Example 1)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DPB = B'1, DSIE = B'1, IE = B'1).DMACHCRB (DRST = B'1).

Figure 44.7 Operating Mode 1 (Example 2)

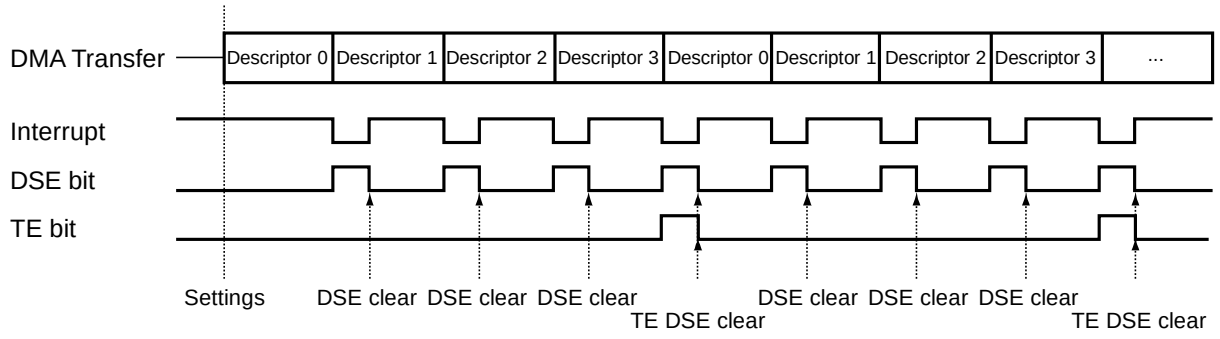


Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DPB = B'1, DSIE = B'0, IE = B'1), DMACHCRB (DRST = B'1).

Figure 44.8 Operating Mode 1 (Example 3)

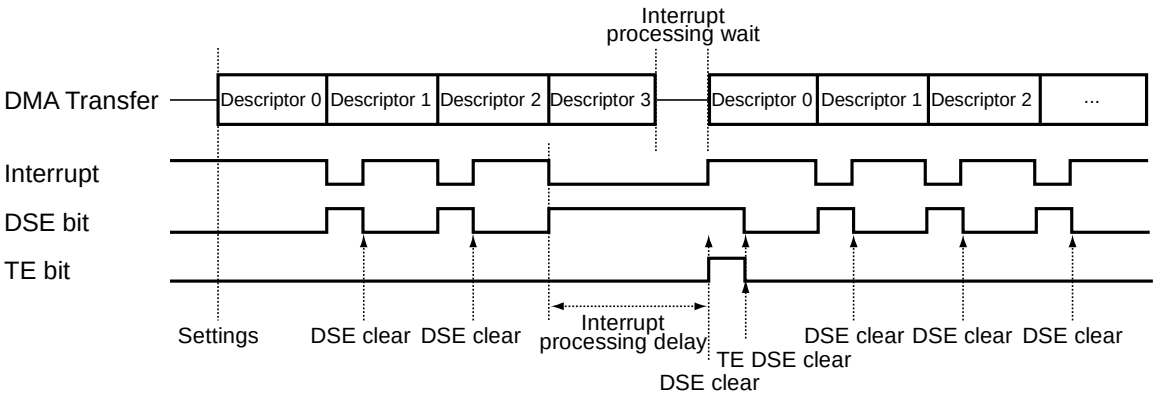
(4) Operating Mode 2 of Descriptor Memory

Set the DPM bits in DMACHCR to B'10 to select operating mode 2 (repeat mode). This mode allows consecutive transfer under control of the descriptor memory.
In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.
When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.
When the DSIE bit in DMACHCR is set to 0, after transfer under control of all stages of the descriptor memory is complete, the TE bit in DMACHCR is set to 1 and a TE interrupt is generated. If a TE interrupt has not been processed when a further interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the TE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.
To end operation in mode 2, change the mode to mode 1 by using the TE interrupt processing. When the mode is changed to mode 1, the DMA transfer is completed when the next TE interrupt is generated.
Figure 44.9 is an example of transfer when operating mode 2 is selected and the TE and DSE bits are set to 1.
Figure 44.10 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE and DSE bits are set to 1.
Figure 44.11 is an example of transfer when operating mode 2 is selected and the TE bit is set to 1.
Figure 44.12 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE is set to 1.
In each example, there are four descriptor stages.



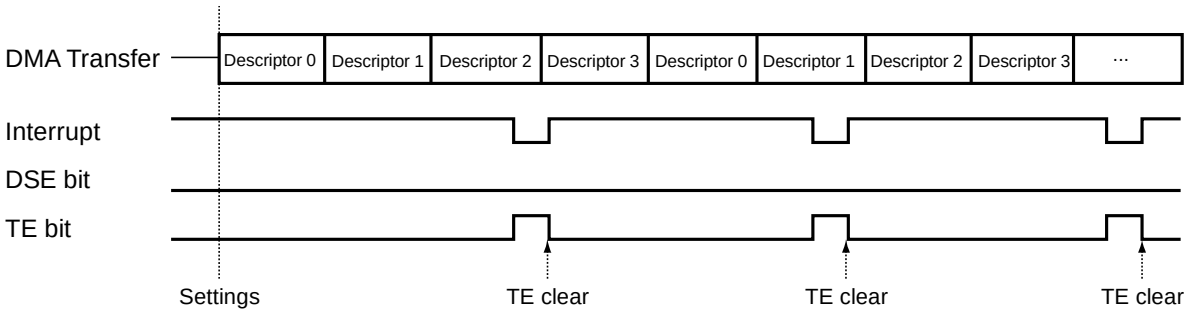
Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'1, IE = B'1), DMACHCRB (DRST = B'1).

Figure 44.9 Operating Mode 2 (Example 1)



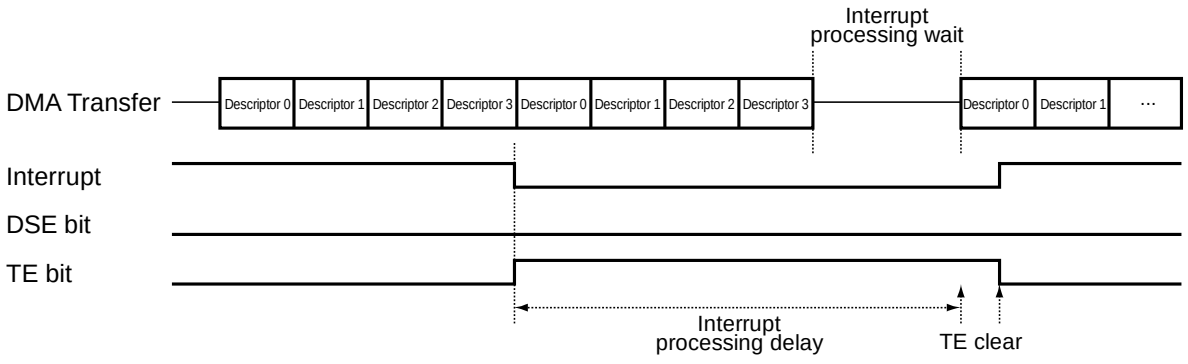
Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'1, IE = B'1), DMACHCRB (DRST = B'1).

Figure 44.10 Operating Mode 2 (Example 2)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'1, IE = B'1), DMACHCRB (DRST = B'1).

Figure 44.11 Operating Mode 2 (Example 3)

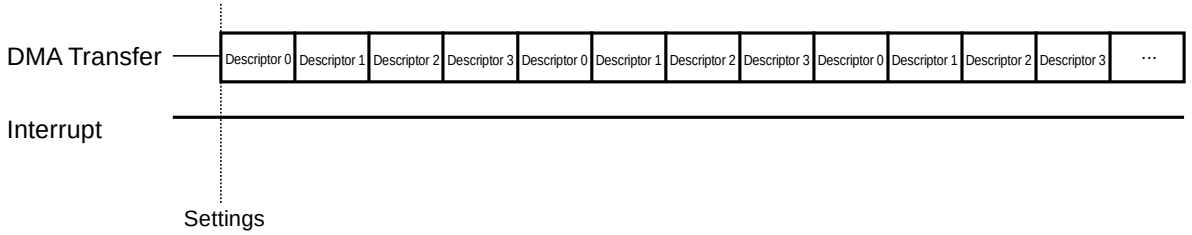


Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'0, IE = B'1), DMACHCRB (DRST = B'1).

Figure 44.12 Operating Mode 2 (Example 4)

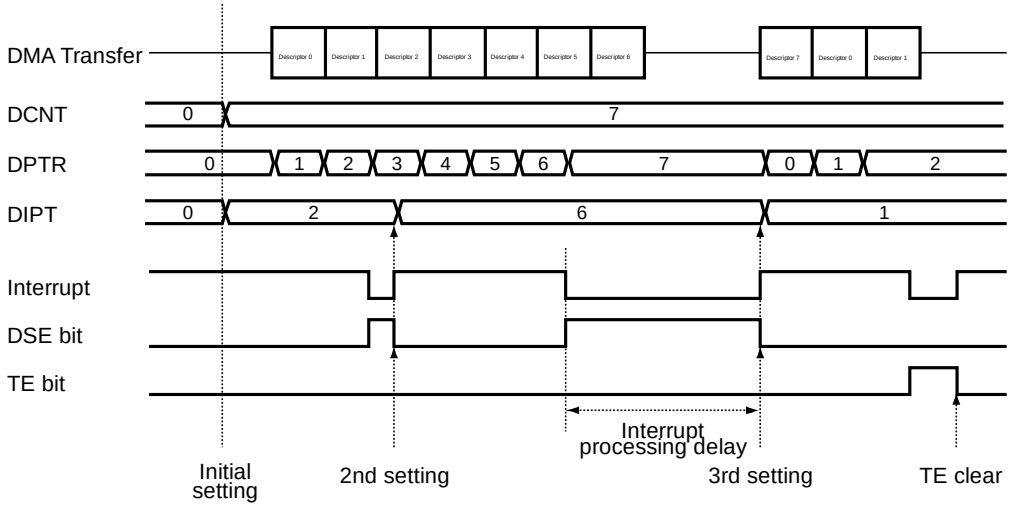
(5) Operating Mode 3 of Descriptor Memory

Set the DPM bits in DMACHCR to B'11 to select operating mode 3 (infinite repeat mode). This mode allows consecutive transfer under control of the descriptor memory.
In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.
When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. Even if a first DSE interrupt has not been processed when a further DSE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of DSE interrupts that have been generated, the DSE bit can be cleared by writing to it once. Similarly, even if a first TE interrupt has not been processed when a further TE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of TE interrupts that have been generated, the TE bit can be cleared by writing to it once.
Figure 44.13 is an example of transfer when infinite repeat mode is selected.
Figure 44.14 is an example of transfer when read-out interrupt mode is selected.
In each example, there are four descriptor stages.



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'11, DPB = B'1, DSIE = B'0, IE = B'0), DMACHCRB (DRST = B'1).

Figure 44.13 Operating Mode 3 (Infinite Repeat Mode)



Initial setting:
1. Set the DMACHCRB register (DCNT = 7).
2. The descriptor has three setting (DMASAR, DMADAR, DMATCR) stages.
3. Set the DMADPCR register (DIPT = 2).
4. Set the DMACHCR register (DPM = B'11, DPB = B'1, DSIE = B'1, IE = B'0), DMACHCRB (DRST = B'1).

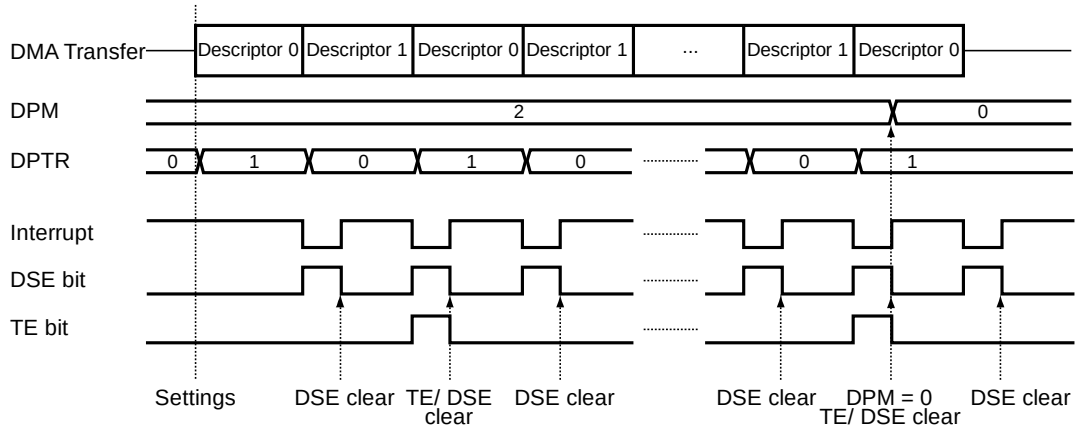
2nd setting:
1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMADPCR register (DIPT = 6).
   (3 stages + 4 stages -1) mod 8 = 6
3. Clear DSE.

3rd setting: (Transfer end)
1. The descriptor has three setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMADPCR register (DIPT =1).
   (3 stages + 4 stages + 3 stages -1) mod 8 = 1
3. Clear the DSE bit and set the DMACHCR register (DPM = B'11, DPB = B'0, DSIE = B'0, IE = B'1).

Figure 44.14 Operating Mode 3 (Read-Out Interrupt Mode)

(6) Using the Descriptor Memory for Double Buffering

To use the descriptor memory for double buffering, set the number of stages of descriptor memory to 2, set the buffer configuration to the descriptor memory, and activate the memory in operating mode 2. The DSE interrupt is used in double buffering. To end the use of double buffering, disable the descriptor operating mode, which stops the transfer on completion of the transfer currently in progress.



Settings: 1. The descriptor has two setting (buffer A, buffer B) stages.

2. Set the DMACHCRB register (DCNT = 1).

3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'1, IE = B'0), DMACHCRB (DRST = B'1).

Figure 44.15 Using the Descriptor Memory for Double Buffering

44.3.5 Transmission Flow

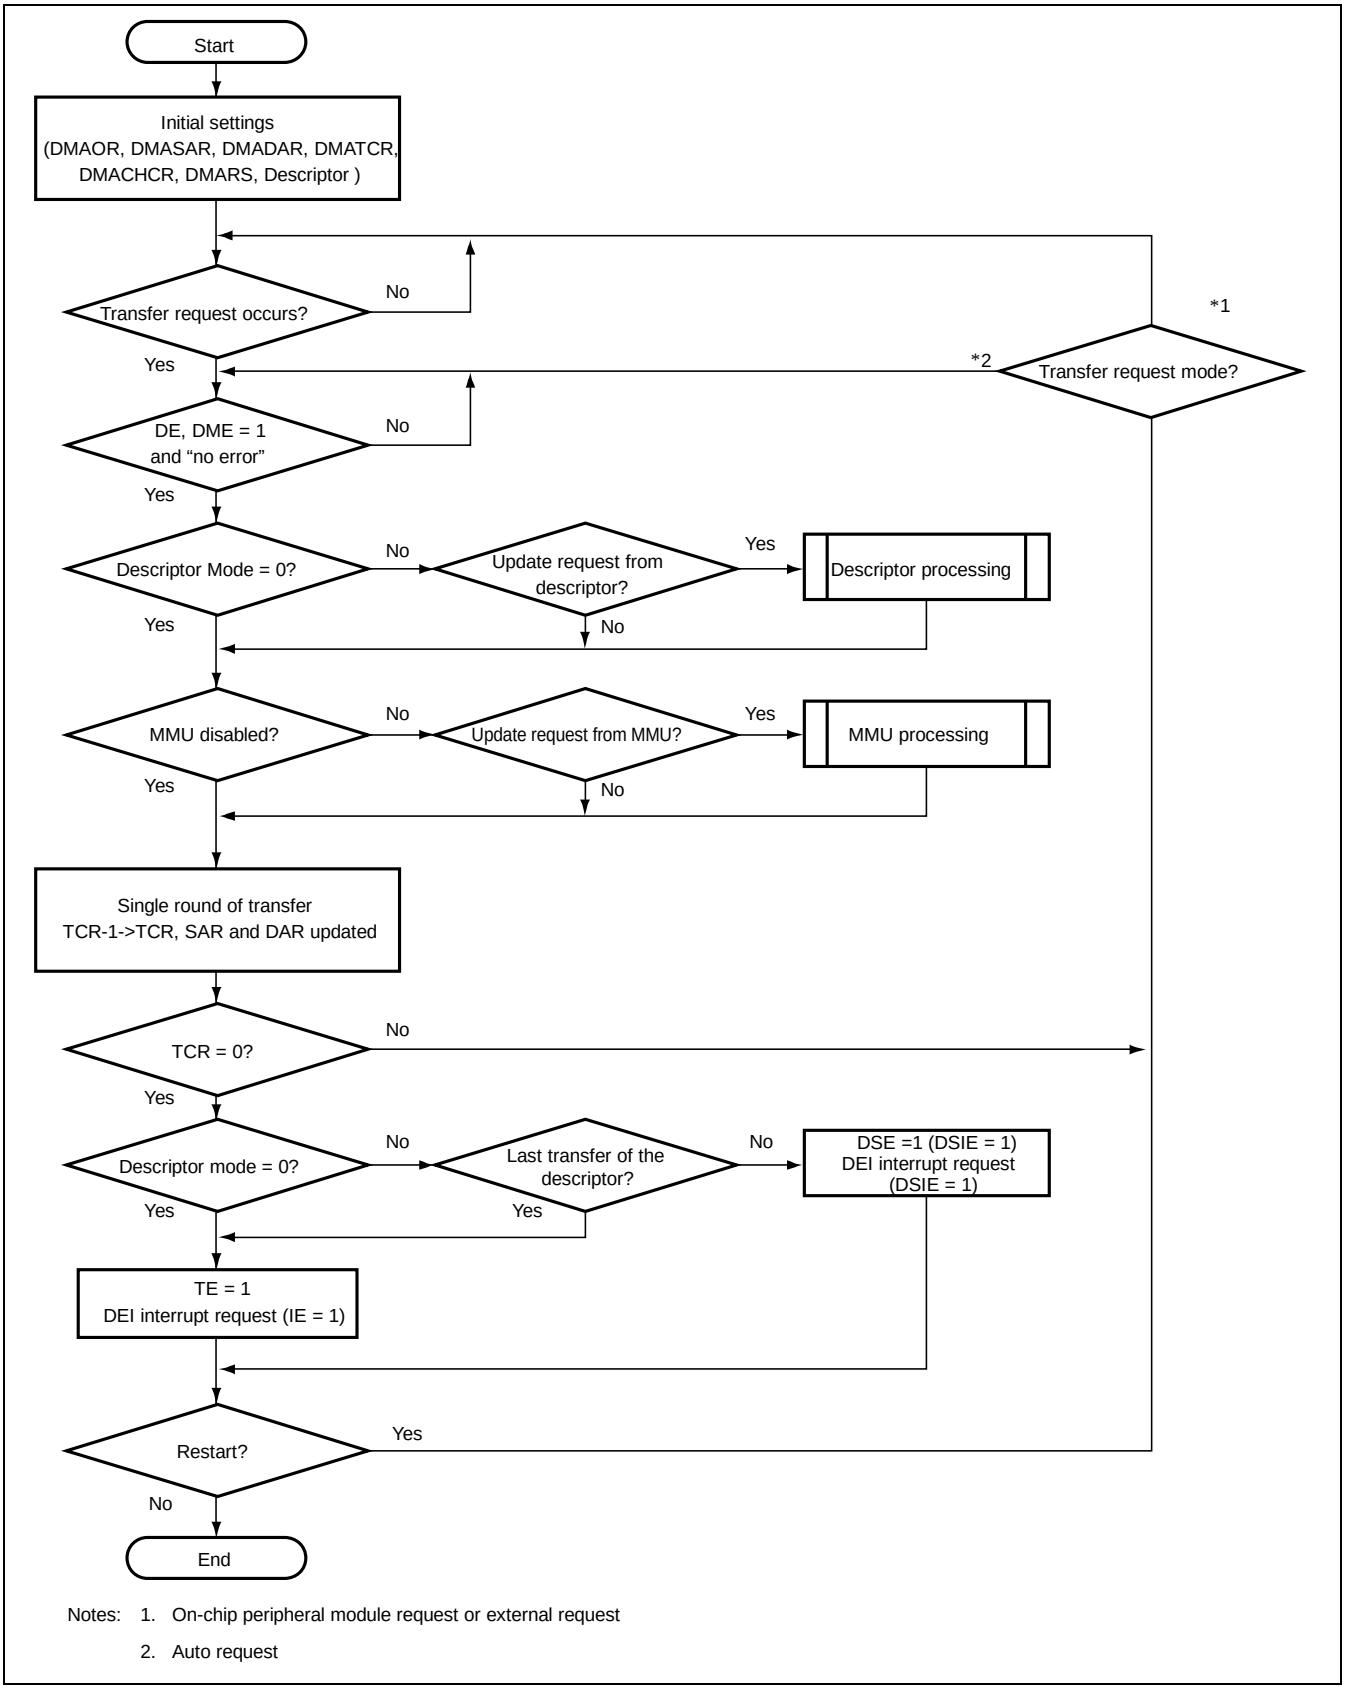
Set the transfer conditions as required in the following registers:
DMA source address register (DMASAR), DMA destination address register (DMADAR), DMA transfer count register (DMATCR), DMA Channel control register (DMACHCR), DMA operation register (DMAOR) and DMA extended resource selector (DMARS)
The DMAC then transmits data in the following order.

- A transfer request is generated and the controller checks whether the transfer is allowed (DE = 1, DME = 1, TE = 0, DSE = 0, CAE = 0). When a channel is in the auto request mode, the transfer starts automatically.
- The controller checks whether updating from the descriptor memory is required.

  Updating from the descriptor memory proceeds when the DPB bit in DMACHCR is set to 1 or the descriptor memory is enabled, if DMATCR is set to 0.

  For updating by using the descriptor memory, see section 44.3.4, Descriptor Memory.
- Check whether address translation by the IPMMU is required.

  Address translation by the IPMMU proceeds if the address exceeds the effective size for address translation when the DE bit in DMACHCR is enabled and updating of transfer settings from the descriptor memory is executed.
- Each time a transfer request is generated, the amount of data for a single round of transfer (specified by the TS[3:0] bits) is transmitted. The value in DMATCR is decremented by 1 every time the DMA transfer is completed.
- When the specified number of rounds of transfer are completed (the value in DMATCR is set to 0), the transfer ends normally. A TE interrupt is generated for the CPU upon the end of the transfer if the IE bit in DMACHCR is set to 1. If the descriptor memory is enabled, the processing differs with the mode of the descriptor memory. For more details, see section 44.3.4, Descriptor Memory.
- Transfer is aborted when the DMAC encounters an address error. Transfer is also aborted when the DE bit in DMACHCR or the DME bit in DMAOR is set to 0.



Notes: 1. On-chip peripheral module request or external request
2. Auto request

Figure 44.16 Transmission Flow

44.3.6 Total Size Transmission

The amount of data for total size transmission can be set in DMATSR (in bytes), and this setting is effective regardless of the size specified in the TS bits in DMACHCR. Thereby, the desired size can be transmitted in a single round of DMA transfer.

To use this function, make the settings for total size transmission in DMASAR, DMADAR, DMATSR, DMATSRB and DMACHCR.

Total size is set in the TCR (TSR) field of descriptors and 1 is set in DMACHCRB.DTS when total size transmission and descriptors are in use.

44.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

Pay attention to the following notes when using the audio-DMAC.

(1) DMA Transfer for Peripheral Modules

When executing DMA transfer for an on-chip peripheral module, set addresses on the appropriate boundary (in terms of the amount of data for each round of transfer) for the transfer source and destination addresses. Otherwise, an address error may occur.

(2) Module Stop

While the audio-DMAC is operating, the module stop register (MSTPCR5) should not be set to stop the audio-DMAC. If the audio-DMAC is stopped in this way, results of the transfer that was in progress cannot be guaranteed.

(3) Address Error

When a DMA address error is generated, reset the registers of the channel on which the error has occurred and then start transfer anew.

(4) Aborting DMA Transfer

To abort a DMA transfer, disable the interrupt signal and set the DE bit in the DMA channel control register (DMACHCR) to 0 to disable the DMA transfer. If the TE and DSE bits are set when DMA transfer is aborted, these bits should be initialized. There is a possibility that TE and DSE will not be set with synchronized timing after transmission, so it's necessary to recognize the following three possibilities and take measures accordingly.

1. The DSE and TE bits are set to 1 before initialization of DMACHCR, but after the interrupt was disabled.
   The TE and DSE bits are initialized within the DMA transfer initialization sequence.
2. The DSE and TE bits are set to1 and the controller fails to abort the transfer, after the interrupt was disabled.
   When the DE bit has become 0 after DMA transfer initialization, check the TE and DSE bits. If the TE or DSE bit is 1, go through the DMA transfer initialization process.
3. The TE and DSE bits are not cleared to 0 but the transfer is aborted, after the interrupt is disabled.
   The TE or DSE bits are not set because data for transfer still remain after transfer is aborted.

Note: Initialization of DMA transfer during execution of the last transfer leads to a delay in setting of the TE and DSE bits, so include a dummy read.

Figure 44.17 shows an example of processing to abort DMA transfer.

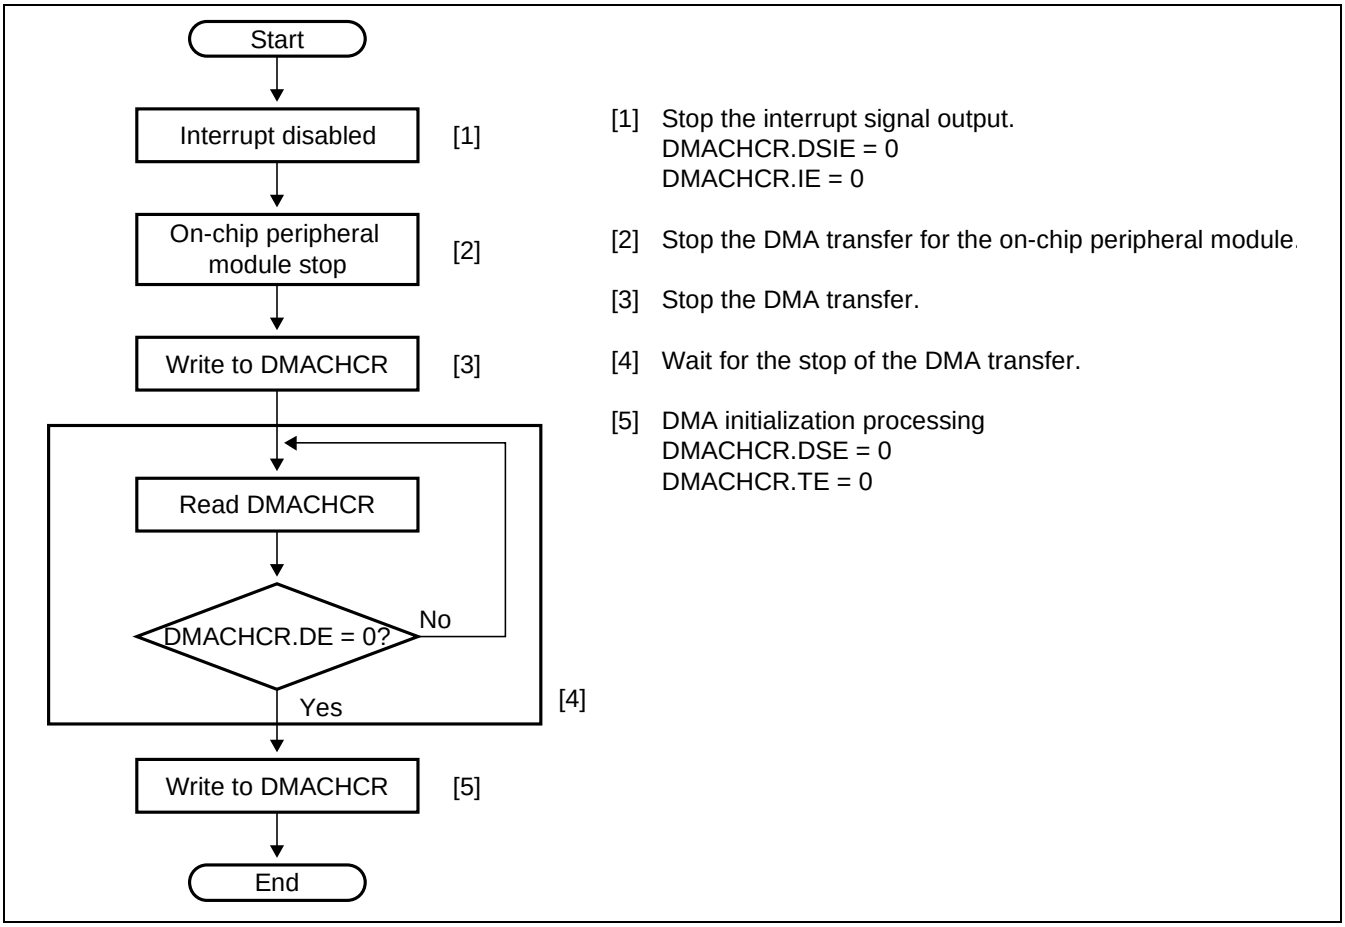


Figure 44.17 Example of Processing to Abort DMA Transfer

45. Audio-DMAC-Peripheral-Peripheral (Audio-DMACpp)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

45.1 Overview

The Audio DMAC-Peripheral-Peripheral module controls data transfer between the audio modules connected to the audio local bus.

45.1.1 Features

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

- Number of channels: 29 channels + 29 channels(extended)
- Data transfer size: Longword (4 bytes)
- Addressing mode: Dual addressing; fixed access size
- Transfer count: Not programmable
- Interrupt processing: None

[RZ/G2E]

- Number of channels: 29 channels (extended)
- Data transfer size: Longword (4 bytes)
- Addressing mode: Dual addressing; fixed access size
- Transfer count: Not programmable
- Interrupt processing: None

45.1.2 Block Diagram

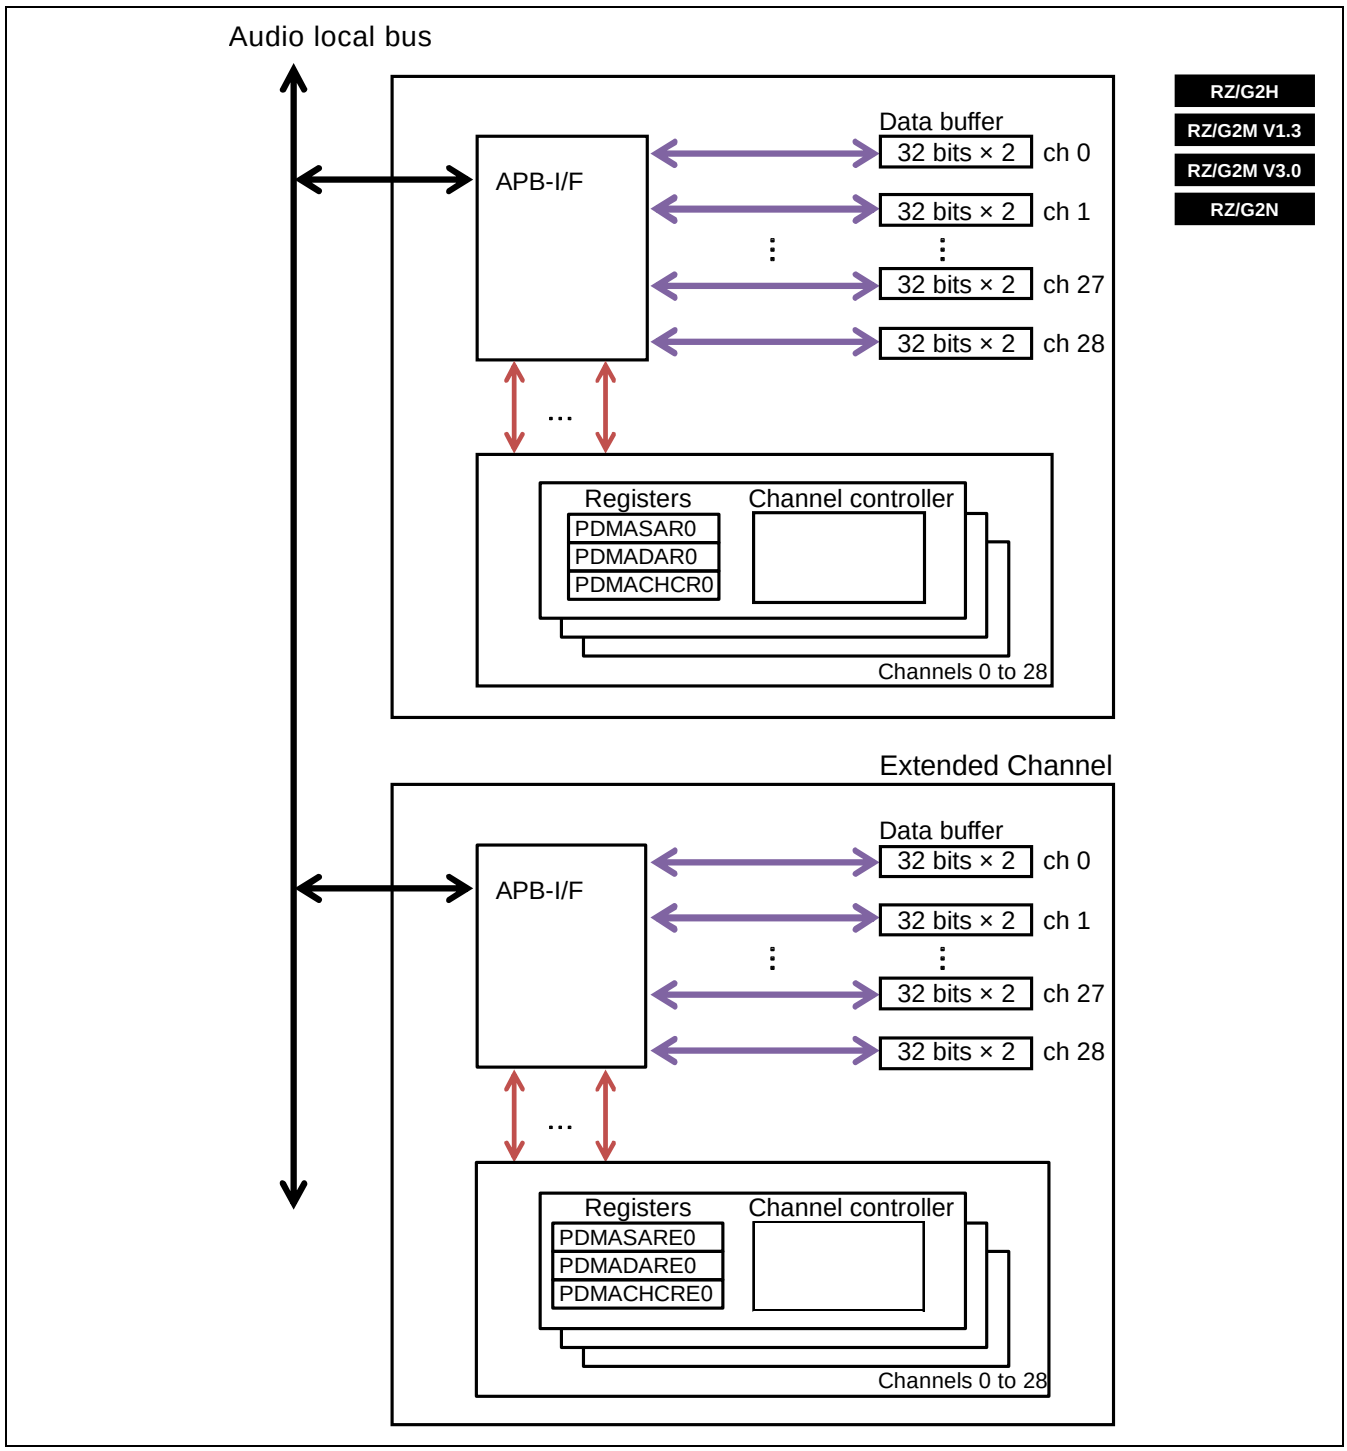

Figure 45.1 Block Diagram [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

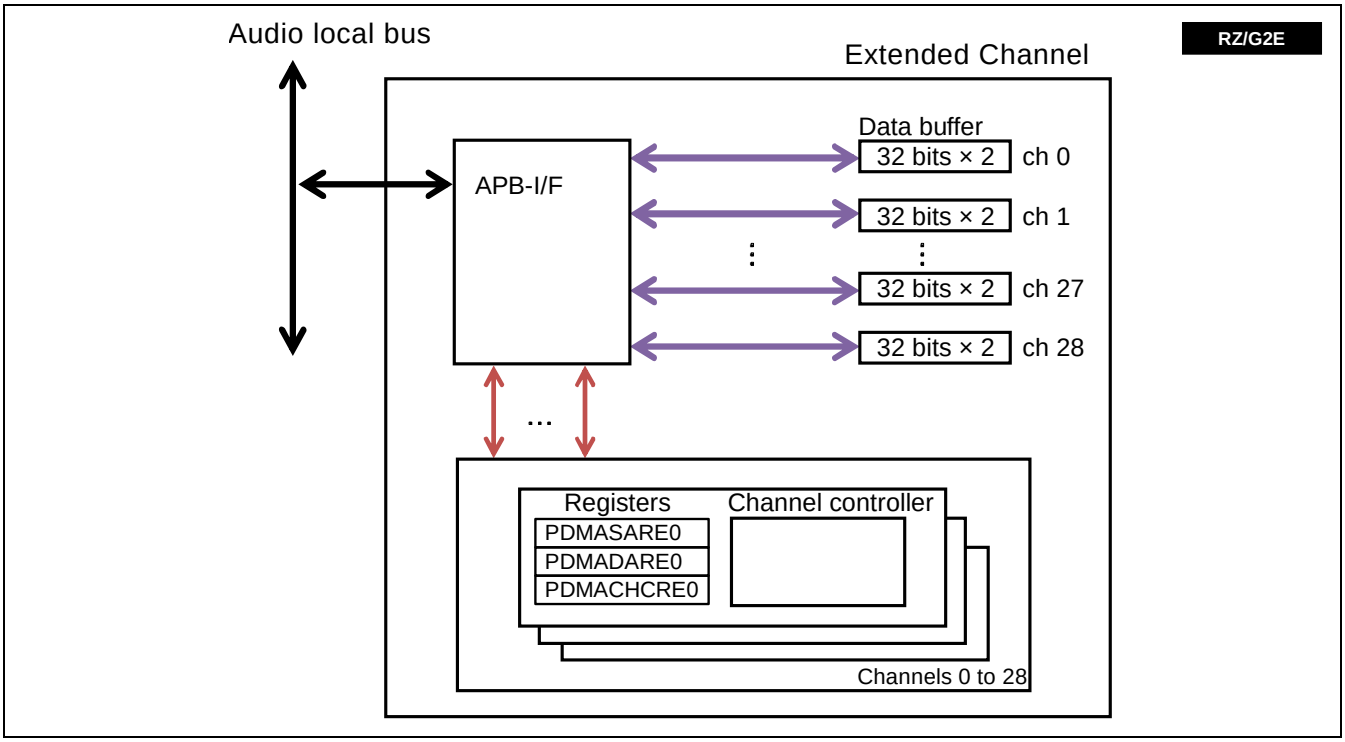

Figure 45.2 Block Diagram [RZ/G2E]

45.1.3 External Pins

No external pins are provided.

