Rev.1.01 Jan. 2021

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

Trademarks

Renesas and the Renesas logo are trademarks of Renesas Electronics Corporation. All trademarks and registered trademarks are the property of their respective owners.

Trademarks (continued)

For the “Cortex” notation, it is used as follows;
- Arm® Cortex®-A53
- Arm® Cortex®-A57
- Arm® Cortex®-R7

Note that after this page, they may be noted as Cortex-A53, Cortex-A57, and Cortex-R7 respectively.

Examples of trademark or registered trademark used in the RZ/G series, 2nd Generation User’s Manual:
Hardware;
- AMBA®: AMBA is a registered trademark of Arm Limited.
- CoreLink™: CoreLink is a trademark of Arm Limited.
- CoreSight™: CoreSight is a trademark of Arm Limited.
- HDMI®: HDMI is a registered trademark of HDMI Licensing, LLC.
- HyperFlash™: HyperFlash is a trademark of Cypress Semiconductor Corporation.
- Magic Packet™: Magic Packet is a trademark of Advanced Micro Devices, Inc.
- MIPI®: MIPI is a registered trademark of MIPI Alliance, Inc.
- Neon™: Neon is a trademark of Arm Limited.
- OpenGL ES™: OpenGL ES is a trademark of Khronos Group, Inc.
- PCIe®: PCIe is a registered trademark of PCI-SIG, Inc.
- PCI Express®: PCI Express is a registered trademark of PCI-SIG, Inc.
- PowerVR®: PowerVR is a registered trademark of Imagination Technologies Group Plc.

Note that in each section of the Manual, trademark notation of ® and TM may be omitted.
All other trademarks and registered trademarks are the property of their respective owners.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

How to Use This Manual

1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the hardware functions of the RZ/G series, 2nd generation products. It is intended for users designing application systems incorporating the RZ/G series, 2nd generation products. A basic knowledge of electric circuits, logical circuits, and MCUs is necessary in order to use this manual.

The manual comprises an overview of the product; descriptions of the CPU, system control functions, peripheral functions for each product of the RZ/G series, 2nd generation.

> Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Usage Notes section.

> The revision history summarizes the locations of revisions and additions. It does not list all revisions. Refer to the text of the manual for details.

2. Revision Numbers of User's Manual

The development of the basic line-up of the RZ/G series, 2nd generation has been finished.

Note. Additional new line-up of the RZ/G series, 2nd generation (ex. RZ/G2M V3.0) is still under development.

Note that update information for the development finished product(s) is provided by the Renesas Technical Update.

Following table summarizes the relationship between manual revisions and products.

RZ/G series, 2nd generation Products	Manual Revision	Remarks
	Rev.1.01	
RZ/G2H	Applicable	—
RZ/G2M V1.3	Applicable	—
RZ/G2M V3.0	N/A (Rev.0.5)	—
RZ/G2N	Applicable	—
RZ/G2E	Applicable	—

3. Notation of reference document for Realtime Core.

This document described except parts of the Realtime Core of RZ/G Series, 2nd Generation products. Refer to document of RZ/G Series, 2nd Generation User's Manual: Hardware, Additional document for Real Time Core.

Contents

1. Overview 1-1
1.1 Introduction 1-1
1.2 List of Specifications 1-2
1.2.1 Arm Core 1-2
1.2.2 CPU Core Peripherals 1-3
1.2.3 External Bus Module 1-5
1.2.4 Internal Bus Module 1-7
1.2.5 Internal Memory 1-9
1.2.6 Graphics Units 1-10
1.2.7 Video Processing 1-14
1.2.8 Sound Interface 1-19
1.2.9 Storage 1-22
1.2.10 Network 1-24
1.2.11 Timer 1-25
1.2.12 Peripheral Module 1-26
1.2.13 Others 1-28

2. Area Map 2-1

3. Mode Pin Settings (RZ/G2H) 3-1

4. Mode Pin Settings (RZ/G2M V1.3, RZ/G2M V3.0) 4-1

5. Mode Pin Settings (RZ/G2N) 5-1

6. Mode Pin Settings (RZ/G2E) 6-1

7. AP-System Core 7-1
7.1 Overview 7-1
7.1.1 Features 7-2
7.1.1.1 Cortex-A57 CPU cluster 7-2
7.1.1.2 Cortex-A53 CPU Cluster 7-3
7.1.1.3 Cache Coherent Interconnect (CCI-500) 7-4
7.1.1.4 Generic Counter 7-4
7.1.2 Block Diagram 7-5
7.1.3 External Pins 7-7
7.1.4 Register Configuration 7-7
7.1.5 Connected Module 7-11
7.2 Register Description 7-12
7.3 Operation 7-13
7.3.1 Boot Address Setting 7-13
7.3.2 Power-Up/Down Mechanism 7-13
7.3.3 Switching between AArch32 and AArch64 7-16
7.3.4 Maximum Outstanding Setting of CCI-500 7-16
7.3.5 System Address Map 7-16
7.3.6 Frequency for Counting Up of Generic Counter 7-17
7.3.7 How to Start a Generic Counter 7-17
7.4 Usage Notes 7-18
7.4.1 L2 Cache Setting for Cortex-A57 7-18
7.4.2 Memory Attribute 7-18

8. Pin Function Controller (PFC) 8-1
8.1 Overview 8-1
8.1.1 Features 8-1
8.1.2 Block Diagram 8-2
8.1.3 External Pins 8-2
8.1.4 Register Configuration 8-3
8.1.5 Connected Module 8-7
8.2 Register Description 8-7
8.2.1 LSI Multiplexed Pin Setting Mask Register (PMMR) 8-8
8.2.2 GPIO/Peripheral Function Select Register 0-7 (GPSR0-7) 8-9
8.2.3 Peripheral Function Select Register 0-18 (IPSR0-18) 8-13
8.2.4 DRV Control Register 0-24 (DRVCTRL0-24) 8-22
8.2.5 POC Control Register 0 (POCCTRL0) 8-34
8.2.6 TDSEL Control Register 0 (TDSELCTRL0) 8-36
8.2.7 LSI pin pull-enable register 0-6 (PUEN0-6) 8-38
8.2.8 LSI pin pull-up/down control Register 0-6 (PUD0-6) 8-43
8.2.9 Module Select Register 0-2 (MOD_SEL0-2) 8-47
8.3 Operation 8-55
8.3.1 Function Setting for Multiplexed Pins 8-55
8.3.2 Setting Pull-Up/Down Resistors 8-56
8.4 Usage Note 8-57
8.4.1 Notes for Using I2C0/3/5 8-57

9. Pin Function Controller (PFC) 9-1
9.1 Overview 9-1
9.1.1 Features 9-1
9.1.2 Block Diagram 9-2
9.1.3 External Pins 9-2
9.1.4 Register Configuration 9-3
9.1.5 Connected Module 9-5
9.2 Register Description 9-6
9.2.1 LSI Multiplexed Pin Setting Mask Register (PMMR) 9-7
9.2.2 GPIO/Peripheral Function Select Register 0-6 (GPSR0-6) 9-8
9.2.3 Peripheral Function Select Register 0-15 (IPSR0-15) 9-11
9.2.4 DRV Control Register 0-24 (DRVCTRL8-10) 9-18
9.2.5 POC Control Register 0 (POCCTRL0) 9-21
9.2.6 POC Control Register 2 (POCCTRL2) 9-22
9.2.7 TDSEL Control Register 0 (TDSELCTRL0) 9-23
9.2.8 LSI pin pull-enable register 0-5 (PUEN0-5) 9-25
9.2.9 LSI pin pull-up/down control Register 0-5 (PUD0-5) 9-27
9.2.10 Module Select Register 0-1 (MOD_SEL0-1) 9-29
9.3 Operation 9-37
9.3.1 Function Setting for Multiplexed Pins 9-37
9.3.2 Setting Pull-Up/Down Resistors 9-38