45.1.4 Register Configuration

Table 45.1 List of Registers

Register Name	Abbreviation	R/W	Address	Initial Value	Access Size	Second Generation RZ/G Series Products: RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
PDMA Source Address n Register	PDMASARn	R/W	H'EC74_0020 + H'10 × [n]	H'0000_0000	32	√	√	√	—
PDMA Destination Address n Register	PDMADARn	R/W	H'EC74_0024 + H'10 × [n]	H'0000_0000	32	√	√	√	—
PDMA Channel Control n Register	PDMACHCRn	R/W	H'EC74_002C + H'10 × [n]	H'0000_0000	32	√	√	√	—
PDMA Source Address n Register (extended)	PDMASAREn	R/W	H'EC76_0020 + H'10 × [n]	H'0000_0000	32	√	√	√	√
PDMA Destination Address n Register (extended)	PDMADAREn	R/W	H'EC76_0024 + H'10 × [n]	H'0000_0000	32	√	√	√	√
PDMA Channel Control n Register (extended)	PDMACHCREn	R/W	H'EC76_002C + H'10 × [n]	H'0000_0000	32	√	√	√	√

Notes: 1. N indicates the DMAC channel number (n = 0 to 28)
2. Access the listed registers from the CPU in longword (32-bit) units; byte or word access is prohibited.
3. Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

45.1.5 Connected Module

Table 45.2 Connected module

Module name	Connected module name	Function of connected module
Audio DMAC-Peripheral-Peripheral	APMU	Access the Register
	CPG	Output Clocks
	SSIU	Serial Sound Interface Unit
	SSI	Serial Sound Interface
	SCU	Sampling Rate Converter Unit

45.2 Register Description

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit, and writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/W: Write-only. The read value is undefined.

45.2.1 PDMA Source Address n Register (PDMASARn)

Note: n = 0 to 28

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: Sets the DMA transfer source address.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SAR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SAR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SAR	All 0	R/W	Sets the DMA transfer source address.

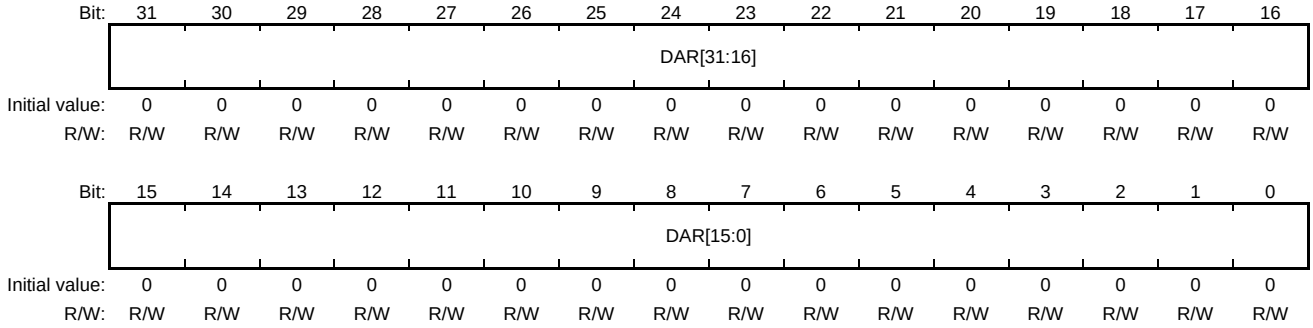
Note: It's prohibited to set same source address in other channels including PDMASARn and PDMASAREn.

45.2.2 PDMA Destination Address n Register (PDMADARn)

Note: n = 0 to 28

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: Sets the DMA transfer destination address.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DAR	All 0	R/W	Sets the DMA transfer destination address.

Note: It's prohibited to set same destination address in other channels including PDMADARn and PDMADAREn.

45.2.3 PDMA Channel Control n Register (PDMACHCRn)

Note: n = 0 to 28

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: Selects the request sources of DMA transfer source and destination, and also starts or stops DMA.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SRS[6:0]							—	DRS[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	SRS	H'00	R/W	Transfer Source Request Source Select (setting H'00 to H'38 and the values with "—" are prohibited) Refer to Table 45.3.
23	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 16	DRS	H'00	R/W	Transfer Destination Request Source Select (setting H'00 to H'36 and the values with "—" are prohibited) Refer to Table 45.3.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DE	B'0	R/W	DMA Enable To enable DMA transfer function, set this bit to 1. Clearing this bit to 0 stops transfer. Note: Even if 0 is written to this bit while it is 1, 1 is read out until the transfer is completed.

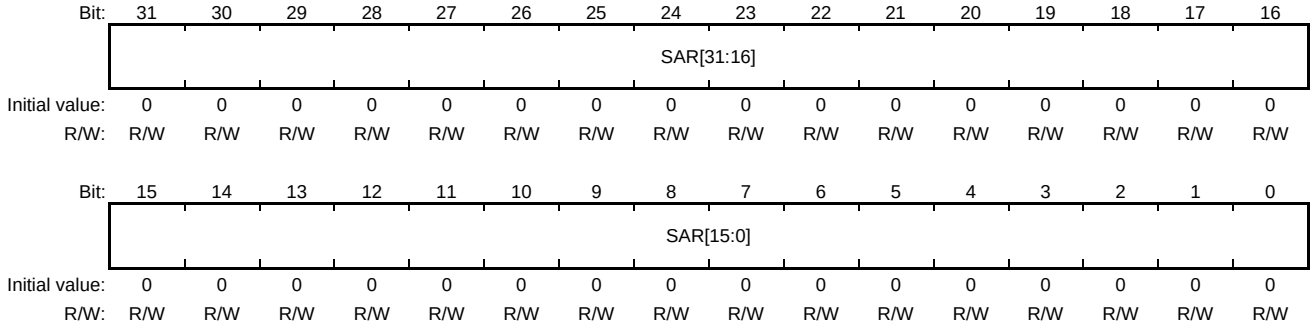
Notes: 1. It's prohibited to set same source/destination request source in other channels including PDMACHCRn.SRS/DRS and PDMACHCREn.SRS/DRS.
2. When clearing DE bit, do not change other bits.

45.2.4 PDMA Source Address n Register (extended) (PDMASAREn)

Note: n = 0 to 28

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: Sets the DMA transfer source address.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SAR	All 0	R/W	Sets the DMA transfer source address.

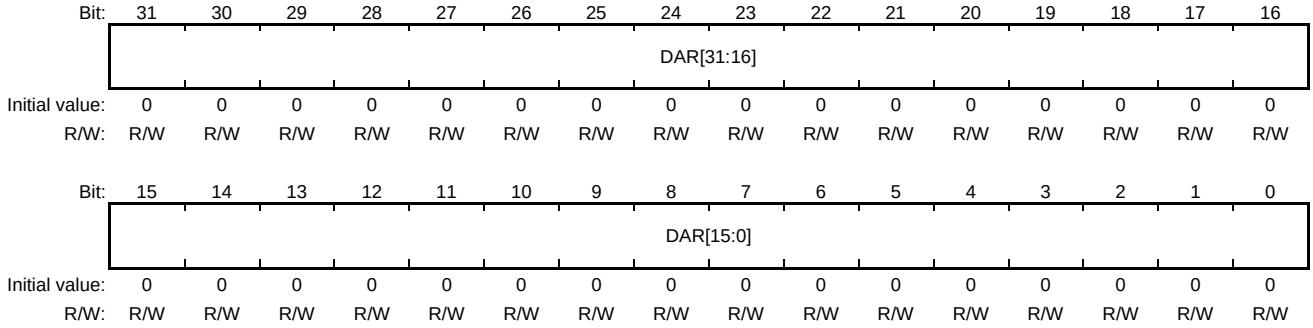
Note: It's prohibited to set same source address in other channels including PDMASARn and PDMASAREn.

45.2.5 PDMA Destination Address n Register (extended) (PDMADAREn)

Note: n = 0 to 28

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: Sets the DMA transfer destination address.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DAR	All 0	R/W	Sets the DMA transfer destination address.

Note: It's prohibited to set same destination address in other channels including PDMADARn and PDMADAREn.

45.2.6 PDMA Channel Control n Register (extended) (PDMACHCREn)

Note: n = 0 to 28

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: Selects the request sources of DMA transfer source and destination, and also starts or stops DMA.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SRS[6:0]							—	DRS[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	SRS	H'00	R/W	Transfer Source Request Source Select (setting H'00 to H'5B and the values with "—" are prohibited) Refer to Table 45.4(extended).
23	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 16	DRS	H'00	R/W	Transfer Destination Request Source Select (setting H'00 to H'5C and the values with "—" are prohibited) Refer to Table 45.4(extended).
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DE	B'0	R/W	DMA Enable To enable DMA transfer function, set this bit to 1. Clearing this bit to 0 stops transfer. Note: Even if 0 is written to this bit while it is 1, 1 is read out until the transfer is completed.

Notes: 1. It's prohibited to set same source/destination request source in other channels including PDMACHCRn.SRS/DRS and PDMACHCREn.SRS/DRS.
2. When clearing DE bit, do not change other bits.

46. EthernetAVB-IF

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

46.1 Overview

The EthernetAVB-IF includes an Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.

When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

The EthernetAVB-IF has a dedicated direct memory access controller (AVB-DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the User RAM(URAM) at high speed.

The AVB-DMAC is compliant with the following three standards formulated for IEEE 802.1BA: the IEEE 802.1AS timing and synchronization protocol, the IEEE 802.1Qav real-time transfer, and the IEEE 802.1Qat stream reservation protocol.

In this section, URAM refers to the local RAM and external memory for the LSI.

46.1.1 Features

Table 46.1 lists the specifications of the EthernetAVB-IF module.

Table 46.1 Specifications (Functions)

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Data transmission and reception	Transmission and reception of Ethernet (IEEE 802.3) frames
Transfer speed	Supports transfer at 100 and 1000 Mbps
Mode	Full-duplex mode
Interface	Supports the RGMII (Reduced Gigabit Media Independent Interface)
Summary of the EthernetAVB-IF function	An intelligent frame separation DMAC (AVB-DMAC) conforming with the following standards stipulated for IEEE 802.1BA: IEEE 802.1AS (time synchronization protocol) IEEE 802.1Qav (real-time transfer) IEEE 1722 (AVTP presentation timestamp) IEEE 802.1Qat is supported by software. Descriptor management system Identification and sorting of frame data, and extraction and gathering of valid data Controllable interrupt frequency (reducing the load on the CPU)
Transmit/Receive FIFO	For transmission: 16Kbytes For reception: 8Kbytes
Max frame size	For transmission: 2047bytes For reception: 4092bytes
Magic Packet™	Detection of Magic Packets™* and output of a detected signal

Note: * Magic Packet™ is a trademark of Advanced Micro Devices, Inc.

46.1.2 Block Diagram

Figure 46.1, Figure 46.2, Figure 46.3 are block diagram of the EthernetAVB-IF.

46.1.5 Connected Module

Table 46.6 Connected module

Module name	Connected module name	Function of connected module
EthernetAVB-IF	AP-System Core	Access the Registers
	CPG	Output clocks
	PFC	Select the External pins
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-SYS	Control to interrupt
	ADG	Output capture signal
	DU	Output capture signal

46.2 Register Description

46.2.1 AVB-DMAC Mode Register (CCC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CCC register specifies the operating mode of the AVB-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	FCE	LBME	—	—	—	—	—	—	CSEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DTSR	GAC	—	—	—	—	—	OPC[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
25	FCE	B'0	R/W	Flow Control Enable This bit enables the flow control support of E-MAC. When flow control is enabled, the E-MAC gets informed about the Rx-FIFO level (Rx-FIFO fill level reached RCR.RFCL). 0: Flow control disabled 1: Flow control enabled
24	LBME	B'0	R/W	Loopback Mode Enable This bit enables loopback mode. In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the RGMII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Normal operation 1: Loopback mode is enabled. Note: Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data.
23 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
17, 16	CSEL[1:0]	B’00	R/W	gPTP Clock Select These bits select the clock source for the gPTP timer. Writing to these bits is only possible when the current operating mode is configuration mode and CCC.GAC is 0. Writing to these bits is only possible when the current operating mode is Reset mode when writing CCC.GAC to 1 and CCC.OPC to B'01 by same write access. B’00: gPTP is disabled B’01: High-speed peripheral bus clock B’10 and B’11: Setting prohibited
15 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
8	DTSR	B’0	R/W	Data Transmission Suspend Request This bit can suspend access to the URAM. The access is suspended on completion of the transfer of the AXI transaction currently being transferred. This function disables access to the URAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the URAM is necessary, for example, in checking its integrity. Note that the transmission and reception queues are not processed while access is suspended. Change neither the AVB-DMAC settings nor the mode while access is suspended. 0: Normal operation 1: Requests suspension
7	GAC	B’0	R/W	Gptp Active in Config This bit enables the gPTP support of EthernetAVB-IF in CONFIG mode. Function of gPTP support in OPERATION and STANDBY is not influenced by this bit. When gPTP support is active in CONFIG, CCC.CSEL defines the timer clock source. The CPU can only write 1 to this bit if CSR.OPS is RESET when writing CCC.OPC to B'01 by same write access. 0: Normal operation 1: gPTP support active in CONFIG mode
6 to 2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
1, 0	OPC[1:0]	B’00	R/W	Operating Mode Configuration These bits specify the operating mode. For the operating modes, see section 46.3.1(1) Operating Modes. Writing to these bits is possible in any of the operating modes, but should not be done after the application system has issued a Power Off request. When CCC.GAC is 1 CPU should not write B'11 to these bits. [Changing condition] These bits are set to B'00 when RESET mode is entered due to 'enter power off' request. B’00: Reset mode B’01: Configuration mode B’10: Operation mode B’11: standby mode

46.2.2 Descriptor Base Address Table Register (DBAT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The DBAT register specifies the base address of the descriptor table in the URAM. For the structure of this table, see section 46.3.3 Descriptors. Writing to this bit is only possible when the current operating mode is configuration mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TA[31:0]	H'0000_0000	R/W	Descriptor Base Table Address Base address of the descriptor table in the URAM Note: The setting of this bit must be a multiple of four (i.e. bit 0 and bit 1 must be set to 0).

46.2.3 Descriptor Base Address Load Request Register (DLR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The DLR register is used to issue a request to load the values from the current descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Setting a bit to 1 issues a request for loading the descriptor base address for the queue q. If transfer is currently in progress, loading is executed on completion of transfer for the current frame. Completion of loading leads to automatic setting of the corresponding bit to 0.

For the transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is operation mode. Only 1 can be written to this bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	LBA15	B'1	R/W	Base Address Load Request (Rx11: Stream 9) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
14	LBA14	B'1	R/W	Base Address Load Request (Rx10: Stream 8) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
13	LBA13	B'1	R/W	Base Address Load Request (Rx9: Stream 7) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
12	LBA12	B'1	R/W	Base Address Load Request (Rx8: Stream 6) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
11	LBA11	B'1	R/W	Base Address Load Request (Rx7: Stream 5) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
10	LBA10	B'1	R/W	Base Address Load Request (Rx6: Stream 4) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
9	LBA9	B'1	R/W	Base Address Load Request (Rx5: Stream 3) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
8	LBA8	B'1	R/W	Base Address Load Request (Rx4: Stream 2) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

Bit	Bit Name	Initial Value	R/W	Description
7	LBA7	B'1	R/W	Base Address Load Request (Rx3: Stream 1) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
6	LBA6	B'1	R/W	Base Address Load Request (Rx2: Stream 0) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
5	LBA5	B'1	R/W	Base Address Load Request (Rx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
4	LBA4	B'1	R/W	Base Address Load Request (Rx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
3	LBA3	B'1	R/W	Base Address Load Request (Tx3: Stream Class A) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
2	LBA2	B'1	R/W	Base Address Load Request (Tx2: Stream Class B) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
1	LBA1	B'1	R/W	Base Address Load Request (Tx1: Network Control) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.
0	LBA0	B'1	R/W	Base Address Load Request (Tx0: Best Effort) 0: No load request is issued. 1: When written: A request for loading the corresponding base address is issued. When read: The given base address is being loaded.

46.2.4 AVB-DMAC Status Register (CSR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CSR register is used to indicate the operating mode in which the AVB-DMAC is running and the individual communications states.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	TDUO	RPO	TPO3	TPO2	TPO1	TPO0

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are read as 0.
21	TDUO	B'0	R	Transmission Descriptor Update On-going This bit indicates that there is pending descriptor update for one or more transmit queues. When this bit is 1, there are descriptors of already or currently processed transmit storage elements not updated in URAM. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when all transmit queue related storage elements processed. This bit is set to 1 when descriptor related status update procedure starts (descriptor update and register flagging). 0: No pending descriptor update 1: Pending descriptor update in URAM
20	RPO	B'0	R	Receive Process Status This bit indicates whether a reception queue contains an unread received frame. This bit being set to 1 indicates that a received frame is yet to be stored in the URAM. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Received frames in the reception FIFO all being stored in the URAM. 1: Reception is in progress. [Setting condition] — A received frame being stored in the reception FIFO (but not yet in the URAM).

Bit	Bit Name	Initial Value	R/W	Description
19	TPO3	B'0	R	Transmit Process Status 3 (Stream Class A) This bit indicates whether a class A stream is being transmitted. This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Completion of transfer of all frames for transmission from the transmission FIFO and TCCR.TSRQ3 is 0. 1: Transmission is in suspended. [Setting condition] — Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3)).
18	TPO2	B'0	R	Transmit Process Status 2 (Stream Class B) This bit indicates whether a class B stream is being transmitted. This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Completion of transfer of all frames for transmission from the transmission FIFO and TCCR.TSRQ2 is 0. 1: Transmission is in suspended. [Setting condition] — Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2)).
17	TPO1	B'0	R	Transmit Process Status 1 (Network Control) This bit indicates whether a network control is being transmitted. This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Completion of transfer of all frames for transmission from the transmission FIFO and TCCR.TSRQ1 is 0. 1: Transmission is in suspended. [Setting condition] — Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1)).

Bit	Bit Name	Initial Value	R/W	Description
16	TPO0	B'0	R	Transmit Process Status 0 (Best Effort) This bit indicates whether a best effort is being transmitted. This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the URAM, or the E-MAC is transmitting data. 0: Normal operation [Clearing conditions] — The current operating mode is not operation mode. — Completion of transfer of all frames for transmission from the transmission FIFO and TCCR.TSRQ0 is 0. 1: Transmission is in suspended. [Setting condition] — Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0)).
15 to 9	—	All 0	R	Reserved These bits are read as 0.
8	DTS	B'0	R	Data Transmission Suspended Status This bit indicates whether access to the URAM is enabled. 0: Normal operation [Clearing conditions] — The data transmission suspend request bit in the AVB-DMAC mode register (CCC.DTSR) being 0. 1: Transmission is in suspended. [Setting condition] — Access to the URAM not proceeding while the data transmission suspend request bit (CCC.DTSR) in the AVB-DMAC mode register (CCC) is 1 (if the URAM is being accessed, this bit is set to 1 on completion of access).
7 to 4	—	All 0	R	Reserved These bits are read as 0.
3 to 0	OPS[3:0]	B'0001	R	Operating Mode Status These bits indicate the current operating mode. For the operating modes, see section 46.3.1(1) Operating Modes. B'0001: Reset mode B'0010: Configuration mode B'0100: Operation mode B'1000: standby mode Other settings are reserved.

46.2.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CDARq register indicates the current descriptor address.

CDAR0 to CDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while CDAR4 to CDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, the contents of the register for the queue to be used are set in the descriptor base address table register (DBAT).

Also, when the descriptor base address load request register (DLR) issues a load request, the contents of the descriptor base address table register (DBAT) are set in to the corresponding CDAR registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are read as 0.
12	EIL	B'0	R	Error Information Lost This bit indicates that error information detect by EthernetAVB-IF is lost, because the previous reported error has not been processed by CPU. [Changing conditions] — This bit is set to 0 when leaving operation mode. — This bit is set to 0 when CPU writes 0 to EIS.QEF. — This bit is set to 1 when the set condition of EIS.QEF is fulfilled while EIS.QEF is 1. 0: No loss of error information 1: Lost of error information detected

Bit	Bit Name	Initial Value	R/W	Description
11 to 8	ET[3:0]	B’0000	R	Error Type These bits indicate details about the transfer stage which was handled when EthernetAVB-IF has detected an error. When the fault is related to the read descriptor (ESR.ET = B'0000 or B'0010), CPU needs to correct the faulty descriptor before the related queue can continue processing. Because the queue halts at the faulty descriptor CDARq.CDA (q = ESR.EQN) is identifying the faulty descriptor directly. When the fault is related to descriptor writing (ESR.ET = B'0001), CPU needs to recognize the not-updated or incorrectly updated descriptor in queue ESR.EQN. The write problem is not influencing how EthernetAVB-IF processes the descriptor chain. When the fault is related to the Tx-buffer (ESR.ET = B'0011), CPU needs to clean-up the Tx-buffer to correct the buffer control structures. All other errors are transient in nature and may be corrected by continuation of hardware or software operation; so there is no strong demand on CPU interaction. Refer to Section 46.3.2(2) Checking Integrity for details of error handling. The CPU should only evaluate these bits when the EIS.QEF bit is 1. [Changing condition] — These bits are updated when the set condition of the EIS.QEF bit is fulfilled and the EIS.QEF bit is 0. B’0000: Read descriptor from URAM B’0001: Write descriptor to URAM B’0010: Interpret data descriptor B’0011: Tx-buffer is corrupted B’0100: Read data from URAM B’0101: Write data or timestamp to URAM B’0110: Reading from Rx-FIFO B’0111: Rx-FIFO is corrupted B’1000: Frame size error during reception detected B’1001: Frame size error during transmission detected B’1010: Tx-buffer overflow B’1011: AVTP FIFO error
7 to 5	—	All 0	R	Reserved These bits are read as 0.
4 to 0	EQN[4:0]	B’0_0000	R	Error Queue Number These bits indicate the queue number which was handled when EthernetAVB-IF has detected an error. A fault reported for ESR.EQN = 0 to 3 is related to transmit queue t (t = 0 to 3). From ESR.EQN = 4, the fault is related to receive queue r (r = ESR.EQN – 4). The CPU should only evaluate these bits when the EIS.QEF bit is 1. The CPU should not evaluate these bits when the ESR.ET bit is B'0011, B'0111 or B'1011. [Changing condition] — These bits are updated when the set condition of the EIS.QEF bit is fulfilled and the EIS.QEF bit is 0.

46.2.7 AVB-DMAC Product Specific Register (APSR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Writing to this bit is only possible when the current operating mode is configuration mode.

46.2.8 Receive Configuration Register (RCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RCR register is used to make settings related to reception for the AVB-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	RFCL[12:0]												
Initial value:	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	ETS2	ETS0	ESF[1:0]		ENCF	EFFS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
28 to 16	RFCL[12:0]	H'1800	R/W	Receive FIFO Caution Level These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission. If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending. If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending. Writing to this bit is only possible when the current operating mode is configuration mode. Recommended value: H'1800 Notes: • The setting of this bit must be a multiple of four (i.e. set RFCL[1:0] = B'00). • In the case of this LSI chip, set these bits to H'1800.
15 to 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5	ETS2	B’0	R/W	Time Stamp Enable (Stream) Enables the inclusion of time-stamp information in reception queues 2 to 17. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Time stamping is disabled. 1: Time stamping is enabled. Recommended value: 0

Bit	Bit Name	Initial Value	R/W	Description
4	ETS0	B’0	R/W	Time Stamp Enable (Best Effort) Enables the inclusion of time-stamp information in reception queue 0. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Time stamping is disabled. 1: Time stamping is enabled. Recommended value: 0
3, 2	ESF[1:0]	B’00	R/W	Stream Filtering Select Settings for reception queues 2 to 17. These bits select separation filtering for reception queues 2 to 17. The queue-dependent separation filter can be used in combination with the identification of AVB stream frames. When the value is B'00, filtering is disabled and frames from streams are processed in reception queue 0 (best effort). When the value is B'01, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort). When the value is B'10, the separation filter is enabled for AVB stream frames; frames from non-matching streams are discarded. When the value is B'11, the separation filter is enabled for AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort). For separation filtering, see section 46.3.4(1)(a) Separation Filtering. Writing to this bit is only possible when the current operating mode is configuration mode. B’00: Filtering is disabled. Frames are processed in queue 0 (best effort). B’01: The filter for both AVB stream frames and non-AVB stream frames is enabled; non-matching frames from the stream are processed in queue 0 (best effort). B’10: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames are discarded. B’11: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from a stream are processed in queue 0 (best effort). Recommended value: B'10 or B'11
1	ENCF	B’0	R/W	Network Control Filtering Enable Setting for reception queue 1 (network control) Enables the AVB network control frame for reception queue 1. When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort). Writing to this bit is only possible when the current operating mode is configuration mode. 0: Network control is disabled. 1: Network control is enabled.

Bit	Bit Name	Initial Value	R/W	Description
0	EFFS	B'0	R/W	Error Frame Enable Enables or disables the reception of frames that have been classified as error frames by the E-MAC. Received error frames are stored in reception queue 0 (best effort). An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MS). Writing to this bit is only possible when the current operating mode is configuration mode. 0: Error frames are disabled. 1: Error frames are enabled. Recommended value: 0

46.2.9 Receive Queue Configuration Register i (RQCi) (i = 0 to 4)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RQC0 register is used to set up reception queues 0 to 3.

The RQC1 register is used to set up reception queues 4 to 7.

The RQC2 register is used to set up reception queues 8 to 11.

The RQC3 register is used to set up reception queues 12 to 15.

The RQC4 register is used to set up reception queues 16 to 17.

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R/W	Reserved These bits are read as 0. The write value should be 0.
30	PIA3	B'0	R/W	Packed Incremental data Area (Receive Queue 3 + i × 4) This bit defines how addresses inside the incremental data area of queue 3 + i × 4 are handled. When this bit is 0, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if CSR.OPS is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area
29, 28	UFCC3[1:0]	B'00	R/W	Unread Frame Counter Configuration (Receive Queue 3 + i × 4) These bits set the unread frame counter used in reception queue 3 + i × 4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 3 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
27, 26	TSEL3	B’00	R/W	Truncation SELection (Receive Queue 3 + i × 4) This bit defines a maximum number of bytes for storing frames in receive queue 3 + i × 4. Frames longer than the selected maximum are truncated. EthernetAVB-IF provides 2 common configurations for the maximum frame length. This bit selects one of the configurations j defined by RTCi.MFLj. B’00: Maximum frame length defined by RTC0.MFL0 B’01: Maximum frame length defined by RTC0.MFL1 Other configurations are Invalid The CPU can only write to these bits if CSR.OPS is CONFIG.
25, 24	RSM3[1:0]	B’00	R/W	Receive Synchronous Mode (Receive Queue 3 + i × 4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 46.3.4(3)(c) Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. B’00: Mode with write-back B’01: Keep DT mode (no update of DT field at descriptor write back) B’10: No write-back (no descriptor write back) B’11: Invalid
23	—	B’0	R/W	Reserved These bits are read as 0. The write value should be 0.
22	PIA2	B’0	R/W	Packed Incremental data Area (Receive Queue 2 + i × 4) This bit defines how addresses inside the incremental data area of queue 2 + i × 4 are handled. When this bit is 0, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if CSR.OPS is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area
21, 20	UFCC2[1:0]	B’00	R/W	Unread Frame Counter Configuration (Receive Queue 2 + i × 4) These bits set the unread frame counter used in reception queue 2 + i × 4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 2 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
19, 18	TSEL2	B’00	R/W	Truncation SELection (Receive Queue 2 + i × 4) This bit defines a maximum number of bytes for storing frames in receive queue 2 + i × 4. Frames longer than the selected maximum are truncated. EthernetAVB provides 2 common configurations for the maximum frame length. This bit selects one of the configurations j defined by RTCi.MFLj. B’00: Maximum frame length defined by RTC0.MFL0 B’01: Maximum frame length defined by RTC0.MFL1 Other configurations are Invalid The CPU can only write to these bits if CSR.OPS is CONFIG.
17, 16	RSM2[1:0]	B’00	R/W	Receive Synchronous Mode (Receive Queue 2 + i × 4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 46.3.4(3)(c) Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. B’00: Mode with write-back B’01: Keep DT mode (no update of DT field at descriptor write back) B’10: No write-back (no descriptor write back) B’11: Invalid
15	—	B’0	R/W	Reserved These bits are read as 0. The write value should be 0.
14	PIA1	B’0	R/W	Packed Incremental data Area (Receive Queue 1 + i × 4) This bit defines how addresses inside the incremental data area of queue 1 + i × 4 are handled. When this bit is 0, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if CSR.OPS is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area
13, 12	UFCC1[1:0]	B’00	R/W	Unread Frame Counter Configuration (Receive Queue 1 + i × 4) These bits set the unread frame counter used in reception queue 1 + i × 4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 1 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
11, 10	TSEL1	B’00	R/W	Truncation SELection (Receive Queue 1 + i × 4) This bit defines a maximum number of bytes for storing frames in receive queue 1 + i × 4. Frames longer than the selected maximum are truncated. EthernetAVB-IF provides 2 common configurations for the maximum frame length. This bit selects one of the configurations j defined by RTCi.MFLj. B’00: Maximum frame length defined by RTC0.MFL0 B’01: Maximum frame length defined by RTC0.MFL1 Other configurations are Invalid The CPU can only write to these bits if CSR.OPS is CONFIG.
9, 8	RSM1[1:0]	B’00	R/W	Receive Synchronous Mode (Receive Queue 1 + i × 4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 46.3.4(3)(c) Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. B’00: Mode with write-back B’01: Keep DT mode (no update of DT field at descriptor write back) B’10: No write-back (no descriptor write back) B’11: Invalid
7	—	B’0	R/W	Reserved These bits are read as 0. The write value should be 0.
6	PIA0	B’0	R/W	Packed Incremental data Area (Receive Queue 0 + i × 4) This bit defines how addresses inside the incremental data area of queue 0 + i × 4 are handled. When this bit is 0, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if CSR.OPS is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area
5, 4	UFCC0[1:0]	B’00	R/W	Unread Frame Counter Configuration (Receive Queue 0 + i × 4) These bits set the unread frame counter used in reception queue 0 + i × 4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 0 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode.

Bit	Bit Name	Initial Value	R/W	Description
3, 2	TSEL0	B’00	R/W	Truncation SELection (Receive Queue 0 + i × 4) This bit defines a maximum number of bytes for storing frames in receive queue 0 + i × 4. Frames longer than the selected maximum are truncated. EthernetAVB-IF provides 2 common configurations for the maximum frame length. This bit selects one of the configurations j defined by RTCi.MFLj. B’00: Maximum frame length defined by RTC0.MFL0 B’01: Maximum frame length defined by RTC0.MFL1 Other configurations are Invalid The CPU can only write to these bits if CSR.OPS is CONFIG.
1, 0	RSM0[1:0]	B’00	R/W	Receive Synchronous Mode (Receive Queue 0 + i × 4) These bits set receive synchronous mode. Set B'00 in this bit. For receive synchronous mode, see section 46.3.4(3)(c) Mode with Write-Back. Writing to the bits is only possible when the current operating mode is configuration mode. B’00: Mode with write-back B’01: Keep DT mode (no update of DT field at descriptor write back) B’10: No write-back (no descriptor write back) B’11: Invalid

46.2.10 Receive Padding Configuration Register (RPC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RPC register is used to set padding for received frames.

Note: Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
23 to 16	DCNT[7:0]	H'00	R/W	Stored Data Counter These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes). When these bits are 0, all received data have been stored following the initial padding. Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see section 46.3.4(3)(b) Incremental Data Areas.
15 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10 to 8	PCNT[2:0]	B'001	R/W	Stored Padding Counter These bits specify the amount of padding to be appended to the URAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes). Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see section 46.3.4(3)(b) Incremental Data Areas. The CPU should not write 0 to these bits.
7 to 0	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

46.2.11 Reception Truncation Configuration register (RTC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RTC register is used to set Maximum Number of bytes stored per received frame.

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
27 to 16	MFL1[11:0]	H'FFC	R/W	Maximum Frame Length 1 These bits define the maximum frame length (64 to 4092 bytes) stored to URAM. For each receive queue one parameter 1 used for truncation is selected. When a frame received by E-MAC is truncated, CPU gets informed by EIS.QEF and frame size error (ESR.ET is B'1000). Additionally the DESCR.TI in the updated descriptor is set to 1. The CPU can only write to these bits if CSR.OPS is CONFIG. The CPU should only write values which are a multiple of 4 to these bits. The CPU should not write values less than 64 to these bits. The CPU should not write values less then SFO.FBP + 8 to these bits when RCR.ESF is not equal to B'00.
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11 to 0	MFL0[11:0]	H'FFC	R/W	Maximum Frame Length 0 These bits define the maximum frame length (64 to 4092 bytes) stored to URAM. For each receive queue one parameter 0 used for truncation is selected. When a frame received by E-MAC is truncated, CPU gets informed by EIS.QEF and frame size error (ESR.ET is B'1000). Additionally the DESCR.TI in the updated descriptor is set to 1. The CPU can only write to these bits if CSR.OPS is CONFIG. The CPU should only write values which are a multiple of 4 to these bits. The CPU should not write values less than 64 to these bits. The CPU should not write values less then SFO.FBP + 8 to these bits when RCR.ESF is not equal to B'00.

46.2.12 Unread frame counter warning level register (UFCW)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The UFCW register sets the warning levels for the number of unread frames.

One of the four warning levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

The CPU should not write 63 to these bits.

46.2.14 Unread Frame Counter Register i (UFCVi) (i = 0 to 4)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The UFCV0 register indicates the number of unread frames in reception queues 0 to 3.

The UFCV1 register indicates the number of unread frames in reception queues 4 to 7.

The UFCV2 register indicates the number of unread frames in reception queues 8 to 11.

The UFCV3 register indicates the number of unread frames in reception queues 12 to 15.

The UFCV4 register indicates the number of unread frames in reception queues 16 and 17.

For a description of how to use unread frames, refer to section 46.3.4 (4), Unread Frame Counters.

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (DLR) issues a base address load request.

The number is incremented when data received in reception queue r are stored normally. The maximum increment is H'3F. If the value exceeds H'3F, incrementation will not proceed.)

The number is decremented by the value written to the unread frame counter decrement register i (UFCDi).

46.2.15 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The UFCD0 register is used to decrement unread counters in reception queues 0 to 3.

The UFCD1 register is used to decrement unread counters in reception queues 4 to 7.

The UFCD2 register is used to decrement unread counters in reception queues 8 to 11.

The UFC register is used to decrement unread counters in reception queues 12 to 15.

The UFCD4 register is used to decrement unread counters in reception queues 16 and 17.

Write H'3F to these bits to reset the unread counters in reception queue r (r = 0 to 17). These bits are always read as 0.

46.2.16 Separation Filter Offset Register (SFO)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The SFO register sets an offset into frames for use by the separation filter.

Note: Received frames having fewer bytes than the setting of these bits + 8 bytes are judged to be non-matching by the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (RCR.ESF).

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5 to 0	FBP[5:0]	B'00_0000	R/W	First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 46.2 Operating Mode of AVB-DMAC, in section 46.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of SFVi.LV[5:0] when SFL.LC changes from 30 (Load SFO.FBP) to 31 while CSR.OPS is OPERATION. For separation filtering, see section 46.3.4(1)(a) Separation Filtering.

46.2.17 Separation Filter Pattern Register i (SFPi) (i = 0 to 31)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

A pair of SFPi registers set the pattern for the separation filters to be used by the corresponding reception queues 2 to 17 (for streams 0 to 15).

Each queue shares a 64-bit setting; reception queue 2 (for stream 0) uses SFP0 and SFP1, reception queue 17 (for stream 15) uses SFP30 and SFP31, and so on.

The separation filter passes a frame when, after masking by the mask value set in the separation filter mask register (SFMi), data from received frames match the value defined in these bits.

SFPi.FP[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while SFPi.FP[63:56] (where i is the corresponding odd number) are used for the byte at the address specified by the separation filter offset register (SFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

[Changing condition]

These bits are updated to the value of SFVi.LV[63:0] when SFL.LC changes from s (Load SFPi.FPs) to 31 while CSR.OPS is OPERATION.

For separation filtering, see section 46.3.4(1)(a) Separation Filtering.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FP[31:0]	H'0000_0000	R/W	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

46.2.18 Separation Filter Value register i (SFVi) (i = 0 to 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

These bits define the 64 bit value to be loaded for separation filtering.

When loading the first by position (SFO.FBP), SFVi.LV[63:6] are ignored.

The CPU can only write to these bits if CSR.OPS is OPERATION.

The CPU can only write to these bits if SFL.LC is 31.

[Changing condition]

These bits are set to 0 when leaving OPERATION mode.

For separation filtering, see section 46.3.4(1)(a) Separation Filtering.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LV[31:0]	H'0000_0000	R/W	Separation Filter Value These bits set the Load value of the separation filter.

46.2.19 Separation Filter Mask Register i (SFMi) (i = 0 or 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

A pair of SFMi registers sets the mask value for the separation filter used by the corresponding reception queue 2 to 17 (stream 0 to 15).

SFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while SFM1.CFM[63:56] are used for the separation filter offset register (SFO) + 7.

Frame data at the positions of mask bits that are set to 0 are masked; that is, they do not affect pattern-matching by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode.

[Changing condition]

These bits are updated to the value of SFVi.LV[63:0] when SFL.LC changes from 29 (Load SFMi.CFM) to 31 while CSR.OPS is OPERATION.

For separation filtering, see section 46.3.4(1)(a) Separation Filtering.

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
4 to 0	LC[4:0]	H'1F	R/W	Load Command These bits control update of separation filter configuration in OPERATION mode. By writing 30 to these bits CPU triggers an update of First Byte Position (SFO.FBP) value. By writing 29 to these bits CPU triggers an update of Common Filter Mask (SFMi.CFM) value. By writing number between 0 and 15 to these bits CPU triggers an update of Filter Pattern s (SFPi.FPs) value. The number written to SFL.LC defines the index s of the updated Filter Pattern. The CPU can only write to these bits if CSR.OPS is OPERATION. The CPU can only write to these bits if SFL.LC is 31. [Changing condition] These bits are set to 31 when leaving OPERATION mode. These bits are set to 31 when the requested update has been processed. 0-15: Load of SFPi.FPs with s = SFL.LC 16-28: Invalid 29: Load of SFMi.CFM 30: Load of SFO.FBP 31: No pending load request

46.2.21 Current Incremental Address Register r (CIARr) (r = 0 to 17)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CIARr register is used to check queue address.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CIA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CIA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CIA[31:0]	H'0000_0000	R	Current incremental address used by receive queue These bits indicate the incremental address of receive queue r, where currently frame data is stored or where frame data will be stored when queue r gets active. Refer to section 46.3.4(3)(b) Incremental Data Areas. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are updated to next address in incremental data area when processing a FEMPTY_IS or FEMPTY_IC descriptor.

46.2.22 Last Incremental Address Register r (LIARr) (r = 0 to 17)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The LIARr register is used to check queue address.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LIA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LIA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LIA[31:0]	H'0000_0000	R	Last incremental address used by receive queue These bits indicate the current incremental address of receive queue r (CIARr.CIA) before its address was updated due to processing a FEMPTY_IS descriptor. So it describes the first not used address inside the incremental data area of receive queue r. Refer to section 46.3.4(3)(b) Incremental Data Areas. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to CIARr.CIA when processing a FEMPTY_IS descriptor.

46.2.23 Transmit Configuration Register (TGC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TGC register is used to make settings related to transmission for the AVB-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
21, 20	TBD3[1:0]	B'10	R/W	Transmit FIFO Size (Stream Class A) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 3 (for stream class A). Writing to these bits is only possible when the current operating mode is configuration mode.
19, 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17, 16	TBD2[1:0]	B'10	R/W	Transmit FIFO Size (Stream Class B) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 2 (for stream class B). Writing to these bits is only possible when the current operating mode is configuration mode.
15, 14	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
13, 12	TBD1[1:0]	B'10	R/W	Transmit FIFO Size (Network Control) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 1 (for network control). Writing to these bits is only possible when the current operating mode is configuration mode.
11, 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9, 8	TBD0[1:0]	B'10	R/W	Transmit FIFO Size (Best Effort) These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queue 0 (for best effort). Writing to these bits is only possible when the current operating mode is configuration mode.
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	TQP	B'0	R/W	Transmission Queues Priority This bit defines how EthernetAVB-IF prioritises between transmit queues when scheduling transmission. For fetching always the queue with highest priority is selected, for transmission the queue with highest priority where data is available in Tx-Buffer. Transmission priority of queue 2 and 3 can be influenced by the credit based shaping algorithm. The priority of the transmit queues is given from high to low. 0: Default priority: Q3(CBS), Q2(CBS), Q1, Q0 1: Alternate priority: Q1, Q3(CBS), Q2(CBS), Q0 For the credit-based shaping (CBS) algorithm, see section 46.3.6 CBS (Credit-Based Shaping). Writing to the bits is only possible when the current operating mode is configuration mode.
4	ECBS	B'0	R/W	Enable Credit Based Shaping This bit defines if CBS algorithm is used for transmit queue 2 and 3 to prioritise between transmit queues when scheduling transmission. When CBS is enabled, the shaping bases on queue specific configuration in CIVRc, CDVRc, CULc and CLLc. 0: CBS globally disabled 1: CBS enabled based on queue specific configuration For the credit-based shaping (CBS) algorithm, see section 46.3.6 CBS (Credit-Based Shaping). Writing to the bits is only possible when the current operating mode is configuration mode.
3	TSM3	B'0	R/W	Transmit Synchronous Mode (Stream Class A) Set these bits to 0. 0: With write-back 1: Setting prohibited
2	TSM2	B'0	R/W	Transmit Synchronous Mode (Stream Class B) Set these bits to 0. 0: With write-back 1: Setting prohibited
1	TSM1	B'0	R/W	Transmit Synchronous Mode (Network Control) Set these bits to 0. 0: With write-back 1: Setting prohibited
0	TSM0	B'0	R/W	Transmit Synchronous Mode (Best Effort) Set these bits to 0. 0: With write-back 1: Setting prohibited

46.2.24 Transmit Configuration Control Register (TCCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TCCR register controls transmission by the AVB-DMAC and is used to make related settings.

Conditions for updating:

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, and when a descriptor with defective data is processed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MFR	MFEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TFR	TFEN	—	—	—	—	TSRQ3	TSRQ2	TSRQ1	TSRQ0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	MFR	B'0	R/W	E-MAC status FIFO Release This bit releases the oldest entry of the E-MAC status FIFO. When 1 is written to this bit, EthernetAVB-IF gets informed that CPU has processed the oldest E-MAC status FIFO entry as visible in MFA register. The oldest entry is removed from E-MAC status FIFO. This bit is always read as 0. 0: No request to E-MAC status FIFO 1: Release oldest entry of E-MAC status FIFO
16	MFEN	B'0	R/W	E-MAC status FIFO ENable This bit enables the storage of transmission status information (the MAC flags for frame transmission) in the E-MAC status FIFO. Additionally CPU can control the status storage for each frame provided for transmission using DESCR.MSR. When this bit is set to 0 all pending FIFO entries are removed. 0: Disabled 1: Enabled
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9	TFR	B'0	R/W	Time Stamp FIFO Release This bit releases the oldest entry in the time-stamp FIFO. For a description of how to use the time-stamp FIFO, see section 46.3.5(4) Time Stamping in Transmission. 0: (Not operating) 1: Releases the oldest entry in the time-stamp FIFO.

Bit	Bit Name	Initial Value	R/W	Description
8	TFEN	B'0	R/W	Time Stamp FIFO Enable This bit enables storage in the time-stamp FIFO. When it is set, time-stamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see section 46.3.5(2)(b) Configuration of Transmission Frame Data Descriptors. When 0 is set in this bit, no entries are made in the time-stamp FIFO. For a description of how to use the time-stamp FIFO, see section 46.3.5(4) Time Stamping in Transmission. 0: Recording of transmission time stamps in the time-stamp FIFO is disabled. 1: Recording of transmission time stamps in the time-stamp FIFO is enabled.
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	TSRQ3	B'0	R/W	Transmit Start Request (Queue 3 (Stream Class A)) This bit issues a request to start transmission for transmission queue 3. When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO. Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission. For the scheduling of transmission queues, see section 46.3.5(1) Transmission Modes. Writing to this bit is only possible when the current operating mode is operation mode. Only 1 can be written to the bit. Writing 0 to the bit has no effect. 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.
2	TSRQ2	B'0	R/W	Transmit Start Request (Queue 2 (Stream Class B)) This bit issues a request to start transmission for transmission queue 2. When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO. Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission. For the scheduling of transmission queues, see section 46.3.5(1) Transmission Modes. Writing to this bit is only possible when the current operating mode is operation mode. Only 1 can be written to the bit. Writing 0 to the bit has no effect. 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.

Bit	Bit Name	Initial Value	R/W	Description
1	TSRQ1	B'0	R/W	Transmit Start Request (Queue 1 (Network Control)) This bit issues a request to start transmission for transmission queue 1. When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO. Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission. For the scheduling of transmission queues, see section 46.3.5(1) Transmission Modes. Writing to this bit is only possible when the current operating mode is operation mode. Only 1 can be written to the bit. Writing 0 to the bit has no effect. 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.
0	TSRQ0	B'0	R/W	Transmit Start Request (Queue 0 (Best Effort)) This bit issues a request to start transmission for transmission queue 0. When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO. Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission. For the scheduling of transmission queues, see section 46.3.5(1) Transmission Modes. Writing to this bit is only possible when the current operating mode is operation mode. Only 1 can be written to the bit. Writing 0 to the bit has no effect. 0: Transmission queue is empty or stopped. 1: When written: A transmission start request is issued. When read: Fetching of data for transmission is pending.

46.2.25 Transmit Status Register (TSR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TSR register indicates the state of transmission by the AVB-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MFFL[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TFFL[2:0]			—	—	—	—	CCS1[1:0]		CCS0[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
20 to 16	MFFL[4:0]	H'00	R	Number of entries stored in the E-MAC status FIFO E-MAC status FIFO Fill Level These bits indicate the number of entries available in the MAC status FIFO. If this value is 0, the FIFO is empty. If this value is 16, the FIFO is full. The values 17 to 31 are reserved. [Changing condition] These bits are set to 0 when leaving OPERATION mode. These bits are set to 0 when TCCR.MFEN is 0. This value is incremented when frame with DESCR.MSR has been transmitted by E-MAC, TCCR.MFEN is 1 and TSR.MFFL is not 16. This value is incremented when E-MAC detects an error during transmission, TCCR.MFEN is 1 and TSR.MFFL is not 16. This value is decremented when 1 is written to TCCR.MFR and TSR.MFFL is not 0.
15 to 11	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	TFFL[2:0]	B’00	R	Time Stamp FIFO Count These bits indicate the number of time stamps in the time-stamp FIFO. The values 0 and 3 indicate that the time-stamp FIFO is empty and full, respectively (values 4 to 7 are reserved). Conditions for updating: • The bits are set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) = 0. • When the time stamp FIFO enable bit (TCCR.TFEN) is 1 and these bits are not 3, the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E-MAC (for DESCR.TSR, see section 46.3.5(2)(b) Configuration of Transmission Frame Data Descriptors. • The value of these bits is decremented if it is not 0 when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).
7 to 4	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
3, 2	CCS1[1:0]	B’00	R	CBS Counter Status 1 (Class A) These bits indicate the CBS (credit-based shaping) state of stream data transmission queue 1. If the calculated credit value is outside the range specified by CBS upper limit register c (CULc) and CBS lower limit register c (CLLc), it falls outside the range for CBS. Conditions for updating: • The bits are set to B'00 when the operating mode is not operation mode. The bits are set to B'00 when the CBS is inside the condition limits. • The bits are set to B'01 if the credit value calculated by the CBS is lower than the value in CBS lower limit register c (CLLc). • The bits are set to B'10 if the credit value calculated by the CBS is higher than the value in CBS upper limit register c (CULc). B’00: The current credit value is within the limit. B’01: The current credit value is less than or equal to the lower limit. B’10: The current credit value is greater than or equal to the upper limit. B’11: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CCS0[1:0]	B’00	R	CBS Counter Status 0 (Class B) These bits indicate the CBS (credit-based shaping) state of stream data transmission queue 0. If the calculated credit value is outside the range specified by CBS upper limit register c (CULc) and CBS lower limit register c (CLLc), it falls outside the range for CBS. Conditions for updating: • The bits are set to B'00 when the operating mode is not operation mode. The bits are set to B'00 when the CBS is inside the condition limits. • The bits are set to B'01 if the credit value calculated by the CBS is lower than the value in CBS lower limit register c (CLLc). • The bits are set to B'10 if the credit value calculated by the CBS is higher than the value in CBS upper limit register c (CULc). B’00: The current credit value is within the limit. B’01: The current credit value is less than or equal to the lower limit. B’10: The current credit value is greater than or equal to the upper limit. B’11: Setting prohibited

46.2.26 E-MAC status FIFO Access register (MFA)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The MFA register indicates the state of MAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	MST[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MSV[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

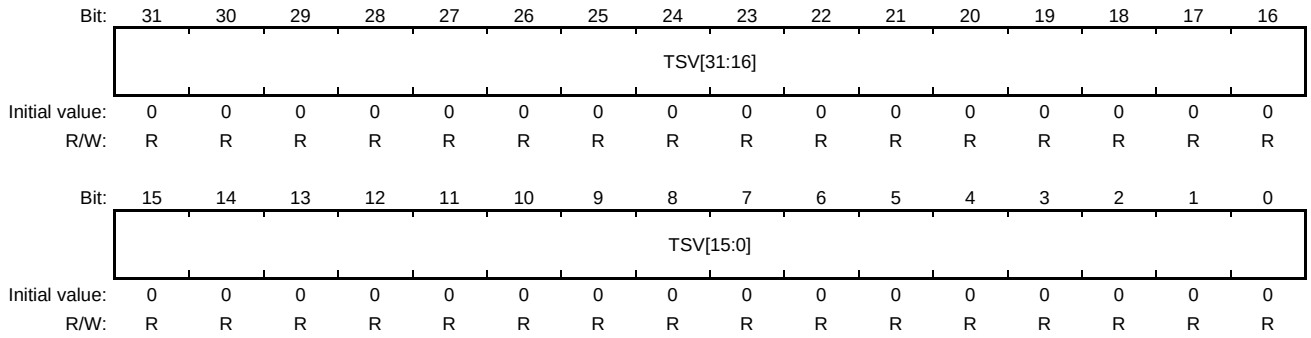
Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
25 to 16	MST[9:0]	H'000	R	Tag number from descriptor identifying the frame E-MAC status relation E-MAC Status Tag These bits represent the DESCR.TAG bits from the descriptor defining the data for frame transmission. The tag is used to get the relation between the frame inside a transmit queue and the E-MAC status available in the FIFO (MFA.MSV). The CPU should not read these bits when TSR.MFFL is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1 to TCCR.MFR). These bits are updated when the FIFO is overwritten (a frame with DESCR.MSR in descriptor has been transmitted by MAC, TCCR.MFEN is 1 and TSR.MFFL is 16). These bits are updated when the FIFO is overwritten (E-MAC detects an error during transmission and TSR.MFFL is 16). *Note for verification: These bits are set to 0 when leaving OPERATION mode.*
15 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	MSV[3:0]	H'0	R	E-MAC Status Value These bits represent the E-MAC status bits as stored in the oldest E-MAC status FIFO entry. *MSV[3] Reserved* *MSV[2] Carrier lost during frame transmission* *MSV[1] Delay collision* *MSV[0] Transmission time out* The CPU should not read these bits when TSR.MFFL is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1 to TCCR.MFR). These bits are updated when the FIFO overwritten (a frame with DESCR.MSR in descriptor has been transmitted by E-MAC, TCCR.MFEN is 1 and TSR.MFFL is 16). These bits are updated when the FIFO is overwritten (E-MAC detects an error during transmission and TSR.MFFL is 16). *Note for verification: These bits are set to 0 when leaving OPERATION mode.*

46.2.27 Time Stamp FIFO Access Register 0 (TFA0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

TFA0 indicates the nano seconds portion of the timestamp value.

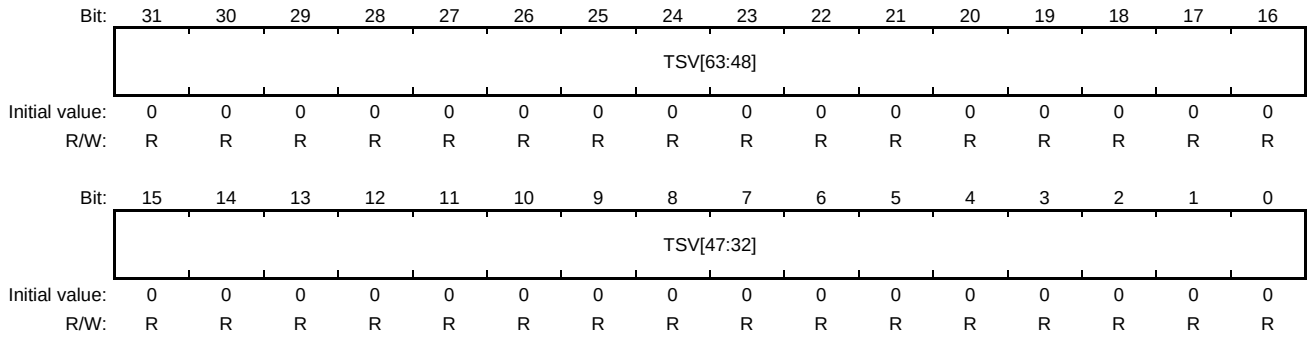


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSV[31:0]	H'0000_0000	R	Time Stamp Value These 80 bits consist of TFA0.TSV[31:0], TFA1.TSV[63:32], and TFA2.TSV[79:64], which together indicate the oldest time stamp value stored in the time-stamp FIFO. Once the time-stamp FIFO is full, no further time-stamp values are stored. Conditions for updating: • The bits are set to H'0000_0000 when the operating mode is not operation mode. • The register is updated whenever a value is stored in the time-stamp FIFO (when the time-stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1). • The register is updated when the oldest entry is released (when the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR) is set to 1).

46.2.28 Time Stamp FIFO Access Register 1 (TFA1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TFA1 register indicates the lower seconds portion of the timestamp value.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSV[63:32]	H'0000_0000	R	Time Stamp Value For details, see section 46.2.28 Time Stamp FIFO Access Register 0 (TFA0).

46.2.29 Time Stamp FIFO Access Register 2 (TFA2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TFA2 register indicates the timestamp tag and the higher seconds portion of the timestamp value.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are read as 0.
25 to 16	TST[9:0]	H'000	R	Time Stamp Tag These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the time-stamp values (accessible through time stamp FIFO access register i (TFAi)) which can be placed in the FIFO. For the tagging of frames in transmission, see section 46.3.5(4) Time Stamping in Transmission. Conditions for updating: • The bits are set to H'000 when the operating mode is not operation mode. • Updated when a value is stored in the time-stamp FIFO (when the value of the time stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1). • Updated when the oldest entry has been released (1 is set in the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR)).
15 to 0	TSV[79:64]	H'0000	R	Time Stamp Value For details, see section 46.2.28 Time Stamp FIFO Access Register 0 (TFA0).

46.2.30 Version and Release Register (VRR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

46.2.31 CBS Increment Value Register c (CIVRc) (c = 0 or 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B).

The CIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CIV[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CIV[31:0]	H'0000_0001	R/W	CBS Increment Value CBS increment value (1 to H'FFFF) These bits define the increment value related to idleSlope for the CBS algorithm. Set a value in the range from H'0000_0001 to H'0000_FFFF. The value to be written to these bits depends on the Ethernet bit rate and HPϕ (high-speed peripheral clock). For details, see section 46.3.6 CBS (Credit-Based Shaping). Note: When write to these bits, corresponding queue's credits are cleared to 0 respectively.

46.2.32 CBS Decrement Value Register c (CDVRc) (c = 0 or 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The CDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDV[31:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDV[31:0]	H'FFFF_FFFF	R/W	CBS Decrement Value Setting value: –1 to –65536 (H'FFFF_FFFF to H'FFFF_0000) These bits set the decrement for the CBS algorithm. These bits define the decrement value related to sendSlope for CBS algorithm. The value to be written to these bits depends on the Ethernet bit rate and HPϕ (high-speed peripheral clock). For details, see section 46.3.6 CBS (Credit-Based Shaping). Note: When write to these bits, corresponding queue's credits are cleared to 0 respectively.

46.2.33 CBS Upper Limit Register c (CULc) (c = 0 or 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CUL0 register sets the upper limit for credit values calculated by using the CBS algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the upper limit for credit values calculated by using the CBS algorithm for transmission queue 3 (for stream class A).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ULV[31:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ULV[31:0]	H'7FFF_FFFF	R/W *	CBS Upper Limit These bits set the upper limit for credit values calculated by using the CBS algorithm. The setting is a limiting value for error detection and does not normally affect operation of the algorithm. Write a positive value to these bits. For details, see section 46.3.6 CBS (Credit-Based Shaping).

Note: * Bit 31 is read only.

46.2.34 CBS Lower Limit Register c (CLLc) (c = 0 or 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CUL0 register sets the lower limit for credit values calculated by using the CBS algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the lower limit for credit values calculated by using the CBS algorithm for transmission queue 3 (for stream class A).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LLV[31:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LLV[31:0]	H'8000_0001	R/W*	CBS Lower Limit These bits set the lower limit for credit values calculated by using the CBS algorithm. The setting is a limiting value for error detection and does not normally affect operation of the algorithm. Write a negative value to these bits. For details, see section 46.3.6 CBS (Credit-Based Shaping).

Note: * Bit 31 is read only.

46.2.35 Descriptor Interrupt Control Register (DIC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The DIC register is used to control descriptor interrupts 1 to 15.

When an interrupt source flag is set (a bit from DPF1 to DPF15 bits in the descriptor interrupt status register (DIS) = 1) while the interrupt is enabled, the interrupt is issued.

[Changing condition]

This bit is set to 0 when writing 1 to DID.DPDi.

This bit is set to 1 when writing 1 to DIE.DPSi.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7	DPF7	B'0	R/W	Descriptor Interrupt Status7 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
6	DPF6	B'0	R/W	Descriptor Interrupt Status6 0: The interrupt is not pending. 1: The interrupt is pending.
5	DPF5	B'0	R/W	Descriptor Interrupt Status5 0: The interrupt is not pending. 1: The interrupt is pending.
4	DPF4	B'0	R/W	Descriptor Interrupt Status4 0: The interrupt is not pending. 1: The interrupt is pending.
3	DPF3	B'0	R/W	Descriptor Interrupt Status3 0: The interrupt is not pending. 1: The interrupt is pending.
2	DPF2	B'0	R/W	Descriptor Interrupt Status2 0: The interrupt is not pending. 1: The interrupt is pending.
1	DPF1	B'0	R/W	Descriptor Interrupt Status1 0: The interrupt is not pending. 1: The interrupt is pending.
0	—	B'0	R/W	Reserved These bits are read as 0. The write value should be 0.

DPF1 to DPF15 Descriptor Interrupt Status Bits:

When DESCR.DIE is 1 to 15, the corresponding bit indicates completion of the processing of a descriptor within the reception or transmission queue.

When DESCR.DIE is 0, the descriptor interrupt is not generated.

When DESCR.DIE is 0001b, in addition a queue specific descriptor interrupt is generated.

Only 0 can be written to these bits.

[Conditions for Changing]

— A bit is set to 0 when the operating mode is not operation mode.
— A bit is set to 1 when a descriptor with DESCR.DIE set to the corresponding number from 1 to 15 is processed.

46.2.37 Error Interrupt Control Register (EIC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The EIC register controls the AVB-DMAC-related error interrupts.

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
16	QFS	B'0	R/W	Queue Full Error Interrupt Status With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (RIS2) = 1). [Conditions for Changing] — If the receive queue r full interrupt status bit (RIS2.QFFr) and/or the receive queue r full interrupt enable bit in the - receive interrupt control register 2 (RIC2.QFEr) are updated, this bit is also updated. — If the receive FIFO full interrupt status bit (RIS2.RFFF) and/or the receive FIFO full interrupt enable bit (RIC2.RFFE) are updated, this bit is also updated. 0: The interrupt is not pending. 1: The interrupt is pending.
15 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10	TBFF	B'0	R/W	Tx-Buffer Full Flag This bit indicates that fetching transmit data was delayed because the Tx-Buffer has no sufficient storage available to store fetched frame. It depends on configuration of TGC.TBDt (refer to section 46.3.5(1)) if a full Tx-Buffer is expected during normal operation. No frame gets lost but transmission priority may be influenced. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when frame data has been fetched from URAM but there is no storage available in Tx-Buffer. 0: No interrupt pending 1: Tx-Buffer full condition detected

Bit	Bit Name	Initial Value	R/W	Description
9	MFFF	B'0	R/W	E-MAC status FIFO Full Flag This bit indicates that a transmission E-MAC status is overwritten because the E-MAC status FIFO is full (overwrite condition). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a frame with DESCR.MSR has been transmitted by E-MAC, TCCR.MFEN is 1 and TSR.MFFL is 16. This bit is set to 1 when E-MAC detects an error during transmission and TSR.MFFL is 16. 0: No interrupt pending 1: E-MAC status FIFO full, oldest E-MAC status lost
8	TFFF	B'0	R/W	Time Stamp FIFO Full Error Interrupt Status This bit indicates that a new transmission time stamp has been discarded due to the time-stamp FIFO being full (i.e. has reached the overflow state). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is set to 1 and the time stamp FIFO count bit in the transmit status register (TSR.TFFL) is set to 3. 0: The interrupt is not pending. 1: The interrupt is pending.
7	CULF1	B'0	R/W	CBS Upper Limit Error Interrupt Status (Class A) This bit indicates that CBS counter 1 has exceeded the set upper limit (CUL1.ULV in the CBS upper limit register c (CULc)). Only 0 can be written to the bit. [Conditions for Changing] — This bit is set to 0 when the operating mode is not operation mode. — This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (TSR.CCS1) change from B'00 (indicating a value within the range between the limits) to B'10 (indicating a value over the upper limit). 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
6	CULF0	B’0	R/W	CBS Upper Limit Error Interrupt Status (Class B) This bit indicates that CBS counter 0 has exceeded the set upper limit (CUL0.ULV in the CBS upper limit register c (CULc)). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register changes from B'00 (indicating a value within the range between the limits) to B'10 (indicating a value over the upper limit). 0: The interrupt is not pending. 1: The interrupt is pending.
5	CLLF1	B’0	R/W	CBS Lower Limit Error Interrupt Status (Class A) This bit indicates that CBS counter 1 has fallen below the set lower limit (CLL1.LLV in CBS lower limit register c (CLLc)). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (TSR.CCS1) changes from B'00 (indicating a value within the range between the limits) to B'01 (indicating a value less than the lower limit). 0: The interrupt is not pending. 1: The interrupt is pending.
4	CLLF0	B’0	R/W	CBS Lower Limit Error Interrupt Status (Class B) This bit indicates that CBS counter 0 has fallen below the set lower limit (CLL0.LLV in the CBS lower limit register c (CLLc)). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (TSR.CCS0) changes from B'00 (indicating a value within the range between the limits) to B'01 (indicating a value less than the lower limit). 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
3	SEF	B'0	R/W	Separation Error Flag This bit indicates that a received frame was discarded because it has not matched any configurated separation filter for AVB stream data frames. The CPU can only write 0 to this bit. [Conditions for Changing] — This bit is set to 0 when leaving operation mode. — This bit is set to 1 when a valid AVB stream data frame was received by E-MAC but discarded because the RCR.ESF bits are B'10 and no separation filter has matched. 0: No interrupt pending. 1: AVB stream data frame has discarded.
2	QEF	B'0	R/W	Queue Error Flag This bit indicates that an error has been detected while processing reception or transmit queue or while processing AVTP FIFO entries. Details about the detected error is indicated by ESR. Section 46.3.2(2) gives an overview of detail error conditions and the required interaction. The CPU can only write 0 to this bit. [Conditions for Changing] — This bit is set to 0 when leaving operating mode. — This bit is set to 1 when an error condition is detected. 0: No interrupt pending. 1: Interrupt pending.
1	MTEF	B'0	R/W	E-MAC Transmission Error Flag This bit indicates that the E-MAC has detected a fault during transmission. For detail, the E-MAC registers have to be checked. The CPU can only write 0 to this bit. [Conditions for Changing] — This bit is set to 0 when leaving operating mode. — This bit is set to 1 when E-MAC detects an error during frame transmission. 0: No interrupt pending. 1: E-MAC has reported an error during transmission.

Bit	Bit Name	Initial Value	R/W	Description
0	MREF	B'0	R/W	E-MAC Reception Error Flag This bit indicates that the E-MAC has detected a fault during reception. For detail, the E-MAC registers have to be checked. Note: When the storage of faulty received frames (RCR.EFFS) is enabled, the E-MAC error code (DESCR.MSC) is stored in the descriptor. By evaluating this information, CPU can identify corrupted frames in URAM. The CPU can only write 0 to this bit. [Conditions for Changing] — This bit is set to 0 when leaving operating mode. — This bit is set to 1 when E-MAC detects an error during frame reception. 0: No interrupt pending. 1: E-MAC has reported an error during reception.

46.2.39 Receive Interrupt Control Register 0 (RIC0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RIC0 register controls the AVB-DMAC receive interrupts.

When an interrupt source flag is set (a bit from among the receive interrupt status bits in the receive interrupt status register (RIS0.FRF0 to 17) = 1) while the interrupt is enabled, the interrupt is issued.

[Changing condition]

This bit is set to 0 when writing 1 to RID0.FRDr.

This bit is set to 1 when writing 1 to RIE0.FRSr.

FRF0 to FRF17 Receive Frame Interrupt Status Bits 0 to 17:

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data are ready for CPU processing.

Only 0 can be written to the bit.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 0 when a value is written to the unread frame counter decrement register i (UFCDi) (i = 0 to 4), and this decrements the value of unread frame counter register i (UFCVi) (i = 0 to 4) to 0.
- When a frame is stored normally in a reception queue, the corresponding bit is set to 1.

46.2.41 Receive Interrupt Control Register 1 (RIC1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RIC1 register controls the AVB-DMAC receive interrupts.

Bit	Bit Name	Initial Value	R/W	Description
31	RFWF	B'0	R/W	Receive FIFO Warning Interrupt Status This bit indicates that the reception FIFO has exceeded the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the reception FIFO exceeded the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)). 0: The interrupt is not pending. 1: The interrupt is pending.
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RWF17	B'0	R/W	Reception Warning Flag 17 This bit indicates that the unread frame counter of receive queue 17 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA21 is 1). This bit is set to 0 when CPU writes to UFCD4.DV1 and UFCV4.CV1 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV4.CV1 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
16	RWF16	B'0	R/W	Reception Warning Flag 16 This bit indicates that the unread frame counter of receive queue 16 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA20 is 1). This bit is set to 0 when CPU writes to UFCD4.DV0 and UFCV4.CV0 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV4.CV0 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
15	RWF15	B'0	R/W	Reception Warning Flag 15 This bit indicates that the unread frame counter of receive queue 15 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA19 is 1). This bit is set to 0 when CPU writes to UFCD3.DV3 and UFCV3.CV3 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV3.CV3 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
14	RWF14	B'0	R/W	Reception Warning Flag 14 This bit indicates that the unread frame counter of receive queue 14 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA18 is 1). This bit is set to 0 when CPU writes to UFCD3.DV2 and UFCV3.CV2 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV3.CV2 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
13	RWF13	B'0	R/W	Reception Warning Flag 13 This bit indicates that the unread frame counter of receive queue 13 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA17 is 1). This bit is set to 0 when CPU writes to UFCD3.DV1 and UFCV3.CV1 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV3.CV1 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
12	RWF12	B'0	R/W	Reception Warning Flag 12 This bit indicates that the unread frame counter of receive queue 12 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA16 is 1). This bit is set to 0 when CPU writes to UFCD3.DV0 and UFCV3.CV0 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV3.CV0 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
11	RWF11	B'0	R/W	Reception Warning Flag 11 This bit indicates that the unread frame counter of receive queue 11 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA15 is 1). This bit is set to 0 when CPU writes to UFCD2.DV3 and UFCV2.CV3 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV2.CV3 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
10	RWF10	B'0	R/W	Reception Warning Flag 10 This bit indicates that the unread frame counter of receive queue 10 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA14 is 1). This bit is set to 0 when CPU writes to UFCD2.DV2 and UFCV2.CV2 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV2.CV2 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
9	RWF9	B'0	R/W	Reception Warning Flag 9 This bit indicates that the unread frame counter of receive queue 9 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA13 is 1). This bit is set to 0 when CPU writes to UFCD2.DV1 and UFCV2.CV1 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV2.CV1 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
8	RWF8	B'0	R/W	Reception Warning Flag 8 This bit indicates that the unread frame counter of receive queue 8 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA12 is 1). This bit is set to 0 when CPU writes to UFCD2.DV0 and UFCV2.CV0 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV2.CV0 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
7	RWF7	B'0	R/W	Reception Warning Flag 7 This bit indicates that the unread frame counter of receive queue 7 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA11 is 1). This bit is set to 0 when CPU writes to UFCD1.DV3 and UFCV1.CV3 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV1.CV3 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
6	RWF6	B'0	R/W	Reception Warning Flag 6 This bit indicates that the unread frame counter of receive queue 6 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA10 is 1). This bit is set to 0 when CPU writes to UFCD1.DV2 and UFCV1.CV2 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV1.CV2 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
5	RWF5	B'0	R/W	Reception Warning Flag 5 This bit indicates that the unread frame counter of receive queue 5 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA9 is 1). This bit is set to 0 when CPU writes to UFCD1.DV1 and UFCV1.CV1 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV1.CV1 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
4	RWF4	B'0	R/W	Reception Warning Flag 4 This bit indicates that the unread frame counter of receive queue 4 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA8 is 1). This bit is set to 0 when CPU writes to UFCD1.DV0 and UFCV1.CV0 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV1.CV0 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
3	RWF3	B'0	R/W	Reception Warning Flag 3 This bit indicates that the unread frame counter of receive queue 3 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA7 is 1). This bit is set to 0 when CPU writes to UFCD0.DV3 and UFCV0.CV3 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV0.CV3 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
2	RWF2	B'0	R/W	Reception Warning Flag 2 This bit indicates that the unread frame counter of receive queue 2 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA6 is 1). This bit is set to 0 when CPU writes to UFCD0.DV2 and UFCV0.CV2 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV0.CV2 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached

Bit	Bit Name	Initial Value	R/W	Description
1	RWF1	B'0	R/W	Reception Warning Flag 1 This bit indicates that the unread frame counter of receive queue 1 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA5 is 1). This bit is set to 0 when CPU writes to UFCD0.DV1 and UFCV0.CV1 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV0.CV1 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached
0	RWF0	B'0	R/W	Reception Warning Flag 0 This bit indicates that the unread frame counter of receive queue 0 has reached the configured warning level. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when CPU request a reload of the base address (DLR.LBA4 is 1). This bit is set to 0 when CPU writes to UFCD0.DV0 and UFCV0.CV0 is decremented to a value less than the selected warning level UFCW.WLj. This bit is set to 1 when a frame is stored in queue r and the unread frame counter value r is incremented to the selected warning level j (UFCV0.CV0 + 1 == UFCW.WLj). 0: No interrupt pending 1: Unread frame counter warning level reached

46.2.43 Receive Interrupt Control Register 2 (RIC2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RIC2 register controls the AVB-DMAC receive interrupts.