10. General-Purpose Input/Output Ports (GPIO) 10-1
10.1 Overview 10-1
10.1.1 Features 10-1
10.1.2 Block Diagram 10-2
10.1.3 External Pins 10-4
10.1.4 Register Configuration 10-4
10.1.5 Connected Module 10-9
10.2 Register Description 10-10
10.2.1 General IO/Interrupt Switching Register n (IOINTSEL0 to IOINTSELn) 10-10

10.2.2 General Input/Output Switching Register n (INOUTSEL0 to INOUTSELn) 10-11
10.2.3 General Output Register n (OUTDT0 to OUTDTn) 10-12
10.2.4 General Input Register n (INDT0 to INDTn) 10-13
10.2.5 Interrupt Display Register n (INTDT0 to INTDTn) 10-14
10.2.6 Interrupt Clear Register n (INTCLR0 to INTCLRn) 10-16
10.2.7 Interrupt Mask Register n (INTMSK0 to INTMSKn) 10-17
10.2.8 Interrupt Mask Clear Register n (MSKCLR0 to MSKCLRn) 10-18
10.2.9 Positive/Negative Logic Select Register n (POSNEG0 to POSNEGn) 10-19
10.2.10 Edge/level Select Register n (EDGLEVEL0 to EDGLEVELn) 10-20
10.2.11 Chattering Prevention On/Off Register n (FILONOFF0 to FILONOFFn) 10-21
10.2.12 Interrupt Sub Mask Register n (INTMSKS0 to INTMSKSn) 10-22
10.2.13 Interrupt Sub Mask Clear Register n (MSKCLRS0 to MSKCLRSn) 10-23
10.2.14 Output Data Select Register n (OUTDTSEL0 to OUTDTSELn) 10-24
10.2.15 Output Data High Register n (OUTDTH0 to OUTDTHn) 10-25
10.2.16 Output Data Low Register n (OUTDTL0 to OUTDTLn) 10-26
10.2.17 One Edge/Both Edge Select Register n (BOTHEDGE0 to BOTHEDGEn) 10-27
10.3 Operation 10-28
10.3.1 Port Pin Specifications 10-28
10.3.2 Operations in Each Mode 10-36
10.3.2.1 Mode Switching 10-36
10.3.2.2 General Input/Output Mode 10-36
10.3.2.3 Interrupt Input Mode 10-36
10.3.3 Handling of Input Signals on Port Pins 10-37
10.3.3.1 Chattering 10-37
10.3.3.2 Input Signal Synchronization 10-37
10.3.4 Interrupt Display Timing Charts 10-38
10.3.5 Using GPIO 10-39
10.3.5.1 Setting Edge-Sensitive Interrupt Input Mode 10-39
10.3.5.2 Setting Level-Sensitive Interrupt Input Mode 10-40
10.3.5.3 Setting General Output Mode 10-41
10.3.5.4 Setting Output data high/Output data low Mode 10-42
10.3.5.5 Setting General Input Mode 10-43

11. Clock Pulse Generator (CPG) 11-1
11.1 Overview 11-1
11.1.1 Features 11-1
11.1.2 Block Diagram 11-2
11.1.3 External Pins 11-7
11.1.4 List of Clock Outputs 11-9
11.1.5 Clock Operating Modes 11-19
11.1.6 Register Configuration 11-23
11.2 Register Description 11-25
11.2.1 CPG Write Protect Control Register (CPGWPCR) 11-25
11.2.2 CPG Write Protect Register (CPGWPR) 11-26
11.2.3 Frequency Control Register B (FRQCRB) 11-27
11.2.4 Frequency Control Register C (FRQCRC) 11-30
11.2.5 PLL Enable Control Register (PLLECR) 11-32
11.2.6 PLL0 Control Register (PLL0CR) 11-34
11.2.7 PLL2 Control Register (PLL2CR) 11-37
11.2.8 PLL3 Control Register (PLL3CR) 11-39
11.2.9 PLL4 Control Register (PLL4CR) 11-42
11.2.10 SD-IFn Clock Frequency Control Register (SDnCKCR, n = 0 to 3 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N], n = 0, 1, 3 [RZ/G2E]) 11-44
11.2.11 RPC-IF Clock Frequency Control Register (RPCCKCR) 11-46

11.2.12 CAN-FD Clock Frequency Control Register (CANFDCKCR) 11-49
11.2.13 MSIOF Clock Frequency Control Register (MSOCKCR) 11-50
11.2.14 HDMI-IF Clock Frequency Control Register (HDMICKCR) 11-51
11.2.15 CSI0 Clock Frequency Control Register (CSI0CKCR) 11-52
11.2.16 RCLK Frequency Control Register (RCKCR) 11-53
11.2.17 LV0 Clock Control Register (LV0CKCR) 11-55
11.2.18 LV1 Clock Control Register (LV1CKCR) 11-57
11.2.19 ZA2 Clock Control Register (ZA2CKCR) 11-58
11.2.20 ZA8 Clock Control Register (ZA8CKCR) 11-59
11.2.21 Z2D Clock Control Register (Z2DCKCR) 11-60
11.2.22 Frequency Control Register D (FRQCRD) 11-61
11.3 Operation 11-62
11.3.1 Changing Frequency 11-62
11.4 Usage Notes 11-63
11.4.1 Write protect function for CPG registers 11-63
11.4.2 Notes on Board Designing 11-64

12. Module Standby, Software Reset 12-1
12.1 Overview 12-1
12.1.1 Features 12-1
12.1.2 External Pins 12-1
12.1.3 Register Configuration 12-2
12.2 Register Description 12-6
12.2.1 Module Stop Status Register (MSTPSRn (n = 1 to 10)) 12-6
12.2.1.1 Module Stop Status Register 1 (MSTPSR1) 12-7
12.2.1.2 Module Stop Status Register 2 (MSTPSR2) 12-9
12.2.1.3 Module Stop Status Register 3 (MSTPSR3) 12-11
12.2.1.4 Module Stop Status Register 4 (MSTPSR4) 12-13
12.2.1.5 Module Stop Status Register 5 (MSTPSR5) 12-15
12.2.1.6 Module Stop Status Register 6 (MSTPSR6) 12-17
12.2.1.7 Module Stop Status Register 7 (MSTPSR7) 12-19
12.2.1.8 Module Stop Status Register 8 (MSTPSR8) 12-21
12.2.1.9 Module Stop Status Register 9 (MSTPSR9) 12-23
12.2.1.10 Module Stop Status Register 10 (MSTPSR10) 12-25
12.2.2 Module Stop Control Register (RMSTPCRn/SMSTPCRn (n = 1 to 10)) 12-27
12.2.2.1 Realtime Module Stop Control Register 1 (RMSTPCR1)/System Module Stop Control Register 1 (SMSTPCR1) 12-27
12.2.2.2 Realtime Module Stop Control Register 2 (RMSTPCR2)/System Module Stop Control Register 2 (SMSTPCR2) 12-29
12.2.2.3 Realtime Module Stop Control Register 3 (RMSTPCR3)/System Module Stop Control Register 3 (SMSTPCR3) 12-31
12.2.2.4 Realtime Module Stop Control Register 4 (RMSTPCR4)/System Module Stop Control Register 4 (SMSTPCR4) 12-33
12.2.2.5 Realtime Module Stop Control Register 5 (RMSTPCR5)/System Module Stop Control Register 5 (SMSTPCR5) 12-35
12.2.2.6 Realtime Module Stop Control Register 6 (RMSTPCR6)/System Module Stop Control Register 6 (SMSTPCR6) 12-37
12.2.2.7 Realtime Module Stop Control Register 7 (RMSTPCR7)/System Module Stop Control Register 7 (SMSTPCR7) 12-39
12.2.2.8 Realtime Module Stop Control Register 8 (RMSTPCR8)/System Module Stop Control Register 8 (SMSTPCR8) 12-41
12.2.2.9 Realtime Module Stop Control Register 9 (RMSTPCR9)/System Module Stop Control Register 9 (SMSTPCR9) 12-43