Bit	Bit Name	Initial Value	R/W	Description
31	RFFF	B’0	R/W	Receive FIFO Full Interrupt Status This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full. When receiving a frame is not possible, the frame will be discarded. Other information regarding discarded frames is not retained. Even if the frame is discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when frame data provided by the E-MAC cannot be stored in the reception FIFO. 0: The interrupt is not pending. 1: The interrupt is pending
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	QFF17	B’0	R/W	Receive Queue 17 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
16	QFF16	B’0	R/W	Receive Queue 16 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
15	QFF15	B’0	R/W	Receive Queue 15 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
14	QFF14	B’0	R/W	Receive Queue 14 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
13	QFF13	B'0	R/W	Receive Queue 13 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
12	QFF12	B'0	R/W	Receive Queue 12 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
11	QFF11	B'0	R/W	Receive Queue 11 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
10	QFF10	B'0	R/W	Receive Queue 10 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
9	QFF9	B'0	R/W	Receive Queue 9 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
8	QFF8	B'0	R/W	Receive Queue 8 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
7	QFF7	B'0	R/W	Receive Queue 7 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
6	QFF6	B'0	R/W	Receive Queue 6 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
5	QFF5	B'0	R/W	Receive Queue 5 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
4	QFF4	B'0	R/W	Receive Queue 4 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
3	QFF3	B'0	R/W	Receive Queue 3 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
2	QFF2	B'0	R/W	Receive Queue 2 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
1	QFF1	B'0	R/W	Receive Queue 1 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
0	QFF0	B'0	R/W	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits:

These bits indicate that reception queue r did not have space for storing a received frame.

A reception queue is treated as full when it has no descriptors (descriptor type (DESCR.DT) = FEMPTY, FEMPTY_IS, FEMPTY_IC, or FEMPTY_ND) available or reaches the set level for stopping.

Note: If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see section 46.3.4(3)(a) Storing Frame Data in the Descriptor Data Area, for storing a frame as a divided frame), an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

[Conditions for Changing]

— A bit is set to 0 when the operating mode is not operation mode.
— A bit is set to 1 when reception queue r has no space available for storage.
— A bit is set to 1 when a SW defined stop point (EOS descriptor) reached within a split frame.
— A bit is set to 1 when the unread frame counter (unread frame counter register i (UFCVi) (i = 0 to 4)) reaches the set level for stopping.

46.2.45 Transmit Interrupt Control Register (TIC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TIC register controls the AVB-DMAC transmit interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	TDPE3	B'0	R/W	Transmit Descriptor Processed interrupt Enable 3 While this bit is 1 an interrupt will be generated when TIS.TDPF3 is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.TDPD3. This bit is set to 1 when writing 1 to TIE.TDPS3. 0: Disabled 1: Enabled
18	TDPE2	B'0	R/W	Transmit Descriptor Processed interrupt Enable 2 While this bit is 1 an interrupt will be generated when TIS.TDPF2 is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.TDPD2. This bit is set to 1 when writing 1 to TIE.TDPS2. 0: Disabled 1: Enabled
17	TDPE1	B'0	R/W	Transmit Descriptor Processed interrupt Enable 1 While this bit is 1 an interrupt will be generated when TIS.TDPF1 is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.TDPD1. This bit is set to 1 when writing 1 to TIE.TDPS1. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
16	TDPE0	B'0	R/W	Transmit Descriptor Processed interrupt Enable 0 While this bit is 1 an interrupt will be generated when TIS.TDPF0 is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.TDPD0. This bit is set to 1 when writing 1 to TIE.TDPS0. 0: Disabled 1: Enabled
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWE	B'0	R/W	MAC status FIFO Warning interrupt Enable While this bit is 1 an interrupt will be generated when TIS.MFWF is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.MFWD. This bit is set to 1 when writing 1 to TIE.MFWS. 0: Disabled 1: Enabled
10	MFUE	B'0	R/W	MAC status FIFO Updated interrupt Enable While this bit is 1 an interrupt will be generated when TIS.MFUF is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.MFUD. This bit is set to 1 when writing 1 to TIE.MFUS. 0: Disabled 1: Enabled
9	TFWE	B'0	R/W	Time Stamp FIFO Warning Interrupt Enable When the time-stamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued. 0: Disabled 1: Enabled
8	TFUE	B'0	R/W	Time Stamp FIFO Update Interrupt Enable When the time-stamp FIFO is updated while the interrupt is enabled, the interrupt is issued. 0: Disabled 1: Enabled
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	FTE3	B'0	R/W	Frame Transmitted interrupt Enable 3 While this bit is 1 an interrupt will be generated when TIS.FTF3 is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.FTD3. This bit is set to 1 when writing 1 to TIE.FTS3. 0: Disabled 1: Enabled

Bit	Bit Name	Initial Value	R/W	Description
2	FTE2	B'0	R/W	Frame Transmitted interrupt Enable 2 While this bit is 1 an interrupt will be generated when TIS.FTF2 is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.FTD2. This bit is set to 1 when writing 1 to TIE.FTS2. 0: Disabled 1: Enabled
1	FTE1	B'0	R/W	Frame Transmitted interrupt Enable 1 While this bit is 1 an interrupt will be generated when TIS.FTF1 is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.FTD1. This bit is set to 1 when writing 1 to TIE.FTS1. 0: Disabled 1: Enabled
0	FTE0	B'0	R/W	Frame Transmitted interrupt Enable 0 While this bit is 1 an interrupt will be generated when TIS.FTF0 is 1. [Changing condition] This bit is set to 0 when writing 1 to TID.FTD0. This bit is set to 1 when writing 1 to TIE.FTS0. 0: Disabled 1: Enabled

46.2.46 Transmit Interrupt Status Register (TIS)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TIS register indicates the states of the AVB-DMAC transmit interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	TDPF3	B’0	R/W	Transmit Descriptor Processed Flag 3 This bit indicates that a descriptor in transmit queue 3 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in transmit queue 3 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
18	TDPF2	B’0	R/W	Transmit Descriptor Processed Flag 2 This bit indicates that a descriptor in transmit queue 2 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in transmit queue 2 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
17	TDPF1	B'0	R/W	Transmit Descriptor Processed Flag 1 This bit indicates that a descriptor in transmit queue 1 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in transmit queue 1 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
16	TDPF0	B'0	R/W	Transmit Descriptor Processed Flag 0 This bit indicates that a descriptor in transmit queue 0 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in transmit queue 0 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWF	B'0	R/W	E-MAC status FIFO Warning Flag This bit indicates that the warning level of the E-MAC status FIFO (12 out of 16 entries) has been reached. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when TCCR.MFEN is 0. This bit is set to 0 when writing 1 to TCCR.MFR. This bit is set to 1 when a frame with DESCR.MSR has been transmitted by E-MAC and the E-MAC Status FIFO contains already 11 entries (TSR.MFFL is 11). This bit is set to 1 when E-MAC detects an error during transmission and the E-MAC Status FIFO contains already 11 entries (TSR.MFFL is 11). 0: No interrupt pending 1: Tx Status FIFO warning level has been reached

Bit	Bit Name	Initial Value	R/W	Description
10	MFUF	B'0	R/W	E-MAC status FIFO Updated Flag This bit indicates that the E-MAC status FIFO has been updated after the E-MAC has transmitted a frame. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 0 when TCCR.MFEN is 0. This bit is set to 0 when writing 1 to TCCR.MFR. This bit is set to 1 when a frame with DESCR.MSR has been transmitted by E-MAC and TCCR.MFEN is 1. This bit is set to 1 when E-MAC detects an error during transmission and TCCR.MFEN is 1. 0: No interrupt pending 1: Tx Status FIFO has been updated
9	TFWF	B'0	R/W	Time Stamp FIFO Warning Interrupt Status This bit indicates that the transmission time-stamp FIFO has reached the warning level. Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0. — The bit is set to 1 after a frame including DESCR.TSR set has been transmitted and one entry has already been stored in the time-stamp FIFO. 0: The interrupt is not pending. 1: The time-stamp FIFO has reached the warning level.
8	TFUF	B'0	R/W	Time Stamp FIFO Update Interrupt Status This bit indicates that the transmission time-stamp FIFO has been updated. Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode, when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0, and when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR). — The bit is set to 1 when the time stamp FIFO enable bit (TCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted. 0: The interrupt is not pending. 1: The time-stamp FIFO has been updated.
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
3	FTF3	B'0	R/W	Frame Transmitted Flag 3 This bit indicates that from transmit queue a frame is transmitted by E-MAC. Note: This interrupt flag refers to the end of frame transmission by E-MAC whereas the descriptor interrupt (DIS.DPFi) refers to the end of processing storage element. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a frame from transmit queue 3 has been transmitted by the E-MAC. 0: No interrupt pending 1: Frame transmitted by E-MAC
2	FTF2	B'0	R/W	Frame Transmitted Flag 2 This bit indicates that from transmit queue a frame is transmitted by E-MAC. Note: This interrupt flag refers to the end of frame transmission by E-MAC whereas the descriptor interrupt (DIS.DPFi) refers to the end of processing storage element. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a frame from transmit queue 2 has been transmitted by the E-MAC. 0: No interrupt pending 1: Frame transmitted by E-MAC
1	FTF1	B'0	R/W	Frame Transmitted Flag 1 This bit indicates that from transmit queue a frame is transmitted by E-MAC. Note: This interrupt flag refers to the end of frame transmission by E-MAC whereas the descriptor interrupt (DIS.DPFi) refers to the end of processing storage element. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a frame from transmit queue 1 has been transmitted by the E-MAC. 0: No interrupt pending 1: Frame transmitted by E-MAC
0	FTF0	B'0	R/W	Frame Transmitted Flag 0 This bit indicates that from transmit queue a frame is transmitted by E-MAC. Note: This interrupt flag refers to the end of frame transmission by E-MAC whereas the descriptor interrupt (DIS.DPFi) refers to the end of processing storage element. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a frame from transmit queue 0 has been transmitted by the E-MAC. 0: No interrupt pending 1: Frame transmitted by E-MAC

46.2.47 Interrupt Summary Status Register (ISS)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The ISS register gives a summary of the states of AVB-DMAC-related interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DPM15	B'0	R	Descriptor Interrupt 15 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE15) and descriptor interrupt status flag (DIS.DPF15) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
30	DPM14	B'0	R	Descriptor Interrupt 14 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE14) and descriptor interrupt status flag (DIS.DPF14) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
29	DPM13	B'0	R	Descriptor Interrupt 13 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE13) and descriptor interrupt status flag (DIS.DPF13) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
28	DPM12	B'0	R	Descriptor Interrupt 12 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE12) and descriptor interrupt status flag (DIS.DPF12) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
27	DPM11	B'0	R	Descriptor Interrupt 11 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE11) and descriptor interrupt status flag (DIS.DPF11) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
26	DPM10	B'0	R	Descriptor Interrupt 10 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE10) and descriptor interrupt status flag (DIS.DPF10) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
25	DPM9	B'0	R	Descriptor Interrupt 9 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE9) and descriptor interrupt status flag (DIS.DPF9) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
24	DPM8	B'0	R	Descriptor Interrupt 8 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE8) and descriptor interrupt status flag (DIS.DPF8) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
23	DPM7	B'0	R	Descriptor Interrupt 7 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE7) and descriptor interrupt status flag (DIS.DPF7) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
22	DPM6	B'0	R	Descriptor Interrupt 6 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE6) and descriptor interrupt status flag (DIS.DPF6) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
21	DPM5	B'0	R	Descriptor Interrupt 5 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE5) and descriptor interrupt status flag (DIS.DPF5) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
20	DPM4	B'0	R	Descriptor Interrupt 4 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE4) and descriptor interrupt status flag (DIS.DPF4) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
19	DPM3	B'0	R	Descriptor Interrupt 3 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE3) and descriptor interrupt status flag (DIS.DPF3) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
18	DPM2	B'0	R	Descriptor Interrupt 2 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE2) and descriptor interrupt status flag (DIS.DPF2) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
17	DPM1	B'0	R	Descriptor Interrupt 1 Mirror This bit is set to 1 when the given descriptor interrupt enable bit (DIC.DPE1) and descriptor interrupt status flag (DIS.DPF1) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
16 to 14	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
13	CGIM	B'0	R	gPTP Interrupt Mirror This bit is set to 1 when either interrupt-related bit in the two gPTP-related interrupt registers (GIC and GIS) is 1. 0: The interrupt is not pending. 1: The interrupt is pending.
12	RFWM	B'0	R	Receive FIFO Warning Interrupt Mirror This bit is set to 1 when the receive FIFO warning interrupt enable bit (RIC1.RFWE) and receive FIFO warning interrupt status flag (RIS1.RFWF) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
11	MFWM	B'0	R	E-MAC status FIFO Warning Mirror This bit indicates that TIS.MFWF is 1 and TIC.MFWE is 1. [Changing condition] This bit is updated when TIS.MFWF or TIC.MFWE changes. 0: No interrupt pending 1: E-MAC status FIFO warning interrupt pending
10	MFUM	B'0	R	E-MAC status FIFO Updated Mirror This bit indicates that TIS.MFUF is 1 and TIC.MFUE is 1. [Changing condition] This bit is updated when TIS.MFUF or TIC.MFUE changes. 0: No interrupt pending 1: E-MAC status FIFO updated interrupt pending
9	TFWM	B'0	R	Time Stamp FIFO Warning Interrupt Mirror This bit is set to 1 when the time stamp FIFO warning interrupt enable bit (TIC.TFWE) and time stamp FIFO warning interrupt status flag (TIS.TFWF) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.
8	TFUM	B'0	R	Time Stamp FIFO Update Mirror This bit is set to 1 when the time stamp FIFO update interrupt enable bit (TIC.TFUE) and time stamp FIFO update interrupt status flag (TIS.TFUF) are both 1. 0: The interrupt is not pending. 1: The interrupt is pending.

Bit	Bit Name	Initial Value	R/W	Description
7	MM	B'0	R	E-MAC Interrupt Mirror This bit is set to 1 when an E-MAC interrupt is issued. 0: The interrupt is not pending. 1: The interrupt is pending.
6	EM	B'0	R	Error Interrupt Mirror This bit is set to 1 when an error interrupt is issued (both of a bit in EIS and corresponding to the bit in EIC are 1). 0: The interrupt is not pending. 1: The interrupt is pending.
5 to 3	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
2	FTM	B'0	R	Frame Transmitted Mirror [Changing condition] This bit is set when any matching pair of TIC.FTEt enable and TIS.FTFt flag are both 1. This bit is set when any matching pair of TIC.TDPEt enable and TIS.TDPFt flag are both 1. 0: No interrupt pending 1: Frame transmitted interrupt pending
1	RWM	B'0	R	Reception Warning Mirror [Changing condition] This bit is set when any matching pair of RIC1.RWEr enable and RIS1.RWFr flag are both 1. 0: No interrupt pending 1: Frame transmitted interrupt pending
0	FRM	B'0	R	Frame Received Mirror [Changing condition] This bit is set when any matching pair of RIC0.FREr enable and RIS0.FRFr flag are both 1. This bit is set when any matching pair of RIC3.RDPEr enable and RIS3.RDPFr flag are both 1. 0: No interrupt pending 1: Frame received interrupt pending

46.2.48 Common Interrupt Enable register (CIE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CIE register is used to control the Common Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	RFFL	RFWL	CL0M	RQFM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CTIE	—	—	—	—	—	—	—	CRIE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	RFFL	B'0	R/W	Rx-FIFO Full interrupt Line select This bit selects the interrupt line of notification flagged by RIS2.RFFF. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
18	RFWL	B'0	R/W	Rx-FIFO Warning interrupt Line select This bit selects the interrupt line of notification flagged by RIS1.RFWF. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
17	CL0M	B'0	R/W	Common Line 0 Mode This bit controls if all data related interrupts using a common interrupt line or if queue specific interrupt lines for data related interrupts are used. The selected mode has no influence to internal flagging in EthernetAVB-IF register (e.g. ISS). To prevent interrupt notifications on different lines, it is recommended to set all CIE.CTIE, CIE.CRIE, and DIL.DPLi (i = 2 to 15) to 0 when this bit is 0. 0: Use common interrupt line 0 1: Use queue specific interrupt line 0
16	RQFM	B'0	R/W	Reception Queue Full Mode This bit controls if queue full notification is mapped to error interrupt line or to queue data interrupt line. The selected mode has no influence to internal flagging in EthernetAVB-IF register (e.g. ISS). 0: Use for error interrupt line 1: Use for queue specific interrupt line
15 to 9	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	CTIE	B'0	R/W	Common Transmit Interrupt Enable This bit controls transmit related interrupt line outputs of EthernetAVB-IF. It has no influence to internal flagging in EthernetAVB-IF register (e.g. ISS). These lines are controlled by this bit: line0_Tx[3:0] -- individual transmit queue interrupts Transmission interrupts mapped on other lines are not influenced. 0: Disabled 1: Enabled
7 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
0	CRIE	B'0	R/W	Common Receive Interrupt enable This bit controls receive related interrupt line outputs of EthernetAVB-IF. It has no influence to internal flagging in EthernetAVB-IF register (e.g. ISS). These lines are controlled by this bit: line0_Rx[17:0] -- individual receive queue interrupts Receive interrupts mapped on other lines are not influenced. 0: Disabled 1: Enabled

46.2.49 Reception Interrupt Control register 3 (RIC3)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RIC3 register controls the AVB-DMAC receive descriptor interrupts.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RDPF17	B'0	R/W	Receive Descriptor Processed Flag 17 This bit indicates that a descriptor in reception queue 17 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 17 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
16	RDPF16	B'0	R/W	Receive Descriptor Processed Flag 16 This bit indicates that a descriptor in reception queue 16 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 16 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
15	RDPF15	B'0	R/W	Receive Descriptor Processed Flag 15 This bit indicates that a descriptor in reception queue 15 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 15 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
14	RDPF14	B'0	R/W	Receive Descriptor Processed Flag 14 This bit indicates that a descriptor in reception queue 14 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 14 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
13	RDPF13	B'0	R/W	Receive Descriptor Processed Flag 13 This bit indicates that a descriptor in reception queue 13 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 13 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
12	RDPF12	B'0	R/W	Receive Descriptor Processed Flag 12 This bit indicates that a descriptor in reception queue 12 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 12 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
11	RDPF11	B'0	R/W	Receive Descriptor Processed Flag 11 This bit indicates that a descriptor in reception queue 11 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 11 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
10	RDPF10	B'0	R/W	Receive Descriptor Processed Flag 10 This bit indicates that a descriptor in reception queue 10 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 10 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
9	RDPF9	B'0	R/W	Receive Descriptor Processed Flag 9 This bit indicates that a descriptor in reception queue 9 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 9 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
8	RDPF8	B'0	R/W	Receive Descriptor Processed Flag 8 This bit indicates that a descriptor in reception queue 8 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 8 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
7	RDPF7	B’0	R/W	Receive Descriptor Processed Flag 7 This bit indicates that a descriptor in reception queue 7 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 7 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
6	RDPF6	B’0	R/W	Receive Descriptor Processed Flag 6 This bit indicates that a descriptor in reception queue 6 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 6 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
5	RDPF5	B’0	R/W	Receive Descriptor Processed Flag 5 This bit indicates that a descriptor in reception queue 5 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 5 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
4	RDPF4	B’0	R/W	Receive Descriptor Processed Flag 4 This bit indicates that a descriptor in reception queue 4 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 4 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending

Bit	Bit Name	Initial Value	R/W	Description
3	RDPF3	B’0	R/W	Receive Descriptor Processed Flag 3 This bit indicates that a descriptor in reception queue 3 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 3 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
2	RDPF2	B’0	R/W	Receive Descriptor Processed Flag 2 This bit indicates that a descriptor in reception queue 2 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 2 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
1	RDPF1	B’0	R/W	Receive Descriptor Processed Flag 1 This bit indicates that a descriptor in reception queue 1 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 1 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending
0	RDPF0	B’0	R/W	Receive Descriptor Processed Flag 0 This bit indicates that a descriptor in reception queue 0 has been processed where DESCR.DIE is B'0001. Note: The descriptor with DESCR.DIE is 1, which sets this bit, sets in addition the universal descriptor interrupt DIS.DPF1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when a descriptor in reception queue 0 has been processed where DESCR.DIE is 1. 0: No interrupt pending 1: Descriptor interrupt pending

46.2.51 gPTP Configuration Control Register (GCCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GCCR register is used to set and control the gPTP (generalized precision time protocol).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	LI[2:0]			SPC	—	—	PGM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TCSS[1:0]		—	—	LMTT	LPTC	LTI	LTO	TCR[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
22 to 20	LI[2:0]	B'000	R/W	Index number of compare unit to be loaded Load Index These bits define the target unit to be updated by GCCR.LPTC. The CPU can only write to these bits if GCCR.LPTC is 0b.
19	SPC	B'0	R/W	Start Periodic Comparison This bit defines if the absolute comparison value or the periodicity value is updated to the value of GPTC.PTCV on GCCR.LPTC request. Periodic comparison starts when updating the periodic comparison value; periodic comparison stops when updating the absolute comparison value. The CPU can only write to these bits if GCCR.LPTC is 0b. 0: Absolute comparison value updated by GCCR.LPTC request 1: Periodic comparison value updated by GCCR.LPTC request
18 to 17	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
16	PGM	B'0	R/W	Pulse Generation Mode This bit configures if the pulse per second signal (AVB_AVTP_PPS) is derived from the gPTP timer value or the corrected gPTP timer value. A pulse is generated when the second part of the selected timer is incremented. See section 46.3.8(3) Pulse per second. The CPU can only write to this bit if CSR.OPS is CONFIG. The CPU should only change this bit if CCC.GAC is 0b or if increment value used by gPTP timer is 0. 0: Pulse per second is related to gPTP timer value 1: Pulse per second is related to corrected gPTP timer value
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

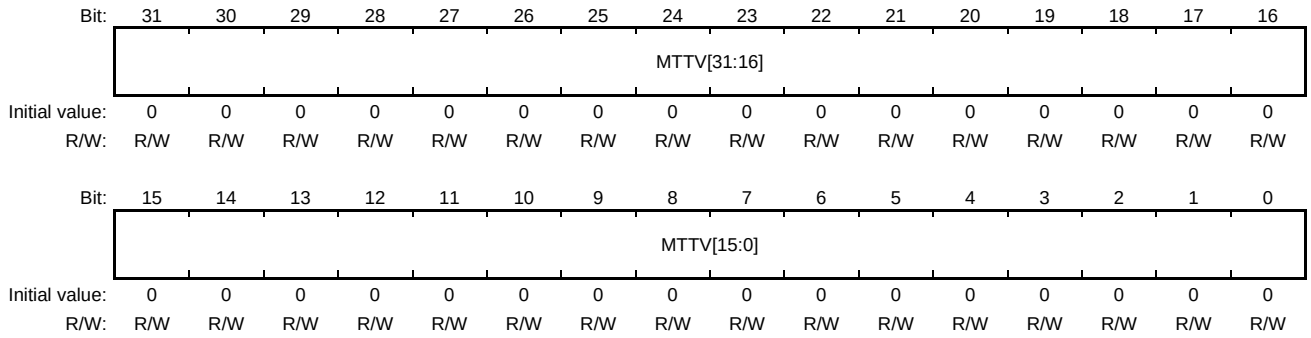
Bit	Bit Name	Initial Value	R/W	Description
9, 8	TCSS[1:0]	B'00	R/W	Timer Capture Source Select These bits select the source used for updating the captured timer register (gPTP timer capture register (GCTi.CTV)). These bits should still be controlled when timer control is not being requested (GCCR.TCR = 0). B'00: gPTP timer value B'01: Adjusted gPTP timer value B'10: AVTP presentation time B'11: Setting prohibited
7, 6	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
5	LMTT	B'1	R/W	Maximum Transit Time Configuration Request This bit issues requests for configuring the gPTP maximum transit time configuration register (GMTT). Only 1 can be written to the bit. [Conditions for Changing] — The bit is set to 1 when the operating mode is not operation mode. — The bit is set to 0 when the value of the gPTP maximum transit time configuration register (GMTT) is loaded. 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
4	LPTC	B'0	R/W	Presentation Time Compare Value Configuration Request This bit issues requests for configuring the gPTP presentation time comparison register (GPTC). Only 1 can be written to the bit. The CPU cannot write to this bit if CSR.OPS is CONFIG and CCC.GAC is 0. The CPU should not write 1 to this bit when AVTP FIFO of selected compare unit is in use. [Conditions for Changing] — The bit is set to 1 when the operating mode is not operation mode and CCC.GAC is 0b. — The bit is set to 0 when the value of the gPTP presentation time comparison register (GPTC) is loaded. 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.

Bit	Bit Name	Initial Value	R/W	Description
3	LTI	B’1	R/W	Timer Increment Value Configuration Request This bit issues requests for configuring the gPTP timer increment configuration register (GTI). Only 1 can be written to the bit. [Conditions for Changing] — The bit is set to 1 when the operating mode is not operation mode and CCC.GAC is 0b. — The bit is set to 0 when the value of the gPTP timer increment configuration register (GTI) is loaded. 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
2	LTO	B’1	R/W	Timer Offset Value Configuration Request This bit issues requests for configuring gPTP timer offset configuration register i (GTOi). Only 1 can be written to the bit. [Conditions for Changing] — The bit is set to 1 when the operating mode is not operation mode and CCC.GAC is 0b. — The bit is set to 0 when the value of gPTP timer offset configuration register i (GTOi) is loaded. 0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.
1, 0	TCR[1:0]	B’00	R/W	Timer Control Request These bits issue requests for controlling the gPTP timer. The source selection (GCCR.TCSS) can be done by same write access. Writing to the bits is only possible when the current operating mode is operation mode, or if CSR.OPS is CONFIG and CCC.GAC is 1. Do not write to the bit when the gPTP timer clock select bit in the AVB-DMAC mode register is B'00. Write to these bits while GCCR.TCR is B'00 or B'10. The CPU should not write other values than B'11 to these bits if GCCR.TCR is B'10. The CPU should only use continuous capture (B'10) for AVTP presentation time value (GCCR.TCSS is B'10). [Conditions for Changing] — The bits are set to B'00 when the operating mode is not operation mode and CCC.GAC is 0b. — The bits are also set to B'00 on completion of the requested processing. B’00: Timer control is not requested. B’01: gPTP/AVTP presentation time reset B’10: Continuous capture of AVTP to GCTt.CTV B’11: Captures the value set in the TCSS bit.

46.2.52 gPTP Maximum Transit Time Configuration Register (GMTT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GMTT register sets the maximum time for transitions of the gPTP timer.



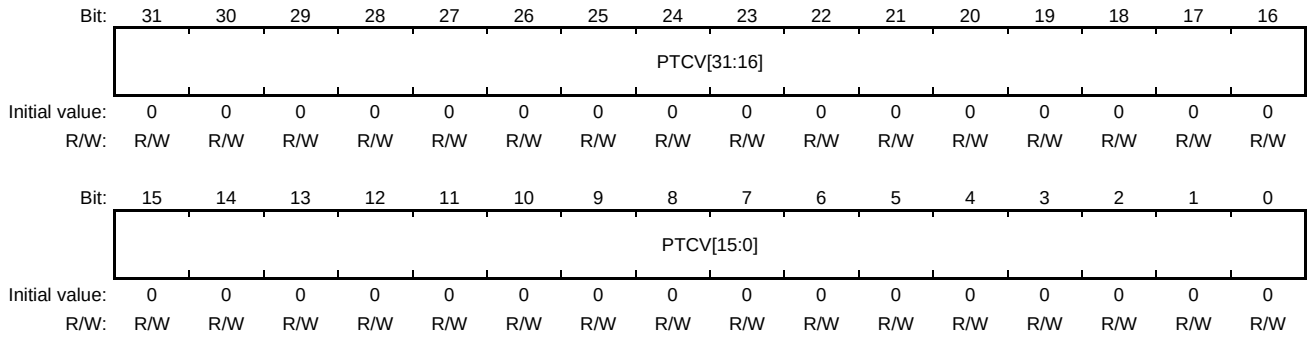
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MTTV[31:0]	H'0000_0000	R/W	Maximum Transit Time These bits set the maximum transition time for use in calculating AVTP presentation time. Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (GCCR.LMTT) to 1.

Note: Do not write a value to these bits when the operating mode is operation mode or CCC.GAC is 1 and the maximum transit time configuration request bit (GCCR.LMTT) is 1.

46.2.53 gPTP Presentation Time Comparison Register (GPTC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GPTC register sets a value for comparison with presentation times in the gPTP timer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PTCV[31:0]	H'0000_0000	R/W	Presentation Time Comparison Value These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended. Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (GCCR.LPTC) to 1.

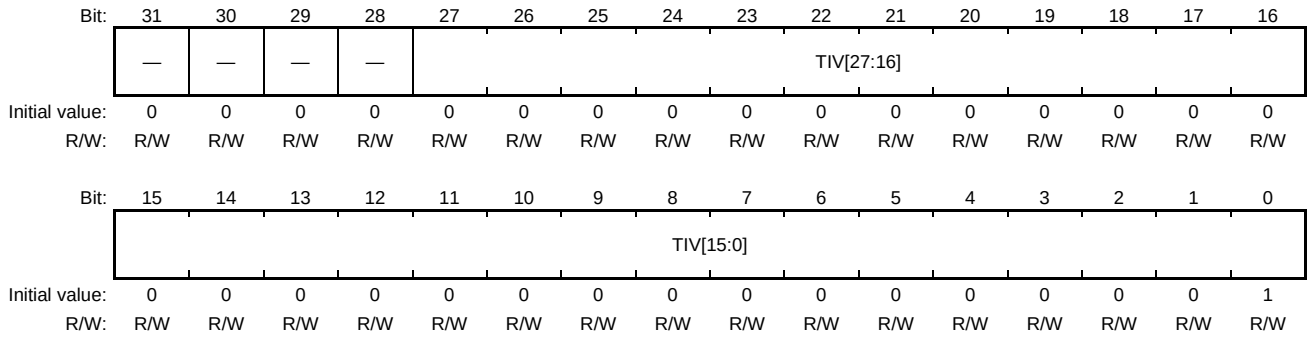
Note: Do not write a value to these bits when the presentation time comparison value configuration request bit (GCCR.LPTC) is 1.

The CPU should only write values in range of 0 to H'3FFF_FFFF to these bits when they are defining the period value of AVTP comparison unit (controlled by GCCR.SPC).

46.2.54 gPTP Timer Increment Configuration Register (GTI)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GTI register sets the increment for the gPTP timer.



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
27 to 0	TIV[27:0]	H'000_0001	R/W	gPTP Timer Increment Value When the gPTP clock select bits in the AVB-DMAC mode register (CCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses. Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (GCCR.LTI) to 1.

Note: Do not write a value to these bits when the operating mode is operation mode and CCC.GAC is 1 and the timer increment value configuration request bit (GCCR.LTI) is 1.

Do not write 0 to the bits.

Keep comparison value in the following range

$x \leq comparison\_value \leq 2^{32} - x$

, where x is amount of nanoseconds of the configured increment value in GTI.TIV

The CPU should not program increment values less than H'0010_0000

46.2.55 gPTP timer offset register i (GTOi) (i = 0 to 2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in GTO0, 32 to 63 in GTO1, and 64 to 79 in GTO2, which together make up the gPTP timer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TOV[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TOV[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TOV[31:0]	H'0000_0000	R/W	Timer Offset Value This is an 80-bit value consisting of the settings in GTO0.TOV[31:0], GTO1.TOV[63:32], and GTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer. Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1.

Note: Do not write a value to these bits when the operating mode is operation mode and CCC.GAC is 1 and the timer offset value configuration request bit (GCCR.LTO) is 1. Write H'0000 to GTO2.TOV[95:80].

Set a value in the range from 0 to 10^9-1 (H'0000_0000 to H'3B9A_C9FF) in GTOi.TOV[31:0].

46.2.56 gPTP Interrupt Control Register (GIC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GIC register is used to control gPTP-related interrupts.