12.2.2.10 Realtime Module Stop Control Register 10 (RMSTPCR10)/System Module Stop Control Register 10 (SMSTPCR10) ... 12-45
12.2.3 Software Reset Register (SRCRn (n = 1 to 10)) ... 12-46
12.2.3.1 Software Reset Register 1 (SRCR1) ... 12-47
12.2.3.2 Software Reset Register 2 (SRCR2) ... 12-49
12.2.3.3 Software Reset Register 3 (SRCR3) ... 12-51

13. Advanced Power Management Unit for AP-System Core (APMU) ... 13-1
13.1 Overview ... 13-1
13.1.1 Features ... 13-1
13.1.2 External Pins ... 13-1
13.1.3 Register Configuration ... 13-2
13.1.4 Connected Module ... 13-4
13.2 Register Description ... 13-5
13.2.1 Cortex-A53/Cortex-A57 CPU*n* Power Status Control Register (CA53CPU*n*CR, CA57CPU*n*CR (*n* = 0 to 3)) ... 13-5
13.2.2 Cortex-A53/Cortex-A57 Common Power Control Register (CA53CPUCMCR, CA57CPUCMCR) ... 13-6
13.2.3 Cortex-A53/Cortex-A57 CPU Wake Up Control Register (CA53WUPCR, CA57WUPCR) ... 13-7
13.2.4 Cortex-A53/Cortex-A57 Power Status Register (CA53PSTR, CA57PSTR) ... 13-10
13.2.5 Cortex-A53/Cortex-A57 Debug Resource Reset Control Register (CA53DBGRCR, CA57DBGRCR) ... 13-15
13.3 Operation ... 13-17
13.3.1 Power Control ... 13-17

14. System Controller (SYSC) ... 14-1
14.1 Overview ... 14-1
14.1.1 Features ... 14-1
14.1.2 Block Diagram ... 14-2
14.1.3 External Pins ... 14-4
14.1.4 Register Configuration ... 14-4
14.1.5 Connected module ... 14-10
14.2 Register Description ... 14-11
14.2.1 Common Registers and Arm CPU related registers ... 14-11
14.2.1.1 SYSC Status Register (SYSCSR) ... 14-12
14.2.1.2 Interrupt Status Register (SYSCISR) ... 14-13
14.2.1.3 Interrupt Status Clear Register (SYSCISCR) ... 14-17
14.2.1.4 Interrupt Enable Register (SYSCIER) ... 14-20
14.2.1.5 Interrupt Mask Register (SYSCIMR) ... 14-24
14.2.1.6 Cortex-A57 Wake Up Mask Register (WUPMSKCA57) ... 14-27
14.2.1.7 Cortex-A53 Wake Up Mask Register (WUPMSKCA53) ... 14-29
14.2.1.8 External Event Request Status Register (SYSCEERSR) ... 14-31
14.2.1.9 External Event Request Status Clear Register (SYSCEERSCR) ... 14-33
14.2.1.10 External Event Request Status Enable Register (SYSCEERSER) ... 14-34
14.2.1.11 External Event Request Status Register2 (SYSCEERSR2) ... 14-35

14.2.1.12 External Event Request Status Clear Register2 (SYSCEERSCR2) 14-37
14.2.1.13 External Event Request Status Enable Register2 (SYSCEERSER2) 14-38
14.2.1.14 External Request Mask Register (SYSCEXTMASK) 14-39
14.2.1.15 Power Status Register n (PWRSRn) (n = 0/6) 14-40
14.2.1.16 Power Shutoff Status Register n (PWROFFSRn) (n = 0/6) 14-41
14.2.1.17 Power Resume Status Register n (PWRONSRn) (n = 0/6) 14-42
14.2.1.18 Power Shutoff/Resume Error Register n (PWRERn) (n = 0/6) 14-43
14.2.1.19 Power Pseudo Shutoff Register n (PWRPSEUn) (n = 0/6) 14-44
14.2.2 Power Control Registers for SCU of Cortex-A53, SCU of Cortex-A57, Video Processing, and Video Codec 14-45
14.2.2.1 Power Status Register n (PWRSRn) (n = 3/4/5/8/9) 14-46
14.2.2.2 Power Shutoff Control Register n (PWROFFCRn) (n = 3/4/5/8/9) 14-47
14.2.2.3 Power Shutoff Status Register n (PWROFFSRn) (n = 3/4/5/8/9) 14-48
14.2.2.4 Power Resume Control Register n (PWRONCRn) (n = 3/4/5/8/9) 14-49
14.2.2.5 Power Resume Status Register n (PWRONSRn) (n = 3/4/5/8/9) 14-50
14.2.2.6 Power Shutoff/Resume Error Register n (PWRERn) (n = 3/4/5/8/9) 14-51
14.2.2.7 Power Pseudo Shutoff Register n (PWRPSEUn) (n = 3/4/5/8/9) 14-52
14.2.3 Power Control Registers for 3D Graphics Engine 14-53
14.2.3.1 Power Status Register n (PWRSRn) (n = 2) 14-54
14.2.3.2 Power Shutoff Control Register n (PWROFFCRn) (n = 2) 14-55
14.2.3.3 Power Shutoff Status Register n (PWROFFSRn) (n = 2) 14-56
14.2.3.4 Power Resume Control Register n (PWRONCRn) (n = 2) 14-57
14.2.3.5 Power Resume Status Register n (PWRONSRn) (n = 2) 14-58
14.2.3.6 Power Shutoff/Resume Error Register n (PWRERn) (n = 2) 14-59
14.2.3.7 Power Pseudo Shutoff Register n (PWRPSEUn) (n = 2) 14-60
14.2.4 Power Control Registers for Video Codec 14-61
14.2.4.1 Power Status Register n (PWRSRn) (n = 10) 14-61
14.2.4.2 Power Shutoff Control Register n (PWROFFCRn) (n = 10) 14-62
14.2.4.3 Power Shutoff Status Register n (PWROFFSRn) (n = 10) 14-64
14.2.4.4 Power Resume Control Register n (PWRONCRn) (n = 10) 14-65
14.2.4.5 Power Resume Status Register n (PWRONSRn) (n = 10) 14-67
14.2.4.6 Power Shutoff/Resume Error Register n (PWRERn) (n = 10) 14-68
14.2.4.7 Power Pseudo Shutoff Register n (PWRPSEUn) (n = 10) 14-69
14.3 Operation 14-70
14.3.1 Power domain structure 14-70
14.3.2 Initial state of power domains 14-73
14.3.3 Power Control of Arm CPUs 14-73
14.3.4 Power Control of non Arm CPU modules 14-74
14.4 Usage Notes 14-75

15. Thermal Sensor/Chip Internal Voltage Monitor (THS/CIVM) 15-1
15.1 Overview 15-1
15.1.1 Features 15-1
15.1.2 Block Diagram 15-1
15.1.3 External Pins 15-3
15.1.4 Register Configuration 15-3
15.1.5 Connected Module 15-4
15.2 Register Description 15-5
15.2.1 Interrupt Status Register (IRQSTR) 15-6
15.2.2 Interrupt Mask Register (IRQMSK) 15-7
15.2.3 Threshold Edge/Level Register (IRQCTL) 15-8
15.2.4 Interrupt Enable Register (IRQEN) 15-9
15.2.5 Interrupt Temperature 1 Register (IRQTEMP1) 15-10
15.2.6 Interrupt Temperature 2 Register (IRQTEMP2) 15-10

15.2.7 Interrupt Temperature 3 Register (IRQTEMP3) 15-11
15.2.8 Control Register (THCTR) 15-12
15.2.9 Status Register (THSTR) 15-15
15.2.10 Temperature Register (TEMP) 15-16
15.2.11 Voltage Register (VOLT) 15-16
15.2.12 THCODE Parameter1 Register (THCODE1) 15-17
15.2.13 THCODE Parameter2 Register (THCODE2) 15-17
15.2.14 THCODE Parameter3 Register (THCODE3) 15-18
15.2.15 PTAT Parameter1 Register (PTAT1) 15-18
15.2.16 PTAT Parameter2 Register (PTAT2) 15-19
15.2.17 PTAT Parameter3 Register (PTAT3) 15-19
15.2.18 Software Correction Parameter Register (THSCP) 15-20
15.3 Operation 15-21
15.3.1 The Initial Sequence of Thermal Sensor/Chip Internal Voltage Monitor 15-21
15.3.1.1 Setting of Normal Mode 15-21
15.3.1.2 Normal Mode 15-23
15.3.2 Interrupt 15-24
15.3.3 Standby Mode 15-25
15.3.4 Software Reset 15-25
15.3.5 Power Voltage 15-27
15.3.6 Input/output Clock 15-27
15.4 Usage Note 15-28

16. Thermal Sensor (THS) 16-1
16.1 Overview 16-1
16.1.1 Features 16-1
16.1.2 Block Diagram 16-1
16.1.3 External Pins 16-2
16.1.4 Register Configuration 16-2
16.1.5 Connected Module 16-3
16.2 Register Description 16-4
16.2.1 Interrupt Status Register (STR) 16-4
16.2.2 Interrupt Enable Register (ENR) 16-5
16.2.3 Interrupt Mask Register (INT_MASK) 16-6
16.2.4 Positive/Negative Logic Select Register (POSNEG) 16-7
16.2.5 THS Control Register (THSCR) 16-8
16.2.6 THS Status Register (THSSR) 16-9
16.2.7 Interrupt Control Register (INTCTLR) 16-10
16.3 Operation 16-12
16.3.1 Initial Sequence of Thermal Sensor 16-12
16.3.2 Temperature Measurement Using Register (When CPCTL = 0) 16-13
16.3.3 Temperature Measurement Using Register (When CPCTL = 1) 16-13
16.3.4 Interrupt 16-14
16.3.5 Standby Mode 16-14
16.3.6 Software Reset 16-15
16.3.7 Power Voltage 16-16
16.3.8 Input/output Clock 16-16
16.3.9 The Temperature Measurement Using External Pins (RZ/G2E) 16-16
16.4 Usage Note 16-19

17. Reset (RST) 17-1
17.1 Overview 17-1
17.1.1 Features 17-1
17.1.2 Block Diagram 17-2

17.1.3 External Pins 17-5
17.1.4 Register Configuration 17-6
17.1.5 Connected module 17-11
17.2 Register Description 17-12
17.2.1 Mode Monitor Register (MODEMR) 17-12
17.2.2 Cortex-A57 Reset Control Register (CA57RESCNT) 17-15
17.2.3 Cortex-A53 Reset Control Register (CA53RESCNT) 17-17
17.2.4 Watchdog Timer Reset Control Register (WDTRSTCR) 17-19
17.2.5 PRESETOUT# Control Register (RSTOUTCR) 17-21
17.2.6 Cortex-A53 Boot Address Register (CA53BAR) 17-22
17.2.7 Cortex-A53 Boot Address Register2 (CA53BAR2) 17-24
17.2.8 Cortex-A57 Boot Address Register (CA57BAR) 17-25
17.2.9 Cortex-A57 Boot Address Register2 (CA57BAR2) 17-27
17.2.10 Cortex-A57 CPUn (n = 0 to 3[RZ/G2H], n = 0 and 1[RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]) Boot Address Register for 64-bit mode H (CA57CPUnBARH) 17-28
17.2.11 Cortex-A57 CPUn (n = 0 to 3[RZ/G2H], n = 0 and 1[RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]) Boot Address Register for 64-bit mode L (CA57CPUnBARL) 17-29
17.2.12 Cortex-A53 CPUn (n = 0 to 3[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0], n = 0 and 1[RZ/G2E]) Boot Address Register for 64-bit mode H (CA53CPUnBARH) 17-32
17.2.13 Cortex-A53 CPUn (n = 0 to 3[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0], n = 0 and 1[RZ/G2E]) Boot Address Register for 64-bit mode L (CA53CPUnBARL) 17-33
17.2.14 Standby Flag Register n (STBCHRn) (n = 0 to 7) 17-36
17.2.15 Soft Power On Reset Control Register (SRESCR) 17-37
17.2.16 SYS Reset Flag Register (SRSTFR) 17-38
17.3 Operation 17-39
17.3.1 Power-On Reset by PRESET# Pin 17-39
17.3.2 WDT reset 17-39

18. Interrupt Controller (INTC) 18-1
18.1 Overview 18-1
18.1.1 Features 18-1
18.1.2 Block Diagram 18-1
18.1.3 External Pins 18-1
18.1.4 Connected Module 18-2

19. Interrupt Controller (INTC-AP) 19-1
19.1 Overview 19-1
19.1.1 Features 19-1
19.1.2 Block Diagram 19-1
19.1.3 External Pins 19-1
19.1.4 Register Configuration 19-1
19.1.5 Connected Module 19-2
19.2 Register Description 19-3
19.3 Operation 19-4
19.3.1 INTC-AP Register Configuration and Function Description 19-4
19.3.2 Interrupts Mapping 19-5

20. Interrupt Controller (INTC-EX) 20-1
20.1 Overview 20-1
20.1.1 Features 20-1
20.1.2 Block Diagram 20-1
20.1.3 External Pins 20-2
20.1.4 Register Configuration 20-2
20.1.5 Connected Module 20-5