Bit	Bit Name	Initial Value	R/W	Description
31	ATCF15	B'0	R/W	Avtp Time Capture Flag 15 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[16] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
30	ATCF14	B'0	R/W	Avtp Time Capture Flag 14 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[15] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
29	ATCF13	B'0	R/W	Avtp Time Capture Flag 13 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[14] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured

Bit	Bit Name	Initial Value	R/W	Description
28	ATCF12	B'0	R/W	Avtp Time Capture Flag 12 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[13] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
27	ATCF11	B'0	R/W	Avtp Time Capture Flag 11 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[12] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
26	ATCF10	B'0	R/W	Avtp Time Capture Flag 10 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[11] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
25	ATCF9	B'0	R/W	Avtp Time Capture Flag 9 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[10] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured

Bit	Bit Name	Initial Value	R/W	Description
24	ATCF8	B'0	R/W	Avtp Time Capture Flag 8 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[9] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
23	ATCF7	B'0	R/W	Avtp Time Capture Flag 7 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[8] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
22	ATCF6	B'0	R/W	Avtp Time Capture Flag 6 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[7] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
21	ATCF5	B'0	R/W	Avtp Time Capture Flag 5 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[6] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured

Bit	Bit Name	Initial Value	R/W	Description
20	ATCF4	B'0	R/W	Avtp Time Capture Flag 4 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[5] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
19	ATCF3	B'0	R/W	Avtp Time Capture Flag 3 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[4] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
18	ATCF2	B'0	R/W	Avtp Time Capture Flag 2 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[3] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
17	ATCF1	B'0	R/W	Avtp Time Capture Flag 1 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[2] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured

Bit	Bit Name	Initial Value	R/W	Description
16	ATCF0	B'0	R/W	Avtp Time Capture Flag 0 This bit indicates that the AVTP time has been captured based on external capture event (rising edge of avb_pt_capture[1] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: AVTP time captured
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9	PTMF7	B'0	R/W	Presentation Time Matched Flag 7 This bit indicates that the AVTP timer value has matched the configured comparison value of AVTP comparator 7. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when the AVTP timer value reaches or exceeds the comparison value of AVTP comparator 7. 0: No interrupt pending 1: Presentation time exceeded
8	PTMF6	B'0	R/W	Presentation Time Matched Flag 6 This bit indicates that the AVTP timer value has matched the configured comparison value of AVTP comparator 6. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when the AVTP timer value reaches or exceeds the comparison value of AVTP comparator 6. 0: No interrupt pending 1: Presentation time exceeded
7	PTMF5	B'0	R/W	Presentation Time Matched Flag 5 This bit indicates that the AVTP timer value has matched the configured comparison value of AVTP comparator 5. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when the AVTP timer value reaches or exceeds the comparison value of AVTP comparator 5. 0: No interrupt pending 1: Presentation time exceeded

Bit	Bit Name	Initial Value	R/W	Description
6	PTMF4	B'0	R/W	Presentation Time Matched Flag 4 This bit indicates that the AVTP timer value has matched the configured comparison value of AVTP comparator 4. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when the AVTP timer value reaches or exceeds the comparison value of AVTP comparator 4. 0: No interrupt pending 1: Presentation time exceeded
5	PTMF3	B'0	R/W	Presentation Time Matched Flag 3 This bit indicates that the AVTP timer value has matched the configured comparison value of AVTP comparator 3. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when the AVTP timer value reaches or exceeds the comparison value of AVTP comparator 3. 0: No interrupt pending 1: Presentation time exceeded
4	PTMF2	B'0	R/W	Presentation Time Matched Flag 2 This bit indicates that the AVTP timer value has matched the configured comparison value of AVTP comparator 2. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when the AVTP timer value reaches or exceeds the comparison value of AVTP comparator 2. 0: No interrupt pending 1: Presentation time exceeded
3	PTMF1	B'0	R/W	Presentation Time Matched Flag 1 This bit indicates that the AVTP timer value has matched the configured comparison value of AVTP comparator 1. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when the AVTP timer value reaches or exceeds the comparison value of AVTP comparator 1. 0: No interrupt pending 1: Presentation time exceeded

Bit	Bit Name	Initial Value	R/W	Description
2	PTMF0	B'0	R/W	Presentation Time Match Interrupt Flag 0 This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (GPTC). Only 0 can be written to the bit. [Conditions for Changing] — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (GPTC). 0: The interrupt is not pending. 1: The interrupt is pending.
1	PTOF	B'0	R/W	Presentation Time Overrun Flag This bit indicates that an external capture event (rising edge of avb_pt_capture[0] signal) has occurred before the last captured value was processed by CPU. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger while GIS.PTCF is 1. 0: No interrupt pending 1: Presentation time overrun
0	PTCF	B'0	R/W	Presentation Time Capture Flag This bit indicates that the AVTP presentation time has been captured based on external capture event (rising edge of avb_pt_capture[0] signal). The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 1 when EthernetAVB-IF gets an external capture trigger. 0: No interrupt pending 1: Presentation time captured

46.2.58 gPTP Captured Presentation Time register (GCPT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GCPT registers that captured presentation the gPTP timer value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CPTV[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CPTV[31:0]	H'0000_0000	R	Captured Presentation Time Value These bits represents the captured AVTP presentation time (with Max Transit Time added) due to HW trigger. The CPU should not read these bits when GIS.PTCF is 0. [Changing condition] These bits are updated with the current AVTP presentation time when an external capture trigger (avb_pt_capture[0]) occurs and GIS.PTCF is 0. *Note for verification: These bits are set to 0 when leaving OPERATION mode and CCC.GAC is 0.*

46.2.59 gPTP Timer Capture Register i (GCTi) (i = 0 to 2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GCTi registers form an 80-bit register that captures the gPTP timer value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CTV[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CTV[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CTV[31:0]	H'0000_0000	R/W	gPTP Timer Capture Value These 80 bits consist of GCT0.CTV[31:0], GCT1.CTV[63:32 and GCT2.CTV[79:64], which together indicate captured timer values. When B'00 (value of the gPTP timer) or B'01 (adjusted gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register, the corresponding 80-bit values are stored in these bits. When B'10 (AVTP presentation time) is selected by the timer capture source select bit, the corresponding 32-bit values are stored in these bits. In case of continuous update (GCCR.TCR is B'10) CPU should only use 32 bit read access to get consistent value. Actual writing of the timer value specified by the timer capture source select bits (GCCR.TCSS) proceeds when B'11 (timer capture request) is written to the timer control request bits in the gPTP configuration control register (GCCR.TCR). Do not read the value while the value of the timer control request bits (GCCR.TCR) is B'11, because this indicates that storage is still in progress. *Note for verification: These bits are set to 0 when leaving OPERATION mode and CCC.GAC is 0.*

46.2.60 gPTP Status Register (GSR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GSR register indicates the state of the gPTP.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
27	AFU3	B’0	R	Avtp Fifo Update 3 This bit indicates an ongoing update of the AVTP-FIFO of compare unit 3. When this bit is 0, the AVTP-FIFO is able to process adding new values. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when AVTP compare value is added to the AVTP-FIFO. This bit is set to 1 when CPU writes a new value to GPTF3.PTFV and GSR.AFFL3 is not 15. 0: No update of AVTP FIFO pending 1: Update of AVTP FIFO with value from GPTF3.PTFV is ongoing
26	AFU2	B’0	R	Avtp Fifo Update 2 This bit indicates an ongoing update of the AVTP-FIFO of compare unit 2. When this bit is 0, the AVTP-FIFO is able to process adding new values. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when AVTP compare value is added to the AVTP-FIFO. This bit is set to 1 when CPU writes a new value to GPTF2.PTFV and GSR.AFFL2 is not 15. 0: No update of AVTP FIFO pending 1: Update of AVTP FIFO with value from GPTF2.PTFV is ongoing

Bit	Bit Name	Initial Value	R/W	Description
25	AFU1	B'0	R	Avtp Fifo Update 1 This bit indicates an ongoing update of the AVTP-FIFO of compare unit 1. When this bit is 0, the AVTP-FIFO is able to process adding new values. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when AVTP compare value is added to the AVTP-FIFO. This bit is set to 1 when CPU writes a new value to GPTF1.PTFV and GSR.AFFL1 is not 15. 0: No update of AVTP FIFO pending 1: Update of AVTP FIFO with value from GPTF1.PTFV is ongoing
24	AFU0	B'0	R	Avtp Fifo Update 0 This bit indicates an ongoing update of the AVTP-FIFO of compare unit 0. When this bit is 0, the AVTP-FIFO is able to process adding new values. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when AVTP compare value is added to the AVTP-FIFO. This bit is set to 1 when CPU writes a new value to GPTF0.PTFV and GSR.AFFL0 is not 15. 0: No update of AVTP FIFO pending 1: Update of AVTP FIFO with value from GPTF0.PTFV is ongoing
23 to 20	AFFL3[3:0]	H'0	R	FIFO fill level of AVTP compare unit 3 These bits indicate the number of AVTP timestamps pending in AVTP-FIFO of compare unit 3. The timestamps are provided by CPU and taken by compare unit when no comparison on AVTP comparator 3 is active. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This value is incremented when a new value is added to AVTP-FIFO (GSR.AFU3 changes to 0). This value is decremented when a timestamp value from FIFO has been loaded to the AVTP comparator.
19 to 16	AFFL2[3:0]	H'0	R	FIFO fill level of AVTP compare unit 2 These bits indicate the number of AVTP timestamps pending in AVTP-FIFO of compare unit 2. The timestamps are provided by CPU and taken by compare unit when no comparison on AVTP comparator 2 is active. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This value is incremented when a new value is added to AVTP-FIFO (GSR.AFU2 changes to 0). This value is decremented when a timestamp value from FIFO has been loaded to the AVTP comparator.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	AFFL1[3:0]	H'0	R	FIFO fill level of AVTP compare unit 1 These bits indicate the number of AVTP timestamps pending in AVTP-FIFO of compare unit 1. The timestamps are provided by CPU and taken by compare unit when no comparison on AVTP comparator 1 is active. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This value is incremented when a new value is added to AVTP-FIFO (GSR.AFU1 changes to 0). This value is decremented when a timestamp value from FIFO has been loaded to the AVTP comparator.
11 to 8	AFFL0[3:0]	H'0	R	FIFO fill level of AVTP compare unit 0 These bits indicate the number of AVTP timestamps pending in AVTP-FIFO of compare unit 0. The timestamps are provided by CPU and taken by compare unit when no comparison on AVTP comparator 0 is active. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This value is incremented when a new value is added to AVTP-FIFO (GSR.AFU0 changes to 0). This value is decremented when a timestamp value from FIFO has been loaded to the AVTP comparator.
7	PCM7	B'0	R	Periodic Comparison Mode 7 This bit indicates if single shot or periodic comparison mode is active on AVTP comparator unit 7. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when the last match has happened after CPU has requested entering single shot mode. This bit is set to 1 when loading a period value for the AVTP comparator. 0: Single shot comparison 1: Periodic comparison
6	PCM6	B'0	R	Periodic Comparison Mode 6 This bit indicates if single shot or periodic comparison mode is active on AVTP comparator unit 6. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when the last match has happened after CPU has requested entering single shot mode. This bit is set to 1 when loading a period value for the AVTP comparator. 0: Single shot comparison 1: Periodic comparison

Bit	Bit Name	Initial Value	R/W	Description
5	PCM5	B'0	R	Periodic Comparison Mode 5 This bit indicates if single shot or periodic comparison mode is active on AVTP comparator unit 5. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when the last match has happened after CPU has requested entering single shot mode. This bit is set to 1 when loading a period value for the AVTP comparator. 0: Single shot comparison 1: Periodic comparison
4	PCM4	B'0	R	Periodic Comparison Mode 4 This bit indicates if single shot or periodic comparison mode is active on AVTP comparator unit 4. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when the last match has happened after CPU has requested entering single shot mode. This bit is set to 1 when loading a period value for the AVTP comparator. 0: Single shot comparison 1: Periodic comparison
3	PCM3	B'0	R	Periodic Comparison Mode 3 This bit indicates if single shot or periodic comparison mode is active on AVTP comparator unit 3. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when the last match has happened after CPU has requested entering single shot mode. This bit is set to 1 when loading a period value for the AVTP comparator. 0: Single shot comparison 1: Periodic comparison
2	PCM2	B'0	R	Periodic Comparison Mode 2 This bit indicates if single shot or periodic comparison mode is active on AVTP comparator unit 2. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when the last match has happened after CPU has requested entering single shot mode. This bit is set to 1 when loading a period value for the AVTP comparator. 0: Single shot comparison 1: Periodic comparison

Bit	Bit Name	Initial Value	R/W	Description
1	PCM1	B'0	R	Periodic Comparison Mode 1 This bit indicates if single shot or periodic comparison mode is active on AVTP comparator unit 1. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when the last match has happened after CPU has requested entering single shot mode. This bit is set to 1 when loading a period value for the AVTP comparator. 0: Single shot comparison 1: Periodic comparison
0	PCM0	B'0	R	Periodic Comparison Mode 0 This bit indicates if single shot or periodic comparison mode is active on AVTP comparator unit 0. [Changing condition] This bit is set to 0 when leaving OPERATION mode and CCC.GAC is 0. This bit is set to 0 when the last match has happened after CPU has requested entering single shot mode. This bit is set to 1 when loading a period value for the AVTP comparator. 0: Single shot comparison 1: Periodic comparison

46.2.61 gPTP Interrupt Enable register (GIE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GIE register is used to control the gPTP Interrupt.

25	ATCD9	B'0	R/W	Avtp Time Captured interrupt Disable 9 This bit supports interrupt enable. It controls set of GIC.ATCE9. This bit is always read as 0. 0: No change of GIC.ATCE9 1: Set GIC.ATCE9 to 0
24	ATCD8	B'0	R/W	Avtp Time Captured interrupt Disable 8 This bit supports interrupt enable. It controls set of GIC.ATCE8. This bit is always read as 0. 0: No change of GIC.ATCE8 1: Set GIC.ATCE8 to 0
23	ATCD7	B'0	R/W	Avtp Time Captured interrupt Disable 7 This bit supports interrupt enable. It controls set of GIC.ATCE7. This bit is always read as 0. 0: No change of GIC.ATCE7 1: Set GIC.ATCE7 to 0
22	ATCD6	B'0	R/W	Avtp Time Captured interrupt Disable 6 This bit supports interrupt enable. It controls set of GIC.ATCE6. This bit is always read as 0. 0: No change of GIC.ATCE6 1: Set GIC.ATCE6 to 0
21	ATCD5	B'0	R/W	Avtp Time Captured interrupt Disable 5 This bit supports interrupt enable. It controls set of GIC.ATCE5. This bit is always read as 0. 0: No change of GIC.ATCE5 1: Set GIC.ATCE5 to 0
20	ATCD4	B'0	R/W	Avtp Time Captured interrupt Disable 4 This bit supports interrupt enable. It controls set of GIC.ATCE4. This bit is always read as 0. 0: No change of GIC.ATCE4 1: Set GIC.ATCE4 to 0
19	ATCD3	B'0	R/W	Avtp Time Captured interrupt Disable 3 This bit supports interrupt enable. It controls set of GIC.ATCE3. This bit is always read as 0. 0: No change of GIC.ATCE3 1: Set GIC.ATCE3 to 0
18	ATCD2	B'0	R/W	Avtp Time Captured interrupt Disable 2 This bit supports interrupt enable. It controls set of GIC.ATCE2. This bit is always read as 0. 0: No change of GIC.ATCE2 1: Set GIC.ATCE2 to 0
17	ATCD1	B'0	R/W	Avtp Time Captured interrupt Disable 1 This bit supports interrupt enable. It controls set of GIC.ATCE1. This bit is always read as 0. 0: No change of GIC.ATCE1 1: Set GIC.ATCE1 to 0

Bit	Bit Name	Initial Value	R/W	Description
16	ATCD0	B'0	R/W	Avtp Time Captured interrupt Disable 0 This bit supports interrupt enable. It controls set of GIC.ATCE0. This bit is always read as 0. 0: No change of GIC.ATCE0 1: Set GIC.ATCE0 to 0
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9	PTMD7	B'0	R/W	Presentation Time Matched interrupt Disable 7 This bit supports interrupt enable. It controls set of GIC.PTME7. This bit is always read as 0. 0: No change of GIC.PTME7 1: Set GIC.PTME7 to 0
8	PTMD6	B'0	R/W	Presentation Time Matched interrupt Disable 6 This bit supports interrupt enable. It controls set of GIC.PTME6. This bit is always read as 0. 0: No change of GIC.PTME6 1: Set GIC.PTME6 to 0
7	PTMD5	B'0	R/W	Presentation Time Matched interrupt Disable 5 This bit supports interrupt enable. It controls set of GIC.PTME5. This bit is always read as 0. 0: No change of GIC.PTME5 1: Set GIC.PTME5 to 0
6	PTMD4	B'0	R/W	Presentation Time Matched interrupt Disable 4 This bit supports interrupt enable. It controls set of GIC.PTME4. This bit is always read as 0. 0: No change of GIC.PTME4 1: Set GIC.PTME4 to 0
5	PTMD3	B'0	R/W	Presentation Time Matched interrupt Disable 3 This bit supports interrupt enable. It controls set of GIC.PTME3. This bit is always read as 0. 0: No change of GIC.PTME3 1: Set GIC.PTME3 to 0
4	PTMD2	B'0	R/W	Presentation Time Matched interrupt Disable 2 This bit supports interrupt enable. It controls set of GIC.PTME2. This bit is always read as 0. 0: No change of GIC.PTME2 1: Set GIC.PTME2 to 0
3	PTMD1	B'0	R/W	Presentation Time Matched interrupt Disable 1 This bit supports interrupt enable. It controls set of GIC.PTME1. This bit is always read as 0. 0: No change of GIC.PTME1 1: Set GIC.PTME1 to 0
2	PTMD0	B'0	R/W	Presentation Time Matched interrupt Disable 0 This bit supports interrupt enable. It controls set of GIC.PTME0. This bit is always read as 0. 0: No change of GIC.PTME0 1: Set GIC.PTME0 to 0

Bit	Bit Name	Initial Value	R/W	Description
1	PTOD	B'0	R/W	Presentation Time Overrun interrupt Disable This bit supports interrupt enable. It controls set of GIC.PTOE. This bit is always read as 0. 0: No change of GIC.PTOE 1: Set GIC.PTOE to 0
0	PTCD	B'0	R/W	Presentation Time Captured interrupt Disable This bit supports interrupt enable. It controls set of GIC.PTCE. This bit is always read as 0. 0: No change of GIC.PTCE 1: Set GIC.PTCE to 0

46.2.63 gPTP Interrupt Line selection register (GIL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GIL register is used to control the gPTP Interrupt line.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26	ATCL10	B’0	R/W	Avtp Time Captured interrupt Line select 10 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification

Bit	Bit Name	Initial Value	R/W	Description
25	ATCL9	B'0	R/W	Avtp Time Captured interrupt Line select 9 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
24	ATCL8	B'0	R/W	Avtp Time Captured interrupt Line select 8 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
23	ATCL7	B'0	R/W	Avtp Time Captured interrupt Line select 7 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
22	ATCL6	B'0	R/W	Avtp Time Captured interrupt Line select 6 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
21	ATCL5	B'0	R/W	Avtp Time Captured interrupt Line select 5 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
20	ATCL4	B'0	R/W	Avtp Time Captured interrupt Line select 4 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
19	ATCL3	B'0	R/W	Avtp Time Captured interrupt Line select 3 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
18	ATCL2	B'0	R/W	Avtp Time Captured interrupt Line select 2 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
17	ATCL1	B'0	R/W	Avtp Time Captured interrupt Line select 1 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification

Bit	Bit Name	Initial Value	R/W	Description
16	ATCL0	B'0	R/W	Avtp Time Captured interrupt Line select 0 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9	PTML7	B'0	R/W	Presentation Time Matched interrupt Line select 7 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
8	PTML6	B'0	R/W	Presentation Time Matched interrupt Line select 6 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
7	PTML5	B'0	R/W	Presentation Time Matched interrupt Line select 5 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
6	PTML4	B'0	R/W	Presentation Time Matched interrupt Line select 4 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
5	PTML3	B'0	R/W	Presentation Time Matched interrupt Line select 3 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
4	PTML2	B'0	R/W	Presentation Time Matched interrupt Line select 2 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
3	PTML1	B'0	R/W	Presentation Time Matched interrupt Line select 1 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
2	PTML0	B'0	R/W	Presentation Time Matched interrupt Line select 0 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification

Bit	Bit Name	Initial Value	R/W	Description
1	PTOL	B'0	R/W	Presentation Time Overrun interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification
0	PTCL	B'0	R/W	Presentation Time Captured interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification

46.2.64 gPTP Avtp Capture Prescaler register (GACP)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GACP register is used to control the gPTP Capture Prescaler.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	ACPN[3:0]				ACPV[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11 to 8	ACPN[3:0]	H'0	R/W	Prescaler unit number to be configured Avtp Capture Prescaler unit Number These bits define the number i of AVTP capture unit where the prescaler value should be updated. These bits are always read as 0. The CPU can only write to these bits when CSR.OPS is OPERATION. The CPU can only write to these bits when CSR.OPS is CONFIG and CCC.GAC is 1.
7 to 0	ACPV[7:0]	H'00	R/W	Prescaler configuration of AVTP capture unit i Avtp Capture Prescaler Value These bits define the prescaler configuration used by AVTP capture unit i. If the value is 0, on each rising edge of avb_pt_capture[i+1] the current AVTP timer value is captured. These bits are always read as 0. The CPU can only write to these bits when CSR.OPS is OPERATION. The CPU can only write to these bits when CSR.OPS is CONFIG and CCC.GAC is 1.

46.2.65 gPTP Presentation Time FIFO register i (GPTFi) (i = 0 to 3)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GPTFi register is used to control the gPTP FIFO.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PTFV[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PTFV[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	PTFV[31:0]	H'0000_0000	R/W	Presentation Time Fifo Value These bits define a value to be compared with the AVTP timer value (without Max Transit Time added). When writing to this register the value is added to AVTP-FIFO of comparator unit i. These bits are always read as 0. The CPU cannot write to these bits if CSR.OPS is CONFIG and CCC.GAC is 0. The CPU should not write to these bits when GSR.PCMi is 1. The CPU should not write to these bits when GSR.AFUi is 1. The CPU should not write to these bits when GSR.AFFLi is 15.

46.2.66 gPTP Captured Avtp Time register i (GCATi) (i = 0 to 15)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GCATi register indicates the value of the gPTP captured time.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CATV[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CATV[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CATV[31:0]	H'0000_0000	R	Captured AVTP time value These bits represents the captured AVTP time (without Max Transit Time added) due to HW trigger. The CPU should not read these bits when GIS.ATCFi is 0. [Changing condition] These bits are updated with the current AVTP time when an external capture trigger (avb_pt_capture[i+1]) occurs and GIS.ATCFi is 0. *Note for verification: These bits are set to 0 when leaving OPERATION mode and CCC.GAC is 0.*

46.2.67 Descriptor Interrupt Line selection register (DIL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The DIL register is used to control the Descriptor Interrupt line.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15	DPS15	B'0	R/W	Descriptor Processed interrupt Set 15 This bit supports interrupt enable. It controls set of DIC.DPE15. This bit is always read as 0. 0: No change of DIC.DPE15 1: Set DIC.DPE15 to 1
14	DPS14	B'0	R/W	Descriptor Processed interrupt Set 14 This bit supports interrupt enable. It controls set of DIC.DPE14. This bit is always read as 0. 0: No change of DIC.DPE14 1: Set DIC.DPE14 to 1
13	DPS13	B'0	R/W	Descriptor Processed interrupt Set 13 This bit supports interrupt enable. It controls set of DIC.DPE13. This bit is always read as 0. 0: No change of DIC.DPE13 1: Set DIC.DPE13 to 1
12	DPS12	B'0	R/W	Descriptor Processed interrupt Set 12 This bit supports interrupt enable. It controls set of DIC.DPE12. This bit is always read as 0. 0: No change of DIC.DPE12 1: Set DIC.DPE12 to 1
11	DPS11	B'0	R/W	Descriptor Processed interrupt Set 11 This bit supports interrupt enable. It controls set of DIC.DPE11. This bit is always read as 0. 0: No change of DIC.DPE11 1: Set DIC.DPE11 to 1

Bit	Bit Name	Initial Value	R/W	Description
10	DPS10	B'0	R/W	Descriptor Processed interrupt Set 10 This bit supports interrupt enable. It controls set of DIC.DPE10. This bit is always read as 0. 0: No change of DIC.DPE10 1: Set DIC.DPE10 to 1
9	DPS9	B'0	R/W	Descriptor Processed interrupt Set 9 This bit supports interrupt enable. It controls set of DIC.DPE9. This bit is always read as 0. 0: No change of DIC.DPE9 1: Set DIC.DPE9 to 1
8	DPS8	B'0	R/W	Descriptor Processed interrupt Set 8 This bit supports interrupt enable. It controls set of DIC.DPE8. This bit is always read as 0. 0: No change of DIC.DPE8 1: Set DIC.DPE8 to 1
7	DPS7	B'0	R/W	Descriptor Processed interrupt Set 7 This bit supports interrupt enable. It controls set of DIC.DPE7. This bit is always read as 0. 0: No change of DIC.DPE7 1: Set DIC.DPE7 to 1
6	DPS6	B'0	R/W	Descriptor Processed interrupt Set 6 This bit supports interrupt enable. It controls set of DIC.DPE6. This bit is always read as 0. 0: No change of DIC.DPE6 1: Set DIC.DPE6 to 1
5	DPS5	B'0	R/W	Descriptor Processed interrupt Set 5 This bit supports interrupt enable. It controls set of DIC.DPE5. This bit is always read as 0. 0: No change of DIC.DPE5 1: Set DIC.DPE5 to 1
4	DPS4	B'0	R/W	Descriptor Processed interrupt Set 4 This bit supports interrupt enable. It controls set of DIC.DPE4. This bit is always read as 0. 0: No change of DIC.DPE4 1: Set DIC.DPE4 to 1
3	DPS3	B'0	R/W	Descriptor Processed interrupt Set 3 This bit supports interrupt enable. It controls set of DIC.DPE3. This bit is always read as 0. 0: No change of DIC.DPE3 1: Set DIC.DPE3 to 1
2	DPS2	B'0	R/W	Descriptor Processed interrupt Set 2 This bit supports interrupt enable. It controls set of DIC.DPE2. This bit is always read as 0. 0: No change of DIC.DPE2 1: Set DIC.DPEi to 1

Bit	Bit Name	Initial Value	R/W	Description
1	DPS1	B'0	R/W	Descriptor Processed interrupt Set 1 This bit supports interrupt enable. It controls set of DIC.DPE1. This bit is always read as 0. 0: No change of DIC.DPE1 1: Set DIC.DPE1 to 1
0	—	B'0	R/W	Reserved These bits are read as 0. The write value should be 0.

46.2.71 Descriptor Interrupt Disable register (DID)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The DID register is used to control the Descriptor Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15	DPD15	B'0	R/W	Descriptor Processed interrupt Disable 15 This bit supports interrupt enable. It controls set of DIC.DPE15. This bit is always read as 0. 0: No change of DIC.DPE15 1: Set DIC.DPE15 to 0
14	DPD14	B'0	R/W	Descriptor Processed interrupt Disable 14 This bit supports interrupt enable. It controls set of DIC.DPE14. This bit is always read as 0. 0: No change of DIC.DPE14 1: Set DIC.DPE14 to 0
13	DPD13	B'0	R/W	Descriptor Processed interrupt Disable 13 This bit supports interrupt enable. It controls set of DIC.DPE13. This bit is always read as 0. 0: No change of DIC.DPE13 1: Set DIC.DPE13 to 0
12	DPD12	B'0	R/W	Descriptor Processed interrupt Disable 12 This bit supports interrupt enable. It controls set of DIC.DPE12. This bit is always read as 0. 0: No change of DIC.DPE12 1: Set DIC.DPE12 to 0
11	DPD11	B'0	R/W	Descriptor Processed interrupt Disable 11 This bit supports interrupt enable. It controls set of DIC.DPE11. This bit is always read as 0. 0: No change of DIC.DPE11 1: Set DIC.DPE11 to 0

Bit	Bit Name	Initial Value	R/W	Description
10	DPD10	B'0	R/W	Descriptor Processed interrupt Disable 10 This bit supports interrupt enable. It controls set of DIC.DPE10. This bit is always read as 0. 0: No change of DIC.DPE10 1: Set DIC.DPE10 to 0
9	DPD9	B'0	R/W	Descriptor Processed interrupt Disable 9 This bit supports interrupt enable. It controls set of DIC.DPE9. This bit is always read as 0. 0: No change of DIC.DPE9 1: Set DIC.DPE9 to 0
8	DPD8	B'0	R/W	Descriptor Processed interrupt Disable 8 This bit supports interrupt enable. It controls set of DIC.DPE8. This bit is always read as 0. 0: No change of DIC.DPE8 1: Set DIC.DPE8 to 0
7	DPD7	B'0	R/W	Descriptor Processed interrupt Disable 7 This bit supports interrupt enable. It controls set of DIC.DPE7. This bit is always read as 0. 0: No change of DIC.DPE7 1: Set DIC.DPE7 to 0
6	DPD6	B'0	R/W	Descriptor Processed interrupt Disable 6 This bit supports interrupt enable. It controls set of DIC.DPE6. This bit is always read as 0. 0: No change of DIC.DPE6 1: Set DIC.DPE6 to 0
5	DPD5	B'0	R/W	Descriptor Processed interrupt Disable 5 This bit supports interrupt enable. It controls set of DIC.DPE5. This bit is always read as 0. 0: No change of DIC.DPE5 1: Set DIC.DPE5 to 0
4	DPD4	B'0	R/W	Descriptor Processed interrupt Disable 4 This bit supports interrupt enable. It controls set of DIC.DPE4. This bit is always read as 0. 0: No change of DIC.DPE4 1: Set DIC.DPE4 to 0
3	DPD3	B'0	R/W	Descriptor Processed interrupt Disable 3 This bit supports interrupt enable. It controls set of DIC.DPE3. This bit is always read as 0. 0: No change of DIC.DPE3 1: Set DIC.DPE3 to 0
2	DPD2	B'0	R/W	Descriptor Processed interrupt Disable 2 This bit supports interrupt enable. It controls set of DIC.DPE2. This bit is always read as 0. 0: No change of DIC.DPE2 1: Set DIC.DPE2 to 0

Bit	Bit Name	Initial Value	R/W	Description
1	DPD1	B'0	R/W	Descriptor Processed interrupt Disable 1 This bit supports interrupt enable. It controls set of DIC.DPE1. This bit is always read as 0. 0: No change of DIC.DPE1 1: Set DIC.DPE1 to 0
0	—	B'0	R/W	Reserved These bits are read as 0. The write value should be 0.

46.2.72 Error Interrupt Enable register (EIE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The EIE register is used to control the Error Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
10	TBFS	B'0	R/W	Tx-Buffer Full interrupt Set This bit supports interrupt enable. It controls set of EIC.TBFE. This bit is always read as 0. 0: No change of EIC.TBFE 1: Set EIC.TBFE to 1
9	MFFS	B'0	R/W	E-MAC status FIFO Full interrupt Set This bit supports interrupt enable. It controls set of EIC.MFFE. This bit is always read as 0. 0: No change of EIC.MFFE 1: Set EIC.MFFE to 1
8	TFFS	B'0	R/W	Timestamp FIFO Full interrupt Set This bit supports interrupt enable. It controls set of EIC.TFFE. This bit is always read as 0. 0: No change of EIC.TFFE 1: Set EIC.TFFE to 1
7	CULS1	B'0	R/W	CBS Upper Limit reached interrupt Set 1 This bit supports interrupt enable. It controls set of EIC.CULE1. This bit is always read as 0. 0: No change of EIC.CULE1 1: Set EIC.CULE1 to 1
6	CULS0	B'0	R/W	CBS Upper Limit reached interrupt Set 0 This bit supports interrupt enable. It controls set of EIC.CULE0. This bit is always read as 0. 0: No change of EIC.CULE0 1: Set EIC.CULE0 to 1

Bit	Bit Name	Initial Value	R/W	Description
5	CLLS1	B'0	R/W	CBS Lower Limit reached interrupt Set 1 This bit supports interrupt enable. It controls set of EIC.CLLE1. This bit is always read as 0. 0: No change of EIC.CLLE1 1: Set EIC.CLLE1 to 1
4	CLLS0	B'0	R/W	CBS Lower Limit reached interrupt Set 0 This bit supports interrupt enable. It controls set of EIC.CLLE0. This bit is always read as 0. 0: No change of EIC.CLLE0 1: Set EIC.CLLE0 to 1
3	SES	B'0	R/W	Separation Error interrupt Set This bit supports interrupt enable. It controls set of EIC.SEE. This bit is always read as 0. 0: No change of EIC.SEE 1: Set EIC.QEE to 1
2	QES	B'0	R/W	Queue Error interrupt Set This bit supports interrupt enable. It controls set of EIC.QEE. This bit is always read as 0. 0: No change of EIC.QEE 1: Set EIC.QEE to 1
1	MTES	B'0	R/W	E-MAC Transmission Error interrupt Set This bit supports interrupt enable. It controls set of EIC.MTEE. This bit is always read as 0. 0: No change of EIC.MTEE 1: Set EIC.MTEE to 1
0	MRES	B'0	R/W	E-MAC Reception Error interrupt Set This bit supports interrupt enable. It controls set of EIC.MREE. This bit is always read as 0. 0: No change of EIC.MREE 1: Set EIC.MREE to 1

46.2.73 Error Interrupt Disable register (EID)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The EID register is used to control the Error Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	FRS17	B'0	R/W	Frame Received interrupt Set 17 This bit supports interrupt enable. It controls set of RIC0.FRE17. This bit is always read as 0. 0: No change of RIC0.FRE17 1: Set RIC0.FRE17 to 1
16	FRS16	B'0	R/W	Frame Received interrupt Set 16 This bit supports interrupt enable. It controls set of RIC0.FRE16. This bit is always read as 0. 0: No change of RIC0.FRE16 1: Set RIC0.FRE16 to 1
15	FRS15	B'0	R/W	Frame Received interrupt Set 15 This bit supports interrupt enable. It controls set of RIC0.FRE15. This bit is always read as 0. 0: No change of RIC0.FRE15 1: Set RIC0.FRE15 to 1
14	FRS14	B'0	R/W	Frame Received interrupt Set 14 This bit supports interrupt enable. It controls set of RIC0.FRE14. This bit is always read as 0. 0: No change of RIC0.FRE14 1: Set RIC0.FRE14 to 1
13	FRS13	B'0	R/W	Frame Received interrupt Set 13 This bit supports interrupt enable. It controls set of RIC0.FRE13. This bit is always read as 0. 0: No change of RIC0.FRE13 1: Set RIC0.FRE13 to 1

Bit	Bit Name	Initial Value	R/W	Description
12	FRS12	B'0	R/W	Frame Received interrupt Set 12 This bit supports interrupt enable. It controls set of RIC0.FRE12. This bit is always read as 0. 0: No change of RIC0.FRE12 1: Set RIC0.FRE12 to 1
11	FRS11	B'0	R/W	Frame Received interrupt Set 11 This bit supports interrupt enable. It controls set of RIC0.FRE11. This bit is always read as 0. 0: No change of RIC0.FRE11 1: Set RIC0.FRE11 to 1
10	FRS10	B'0	R/W	Frame Received interrupt Set 10 This bit supports interrupt enable. It controls set of RIC0.FRE10. This bit is always read as 0. 0: No change of RIC0.FRE10 1: Set RIC0.FRE10 to 1
9	FRS9	B'0	R/W	Frame Received interrupt Set 9 This bit supports interrupt enable. It controls set of RIC0.FRE9. This bit is always read as 0. 0: No change of RIC0.FRE9 1: Set RIC0.FRE9 to 1
8	FRS8	B'0	R/W	Frame Received interrupt Set 8 This bit supports interrupt enable. It controls set of RIC0.FRE8. This bit is always read as 0. 0: No change of RIC0.FRE8 1: Set RIC0.FRE8 to 1
7	FRS7	B'0	R/W	Frame Received interrupt Set 7 This bit supports interrupt enable. It controls set of RIC0.FRE7. This bit is always read as 0. 0: No change of RIC0.FRE7 1: Set RIC0.FRE7 to 1
6	FRS6	B'0	R/W	Frame Received interrupt Set 6 This bit supports interrupt enable. It controls set of RIC0.FRE6. This bit is always read as 0. 0: No change of RIC0.FRE6 1: Set RIC0.FRE6 to 1
5	FRS5	B'0	R/W	Frame Received interrupt Set 5 This bit supports interrupt enable. It controls set of RIC0.FRE5. This bit is always read as 0. 0: No change of RIC0.FRE5 1: Set RIC0.FRE5 to 1
4	FRS4	B'0	R/W	Frame Received interrupt Set 4 This bit supports interrupt enable. It controls set of RIC0.FRE4. This bit is always read as 0. 0: No change of RIC0.FRE4 1: Set RIC0.FRE4 to 1

Bit	Bit Name	Initial Value	R/W	Description
3	FRS3	B'0	R/W	Frame Received interrupt Set 3 This bit supports interrupt enable. It controls set of RIC0.FRE3. This bit is always read as 0. 0: No change of RIC0.FRE3 1: Set RIC0.FRE3 to 1
2	FRS2	B'0	R/W	Frame Received interrupt Set 2 This bit supports interrupt enable. It controls set of RIC0.FRE2. This bit is always read as 0. 0: No change of RIC0.FRE2 1: Set RIC0.FRE2 to 1
1	FRS1	B'0	R/W	Frame Received interrupt Set 1 This bit supports interrupt enable. It controls set of RIC0.FRE1. This bit is always read as 0. 0: No change of RIC0.FRE1 1: Set RIC0.FRE1 to 1
0	FRS0	B'0	R/W	Frame Received interrupt Set 0 This bit supports interrupt enable. It controls set of RIC0.FRE0. This bit is always read as 0. 0: No change of RIC0.FRE0 1: Set RIC0.FRE0 to 1

46.2.75 Reception Interrupt Disable register 0 (RID0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RID0 register is used to control the Reception Interrupt.