20.2 Register Description 20-6
20.2.1 Interrupt Request Status Register0 (INTREQ_STS0) 20-6
20.2.2 Interrupt Enable Status Register0 (INTEN_STS0) 20-7
20.2.3 Interrupt Enable Set Register0 (INTEN_SET0) 20-8
20.2.4 IRQn Detect Status Register (DETECT_STATUS) 20-9
20.2.5 IRQn Signal Level Monitor Register (MONITOR) 20-10
20.2.6 IRQn High Level Detect Status Register (HLVL_STS) 20-11
20.2.7 IRQn Low Level Detect Status Register (LLVL_STS) 20-12
20.2.8 IRQn Sync Rising Edge Detect Status Register (S_R_EDGE_STS) 20-13
20.2.9 IRQn Sync Falling Edge Detect Status Register (S_F_EDGE_STS) 20-14
20.2.10 IRQn Async Rising Edge Detect Status Register (A_R_EDGE_STS) 20-15
20.2.11 IRQn Async Falling Edge Detect Status Register (A_F_EDGE_STS) 20-16
20.2.12 IRQn Chattering Reduction Status Register (CHTEN_STS) 20-17
20.2.13 IRQn Configuration Register (CONFIG_n) 20-18
20.2.14 NMI Request Status Register 0 (NMIREQ_STS0) 20-20
20.2.15 NMI Enable Status Register 0 (NMIEN_STS0) 20-22
20.2.16 NMI Enable Set Register 0 (NMIEN_SET0) 20-24
20.2.17 NMI Detect Status Register (DETECT_STATUS_NMI) 20-26
20.2.18 NMI Signal Level Monitor Register (MONITOR_NMI) 20-29
20.2.19 NMI High Level Detect Status Register (HLVL_STS_NMI) 20-32
20.2.20 NMI Low Level Detect Status Register (LLVL_STS_NMI) 20-34
20.2.21 NMI Sync Rising Edge Detect Status Register (S_R_EDGE_STS_NMI) 20-36
20.2.22 NMI Sync Falling Edge Detect Status Register (S_F_EDGE_STS_NMI) 20-38
20.2.23 NMI Async Rising Edge Detect Status Register (A_R_EDGE_STS_NMI) 20-40
20.2.24 NMI Async Falling Edge Detect Status Register (A_F_EDGE_STS_NMI) 20-42
20.2.25 NMI Chattering Reduction Status Register (CHTEN_STS_NMI) 20-44
20.2.26 NMI Debounce Setting Register (DEB_SET_NMI) 20-45
20.2.27 NMI Configuration n Register (CONFIGn_NMI) 20-46
20.2.28 NMI Mask Lock Set Register (NMI_LCK) 20-47
20.2.29 NMI Lock Code Register (NMI_LCKCODE) 20-47
20.2.30 NMI Debug Control Enable Register (NMI_DBG) 20-48
20.2.31 NMI Debug Code Register (NMI_DBGCODE) 20-48
20.3 Operation 20-49
20.3.1 NMI Mask Lock Feature 20-49
20.3.2 Procedure of NMI Mask Lock 20-49

21. AXI-bus 21-1
21.1 Overview 21-1
21.1.1 Features 21-1
21.1.2 Block Diagram 21-2
21.1.3 External Pins 21-6
21.1.4 Register Configuration 21-7
21.2 Register Description 21-13
21.2.1 Address Split Control Register0 (ADSPLCR0) 21-13
21.2.2 Address Split Control Register1 (ADSPLCR1) 21-14
21.2.3 Address Split Control Register2 (ADSPLCR2) 21-15
21.2.4 Address Split Control Register3 (ADSPLCR3) 21-17
21.2.5 Decompression Area Configuration Register An (n = 0-15) (DCMPAREACRAn) 21-18
21.2.6 Decompression Area Configuration Register Bn (n = 0-15) (DCMPAREACRBn) 21-19
21.2.7 Decompression Shadow Area Configuration Register (DCMPSHDWCR) 21-19
21.2.8 Main Memory AXI Control Register (MMCR) 21-21
21.2.9 DRAM Protected Area Division Register n (n = 0-14) (DPTDIVCRn) 21-22
21.2.10 DRAM Protected Area Setting Register n (n = 0-15) (DPTCRn) 21-23
21.2.11 System RAM Protected Area Division Register n (n = 0-14) (SPTDIVCRn) 21-25

21.2.12 System RAM Protected Area Setting Register n (n = 0-15) (SPTCRn) 21-26
21.2.13 TR3 Control Register (TR3CR) 21-28
21.2.14 TR4 Control Register (TR4CR) 21-29
21.2.15 Secure Error Register Upper Address Register (SECADDRU_X) 21-30
21.2.16 Secure Error Register Lower Address Register (SECADDRL_X) 21-31
21.2.17 Secure Error Register (SECERR_X) 21-31
21.2.18 QOSCTRL SL INIT Register (QOSCTRL_SL_INIT) 21-32
21.2.19 QOSCTRL REF ARS Register (QOSCTRL_REF_ARS) 21-33
21.2.20 QOSCTRL REF ENBL Register (QOSCTRL_REF_ENBL) 21-34
21.2.21 QOSCTRL STATQC Register (QOSCTRL_STATQC) 21-35
21.2.22 QOSCTRL MEMBANK Register (QOSCTRL_MEMBANK) 21-36
21.2.23 QOSCTRL RAS Register (QOSCTRL_RAS) 21-37
21.2.24 QOSCTRL DANT Register (QOSCTRL_DANT) 21-38
21.2.25 QOSCTRL DANN LOW Register (QOSCTRL_DANN_LOW) 21-39
21.2.26 QOSCTRL DANN HIGH Register (QOSCTRL_DANN_HIGH) 21-40
21.2.27 QOSCTRL EMS LOW Register (QOSCTRL_EMS_LOW) 21-41
21.2.28 QOSCTRL EMS HIGH Register (QOSCTRL_EMS_HIGH) 21-43
21.2.29 QOSCTRL EARLYR Register (QOSCTRL_EARLYR) 21-45
21.2.30 QOSCTRL RACNT0 Register (QOSCTRL_RACNT0) 21-46
21.2.31 QOSCTRL INSFC Register (QOSCTRL_INSFC) 21-47
21.2.32 QOSCTRL RAEN Register (QOSCTRL_RAEN) 21-48
21.2.33 QOSCTRL STATGEN0 Register (QOSCTRL_STATGEN0) 21-49
21.2.34 QOSWT WTEN Register (QOSWT_WTEN) 21-50
21.2.35 QOSWT WTREF Register (QOSWT_WTREF) 21-51
21.2.36 QOSWT WTSET0 Register (QOSWT_WTSET0) 21-52
21.2.37 QOSWT WTSET1 Register (QOSWT_WTSET1) 21-53
21.2.38 QOSBW FIX QOS BANK0 Register n (QOSBW_FIX_QOS_BANK0) 21-54
21.2.39 QOSBW FIX QOS BANK1 Register n (QOSBW_FIX_QOS_BANK1) 21-58
21.2.40 QOSBW BE QOS BANK0 Register n 21-62
21.2.41 QOSBW BE QOS BANK1 Register n 21-64
21.2.42 CPU Domain Active Register n (CPU_ACTn) (n: 0 to 3) 21-66
21.2.43 Main Memory Secure Error Status Register (MMSECERRST) 21-67
21.2.44 Main Memory Secure Error Address Register0 (MMSECERRADDR0) 21-69
21.2.45 Main Memory Secure Error Address Register1 (MMSECERRADDR1) 21-70
21.3 Operation 21-71
21.3.1 DRAM Split/Linear Address mapping 21-71
21.3.2 Decompression of visual near lossless compressed image 21-73
21.3.3 QoS arbitration 21-73
21.3.4 Access protection for secure/safety regions 21-73
21.3.4.1 Memory Protection 21-73
21.4 Usage Notes 21-74
21.4.1 Change of the initial value of the register 21-74

22.2.13 PMB Status Register (IMPSTR) ... 22-24
22.2.14 PMB Error Address Register (IMPEAR) ... 22-25
22.2.15 uTLB Control Register n (IMUCTRn) ... 22-26
22.2.16 uTLB ASID Register n (IMUASIDn) ... 22-27
22.2.17 MMU System Control Register (IMSCTLR) ... 22-28
22.2.18 MMU Auxiliary Control Register (IMSAUXCTLR) ... 22-30
22.2.19 MMU Interrupt Status Register (IMSSTR) ... 22-31
22.2.20 MMU Performance Monitor Control Register (IMPFMCTR) ... 22-35
22.2.21 MMU Performance Monitor Total Translation Counter (IMPFMTOTAL) ... 22-37
22.2.22 MMU Performance Monitor Hit Counter (IMPFMHIT) ... 22-38
22.2.23 MMU Performance Monitor L3 Miss Counter (IMPFML3MISS) ... 22-39
22.2.24 MMU Performance Monitor L2 Miss Counter (IMPFML2MISS) ... 22-39
22.2.25 MMU Performance Monitor Miss Counter (IMPFMMISS) ... 22-40
22.3 Operation ... 22-41
22.3.1 Address Translation Sequence in micro-TLBs ... 22-41
22.3.2 Address Translation Sequence in the IPMMU ... 22-42
22.3.3 Address Space ... 22-44
22.3.4 Initialization Sequence ... 22-48
22.3.5 TLB Maintenance ... 22-49
22.3.6 Security Support ... 22-50
22.3.7 OS-ID support ... 22-50
22.3.8 Error Handling ... 22-51
22.3.9 Performance monitor ... 22-52
22.4 micro-TLB Assignment ... 22-53
22.4.1 micro-TLB Assignment ... 22-53
22.5 Usage Notes ... 22-62
22.5.1 IPMMU naming ... 22-62
22.5.2 IPMMU configuration ... 22-63
22.5.2.1 IPMMU configuration for FCPCS [RZ/G2H, RZ/G2M V3.0] ... 22-63
22.5.2.2 IPMMU configuration for 3DG [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0] ... 22-64
22.5.3 Restrictions for IPMMU ... 22-65
22.5.3.1 Page size and Section size usage in VMSAv8-32 ... 22-65
22.5.3.2 4KB page usage in VMSAv8-64 ... 22-65
22.5.3.3 Error Handling in VMSAv8-64 ... 22-65
22.5.3.4 Start Level for Page Table Walk ... 22-66
22.5.3.5 Virtual address space range ... 22-68
22.5.3.6 Treatments of ASID feature ... 22-68
22.5.3.7 Disabling the address translation by IPMMU ... 22-68
22.5.3.8 Restriction for DMAC transfer [RZ/G2M V1.3 only] ... 22-68
22.5.3.9 Restriction for OS-ID support [RZ/G2M V1.3 only] ... 22-68
22.5.3.10 Restriction for TLB location [RZ/G2M V1.3 only] ... 22-68
22.5.3.11 Restriction for TLB flush operation [RZ/G2M V1.3 only] ... 22-68
22.5.3.12 Restriction for IPMMU cache [RZ/G2M V1.3, RZ/G2N, RZ/G2E] ... 22-68
22.5.3.13 Restriction for PMB ... 22-68
22.5.3.14 Restriction for PMB with Stage 2 Translation [RZ/G2M V1.3 only] ... 22-69

23. Direct Memory Access Controller for System (SYS-DMAC) 23-1
23.1 Overview 23-1
23.1.1 Features 23-1
23.1.2 External Pins 23-3
23.1.3 Register Configuration 23-4
23.1.4 Connected Module 23-35
23.2 Register Description 23-36
23.2.1 DMA Interrupt Status Register for channels 0 to 15 (DMAISTA_0) 23-36
23.2.2 DMA Interrupt Status Register for channels 16 to 31 (DMAISTA_1) 23-38
23.2.3 DMA Interrupt Status Register for channels 32 to 47 (DMAISTA_2) 23-40
23.2.4 DMA Secure Control Register for channels 0 to 15 (DMASEC_0) 23-42
23.2.5 DMA Secure Control Register for channels 16 to 31 (DMASEC_1) 23-44
23.2.6 DMA Secure Control Register for channels 32 to 47 (DMASEC_2) 23-46
23.2.7 DMA Operation Register for channels 0 to 15 (DMAOR_0) 23-48
23.2.8 DMA Operation Register for channels 16 to 31 (DMAOR_1) 23-50
23.2.9 DMA Operation Register for channels 32 to 47 (DMAOR_2) 23-52
23.2.10 DMA Channel Clear Register for channels 0 to 15 (DMACHCLR_0) 23-54
23.2.11 DMA Channel Clear Register for channels 16 to 31 (DMACHCLR_1) 23-55
23.2.12 DMA Channel Clear Register for channels 32 to 47 (DMACHCLR_2) 23-56
23.2.13 DPRAM Secure Control Register for channels 0 to 15 (DMADPSEC_0) 23-57
23.2.14 DPRAM Secure Control Register for channels 16 to 31 (DMADPSEC_1) 23-58
23.2.15 DPRAM Secure Control Register for channels 32 to 47 (DMADPSEC_2) 23-59
23.2.16 DMA Source Address Registers 0 to 47 (DMASAR_0 to DMASAR_47) 23-60
23.2.17 DMA Destination Address Registers 0 to 47 (DMADAR_0 to DMADAR_47) 23-60
23.2.18 DMA Transfer Count Registers 0 to 47 (DMATCR_0 to DMATCR_47) 23-61
23.2.19 DMA Transfer Count Registers B_0 to 47 (DMATCRB_0 to DMATCRB_47) 23-61
23.2.20 DMA Transfer Size Registers 0 to 47 (DMATSR_0 to DMATSR_47) 23-62
23.2.21 DMA Transfer Size Registers B_0 to 47 (DMATSRB_0 to DMATSRB_47) 23-62
23.2.22 DMA Channel Control Registers 0 to 47 (DMACHCR_0 to DMACHCR_47) 23-63
23.2.23 DMA Channel Control Register B_0 to 47 (DMACHCRB_0 to DMACHCRB_47) 23-67
23.2.24 DMA Buffer Control Registers 0 to 47 (DMABUFCR_0 to DMABUFCR_47) 23-68
23.2.25 DMA Extended Resource Selectors 0 to 47 (DMARS_0 to DMARS_47) 23-69
23.2.26 DMA Descriptor Base Address Registers 0 to 47 (DMADPBASE_0 to DMADPBASE_47) 23-70
23.2.27 DMA Descriptor Control Registers 0 to 47 (DMADPCR_0 to DMADPCR_47) 23-71
23.2.28 DMA Fixed Source Address Registers 0 to 47 (DMAFIXSAR_0 to DMAFIXSAR_47) 23-71
23.2.29 DMA Fixed Destination Address Registers 0 to 47 (DMAFIXDAR_0 to DMAFIXDAR_47) 23-72
23.2.30 DMA Fixed Descriptor Base Address Registers 0 to 47 (DMAFIXDPBASE_0 to DMAFIXDPBASE_47) 23-72
23.2.31 Descriptor Memory (DescriptorMEM) 23-72
23.2.32 Secure Function Secure Status Register for channel 0 to 15 (DMASES_0) 23-73
23.2.33 Secure Function Secure Status Register for channel 16 to 31 (DMASES_1) 23-74
23.2.34 Secure Function Secure Status Register for channel 32 to 47 (DMASES_2) 23-75
23.2.35 Secure Function Slave Error Address Register for channel 0 to 15 (DMASEA_0) 23-76
23.2.36 Secure Function Slave Error Address Register for channel 16 to 31 (DMASEA_1) 23-76
23.2.37 Secure Function Slave Error Address Register for channel 32 to 47 (DMASEA_2) 23-77
23.2.38 Secure Function Error Master ID Register for channel 0 to 15 (DMAEMID_0) 23-77
23.2.39 Secure Function Error Master ID Register for channel 16 to 31 (DMAEMID_1) 23-78
23.2.40 Secure Function Error Master ID Register for channel 32 to 47 (DMAEMID_2) 23-78
23.3 Operation 23-79
23.3.1 DMA Transfer Requests 23-79
23.3.2 Channel Priority 23-84
23.3.3 Slow Speed Mode 23-84
23.3.4 Descriptor Memory 23-85
23.3.5 Transmission Flow 23-93