17	FRD17	B'0	R/W	Frame Received interrupt Disable 17 This bit supports interrupt enable. It controls set of RIC0.FRE17. This bit is always read as 0. 0: No change of RIC0.FRE17 1: Set RIC0.FRE17 to 0
16	FRD16	B'0	R/W	Frame Received interrupt Disable 16 This bit supports interrupt enable. It controls set of RIC0.FRE16. This bit is always read as 0. 0: No change of RIC0.FRE16 1: Set RIC0.FRE16 to 0
15	FRD15	B'0	R/W	Frame Received interrupt Disable 15 This bit supports interrupt enable. It controls set of RIC0.FRE15. This bit is always read as 0. 0: No change of RIC0.FRE15 1: Set RIC0.FRE15 to 0
14	FRD14	B'0	R/W	Frame Received interrupt Disable 14 This bit supports interrupt enable. It controls set of RIC0.FRE14. This bit is always read as 0. 0: No change of RIC0.FRE14 1: Set RIC0.FRE14 to 0
13	FRD13	B'0	R/W	Frame Received interrupt Disable 13 This bit supports interrupt enable. It controls set of RIC0.FRE13. This bit is always read as 0. 0: No change of RIC0.FRE13 1: Set RIC0.FRE13 to 0

Bit	Bit Name	Initial Value	R/W	Description
12	FRD12	B'0	R/W	Frame Received interrupt Disable 12 This bit supports interrupt enable. It controls set of RIC0.FRE12. This bit is always read as 0. 0: No change of RIC0.FRE12 1: Set RIC0.FRE12 to 0
11	FRD11	B'0	R/W	Frame Received interrupt Disable 11 This bit supports interrupt enable. It controls set of RIC0.FRE11. This bit is always read as 0. 0: No change of RIC0.FRE11 1: Set RIC0.FRE11 to 0
10	FRD10	B'0	R/W	Frame Received interrupt Disable 10 This bit supports interrupt enable. It controls set of RIC0.FRE10. This bit is always read as 0. 0: No change of RIC0.FRE10 1: Set RIC0.FRE10 to 0
9	FRD9	B'0	R/W	Frame Received interrupt Disable 9 This bit supports interrupt enable. It controls set of RIC0.FRE9. This bit is always read as 0. 0: No change of RIC0.FRE9 1: Set RIC0.FRE9 to 0
8	FRD8	B'0	R/W	Frame Received interrupt Disable 8 This bit supports interrupt enable. It controls set of RIC0.FRE8. This bit is always read as 0. 0: No change of RIC0.FRE8 1: Set RIC0.FRE8 to 0
7	FRD7	B'0	R/W	Frame Received interrupt Disable 7 This bit supports interrupt enable. It controls set of RIC0.FRE7. This bit is always read as 0. 0: No change of RIC0.FRE7 1: Set RIC0.FRE7 to 0
6	FRD6	B'0	R/W	Frame Received interrupt Disable 6 This bit supports interrupt enable. It controls set of RIC0.FRE6. This bit is always read as 0. 0: No change of RIC0.FRE6 1: Set RIC0.FRE6 to 0
5	FRD5	B'0	R/W	Frame Received interrupt Disable 5 This bit supports interrupt enable. It controls set of RIC0.FRE5. This bit is always read as 0. 0: No change of RIC0.FRE5 1: Set RIC0.FRE5 to 0
4	FRD4	B'0	R/W	Frame Received interrupt Disable 4 This bit supports interrupt enable. It controls set of RIC0.FRE4. This bit is always read as 0. 0: No change of RIC0.FRE4 1: Set RIC0.FRE4 to 0

Bit	Bit Name	Initial Value	R/W	Description
3	FRD3	B'0	R/W	Frame Received interrupt Disable 3 This bit supports interrupt enable. It controls set of RIC0.FRE3. This bit is always read as 0. 0: No change of RIC0.FRE3 1: Set RIC0.FRE3 to 0
2	FRD2	B'0	R/W	Frame Received interrupt Disable 2 This bit supports interrupt enable. It controls set of RIC0.FRE2. This bit is always read as 0. 0: No change of RIC0.FRE2 1: Set RIC0.FRE2 to 0
1	FRD1	B'0	R/W	Frame Received interrupt Disable 1 This bit supports interrupt enable. It controls set of RIC0.FRE1. This bit is always read as 0. 0: No change of RIC0.FRE1 1: Set RIC0.FRE1 to 0
0	FRD0	B'0	R/W	Frame Received interrupt Disable 0 This bit supports interrupt enable. It controls set of RIC0.FRE0. This bit is always read as 0. 0: No change of RIC0.FRE0 1: Set RIC0.FRE0 to 0

30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RWS17	B'0	R/W	Reception Warning interrupt Set 17 This bit supports interrupt enable. It controls set of RIC1.RWE17. This bit is always read as 0. 0: No change of RIC1.RWE17 1: Set RIC1.RWE17 to 1
16	RWS16	B'0	R/W	Reception Warning interrupt Set 16 This bit supports interrupt enable. It controls set of RIC1.RWE16. This bit is always read as 0. 0: No change of RIC1.RWE16 1: Set RIC1.RWE16 to 1
15	RWS15	B'0	R/W	Reception Warning interrupt Set 15 This bit supports interrupt enable. It controls set of RIC1.RWE15. This bit is always read as 0. 0: No change of RIC1.RWE15 1: Set RIC1.RWE15 to 1
14	RWS14	B'0	R/W	Reception Warning interrupt Set 14 This bit supports interrupt enable. It controls set of RIC1.RWE14. This bit is always read as 0. 0: No change of RIC1.RWE14 1: Set RIC1.RWE14 to 1

Bit	Bit Name	Initial Value	R/W	Description
13	RWS13	B'0	R/W	Reception Warning interrupt Set 13 This bit supports interrupt enable. It controls set of RIC1.RWE13. This bit is always read as 0. 0: No change of RIC1.RWE13 1: Set RIC1.RWE13 to 1
12	RWS12	B'0	R/W	Reception Warning interrupt Set 12 This bit supports interrupt enable. It controls set of RIC1.RWE12. This bit is always read as 0. 0: No change of RIC1.RWE12 1: Set RIC1.RWE12 to 1
11	RWS11	B'0	R/W	Reception Warning interrupt Set 11 This bit supports interrupt enable. It controls set of RIC1.RWE11. This bit is always read as 0. 0: No change of RIC1.RWE11 1: Set RIC1.RWE11 to 1
10	RWS10	B'0	R/W	Reception Warning interrupt Set 10 This bit supports interrupt enable. It controls set of RIC1.RWE10. This bit is always read as 0. 0: No change of RIC1.RWE10 1: Set RIC1.RWE10 to 1
9	RWS9	B'0	R/W	Reception Warning interrupt Set 9 This bit supports interrupt enable. It controls set of RIC1.RWE9. This bit is always read as 0. 0: No change of RIC1.RWE9 1: Set RIC1.RWE9 to 1
8	RWS8	B'0	R/W	Reception Warning interrupt Set 8 This bit supports interrupt enable. It controls set of RIC1.RWE8. This bit is always read as 0. 0: No change of RIC1.RWE8 1: Set RIC1.RWE8 to 1
7	RWS7	B'0	R/W	Reception Warning interrupt Set 7 This bit supports interrupt enable. It controls set of RIC1.RWE7. This bit is always read as 0. 0: No change of RIC1.RWE7 1: Set RIC1.RWE7 to 1
6	RWS6	B'0	R/W	Reception Warning interrupt Set 6 This bit supports interrupt enable. It controls set of RIC1.RWE6. This bit is always read as 0. 0: No change of RIC1.RWE6 1: Set RIC1.RWE6 to 1
5	RWS5	B'0	R/W	Reception Warning interrupt Set 5 This bit supports interrupt enable. It controls set of RIC1.RWE5. This bit is always read as 0. 0: No change of RIC1.RWE5 1: Set RIC1.RWE5 to 1

Bit	Bit Name	Initial Value	R/W	Description
4	RWS4	B'0	R/W	Reception Warning interrupt Set 4 This bit supports interrupt enable. It controls set of RIC1.RWE4. This bit is always read as 0. 0: No change of RIC1.RWE4 1: Set RIC1.RWE4 to 1
3	RWS3	B'0	R/W	Reception Warning interrupt Set 3 This bit supports interrupt enable. It controls set of RIC1.RWE3. This bit is always read as 0. 0: No change of RIC1.RWE3 1: Set RIC1.RWE3 to 1
2	RWS2	B'0	R/W	Reception Warning interrupt Set 2 This bit supports interrupt enable. It controls set of RIC1.RWE2. This bit is always read as 0. 0: No change of RIC1.RWE2 1: Set RIC1.RWE2 to 1
1	RWS1	B'0	R/W	Reception Warning interrupt Set 1 This bit supports interrupt enable. It controls set of RIC1.RWE1. This bit is always read as 0. 0: No change of RIC1.RWE1 1: Set RIC1.RWE1 to 1
0	RWS0	B'0	R/W	Reception Warning interrupt Set 0 This bit supports interrupt enable. It controls set of RIC1.RWE0. This bit is always read as 0. 0: No change of RIC1.RWE0 1: Set RIC1.RWE0 to 1

Bit	Bit Name	Initial Value	R/W	Description
31	RFWD	B'0	R/W	Rx-FIFO Warning interrupt Disable This bit supports interrupt enable. It controls set of RIC1.RFWE. This bit is always read as 0. 0: No change of RIC1.RFWE 1: Set RIC1.RFWE to 0
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RWD17	B'0	R/W	Reception Warning interrupt Disable 17 This bit supports interrupt enable. It controls set of RIC1.RWE17. This bit is always read as 0. 0: No change of RIC1.RWE17 1: Set RIC1.RWE17 to 0
16	RWD16	B'0	R/W	Reception Warning interrupt Disable 16 This bit supports interrupt enable. It controls set of RIC1.RWE16. This bit is always read as 0. 0: No change of RIC1.RWE16 1: Set RIC1.RWE16 to 0
15	RWD15	B'0	R/W	Reception Warning interrupt Disable 15 This bit supports interrupt enable. It controls set of RIC1.RWE15. This bit is always read as 0. 0: No change of RIC1.RWE15 1: Set RIC1.RWE15 to 0
14	RWD14	B'0	R/W	Reception Warning interrupt Disable 14 This bit supports interrupt enable. It controls set of RIC1.RWE14. This bit is always read as 0. 0: No change of RIC1.RWE14 1: Set RIC1.RWE14 to 0

Bit	Bit Name	Initial Value	R/W	Description
13	RWD13	B'0	R/W	Reception Warning interrupt Disable 13 This bit supports interrupt enable. It controls set of RIC1.RWE13. This bit is always read as 0. 0: No change of RIC1.RWE13 1: Set RIC1.RWE13 to 0
12	RWD12	B'0	R/W	Reception Warning interrupt Disable 12 This bit supports interrupt enable. It controls set of RIC1.RWE12. This bit is always read as 0. 0: No change of RIC1.RWE12 1: Set RIC1.RWE12 to 0
11	RWD11	B'0	R/W	Reception Warning interrupt Disable 11 This bit supports interrupt enable. It controls set of RIC1.RWE11. This bit is always read as 0. 0: No change of RIC1.RWE11 1: Set RIC1.RWE11 to 0
10	RWD10	B'0	R/W	Reception Warning interrupt Disable 10 This bit supports interrupt enable. It controls set of RIC1.RWE10. This bit is always read as 0. 0: No change of RIC1.RWE10 1: Set RIC1.RWE10 to 0
9	RWD9	B'0	R/W	Reception Warning interrupt Disable 9 This bit supports interrupt enable. It controls set of RIC1.RWE9. This bit is always read as 0. 0: No change of RIC1.RWE9 1: Set RIC1.RWE9 to 0
8	RWD8	B'0	R/W	Reception Warning interrupt Disable 8 This bit supports interrupt enable. It controls set of RIC1.RWE8. This bit is always read as 0. 0: No change of RIC1.RWE8 1: Set RIC1.RWE8 to 0
7	RWD7	B'0	R/W	Reception Warning interrupt Disable 7 This bit supports interrupt enable. It controls set of RIC1.RWE7. This bit is always read as 0. 0: No change of RIC1.RWE7 1: Set RIC1.RWE7 to 0
6	RWD6	B'0	R/W	Reception Warning interrupt Disable 6 This bit supports interrupt enable. It controls set of RIC1.RWE6. This bit is always read as 0. 0: No change of RIC1.RWE6 1: Set RIC1.RWE6 to 0
5	RWD5	B'0	R/W	Reception Warning interrupt Disable 5 This bit supports interrupt enable. It controls set of RIC1.RWE5. This bit is always read as 0. 0: No change of RIC1.RWE5 1: Set RIC1.RWE5 to 0

Bit	Bit Name	Initial Value	R/W	Description
4	RWD4	B'0	R/W	Reception Warning interrupt Disable 4 This bit supports interrupt enable. It controls set of RIC1.RWE4. This bit is always read as 0. 0: No change of RIC1.RWE4 1: Set RIC1.RWE4 to 0
3	RWD3	B'0	R/W	Reception Warning interrupt Disable 3 This bit supports interrupt enable. It controls set of RIC1.RWE3. This bit is always read as 0. 0: No change of RIC1.RWE3 1: Set RIC1.RWE3 to 0
2	RWD2	B'0	R/W	Reception Warning interrupt Disable 2 This bit supports interrupt enable. It controls set of RIC1.RWE2. This bit is always read as 0. 0: No change of RIC1.RWE2 1: Set RIC1.RWE2 to 0
1	RWD1	B'0	R/W	Reception Warning interrupt Disable 1 This bit supports interrupt enable. It controls set of RIC1.RWE1. This bit is always read as 0. 0: No change of RIC1.RWE1 1: Set RIC1.RWE1 to 0
0	RWD0	B'0	R/W	Reception Warning interrupt Disable 0 This bit supports interrupt enable. It controls set of RIC1.RWE0. This bit is always read as 0. 0: No change of RIC1.RWE0 1: Set RIC1.RWE0 to 0

17	QFS17	B'0	R/W	Queue Full interrupt Set 17 This bit supports interrupt enable. It controls set of RIC2.QFE17. This bit is always read as 0. 0: No change of RIC2.QFE17 1: Set RIC2.QFE17 to 1
16	QFS16	B'0	R/W	Queue Full interrupt Set 16 This bit supports interrupt enable. It controls set of RIC2.QFE16. This bit is always read as 0. 0: No change of RIC2.QFE16 1: Set RIC2.QFE16 to 1
15	QFS15	B'0	R/W	Queue Full interrupt Set 15 This bit supports interrupt enable. It controls set of RIC2.QFE15. This bit is always read as 0. 0: No change of RIC2.QFE15 1: Set RIC2.QFE15 to 1
14	QFS14	B'0	R/W	Queue Full interrupt Set 14 This bit supports interrupt enable. It controls set of RIC2.QFE14. This bit is always read as 0. 0: No change of RIC2.QFE14 1: Set RIC2.QFE14 to 1

Bit	Bit Name	Initial Value	R/W	Description
13	QFS13	B'0	R/W	Queue Full interrupt Set 13 This bit supports interrupt enable. It controls set of RIC2.QFE13. This bit is always read as 0. 0: No change of RIC2.QFE13 1: Set RIC2.QFE13 to 1
12	QFS12	B'0	R/W	Queue Full interrupt Set 12 This bit supports interrupt enable. It controls set of RIC2.QFE12. This bit is always read as 0. 0: No change of RIC2.QFE12 1: Set RIC2.QFE12 to 1
11	QFS11	B'0	R/W	Queue Full interrupt Set 11 This bit supports interrupt enable. It controls set of RIC2.QFE11. This bit is always read as 0. 0: No change of RIC2.QFE11 1: Set RIC2.QFE11 to 1
10	QFS10	B'0	R/W	Queue Full interrupt Set 10 This bit supports interrupt enable. It controls set of RIC2.QFE10. This bit is always read as 0. 0: No change of RIC2.QFE10 1: Set RIC2.QFE10 to 1
9	QFS9	B'0	R/W	Queue Full interrupt Set 9 This bit supports interrupt enable. It controls set of RIC2.QFE9. This bit is always read as 0. 0: No change of RIC2.QFE9 1: Set RIC2.QFE9 to 1
8	QFS8	B'0	R/W	Queue Full interrupt Set 8 This bit supports interrupt enable. It controls set of RIC2.QFE8. This bit is always read as 0. 0: No change of RIC2.QFE8 1: Set RIC2.QFE8 to 1
7	QFS7	B'0	R/W	Queue Full interrupt Set 7 This bit supports interrupt enable. It controls set of RIC2.QFE7. This bit is always read as 0. 0: No change of RIC2.QFE7 1: Set RIC2.QFE7 to 1
6	QFS6	B'0	R/W	Queue Full interrupt Set 6 This bit supports interrupt enable. It controls set of RIC2.QFE6. This bit is always read as 0. 0: No change of RIC2.QFE6 1: Set RIC2.QFE6 to 1
5	QFS5	B'0	R/W	Queue Full interrupt Set 5 This bit supports interrupt enable. It controls set of RIC2.QFE5. This bit is always read as 0. 0: No change of RIC2.QFE5 1: Set RIC2.QFE5 to 1

Bit	Bit Name	Initial Value	R/W	Description
4	QFS4	B'0	R/W	Queue Full interrupt Set 4 This bit supports interrupt enable. It controls set of RIC2.QFE4. This bit is always read as 0. 0: No change of RIC2.QFE4 1: Set RIC2.QFE4 to 1
3	QFS3	B'0	R/W	Queue Full interrupt Set 3 This bit supports interrupt enable. It controls set of RIC2.QFE3. This bit is always read as 0. 0: No change of RIC2.QFE3 1: Set RIC2.QFE3 to 1
2	QFS2	B'0	R/W	Queue Full interrupt Set 2 This bit supports interrupt enable. It controls set of RIC2.QFE2. This bit is always read as 0. 0: No change of RIC2.QFE2 1: Set RIC2.QFE2 to 1
1	QFS1	B'0	R/W	Queue Full interrupt Set 1 This bit supports interrupt enable. It controls set of RIC2.QFE1. This bit is always read as 0. 0: No change of RIC2.QFE1 1: Set RIC2.QFE1 to 1
0	QFS0	B'0	R/W	Queue Full interrupt Set 0 This bit supports interrupt enable. It controls set of RIC2.QFE0. This bit is always read as 0. 0: No change of RIC2.QFE0 1: Set RIC2.QFE0 to 1

46.2.79 Reception Interrupt Disable register 2 (RID2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RID2 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	RFFD	B'0	R/W	Rx-FIFO Full interrupt Disable This bit supports interrupt enable. It controls set of RIC2.RFFE. This bit is always read as 0. 0: No change of RIC2.RFFE 1: Set RIC2.RFFE to 0
30 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	QFD17	B'0	R/W	Queue Full interrupt Disable 17 This bit supports interrupt enable. It controls set of RIC2.QFE17. This bit is always read as 0. 0: No change of RIC2.QFE17 1: Set RIC2.QFE17 to 0
16	QFD16	B'0	R/W	Queue Full interrupt Disable 16 This bit supports interrupt enable. It controls set of RIC2.QFE16. This bit is always read as 0. 0: No change of RIC2.QFE16 1: Set RIC2.QFE16 to 0
15	QFD15	B'0	R/W	Queue Full interrupt Disable 15 This bit supports interrupt enable. It controls set of RIC2.QFE15. This bit is always read as 0. 0: No change of RIC2.QFE15 1: Set RIC2.QFE15 to 0
14	QFD14	B'0	R/W	Queue Full interrupt Disable 14 This bit supports interrupt enable. It controls set of RIC2.QFE14. This bit is always read as 0. 0: No change of RIC2.QFE14 1: Set RIC2.QFE14 to 0

Bit	Bit Name	Initial Value	R/W	Description
13	QFD13	B'0	R/W	Queue Full interrupt Disable 13 This bit supports interrupt enable. It controls set of RIC2.QFE13. This bit is always read as 0. 0: No change of RIC2.QFE13 1: Set RIC2.QFE13 to 0
12	QFD12	B'0	R/W	Queue Full interrupt Disable 12 This bit supports interrupt enable. It controls set of RIC2.QFE12. This bit is always read as 0. 0: No change of RIC2.QFE12 1: Set RIC2.QFE12 to 0
11	QFD11	B'0	R/W	Queue Full interrupt Disable 11 This bit supports interrupt enable. It controls set of RIC2.QFE11. This bit is always read as 0. 0: No change of RIC2.QFE11 1: Set RIC2.QFE11 to 0
10	QFD10	B'0	R/W	Queue Full interrupt Disable 10 This bit supports interrupt enable. It controls set of RIC2.QFE10. This bit is always read as 0. 0: No change of RIC2.QFE10 1: Set RIC2.QFE10 to 0
9	QFD9	B'0	R/W	Queue Full interrupt Disable 9 This bit supports interrupt enable. It controls set of RIC2.QFE9. This bit is always read as 0. 0: No change of RIC2.QFE9 1: Set RIC2.QFE9 to 0
8	QFD8	B'0	R/W	Queue Full interrupt Disable 8 This bit supports interrupt enable. It controls set of RIC2.QFE8. This bit is always read as 0. 0: No change of RIC2.QFE8 1: Set RIC2.QFE8 to 0
7	QFD7	B'0	R/W	Queue Full interrupt Disable 7 This bit supports interrupt enable. It controls set of RIC2.QFE7. This bit is always read as 0. 0: No change of RIC2.QFE7 1: Set RIC2.QFE7 to 0
6	QFD6	B'0	R/W	Queue Full interrupt Disable 6 This bit supports interrupt enable. It controls set of RIC2.QFE6. This bit is always read as 0. 0: No change of RIC2.QFE6 1: Set RIC2.QFE6 to 0
5	QFD5	B'0	R/W	Queue Full interrupt Disable 5 This bit supports interrupt enable. It controls set of RIC2.QFE5. This bit is always read as 0. 0: No change of RIC2.QFE5 1: Set RIC2.QFE5 to 0

Bit	Bit Name	Initial Value	R/W	Description
4	QFD4	B'0	R/W	Queue Full interrupt Disable 4 This bit supports interrupt enable. It controls set of RIC2.QFE4. This bit is always read as 0. 0: No change of RIC2.QFE4 1: Set RIC2.QFE4 to 0
3	QFD3	B'0	R/W	Queue Full interrupt Disable 3 This bit supports interrupt enable. It controls set of RIC2.QFE3. This bit is always read as 0. 0: No change of RIC2.QFE3 1: Set RIC2.QFE3 to 0
2	QFD2	B'0	R/W	Queue Full interrupt Disable 2 This bit supports interrupt enable. It controls set of RIC2.QFE2. This bit is always read as 0. 0: No change of RIC2.QFE2 1: Set RIC2.QFE2 to 0
1	QFD1	B'0	R/W	Queue Full interrupt Disable 1 This bit supports interrupt enable. It controls set of RIC2.QFE1. This bit is always read as 0. 0: No change of RIC2.QFE1 1: Set RIC2.QFE1 to 0
0	QFD0	B'0	R/W	Queue Full interrupt Disable 0 This bit supports interrupt enable. It controls set of RIC2.QFE0. This bit is always read as 0. 0: No change of RIC2.QFE0 1: Set RIC2.QFE0 to 0

46.2.80 Transmission Interrupt Enable register (TIE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TIE register is used to control the Transmission Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	TDPS3	B'0	R/W	Transmit Descriptor Processed interrupt Set 3 This bit supports interrupt enable. It controls set of TIC.TDPE3. This bit is always read as 0. 0: No change of TIC.TDPE3 1: Set TIC.TDPE3 to 1
18	TDPS2	B'0	R/W	Transmit Descriptor Processed interrupt Set 2 This bit supports interrupt enable. It controls set of TIC.TDPE2. This bit is always read as 0. 0: No change of TIC.TDPE2 1: Set TIC.TDPE2 to 1
17	TDPS1	B'0	R/W	Transmit Descriptor Processed interrupt Set 1 This bit supports interrupt enable. It controls set of TIC.TDPE1. This bit is always read as 0. 0: No change of TIC.TDPE1 1: Set TIC.TDPE1 to 1
16	TDPS0	B'0	R/W	Transmit Descriptor Processed interrupt Set 0 This bit supports interrupt enable. It controls set of TIC.TDPE0. This bit is always read as 0. 0: No change of TIC.TDPE0 1: Set TIC.TDPE0 to 1
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWS	B'0	R/W	E-MAC status FIFO Warning interrupt Set This bit supports interrupt enable. It controls set of TIC.MFWE. This bit is always read as 0. 0: No change of TIC.MFWE 1: Set TIC.MFWE to 1

Bit	Bit Name	Initial Value	R/W	Description
10	MFUS	B'0	R/W	E-MAC status FIFO Updated interrupt Set This bit supports interrupt enable. It controls set of TIC.MFUE. This bit is always read as 0. 0: No change of TIC.MFUE 1: Set TIC.MFUE to 1
9	TFWS	B'0	R/W	Timestamp FIFO Warning interrupt Set This bit supports interrupt enable. It controls set of TIC.TFWE. This bit is always read as 0. 0: No change of TIC.TFWE 1: Set TIC.TFWE to 1
8	TFUS	B'0	R/W	Timestamp FIFO Updated interrupt Set This bit supports interrupt enable. It controls set of TIC.TFUE. This bit is always read as 0. 0: No change of TIC.TFUE 1: Set TIC.TFUE to 1
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	FTS3	B'0	R/W	Frame Transmitted interrupt Set 3 This bit supports interrupt enable. It controls set of TIC.FTE3. This bit is always read as 0. 0: No change of TIC.FTE3 1: Set TIC.FTE3 to 1
2	FTS2	B'0	R/W	Frame Transmitted interrupt Set 2 This bit supports interrupt enable. It controls set of TIC.FTE2. This bit is always read as 0. 0: No change of TIC.FTE2 1: Set TIC.FTE2 to 1
1	FTS1	B'0	R/W	Frame Transmitted interrupt Set 1 This bit supports interrupt enable. It controls set of TIC.FTE1. This bit is always read as 0. 0: No change of TIC.FTE1 1: Set TIC.FTE1 to 1
0	FTS0	B'0	R/W	Frame Transmitted interrupt Set 0 This bit supports interrupt enable. It controls set of TIC.FTE0. This bit is always read as 0. 0: No change of TIC.FTE0 1: Set TIC.FTE0 to 1

46.2.81 Transmission Interrupt Disable register (TID)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TID register is used to control the Transmission Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
19	TDPD3	All 0	R/W	Transmit Descriptor Processed interrupt Disable 3 This bit supports interrupt enable. It controls set of TIC.TDPE3. This bit is always read as 0. 0: No change of TIC.TDPE3 1: Set TIC.TDPE3 to 0
18	TDPD2	All 0	R/W	Transmit Descriptor Processed interrupt Disable 2 This bit supports interrupt enable. It controls set of TIC.TDPE2. This bit is always read as 0. 0: No change of TIC.TDPE2 1: Set TIC.TDPE2 to 0
17	TDPD1	All 0	R/W	Transmit Descriptor Processed interrupt Disable 1 This bit supports interrupt enable. It controls set of TIC.TDPE1. This bit is always read as 0. 0: No change of TIC.TDPE1 1: Set TIC.TDPE1 to 0
16	TDPD0	All 0	R/W	Transmit Descriptor Processed interrupt Disable 0 This bit supports interrupt enable. It controls set of TIC.TDPE0. This bit is always read as 0. 0: No change of TIC.TDPE0 1: Set TIC.TDPE0 to 0
15 to 12	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
11	MFWD	B’0	R/W	E-MAC status FIFO Warning interrupt Disable This bit supports interrupt enable. It controls set of TIC.MFWE. This bit is always read as 0. 0: No change of TIC.MFWE 1: Set TIC.MFWE to 0

Bit	Bit Name	Initial Value	R/W	Description
10	MFUD	B'0	R/W	E-MAC status FIFO Updated interrupt Disable This bit supports interrupt enable. It controls set of TIC.MFUE. This bit is always read as 0. 0: No change of TIC.MFUE 1: Set TIC.MFUE to 0
9	TFWD	B'0	R/W	Timestamp FIFO Warning interrupt Disable This bit supports interrupt enable. It controls set of TIC.TFWE. This bit is always read as 0. 0: No change of TIC.TFWE 1: Set TIC.TFWE to 0
8	TFUD	B'0	R/W	Timestamp FIFO Updated interrupt Disable This bit supports interrupt enable. It controls set of TIC.TFUE. This bit is always read as 0. 0: No change of TIC.TFUE 1: Set TIC.TFUE to 0
7 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	FTD3	B'0	R/W	Frame Transmitted interrupt Disable 3 This bit supports interrupt enable. It controls set of TIC.FTE3. This bit is always read as 0. 0: No change of TIC.FTE3 1: Set TIC.FTE3 to 0
2	FTD2	B'0	R/W	Frame Transmitted interrupt Disable 2 This bit supports interrupt enable. It controls set of TIC.FTE2. This bit is always read as 0. 0: No change of TIC.FTE2 1: Set TIC.FTE2 to 0
1	FTD1	B'0	R/W	Frame Transmitted interrupt Disable 1 This bit supports interrupt enable. It controls set of TIC.FTE1. This bit is always read as 0. 0: No change of TIC.FTE1 1: Set TIC.FTE1 to 0
0	FTD0	B'0	R/W	Frame Transmitted interrupt Disable 0 This bit supports interrupt enable. It controls set of TIC.FTE0. This bit is always read as 0. 0: No change of TIC.FTE0 1: Set TIC.FTE0 to 0

46.2.82 Reception Interrupt Enable register 3 (RIE3)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RIE3 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RDPS17	B'0	R/W	Receive Descriptor Processed interrupt Set 17 This bit supports interrupt enable. It controls set of RIC3.RDPE17. This bit is always read as 0. 0: No change of RIC3.RDPE17 1: Set RIC3.RDPE17 to 1
16	RDPS16	B'0	R/W	Receive Descriptor Processed interrupt Set 16 This bit supports interrupt enable. It controls set of RIC3.RDPE16. This bit is always read as 0. 0: No change of RIC3.RDPE16 1: Set RIC3.RDPE16 to 1
15	RDPS15	B'0	R/W	Receive Descriptor Processed interrupt Set 15 This bit supports interrupt enable. It controls set of RIC3.RDPE15. This bit is always read as 0. 0: No change of RIC3.RDPE15 1: Set RIC3.RDPE15 to 1
14	RDPS14	B'0	R/W	Receive Descriptor Processed interrupt Set 14 This bit supports interrupt enable. It controls set of RIC3.RDPE14. This bit is always read as 0. 0: No change of RIC3.RDPE14 1: Set RIC3.RDPE14 to 1
13	RDPS13	B'0	R/W	Receive Descriptor Processed interrupt Set 13 This bit supports interrupt enable. It controls set of RIC3.RDPE13. This bit is always read as 0. 0: No change of RIC3.RDPE13 1: Set RIC3.RDPE13 to 1

Bit	Bit Name	Initial Value	R/W	Description
12	RDPS12	B'0	R/W	Receive Descriptor Processed interrupt Set 12 This bit supports interrupt enable. It controls set of RIC3.RDPE12. This bit is always read as 0. 0: No change of RIC3.RDPE12 1: Set RIC3.RDPE12 to 1
11	RDPS11	B'0	R/W	Receive Descriptor Processed interrupt Set 11 This bit supports interrupt enable. It controls set of RIC3.RDPE11. This bit is always read as 0. 0: No change of RIC3.RDPE11 1: Set RIC3.RDPE11 to 1
10	RDPS10	B'0	R/W	Receive Descriptor Processed interrupt Set 10 This bit supports interrupt enable. It controls set of RIC3.RDPE10. This bit is always read as 0. 0: No change of RIC3.RDPE10 1: Set RIC3.RDPE10 to 1
9	RDPS9	B'0	R/W	Receive Descriptor Processed interrupt Set 9 This bit supports interrupt enable. It controls set of RIC3.RDPE9. This bit is always read as 0. 0: No change of RIC3.RDPE9 1: Set RIC3.RDPE9 to 1
8	RDPS8	B'0	R/W	Receive Descriptor Processed interrupt Set 8 This bit supports interrupt enable. It controls set of RIC3.RDPE8. This bit is always read as 0. 0: No change of RIC3.RDPE8 1: Set RIC3.RDPE8 to 1
7	RDPS7	B'0	R/W	Receive Descriptor Processed interrupt Set 7 This bit supports interrupt enable. It controls set of RIC3.RDPE7. This bit is always read as 0. 0: No change of RIC3.RDPE7 1: Set RIC3.RDPE7 to 1
6	RDPS6	B'0	R/W	Receive Descriptor Processed interrupt Set 6 This bit supports interrupt enable. It controls set of RIC3.RDPE6. This bit is always read as 0. 0: No change of RIC3.RDPE6 1: Set RIC3.RDPE6 to 1
5	RDPS5	B'0	R/W	Receive Descriptor Processed interrupt Set 5 This bit supports interrupt enable. It controls set of RIC3.RDPE5. This bit is always read as 0. 0: No change of RIC3.RDPE5 1: Set RIC3.RDPE5 to 1
4	RDPS4	B'0	R/W	Receive Descriptor Processed interrupt Set 4 This bit supports interrupt enable. It controls set of RIC3.RDPE4. This bit is always read as 0. 0: No change of RIC3.RDPE4 1: Set RIC3.RDPE4 to 1

Bit	Bit Name	Initial Value	R/W	Description
3	RDPS3	B'0	R/W	Receive Descriptor Processed interrupt Set 3 This bit supports interrupt enable. It controls set of RIC3.RDPE3. This bit is always read as 0. 0: No change of RIC3.RDPE3 1: Set RIC3.RDPE3 to 1
2	RDPS2	B'0	R/W	Receive Descriptor Processed interrupt Set 2 This bit supports interrupt enable. It controls set of RIC3.RDPE2. This bit is always read as 0. 0: No change of RIC3.RDPE2 1: Set RIC3.RDPE2 to 1
1	RDPS1	B'0	R/W	Receive Descriptor Processed interrupt Set 1 This bit supports interrupt enable. It controls set of RIC3.RDPE1. This bit is always read as 0. 0: No change of RIC3.RDPE1 1: Set RIC3.RDPE1 to 1
0	RDPS0	B'0	R/W	Receive Descriptor Processed interrupt Set 0 This bit supports interrupt enable. It controls set of RIC3.RDPE0. This bit is always read as 0. 0: No change of RIC3.RDPE0 1: Set RIC3.RDPE0 to 1

46.2.83 Reception Interrupt Disable register 3 (RID3)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RID3 register is used to control the Reception Interrupt.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17	RDPD17	B'0	R/W	Receive Descriptor Processed interrupt Disable 17 This bit supports interrupt enable. It controls set of RIC3.RDPE17. This bit is always read as 0. 0: No change of RIC3.RDPE17 1: Set RIC3.RDPE17 to 0
16	RDPD16	B'0	R/W	Receive Descriptor Processed interrupt Disable 16 This bit supports interrupt enable. It controls set of RIC3.RDPE16. This bit is always read as 0. 0: No change of RIC3.RDPE16 1: Set RIC3.RDPE16 to 0
15	RDPD15	B'0	R/W	Receive Descriptor Processed interrupt Disable 15 This bit supports interrupt enable. It controls set of RIC3.RDPE15. This bit is always read as 0. 0: No change of RIC3.RDPE15 1: Set RIC3.RDPE15 to 0
14	RDPD14	B'0	R/W	Receive Descriptor Processed interrupt Disable 14 This bit supports interrupt enable. It controls set of RIC3.RDPE14. This bit is always read as 0. 0: No change of RIC3.RDPE14 1: Set RIC3.RDPE14 to 0
13	RDPD13	B'0	R/W	Receive Descriptor Processed interrupt Disable 13 This bit supports interrupt enable. It controls set of RIC3.RDPE13. This bit is always read as 0. 0: No change of RIC3.RDPE13 1: Set RIC3.RDPE13 to 0

Bit	Bit Name	Initial Value	R/W	Description
12	RDPD12	B'0	R/W	Receive Descriptor Processed interrupt Disable 12 This bit supports interrupt enable. It controls set of RIC3.RDPE12. This bit is always read as 0. 0: No change of RIC3.RDPE12 1: Set RIC3.RDPE12 to 0
11	RDPD11	B'0	R/W	Receive Descriptor Processed interrupt Disable 11 This bit supports interrupt enable. It controls set of RIC3.RDPE11. This bit is always read as 0. 0: No change of RIC3.RDPE11 1: Set RIC3.RDPE11 to 0
10	RDPD10	B'0	R/W	Receive Descriptor Processed interrupt Disable 10 This bit supports interrupt enable. It controls set of RIC3.RDPE10. This bit is always read as 0. 0: No change of RIC3.RDPE10 1: Set RIC3.RDPE10 to 0
9	RDPD9	B'0	R/W	Receive Descriptor Processed interrupt Disable 9 This bit supports interrupt enable. It controls set of RIC3.RDPE9. This bit is always read as 0. 0: No change of RIC3.RDPE9 1: Set RIC3.RDPE9 to 0
8	RDPD8	B'0	R/W	Receive Descriptor Processed interrupt Disable 8 This bit supports interrupt enable. It controls set of RIC3.RDPE8. This bit is always read as 0. 0: No change of RIC3.RDPE8 1: Set RIC3.RDPE8 to 0
7	RDPD7	B'0	R/W	Receive Descriptor Processed interrupt Disable 7 This bit supports interrupt enable. It controls set of RIC3.RDPE7. This bit is always read as 0. 0: No change of RIC3.RDPE7 1: Set RIC3.RDPE7 to 0
6	RDPD6	B'0	R/W	Receive Descriptor Processed interrupt Disable 6 This bit supports interrupt enable. It controls set of RIC3.RDPE6. This bit is always read as 0. 0: No change of RIC3.RDPE6 1: Set RIC3.RDPE6 to 0
5	RDPD5	B'0	R/W	Receive Descriptor Processed interrupt Disable 5 This bit supports interrupt enable. It controls set of RIC3.RDPE5. This bit is always read as 0. 0: No change of RIC3.RDPE5 1: Set RIC3.RDPE5 to 0
4	RDPD4	B'0	R/W	Receive Descriptor Processed interrupt Disable 4 This bit supports interrupt enable. It controls set of RIC3.RDPE4. This bit is always read as 0. 0: No change of RIC3.RDPE4 1: Set RIC3.RDPE4 to 0

Bit	Bit Name	Initial Value	R/W	Description
3	RDPD3	B'0	R/W	Receive Descriptor Processed interrupt Disable 3 This bit supports interrupt enable. It controls set of RIC3.RDPE3. This bit is always read as 0. 0: No change of RIC3.RDPE3 1: Set RIC3.RDPE3 to 0
2	RDPD2	B'0	R/W	Receive Descriptor Processed interrupt Disable 2 This bit supports interrupt enable. It controls set of RIC3.RDPE2. This bit is always read as 0. 0: No change of RIC3.RDPE2 1: Set RIC3.RDPE2 to 0
1	RDPD1	B'0	R/W	Receive Descriptor Processed interrupt Disable 1 This bit supports interrupt enable. It controls set of RIC3.RDPE1. This bit is always read as 0. 0: No change of RIC3.RDPE1 1: Set RIC3.RDPE1 to 0
0	RDPD0	B'0	R/W	Receive Descriptor Processed interrupt Disable 0 This bit supports interrupt enable. It controls set of RIC3.RDPE0. This bit is always read as 0. 0: No change of RIC3.RDPE0 1: Set RIC3.RDPE0 to 0

46.2.84 E-MAC Mode Register (ECMR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

ECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while transmission or reception is enabled (i.e. while the RE or TE bit in this register is 1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCCM	—	—	RCSC	—	DPAD	RZPF	TZPF	PFR	RXF	TXF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MPDE	—	—	RE	TE	—	—	—	DM	PRM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
26	TRCCM	B'0	R/W	Counter Clear Mode This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers. 0: Writing to a counter register leads to the register being cleared to 0. 1: Reading from a counter register leads to the register being cleared to 0.
25, 24	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
23	RCSC	B'0	R/W	Checksum Calculation Setting this bit to 1 enables automatic calculation of checksums for data in received frames. Only the data field of an Ethernet frame without a VLAN field is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion. 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
22	—	B'0	R/W	Reserved This bit is read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
21	DPAD	B'0	R/W	Data Padding This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted. When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission. 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.
20	RZPF	B'0	R/W	PAUSE Frame Reception with Time = 0 When the RZPF bit is set to 0, received PAUSE frames with the Timer value 0 are discarded. When the RZPF bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0. 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.
19	TZPF	B'0	R/W	Transmit Zero PAUSE Frame When setting CCC.FCE=1, and Rx FIFO become Warning Level. 0: Not transmit the PAUSE frame of TIME parameter value 0. 1: Transmit the PAUSE frame of TIME parameter value 0.
18	PFR	B'0	R/W	PAUSE Frame Receive Mode This bit specifies whether PAUSE frames are transferred to the AVB-DMAC. 0: PAUSE frames are not transferred to the AVB-DMAC. 1: PAUSE frames are transferred to the AVB-DMAC.
17	RXF	B'0	R/W	Operating Mode for Flow Control in Reception When the RXF bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see section 46.2.95 PAUSE Frame Receive Counter (PFRCR). Setting this bit to 0 disables PAUSE frame detection. 0: Detection of PAUSE frames is disabled. 1: Flow control for the receiving port is enabled.
16	TXF	B'0	R/W	Transmit Flow control mode 0: Flow control for the transmitting port is disabled. 1: Flow control for the transmitting port is enabled.
15 to 10	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
9	MPDE	B'0	R/W	Magic Packet™ Detection Enable The MPDE bit enables or disables Magic Packet™ detection by hardware to allow activation via the Ethernet connection. 0: Magic Packet™ detection is not enabled. 1: Magic Packet™ detection is enabled.
8, 7	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	RE	B'0	R/W	Reception Enable If this bit is switched from reception being enabled (RE = 1) to reception being disabled (RE = 0) while a frame is being received, reception will continue until reception of the frame is completed. 0: Reception is disabled. 1: Reception is enabled.
5	TE	B'0	R/W	Transmission Enable If this bit is switched from transmission being enabled (TE = 1) to transmission being disabled (TE = 0) while a frame is being transmitted, transmission will continue until transmission of that frame is completed. 0: Transmission is disabled. 1: Transmission is enabled.
4 to 2	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
1	DM	B'0	R/W	Duplex Mode This bit should always be set to 1. The value after reset is 0. 0: Value after reset 1: Full-duplex operation This bit should always be set to 1.
0	PRM	B'0	R/W	Promiscuous Mode Setting the PRM bit enables all Ethernet frames to be received. All Ethernet frames mean all receivable frames, irrespective of differences of destination address (exclude PAUSE frame). 0: Normal operation 1: Promiscuous mode operation

46.2.85 Receive Frame Length Register (RFLR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI. Settings in this register must not be changed while reception is enabled (while the RE bit in the E-MAC mode register (EMCR) is 1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFL[17:16]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
17 to 0	RFL[17:0]	H'0_0000	R/W	Receive Frame Length Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value and more 8 byte length is discarded. CAUTION: The prepared descriptor data size is just the specified value (RFLR.RFL). Therefore descriptor data size must be more than RFLR.RFL + 8 if you will receive such the long frame. H'0_0000 to H'0_05EE: 1,518 bytes H'0_05EF: 1,519 bytes H'0_05F0: 1,520 bytes : : H'0_07FF: 2,047 bytes H'0_0800: 2,048 bytes : : H'0_1000: 4,096 bytes : : H'1_0000: 65,535 bytes : : H'2_0000 to H'3_FFFF: 131,072 bytes

46.2.86 E-MAC Status Register (ECSR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The ECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits associated with interrupts, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ECSIPR) described in section 46.2.88.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PFRI	PHYI	LCHNG	MPD	ICD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
4	PFRI	B'0	R/W	PAUSE Frame Retry Interrupt This bit indicate that reached to the number of PAUSE frame retransmission for register PFTTLR setting. Procedure for 0-clear to this bit is follows. 0: Read the PFTTCR register to clear the PFTTCR register. 1: Write to this bit 1.
3	PHYI	B'0	R/W	PHY interrupt terminal state bit This bit indicates the state of input to the PHY interrupt pin (AVB_PHY_INT) from the PHY-LSI. 0: PHY interrupt terminal (AVB_PHY_INT) is not asserted. 1: PHY interrupt terminal (AVB_PHY_INT) is asserted.
2	LCHNG	B'0	R/W	Link signal change bit This bit indicates a transition of the link status signal (AVB_LINK) input from the PHY-LSI from high to low or low to high. However, signal changes may also be detected at times when the link status signal (AVB_LINK) function is selected. To check the current link state, refer to the link status pin state bit in the PHY status register (PSR.LMON). 0: The change of Link status signal (AVB_LINK) is not detected. 1: The change of Link status signal (AVB_LINK) is detected.
1	MPD	B'0	R/W	Magic Packet™ Detection This bit indicates that a Magic Packet™ has been detected on the line. Writing 1 to this bit clears it to 0. 0: A Magic Packet™ has not been detected. 1: A Magic Packet™ has been detected.

Bit	Bit Name	Initial Value	R/W	Description
0	ICD	B'0	R/W	Illegal Carrier Detection This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used. Writing 1 to this bit clears it to 0. 0: PHY-LSI has not detected an illegal carrier on the line. 1: PHY-LSI has detected an illegal carrier on the line.

46.2.87 E-MAC Interrupt Permission Register (ECSIPR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The ECSIPR register enables or disables the states indicated by the ECSR register as interrupt sources. Each effective bit disables or enables interrupts corresponding to the bits in ECSR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
4	PFRIM	B'0	R/W	PAUSE Frame Retry Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the PAUSE Frame Retry Interrupt bit (ECSR. PFRI) in the E-MAC status register to 1. 0: Interrupts on setting of the PFRI bit is disabled. 1: Interrupts on setting of the PFRI bit is enabled.
3	PHYIM	B'0	R/W	PHY Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the PHY interrupt terminal state bit (ECSR. PHYI) in the E-MAC status register to 1. 0: Interrupts on setting of the PHYI bit is disabled. 1: Interrupts on setting of the PHYI bit is enabled.
2	LINKIM	B'0	R/W	LINK Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the Link signal change bit (ECSR. LCHNG) in the E-MAC status register to 1. 0: Interrupts on setting of the LCHNG bit is disabled. 1: Interrupts on setting of the LCHNG bit is enabled.
1	MPDIP	B'0	R/W	Magic Packet™ Detect Interrupt Enable Setting this bit to 1 selects interrupt generation on setting of the Magic PacketTM detection bit (ECSR.MPD) in the E-MAC status register to 1. 0: Interrupts on setting of the MPD bit is disabled. 1: Interrupts on setting of the MPD bit is enabled.
0	ICDIP	B'0	R/W	Illegal Carrier Detect Interrupt Enable Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ECSR.ICD) in the E-MAC status register to 1. 0: Interrupts on setting of the ICD bit is disabled. 1: Interrupt on setting of the ICD bit is enabled.

46.2.88 PHY Interface Register (PIR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The PIR register provides a means of access to the PHY-LSI internal registers via the MII.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
3	MDI	—	R/W	MII Management Data-In This bit indicates the level of the AVB_MDIO pin.
2	MDO	B'0	R/W	MII Management Data-Out This bit holds data for output from the AVB_MDIO pin. The AVB_MDIO pin outputs data when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).
1	MMD	B'0	R/W	MII Management Mode This bit specifies the direction for data through MDIO (reading or writing). 0: Read direction is specified. 1: Write direction is specified.
0	MDC	B'0	R/W	MII Management Data Clock Values set in this bit are output on the AVB_MDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see section 46.3.13 Connection to PHY-LSI.

46.2.89 PHY Status Register (PSR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The PSR register is a read-only register that can read interface signals from the PHY-LSI.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are read as 0.
0	LMON	B’0	R	Link Status Pin State The Link state can be read by connecting the Link signal output from the PHY-LSI to the link status pin (AVB_LNK) pin. For the active sense, refer to the specifications of the PHY-LSI to be connected. 0: The link status signal (AVB_LNK) is at the low level. 1: The link status signal (AVB_LNK) is at the high level.

46.2.90 PHY_INT Polarity Register (PIPR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The PIPR register is used to set the active sense of the AVB_PHY-INT pin.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
0	PHYIP	B'0	R/W	PHY Interrupt Input Pin Polarity This bit sets the active sense of the PHY interrupt pin (AVB_PHY-INT). For the active sense, refer to the specifications of the PHY-LSI to be connected. 0: PHY interrupt pin (AVB_PHY-INT) is active low (the low level triggers the interrupt state) 1: PHY interrupt pin (AVB_PHY-INT) is active high (the high level triggers the interrupt state)

46.2.91 Automatic PAUSE frame register (APR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The APR register is used to set the value for the TIME parameter of auto generated PAUSE frames.

When ECMR.TXF = b'1, the value shouldn't set all 0 in this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are read as 0. The write value should be 0.
15 to 0	PFRXC[15:0]	H'0000	R	PAUSE Frame Receive Counter These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ECMR = 1). The bits are cleared to 0 when they are read. If counting up and clearing the counter coincide, clearing the counter takes priority.

46.2.95 Automatic PAUSE frame retransmit count register (TPAUSER)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TPAUSER register is used to set the value for upper limit number of auto generated PAUSE frames.

The setting in this register must not be changed while transmission is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	PFRTC[15:0]	H'0000	R	Pause Frame Retry Counter These bits indicate the number of auto PAUSE frames that have been transmit while Receive FIFO caution. The bits are cleared to 0 when they are read and Receive FIFO caution start.

46.2.97 E-MAC Mode Register 2 (GECMR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The GECMR register specifies the operating mode for the E-MAC.

The setting in the GECMR register must not be changed while transmission or reception is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

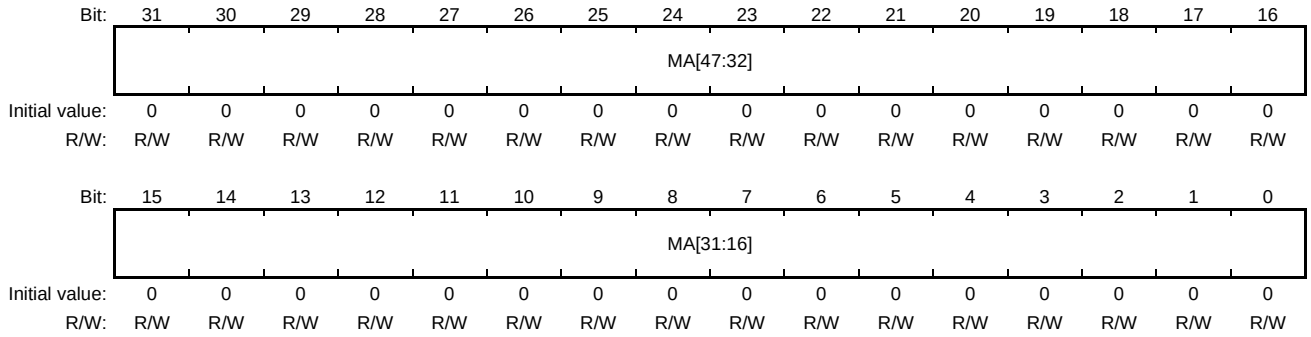
Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
0	SPEED	B'0	R/W	Transfer Speed Setting This bit sets the transfer rate. 0: Transfer is at 100 Mbps. 1: Transfer is at 1000 Mbps.

46.2.98 E-MAC Address High Register (MAHR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The MAHR register specifies the 32 higher-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MA[47:16]	H'0000_0000	R/W	E-MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the E-MAC address. For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'0123_4567 in the MAHR register.

46.2.99 E-MAC Address Low Register (MALR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The MALR register specifies the 16 lower-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

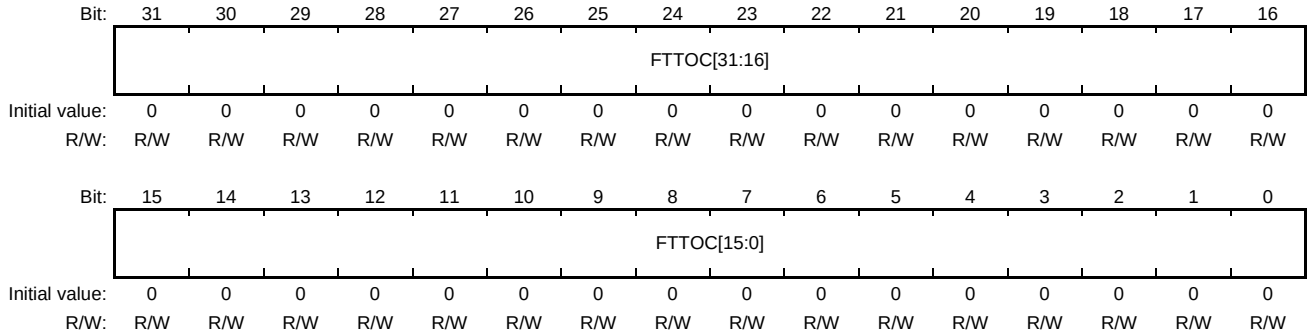
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MA[15:0]	H'0000	R/W	E-MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the E-MAC address. For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'89AB in the MALR register.

46.2.100 Transmit retry over counter register (TROCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TROCR register is a counter that indicates the number of times frames with time-out were transmit. Counting up stops when the value in this register reaches H'FFFF_FFFF.

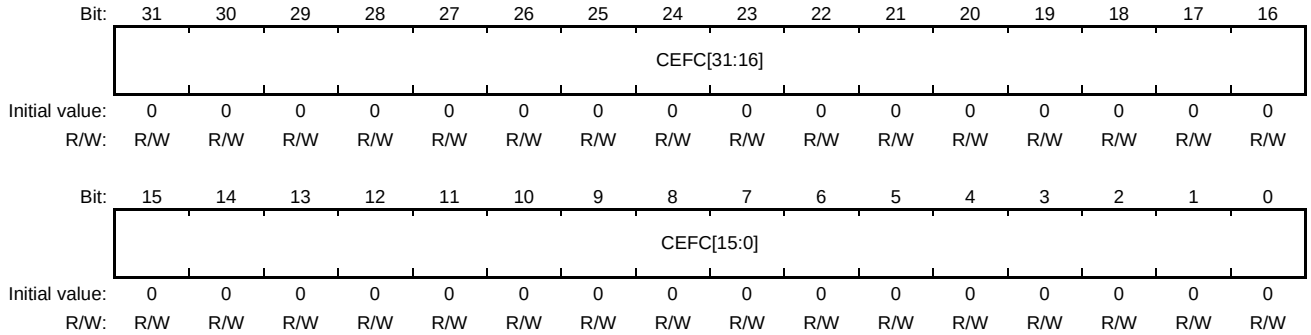


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	FTTOC[31:16]	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	FTTOC [15:0]	H'0000	R/W	Frame transmit time-out counter These bits indicate the number of transmit frames having time-out. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

46.2.101 CRC Error Frame Receive Counter Register (CEFCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The CEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches H'FFFF_FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CEFC[31:16]	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	CEFC[15:0]	H'0000	R/W	CRC Error Frame Counter These bits indicate the number of received frames having CRC errors. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

46.2.102 Frame Receive Error Counter Register (FRECR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The FRECR register is a counter that indicates the number of frames for which receive errors were generated by input on the RX_ER from the PHY-LSI. Counting up stops when the value in this register reaches H'FFFF_FFFF.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FREC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

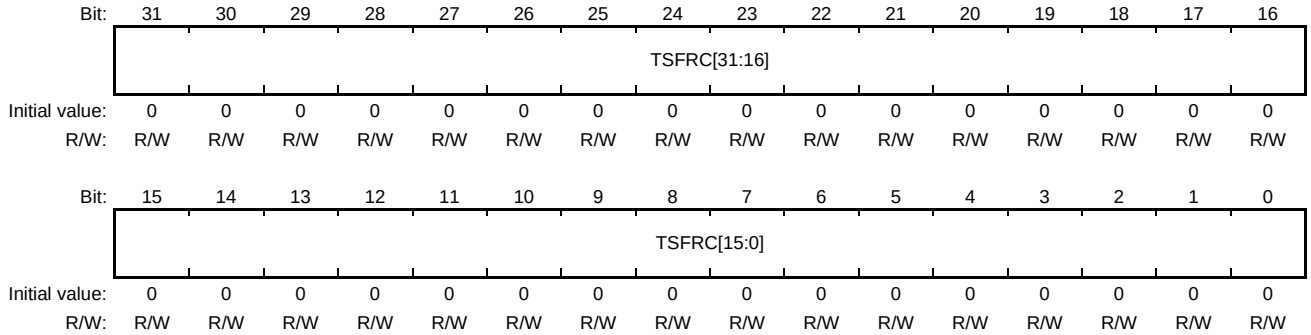
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FREC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	FREC[31:16]	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	FREC[15:0]	H'0000	R/W	Frame Receive Error Counter These bits indicate the number of errors during frame reception. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

46.2.103 Too-Short Frame Receive Counter Register (TSFRCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches H'FFFF_FFFF.

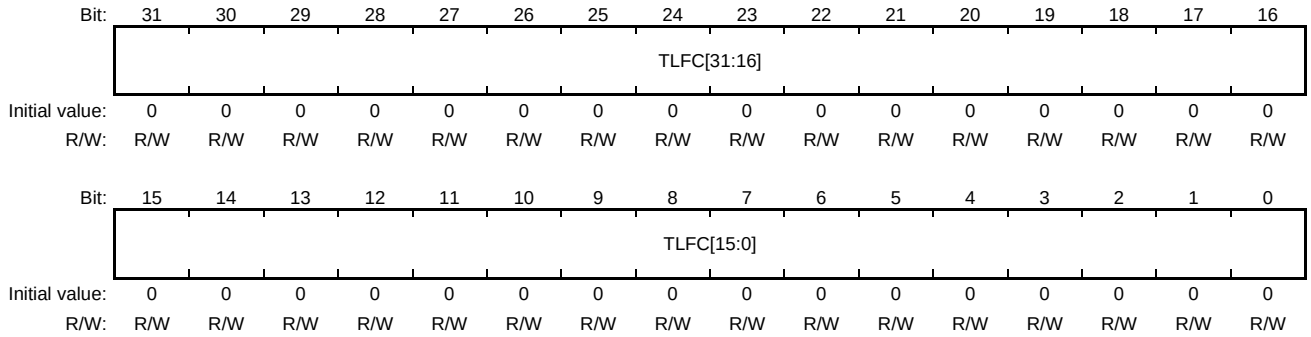


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TSFRC[31:16]	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	TSFRC[15:0]	H'0000	R/W	Too-Short Frame Receive Counter These bits indicate the number of received frames that were fewer than 64 bytes in length. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

46.2.104 Too-Long Frame Receive Counter Register (TLFRCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The TLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (RFLR). Counting up stops when the value in the TLFRCR register reaches H'FFFF_FFFF.

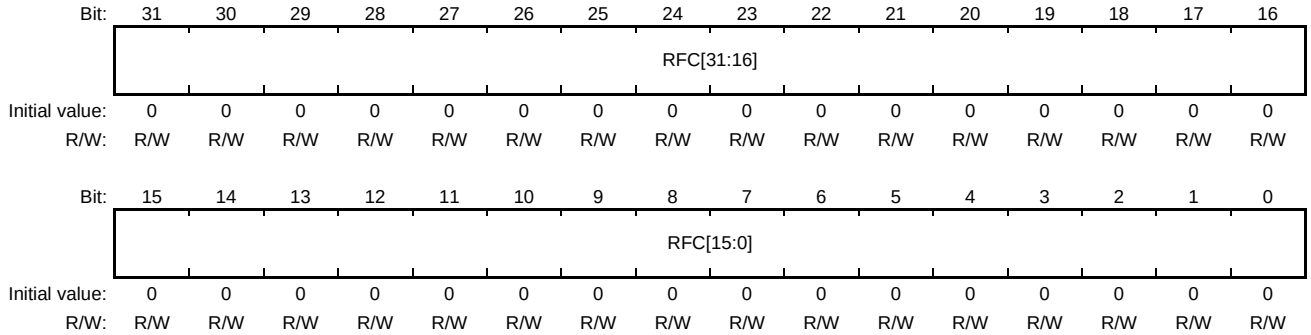


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TLFC[31:16]	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	TLFC[15:0]	H'0000	R/W	Too-Long Frame Receive Counter These bits indicate the number of received frames that were longer than the value in RFLR. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

46.2.105 Residual-Bit Frame Receive Counter Register (RFCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The RFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches H'FFFF_FFFF.

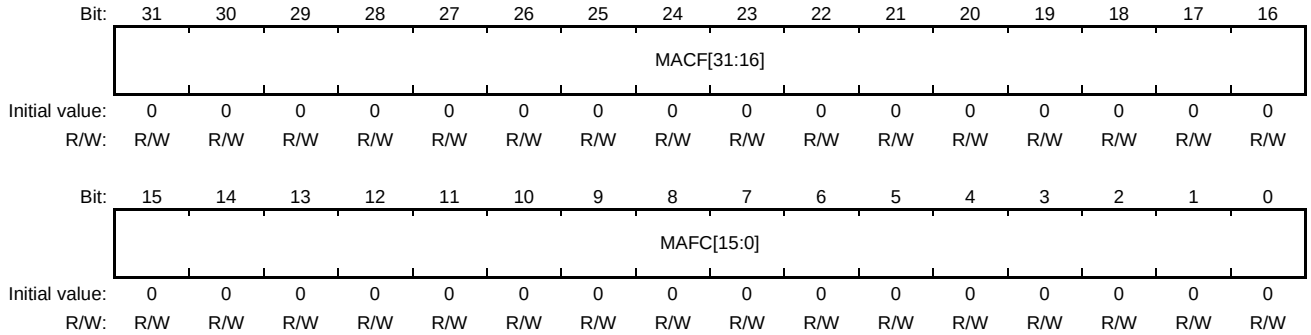


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	RFC[31:16]	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	RFC[15:0]	H'0000	R/W	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

46.2.106 Multicast Address Frame Receive Counter Register (MAFCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

The MAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches H'FFFF_FFFF.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	MACF[31:16]	All 0	R/W	Reserved These bits are read as 0. The write value should be 0.
15 to 0	MAFC[15:0]	H'0000	R/W	Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

46.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

The EthernetAVB-IF consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the RGMII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports a RGMII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the RGMII. It also performs CRC checking of Ethernet frames received from the RGMII and writes the frames to the reception FIFO.

46.3.1 AVB-DMAC Operating Modes

Figure 46.2 illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset and power-down mode)
- Configuration of the operating mode configuration bits (CCC.OPC) in the AVB-DMAC mode register

The current operating mode can be confirmed by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

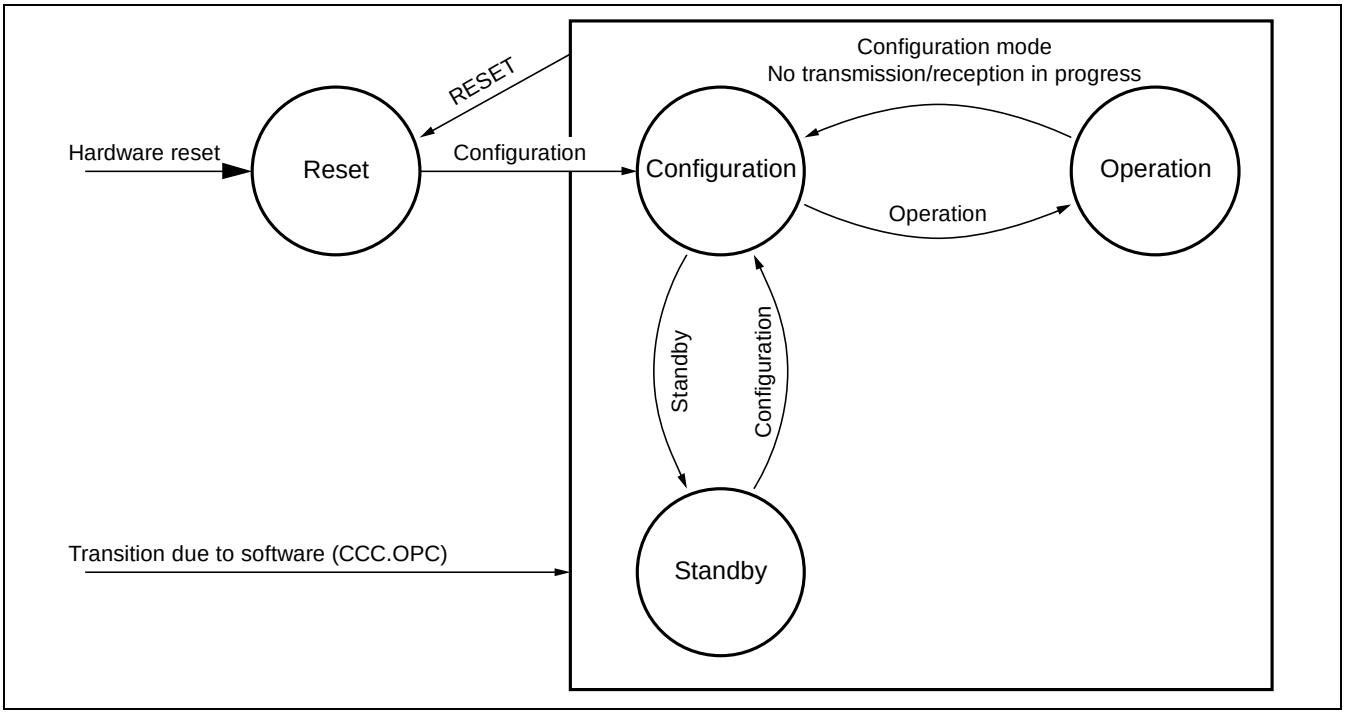


Figure 46.2 Operating Mode of AVB-DMAC

(1) Operating Modes

(a) Reset mode

After a hardware reset, the AVB-DMAC enters reset mode.
In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(b) Configuration mode

In configuration mode, various settings for the AVB-DMAC can be made.
The operation of most functions is stopped and all status registers are initialized to their reset values. The E-MAC functions in this mode.
By CCC.GAC it is possible to enable gPTP support already in CONFIG mode.

(c) Operation mode

In operation mode, all functions of the AVB-DMAC can operate. Ethernet communications can only proceed in this mode.

(d) Standby mode

In standby mode, the E-MAC can only be used to control the operating mode. Other functions cannot be used. When CCC.GAC is 1 CPU should not enter STANDBY mode.

(2) How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (CCC.OPC) (Figure 46.3).

For transitions from operation mode to configuration mode, follow the procedure in Figure 46.4 because any transmission and reception in progress will be executed before the transition to configuration mode.

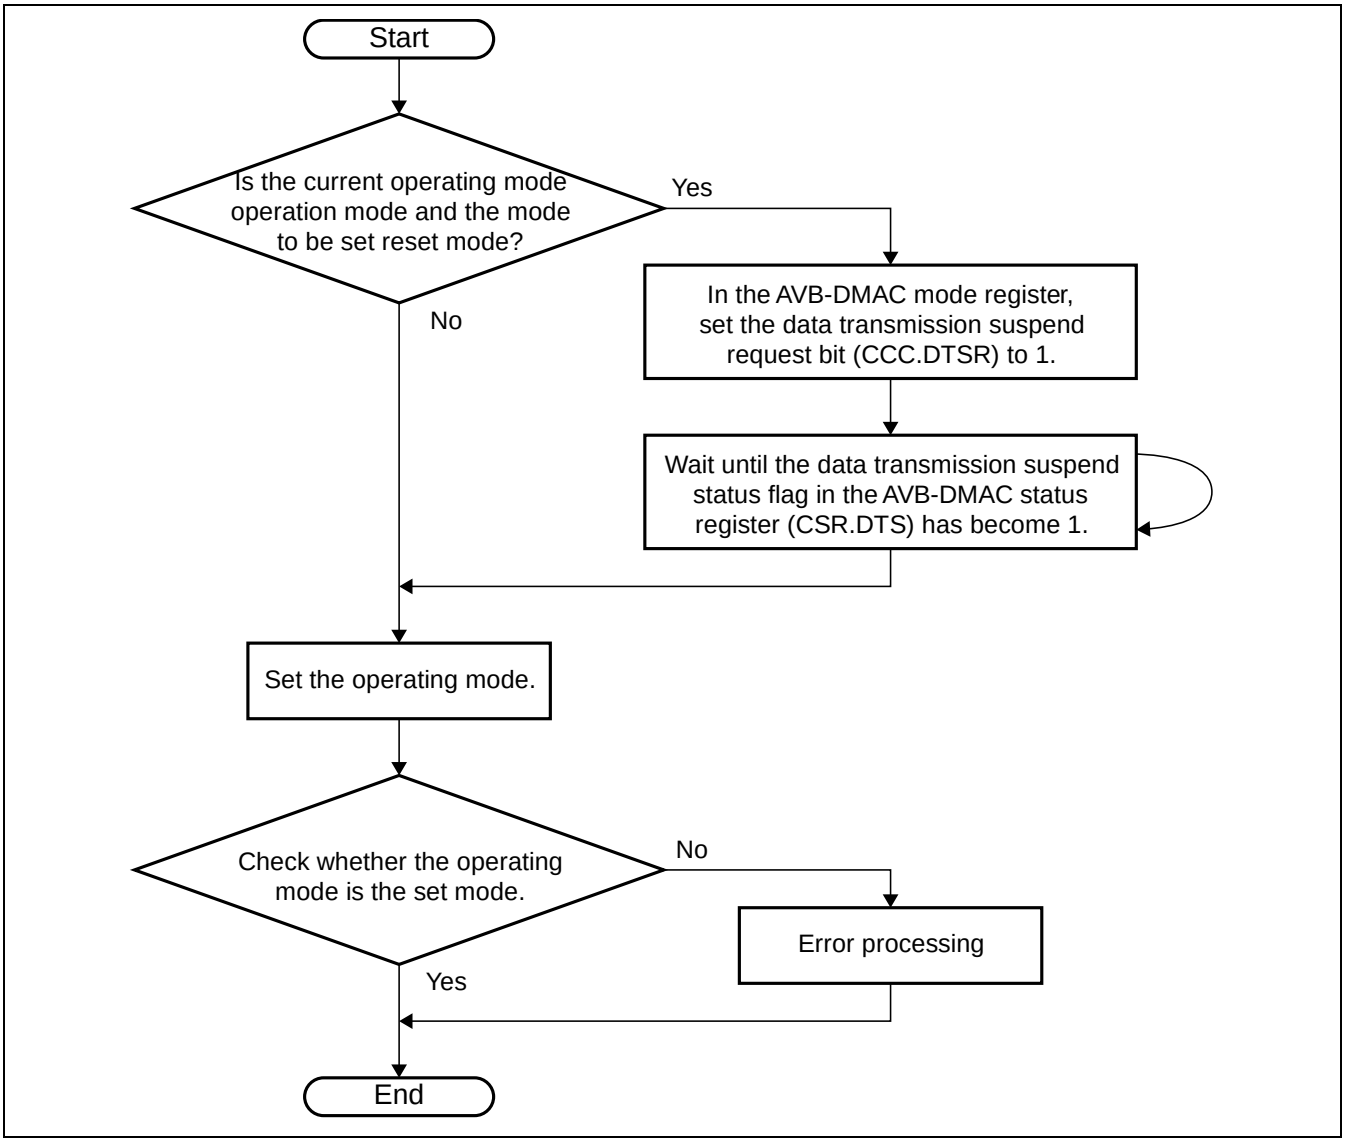

Figure 46.3 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

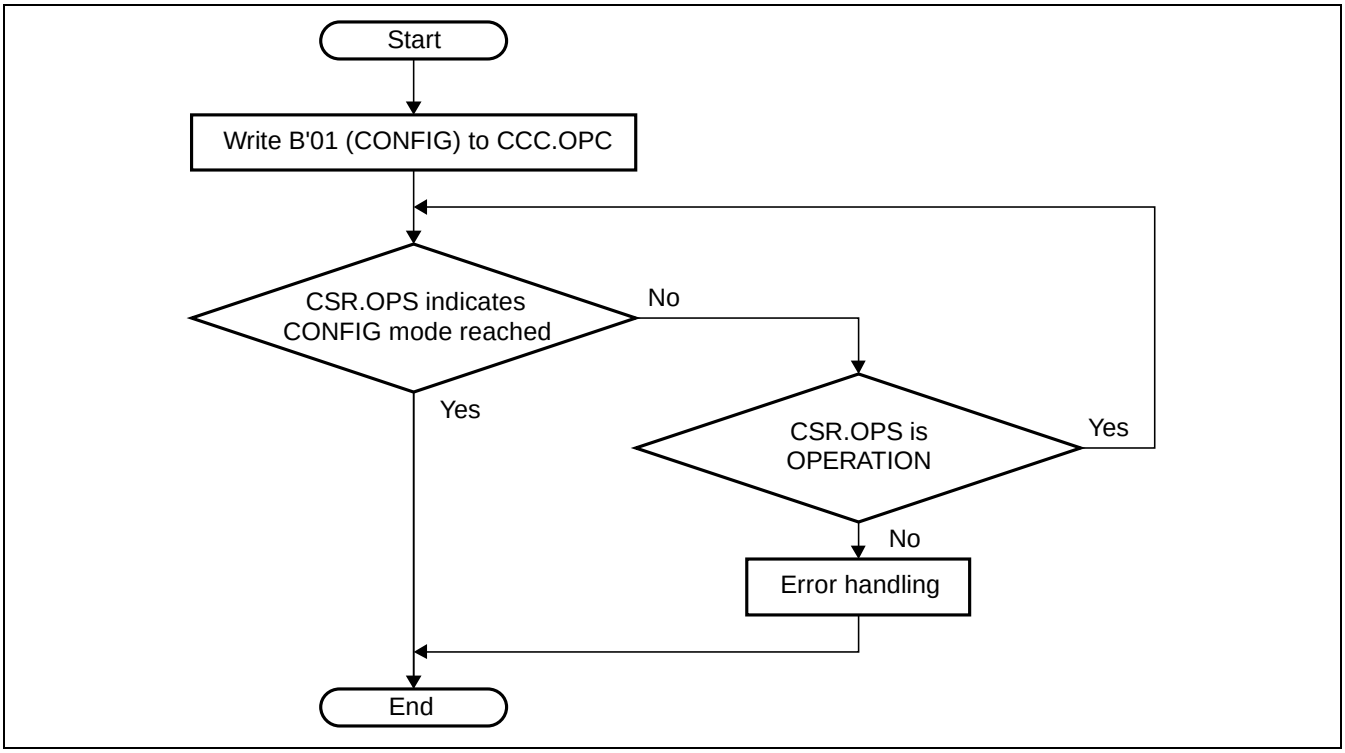

Figure 46.4 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (CSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and URAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and URAM, this is completed (frames for transmission remaining in the URAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

The CPU should not disable URAM transfers by CCC.DTSR nor prevent transmission by MAC when requesting transition from OPERATION to CONFIG, else EthernetAVB-IF cannot perform requested mode change.