23.3.6 Total Size Transmission ... 23-95
23.3.7 Rate access control ... 23-95
23.4 Secure function ... 23-96
23.4.1 Secure function ... 23-96
23.5 Usage Notes ... 23-97

24. Booting ... 24-1
24.1 Overview ... 24-1
24.1.1 Features ... 24-1
24.1.2 External Pins ... 24-2
24.1.2.1 MD Pins ... 24-2
24.1.2.2 HyperFlash Boot Pins ... 24-4
24.1.2.3 Serial Flash Boot Pins ... 24-5
24.1.2.4 SCIF and HSCIF Download Mode Pins ... 24-5
24.1.2.5 eMMC Boot Pins ... 24-6
24.1.2.6 USB Download Mode Pins ... 24-6
24.1.3 Connected Module ... 24-7
24.2 Operation ... 24-8
24.2.1 Boot Operation Overview ... 24-8
24.2.2 Boot Address Control ... 24-9
24.2.3 Boot Parameters ... 24-10
24.2.4 Hyper/Serial ROM Using DMA Boot Sequence ... 24-11
24.2.5 eMMC Using DMA Boot Sequence ... 24-12
24.2.6 SCIF Download Mode ... 24-15
24.2.7 USB download mode ... 24-17
24.2.8 Boot ROM ... 24-18
24.3 Usage Note ... 24-19
24.3.1 IPL Address and Data Size Limitation ... 24-19
24.3.2 Cleanup ... 24-19
24.3.3 Pull-up/down settings ... 24-20
24.3.4 Dual channel Serial Flash(Dual QSPI) boot ... 24-20

25. External Bus Controller for EX-Bus (LBSC) ... 25-1
25.1 Overview ... 25-1
25.1.1 Features ... 25-1
25.1.2 Block Diagram ... 25-2
25.1.3 LBSC Areas ... 25-3
25.1.3.1 LBSC Support Areas ... 25-3
25.1.3.2 Functionality Supported in Each Area ... 25-4
25.1.4 Register Configuration ... 25-4
25.2 Register Description ... 25-6
25.2.1 Area 0 Control Register (CS0CTRL) ... 25-7
25.2.2 Area 1 Control Register (CS1CTRL) ... 25-8
25.2.3 Area 0 RD/WE Pulse Control Register (CSWCR0) ... 25-9
25.2.4 Area 1 RD/WE Pulse Control Register (CSWCR1) ... 25-11
25.2.5 Area 0 External Wait Control Register (CSPWCR0) ... 25-13
25.2.6 Area 1 External Wait Control Register (CSPWCR1) ... 25-14
25.2.7 External Wait Input Control Register (EXWTSYNC) ... 25-15
25.2.8 Area 0 Burst Control Register (CS0BSTCTL) ... 25-16
25.2.9 Area 0 Burst Pitch Set Register (CS0BTPH) ... 25-17
25.2.10 Area 1 Guard Setting Register (CS1GDST) ... 25-18
25.2.11 BSC Interrupt Source Status Register (BCINTSR) ... 25-19
25.2.12 BSC Interrupt Source Clear Register (BCINTCR) ... 25-20
25.2.13 BSC Interrupt Enable Register (BCINTMR) ... 25-21

25.2.14 External Wait Status Register (EXWTSTS) 25-22
25.2.15 EX-BUS Wait Timeout Detection Base Counter Register (EXBCT) 25-23
25.2.16 EX-BUS Wait Timeout Detection Counter Register (EXTCT) 25-24
25.2.17 EX-BUS Wait Timeout Detection Access Source Indication Register (EXTSR) 25-25
25.2.18 EX-BUS Wait Timeout Detection Address Indication Register (EXTADR) 25-26
25.3 Operation 25-27
25.3.1 SRAM Interface (Basic Functionality) 25-27
25.3.2 CPU (AXI Bus) → Burst ROM Interface 25-33
25.3.3 CPU (AXI Bus) → Byte Control SRAM Interface 25-35
25.3.4 Wait Timeout 25-35
25.4 Usage Notes 25-36
25.4.1 Pin Multiplexing 25-36

26. External Bus Controller for LPDDR4/DDR3L SDRAM (DBSC4) 26-1
26.1 Overview 26-1
26.1.1 Definition of Terms and Symbols 26-2
26.1.2 Block Diagram 26-4
26.2 Operation 26-7
26.2.1 Activation Sequence 26-7
26.2.1.1 Overview 26-7
26.2.2 Self-Refresh Sequence 26-8
26.2.2.1 Overview 26-8
26.2.3 SDRAM Power-Supply Backup Mode 26-8
26.2.3.1 Overview 26-8
26.2.4 Recovery from SDRAM Power-Supply Backup Mode 26-9
26.2.4.1 Overview 26-9
26.3 Clock Supply Path 26-10

27. System RAM 27-1
27.1 Overview 27-1
27.1.1 Features 27-1
27.1.2 Block Diagram 27-1
27.2 Operation 27-2
27.2.1 Address of System RAM 27-2

28. 3D Graphics Engine (3DGE) 28-1
28.1 Overview 28-1
28.1.1 Features 28-1
28.1.2 Block Diagram 28-2
28.1.3 Register Configuration 28-4
28.1.4 Connected Module 28-4
28.2 Operation 28-5
28.2.1 Initial Setting 28-5
28.2.1.1 Power and Clock Supply 28-5

29. CSI2 29-1
29.1 Overview 29-1
29.1.1 Features 29-2
29.1.2 Block Diagram 29-2
29.1.3 External Pins 29-6
29.1.4 Register Configuration 29-7
29.1.5 Connected Module 29-12
29.2 Register Description 29-13
29.2.1 Control Timing Select Register (TREF) 29-13