Notes: When the operating mode shifts to configuration mode, all status registers are cleared.
When need status register information, the reception and transmission path can be individually disabled and can check the status before leaving operating mode with follow.
We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (CSR.RPO) and the transmit process status bits (CSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.
5. Capture all of the required status information.
6. Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to initiate the transition to configuration mode.

(3) Leave RESET mode with additional configuration

When writing B'01 (CONFIG) to CCC.OPC while EthernetAVB-IF is in RESET mode, it is possible to configure availability of gPTP support within CONFIG mode

To enable gPTP support in CONFIG mode use a 32 bit write access when setting CCC.OPC to B'01. This write should also set CCC.GAC to 1 and CCC.CSEL to intended configuration.

(4) Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

(a) Hardware reset

Resetting of the LSI chip leads to resetting of the entire EthernetAVB-IF module. The operating mode shifts to reset mode.

(b) Transition during power-off by module standby

This transition is triggered by module standby of CPG during the power-off sequence.

The AVB-DMAC completes the bus master access in progress, and then shifts to reset mode. At this time, the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) are set to B'00.

46.3.2 Common Control for Transmission and Reception

(1) Initialization Procedure

Figure 46.5 shows the overall initialization procedure in outline.

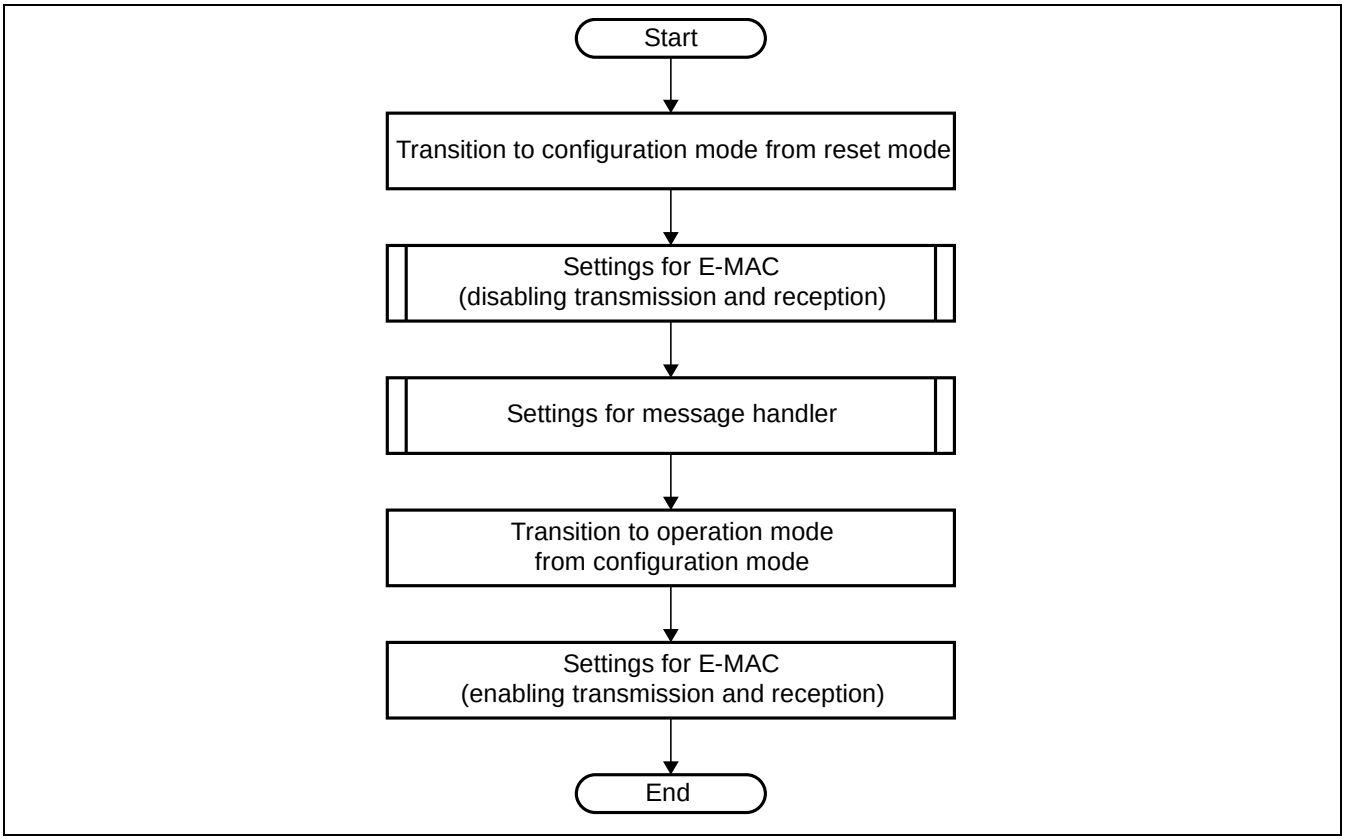

Figure 46.5 Outline of the Initialization Procedure

Note: Before starting configuration, all required clocks should be configured and enabled.

(a) Initializing the Receiver Section

Before starting reception, follow the procedure below.

Keep the operating mode to configuration mode, and do not enable reception until the settings for the AVB-DMAC are completed.

- Set the operating mode to configuration mode.
- Set AVB filtering for network control frames and AVB stream frames to suit the specifications of the product the chip will be used in.
- Create a descriptor chain for each queue to be used.
- Set the base address for table address in the descriptor base address table register (DBAT).
- Specify the maximum frame length with the receive frame length upper limit register (RFLR).
- Specify whether padding is to be used with the receive padding configuration register (RPC).
- Set the unread frame counter for each queue with unread frame counter registers (UFCVs) 0 to 4.

(b) Initializing the Transmitter Section

Figure 46.6 illustrates initialization of the transmitter section.

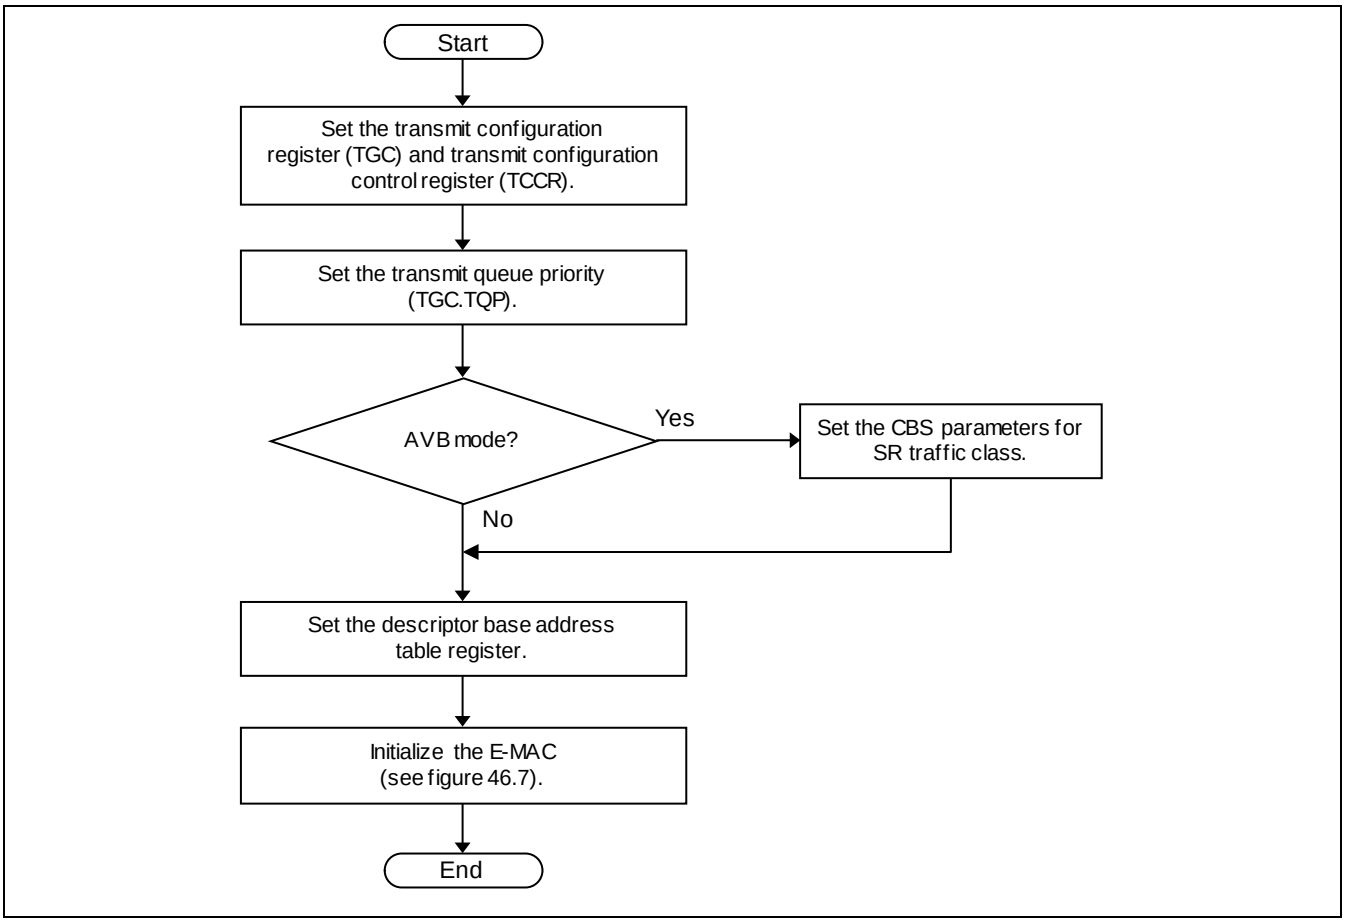

Figure 46.6 Procedure for Initializing the Transmitter Section

(c) Initializing the E-MAC Section

Figure 46.7 illustrates initialization of the E-MAC section.

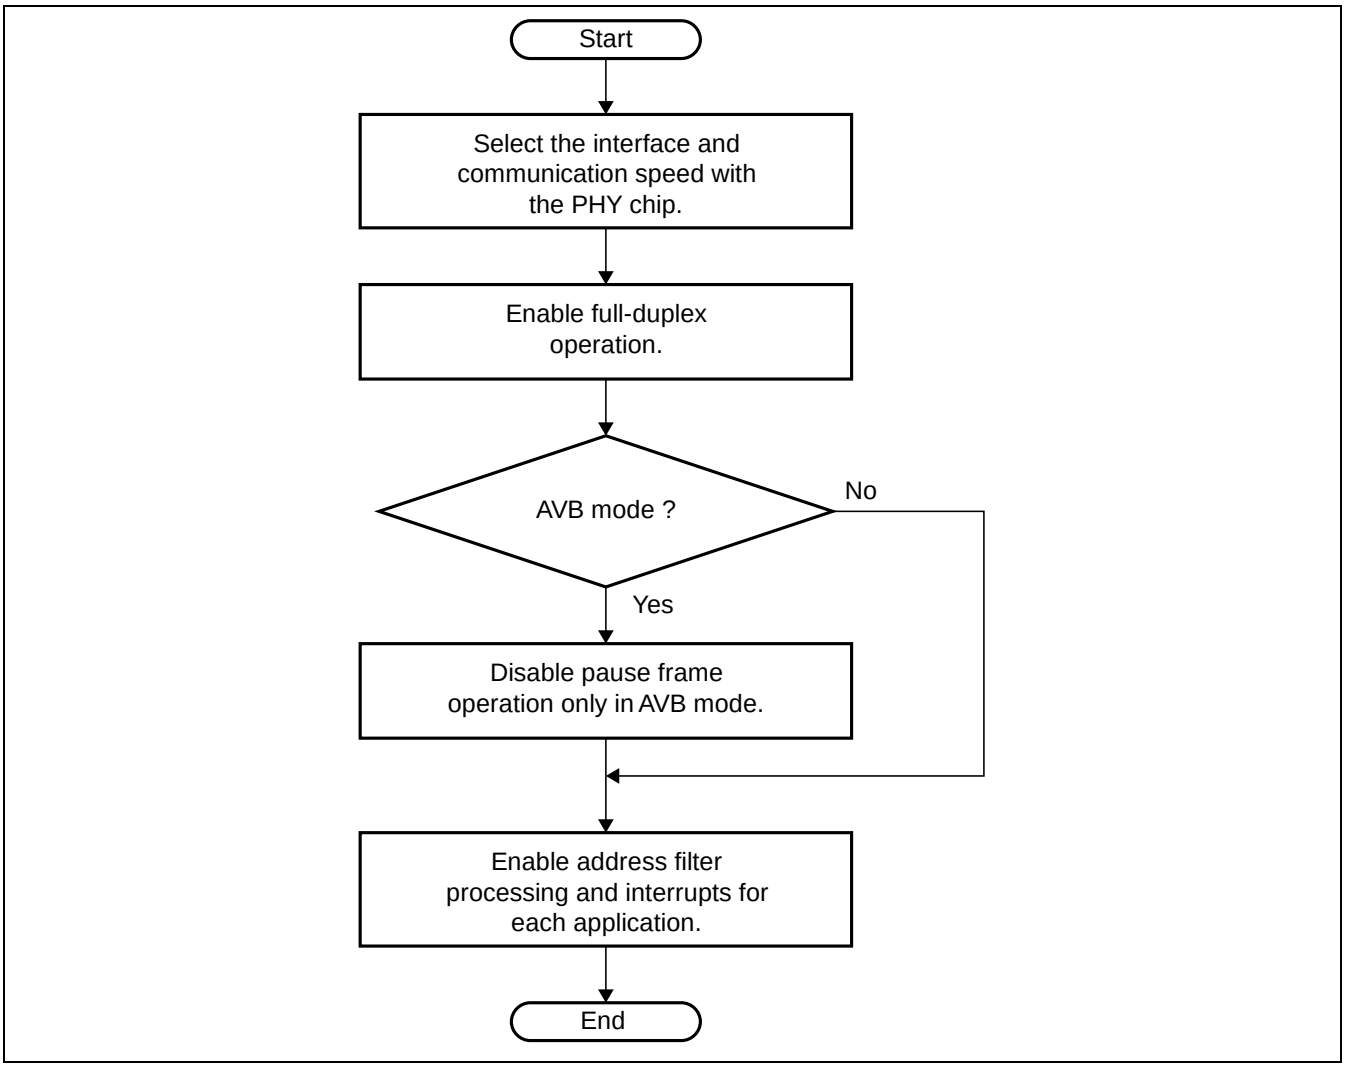

Figure 46.7 Procedure for Initializing the E-MAC Section

(d) Initialization of the Application Unit

Figure 46.8 illustrates initialization of the application unit.

For a description of how to set up the descriptors and the CBS traffic shaping parameters, see section 46.3.3 Descriptors, and section 46.3.6 CBS (Credit-Based Shaping).

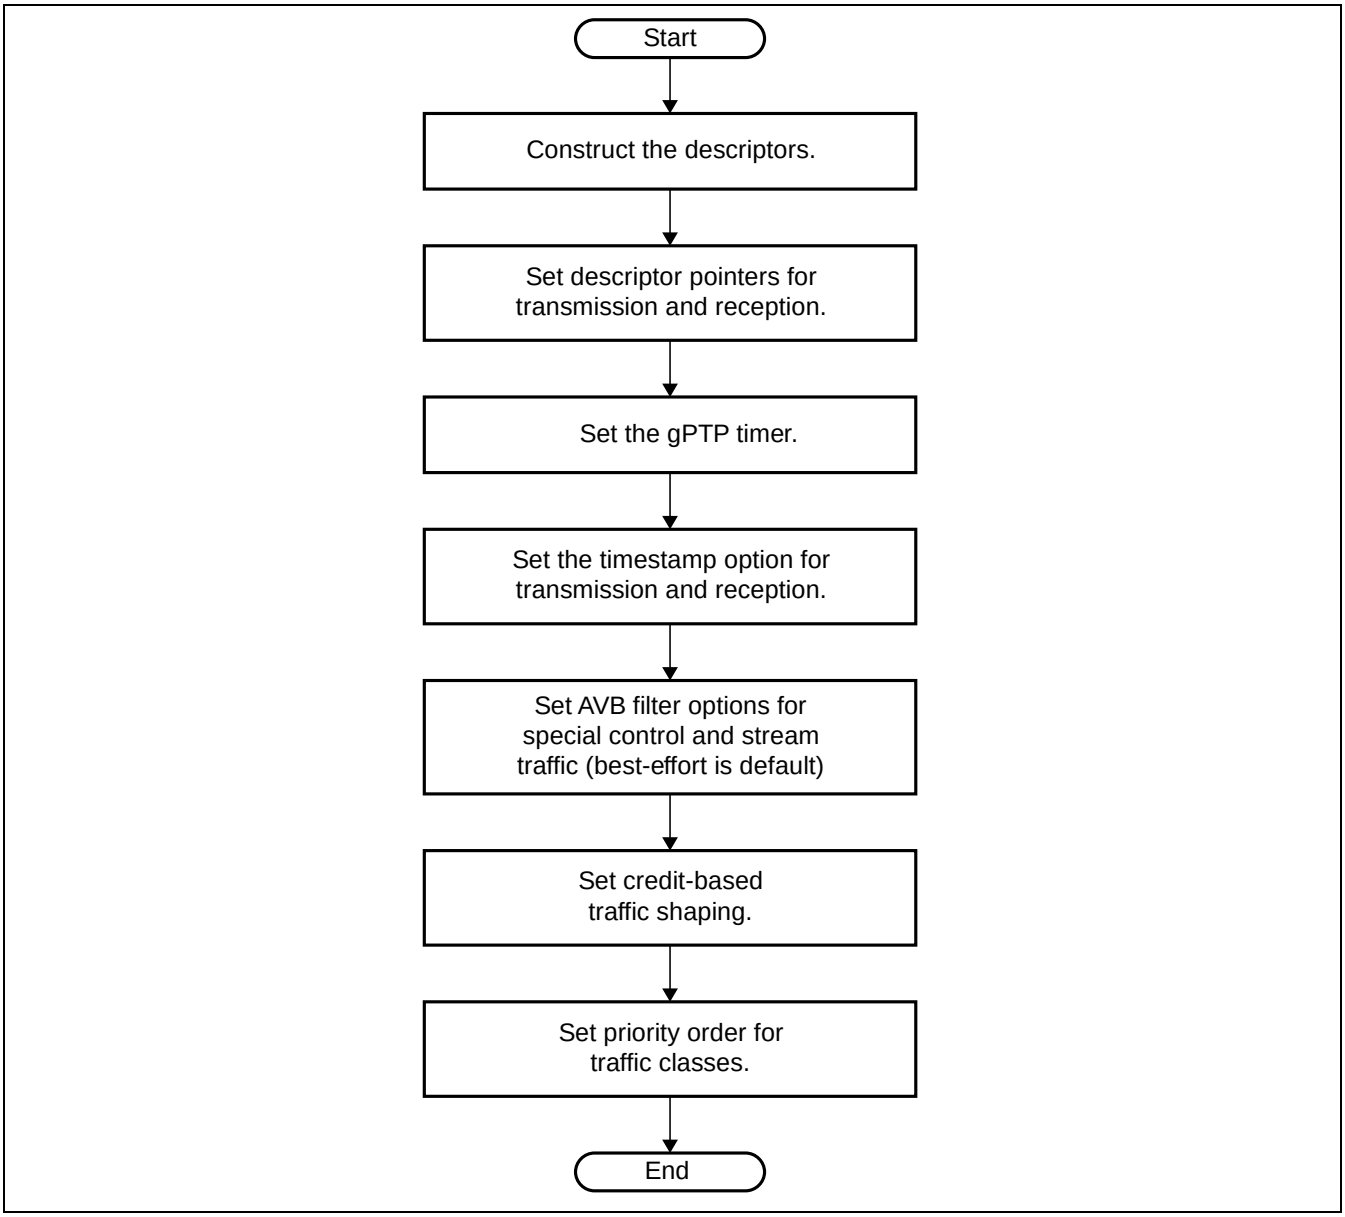

Figure 46.8 Initializing the Sections for Use by the Application

(e) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (TGC.TQP) has no effect.

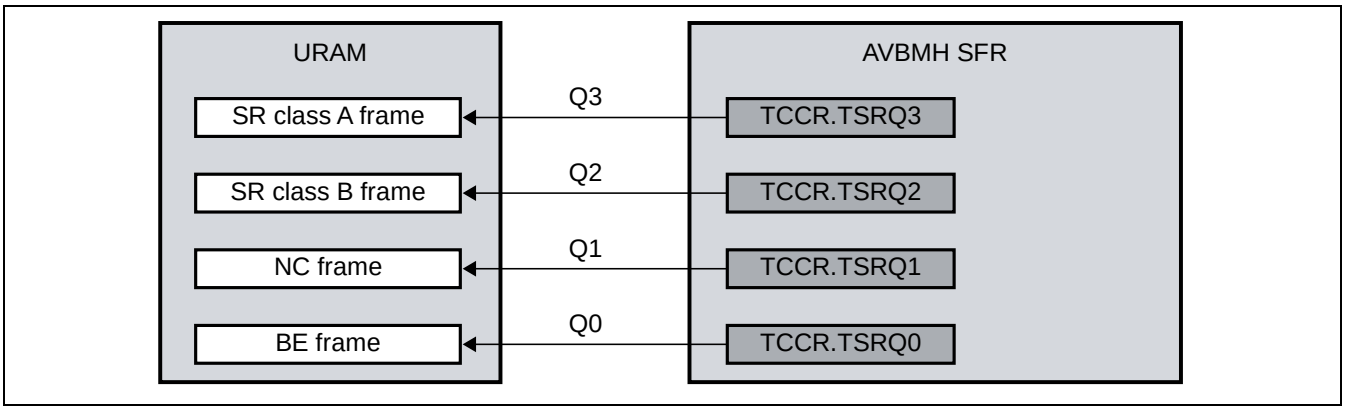

Figure 46.9 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (TGC.TBDt) and on the frame size that can be fetched to the transmission FIFO.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B'00 or B'01, the priority order is Q3 → Q 2 → Q1 → Q0.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B'11, the priority order is Q1 → Q3 → Q2 → Q0.

(2) Checking Integrity

The AVB-DMAC is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

(a) Concept of Integrity Checking in Reception

The aim of integrity checking in reception is preventing the storage of error frames in the URAM. If an error frame is stored in the URAM, software can get information to identify the frame as an error frame.

Note: If a special descriptor chain is to be used for separation of received headers from the associated data, an error that breaks the sequence may lead to storage space for synchronization running out. In such cases, software interaction or re-synchronization via the EOS descriptor is required.

(b) Concept of Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

(c) Items for Monitoring in Both Reception and Transmission

Errors in access to the URAM for reading of descriptors

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed. If this problem occurs in a divided frame, the sequence may be broken.

In reception

— The received frame will be lost.
— The same problem will occur for the next frame of data received for the same queue.

In transmission

— The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
— The frame will be lost from the transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI-Bus. EthernetAVB-IF flags only one access error per descriptor read.

Illegal configuration of a descriptor by an application

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed. If this problem occurs in a divided frame, the sequence may be broken.

In reception

— The received frame will be lost.
— The same problem will occur for the next frame of data received for the same queue.

In transmission

— The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
— The frame will be lost from the transmission FIFO.

Errors in access to the URAM for writing of descriptors

As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated.

As DESCR.DT was not updated, hardware and software synchronization may have been destroyed.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI-Bus.

(d) Items for Monitoring in Reception

Errors in access to the URAM for writing of data or time stamps

— As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
— DESCR.EI is set to indicate incorrect contents.
— This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus.
EthernetAVB-IF flags each access error individually, even they are related to same frame.

Error of the Reception FIFO

— Received frames are all invalidated.
— All frames stored as received frames are discarded. At this time, the number of frames and queue information cannot be captured.

If the reception FIFO RAM faults, AVB-DMAC detects the fault as error of the reception FIFO.

Queue Synchronisation Fault of the Reception

EthernetAVB-IF will not continue splitting frame across EOS descriptor. A queue synchronisation fault is detected when read descriptor with DESCR.DT = EOS at position where FMID, or FEND should be written

— RIS2.QFFr is set 1
— CDARq.CDA is updated as in fault free operation.
— Neither CIARr.CIA nor LIARr.LIA is changed.
— Neither UFCVi.CVr nor RIS0.FRFr is changed.
— Received frame is lost. There is an incomplete frame (no FEND) in descriptor chain.

Note: Reading descriptor may be one or more storage elements ahead in descriptor chain.

(e) Items for Monitoring in Transmission

Errors in Access for Reading Data from the URAM

— Data that have already been fetched are discarded from the transmission FIFO.
— When an error of this type occurs during processing of an FSINGLE or FEND descriptor:
As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
— When an error of this type occurs during processing of an FSTART or FMID descriptor:
— The current descriptor address (CDARq.CDA) is not updated.
— The transmit start bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

Overflow of the Transmission FIFO

— As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
— The frame will be discarded from the FIFO.

Frame size error during transmission

— As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is 1966 or more bytes. Such frames are cut out and transmitted.

Damaged Data in the Transmission FIFO

— Fetching is not affected by damaged data.
— Since damaged data from the FIFO is only detected during frame transmission, an error frame may be transmitted.

If damaged data in the transmission FIFO is an error due to the transmission FIFO, this is detected by the AVB-DMAC.

(f) Items for Monitoring in gPTP

Access error while reading AVTP timestamps from Tx-Buffer RAM

— AVTP timestamps are invalidated.
— gPTP unit ignores the issue. It uses the value as read for AVTP comparison.

An access error when reading timestamps from Tx-Buffer RAM is flagged to EthernetAVB-IF by external RAM protection logic.

46.3.3 Descriptors

(1) Data Representation in URAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the AVB-DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without access to registers of the AVB-DMAC.

Figure 46.10 shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see section 46.3.4(2) Setting Up Reception Descriptors, and section 46.3.5(2) Setting Up Transmission Descriptors.

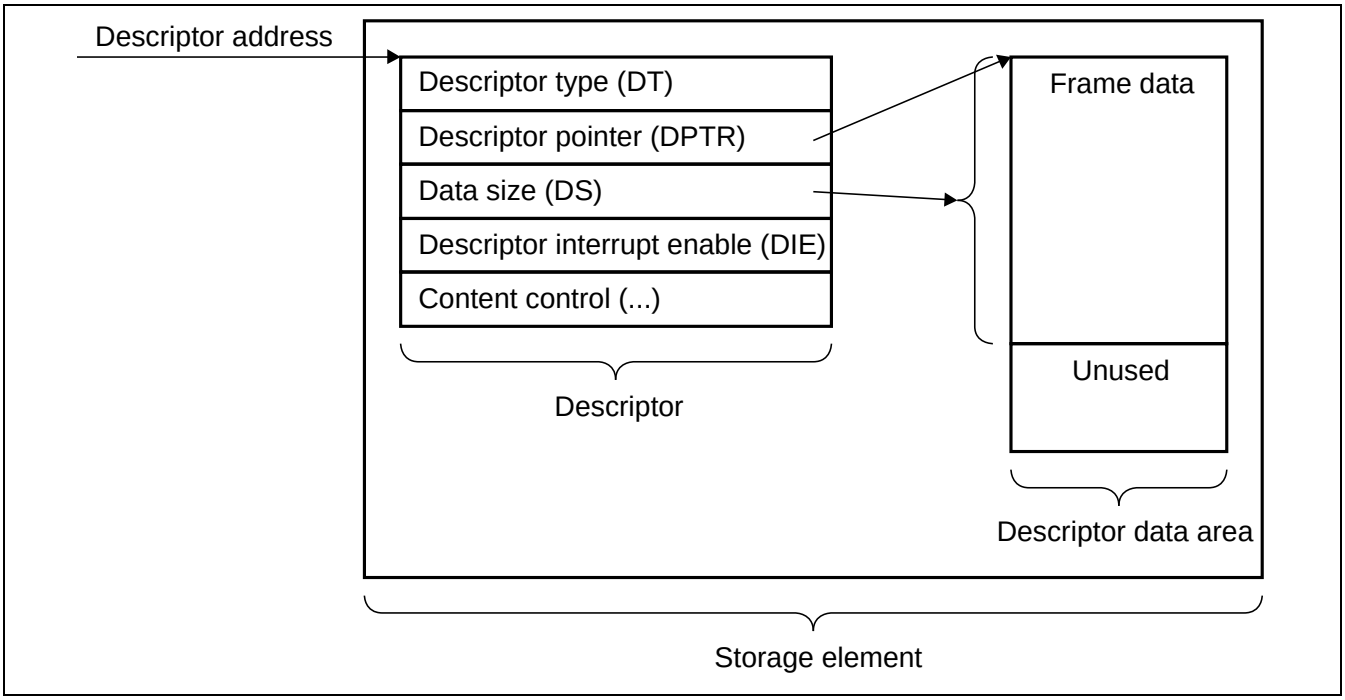

Figure 46.10 Outline of Storage Element Used for Receive and Transmit Queues

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP time stamps is enabled.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

(2) Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see section 46.3.3(6) Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 46.11 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

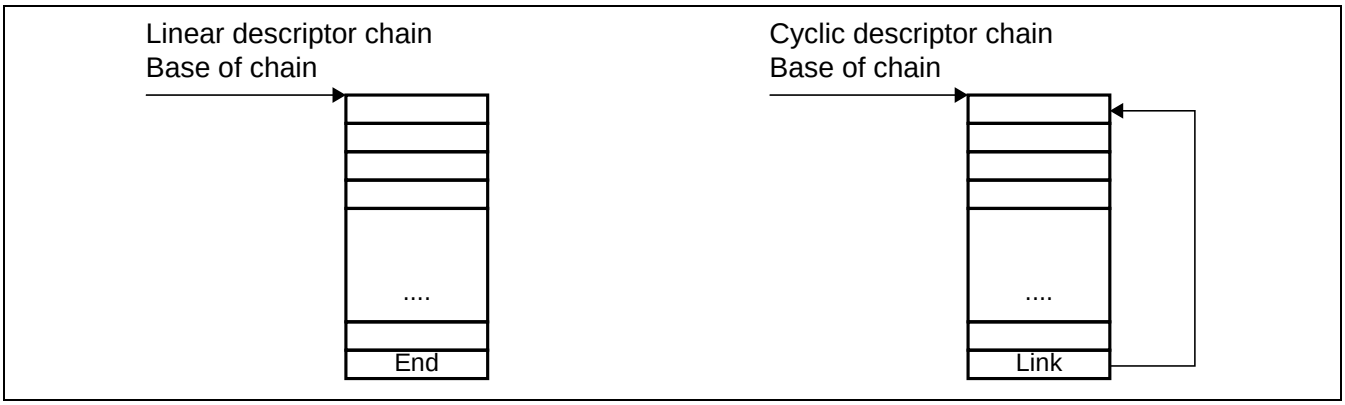

Figure 46.11 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in section 46.3.4(2) Setting Up Reception Descriptors, and section 46.3.5(2) Setting Up Transmission Descriptors.

(3) Descriptor Base Address Table

The base address table in the URAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (DBAT).

Figure 46.12 shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

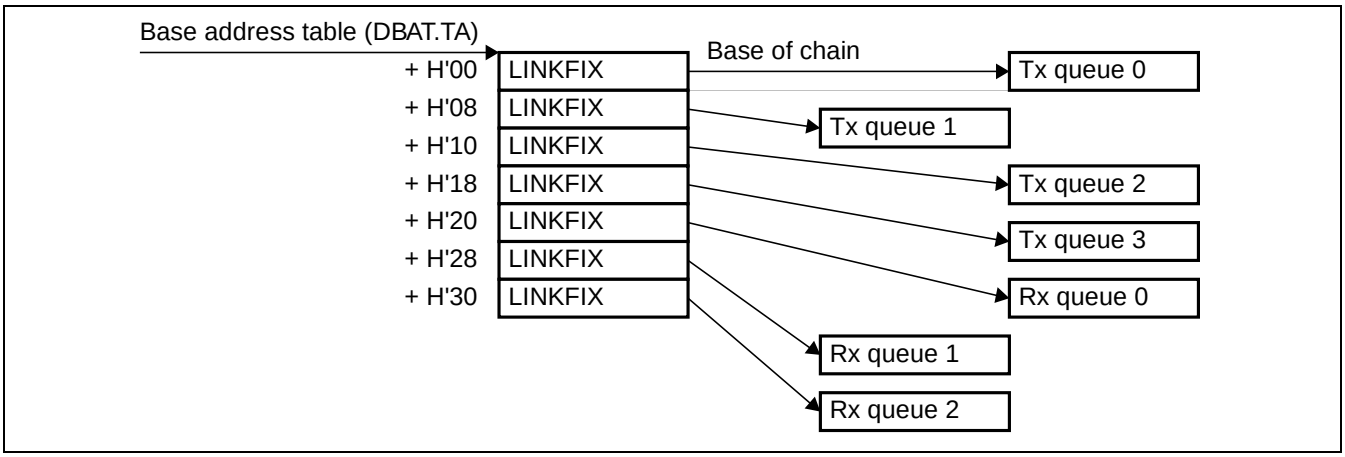

Figure 46.12 Example of a Base Address Table for Reception and Transmission Queues

Note: The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

(4) Descriptor Chain Processing

The descriptor that is currently processed or will be processed when the related queue gets active is the current descriptor. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are stored in registers or in descriptors as described below in the given situations.

- In the descriptor base address table registers for all q queues (DBAT) (DBAT.TA+8*q) when the operating mode shifts to operation mode.
- In the descriptor base address table register (DBAT) (DBAT.TA+8*q) when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- In DESCR.DPTR for a link descriptor (LINK, LINKFIX) to be processed.
- After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue (8 bytes for normal descriptors and 20 bytes for extended descriptors). The AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

(5) Descriptor Interrupts