29.2.2 Software Reset Register (SRST) ... 29-14
29.2.3 PHY Operation Control Register (PHYCNT) ... 29-15
29.2.4 Checksum Control Register (CHKSUM) ... 29-16
29.2.5 Channel Data Type Select Register (VCDT) ... 29-17
29.2.6 Channel Data Type Select Register 2 (VCDT2) ... 29-19
29.2.7 Frame Data Type Select Register (FRDT) ... 29-21
29.2.8 Field Detection Control Register (FLD) ... 29-22
29.2.9 Automatic Standby Control Register (ASTBY) ... 29-24
29.2.10 Long Data Type Setting Register 0 (LNGDT0) ... 29-26
29.2.11 Long Data Type Setting Register 1 (LNGDT1) ... 29-27
29.2.12 Interrupt Enable Register (INTEN) ... 29-28
29.2.13 Interrupt Source Mask Register (INTCLOSE) ... 29-31
29.2.14 Interrupt Status Monitor Register (INTSTATE) ... 29-34
29.2.15 Interrupt Error Status Monitor Register (INTERRSTATE) ... 29-41
29.2.16 Short Packet Data Register (SHPDAT) ... 29-46
29.2.17 Short Packet Count Register (SHPCNT) ... 29-47
29.2.18 LINK Operation Control Register (LINKCNT) ... 29-48
29.2.19 Lane Swap Register (LSWAP) ... 29-49
29.2.20 PHY Test Interface Write Register (PHTW) ... 29-51
29.2.21 PHY Test Interface Read Register (PHTR) ... 29-52
29.2.22 PHY Test Interface Clear Register (PHTC) ... 29-53
29.2.23 PHY Frequency Control Register (PHYPLL) ... 29-54
29.2.24 PHY ESC Error Monitor Register (PHEERM) ... 29-55
29.2.25 PHY Clock Lane Monitor Register (PHCLM) ... 29-57
29.2.26 PHY Data Lane Monitor Register (PHDLM) ... 29-58
29.2.27 Packet Header 0 Monitor Register 0 (PH0M0) ... 29-60
29.2.28 Packet Header 0 Monitor Register 1 (PH0M1) ... 29-61
29.2.29 Packet Header 1 Monitor Register 0 (PH1M0) ... 29-62
29.2.30 Packet Header 1 Monitor Register 1 (PH1M1) ... 29-63
29.2.31 Packet Header 2 Monitor Register 0 (PH2M0) ... 29-64
29.2.32 Packet Header 2 Monitor Register 1 (PH2M1) ... 29-65
29.2.33 Packet Header 3 Monitor Register 0 (PH3M0) ... 29-66
29.2.34 Packet Header 3 Monitor Register 1 (PH3M1) ... 29-67
29.2.35 Packet Header R Monitor Register 0 (PHRM0) ... 29-67
29.2.36 Packet Header R Monitor Register 1 (PHRM1) ... 29-68
29.2.37 Packet Header R Monitor Register 2 (PHRM2) ... 29-68
29.2.38 Packet Header C Monitor Register 0 (PHCM0) ... 29-69
29.2.39 Packet Header C Monitor Register 1 (PHCM1) ... 29-69
29.2.40 CRC Monitor Register 0 (CRCM0) ... 29-70
29.2.41 CRC Monitor Register 1 (CRCM1) ... 29-70
29.2.42 SOT Error Count Register (SERRCNT) ... 29-71
29.2.43 SOTSYNC Error Count Register (SSERRCNT) ... 29-72
29.2.44 ECC_CRCT Count Register (ECCCM) ... 29-73
29.2.45 ECC_ERR Count Register (ECECM) ... 29-74
29.2.46 CRC_ERR Count Register (CRCECM) ... 29-74
29.2.47 Line Register (LCNT) ... 29-75
29.2.48 Line Register 2 (LCNT2) ... 29-75
29.2.49 Line Monitor Register (LCNTM) ... 29-76
29.2.50 Line Monitor Register 2 (LCNTM2) ... 29-76
29.2.51 Frame Count Monitor Register (FCNTM) ... 29-77
29.2.52 Frame Count Monitor Register 2 (FCNTM2) ... 29-77
29.2.53 PHY Data IN Monitor Register (PHYDIM) ... 29-78
29.2.54 PHY Input Monitor Register (PHYIM) ... 29-79
29.2.55 VIN Data Monitor Register (VINDM) ... 29-81

29.2.56 VIN Signal Monitor Register 1 (VINSM1) ... 29-82
29.2.57 VIN Signal Monitor Register 2 (VINSM2) ... 29-83
29.2.58 VIN Signal Monitor Register 3 (VINSM3) ... 29-84
29.2.59 PHY Output Monitor Register (PHYOM) ... 29-85
29.2.60 Packet Header Monitor Registers 1 to 8 (PHM1 to PHM8) ... 29-86
29.2.61 Packet Period Monitor Registers 1 to 8 (PPM1 to PPM8) ... 29-87
29.2.62 CSI0CLK Frequency Configuration Preset Register (CSI0CLK) ... 29-88
29.3 Operation ... 29-89
29.3.1 Transfer Rate ... 29-89
29.3.2 ECC 1-Bit Error Correction and 2-Bit or More Error Detection of a Packet Header ... 29-89
29.3.3 CRC Error Detection of a Payload Data Part ... 29-90
29.3.4 Generation of VD (vertical sync), HD (horizontal sync), and FLD (field) Signals ... 29-91
29.3.5 Four-Channel Output ... 29-92
29.3.6 Interrupts ... 29-93
29.3.7 Lane Swapping ... 29-97
29.3.8 Initial Setting of PHY ... 29-98
29.3.9 PHY Control and Monitoring through Register Setting ... 29-100
29.3.10 Interrupt Generation by ULP Status, and Reception Error Status ... 29-111
29.3.11 Monitoring Function ... 29-112
29.3.12 Standby Mode ... 29-113
29.3.13 Software Reset ... 29-113
29.3.14 Input Clock Signals ... 29-115
29.4 Usage Notes ... 29-116
29.4.1 MIPI CSI-2 Transfer Rate ... 29-116
29.4.2 PHY Operation Control Register (PHYCNT) ... 29-116
29.4.3 Channel Data Type Select Register VCDT and Channel Data Type Select Register VCDT2 ... 29-116
29.4.4 Synchronization Error during HS (Hi-Speed) Reception ... 29-116
29.4.5 FLD Signal ... 29-116
29.4.6 INT_LESS_THAN_WC ... 29-117
29.4.7 Transfer Rate of Interleaved Transmission ... 29-117
29.4.8 Lane Setting ... 29-118
29.4.9 V-blanking Period ... 29-118
29.4.10 Notes on data ... 29-118

30. Video Input Module (VIN) ... 30-1
30.1 Overview ... 30-1
30.1.1 Features ... 30-2
30.1.2 Block Diagram ... 30-8
30.1.3 External Pins ... 30-15
30.1.4 Register Configuration ... 30-19
30.1.5 Connected Module ... 30-47
30.2 Register Description ... 30-48
30.2.1 Video n Main Control Register (VnMC) ... 30-49
30.2.2 Video n Module Status Register (VnMS) ... 30-54
30.2.3 Video n Frame Capture Register (VnFC) ... 30-56
30.2.4 Video n Start Line Pre-Clip Register (VnSLPrC) ... 30-57
30.2.5 Video n End Line Pre-Clip Register (VnELPrC) ... 30-58
30.2.6 Video n Start Pixel Pre-Clip Register (VnSPPrC) ... 30-59
30.2.7 Video n End Pixel Pre-Clip Register (VnEPPrC) ... 30-60
30.2.8 Video n CSI2 Interface Mode Register (VnCSI_IFMD) ... 30-61
30.2.9 Video n Image Stride Register (VnIS) ... 30-68
30.2.10 Video n Memory Base 1 Register (VnMB1) ... 30-70
30.2.11 Video n Memory Base 2 Register (VnMB2) ... 30-71
30.2.12 Video n Memory Base 3 Register (VnMB3) ... 30-72

30.2.13 Video n Line Count Register (VnLC) ... 30-73
30.2.14 Video n Interrupt Enable Register (VnIE) ... 30-74
30.2.15 Video n Interrupt Status Register (VnINTS) ... 30-76
30.2.16 Video n Scanline Interrupt Register (VnSI) ... 30-79
30.2.17 Video n Data Mode Register (VnDMR) ... 30-80
30.2.18 Video n Data Mode Register 2 (VnDMR2) ... 30-84
30.2.19 Video n UV Address Offset Register (VnUVAOF) ... 30-86
30.2.20 YC-RGB Conversion Coefficient Registers ... 30-87
30.2.20.1 Video n Color Space Change Coefficient 1 Register (VnCSCC1) ... 30-88
30.2.20.2 Video n Color Space Change Coefficient 2 Register (VnCSCC2) ... 30-89
30.2.20.3 Video n Color Space Change Coefficient 3 Register (VnCSCC3) ... 30-90
30.2.20.4 Video n YC → RGB Calculation Setting Extension Register 1 (VnCSCE1) ... 30-91
30.2.20.5 Video n YC → RGB Calculation Setting Extension Register 2 (VnCSCE2) ... 30-92
30.2.20.6 Video n YC → RGB Calculation Setting Extension Register 3 (VnCSCRZ/G2E) ... 30-93
30.2.20.7 Video n YC → RGB Calculation Setting Extension Register 4 (VnCSCE4) ... 30-94
30.2.21 UDS Control Registers ... 30-95
30.2.21.1 Video n Scaling Control Register (VnUDS_CTRL) ... 30-95
30.2.21.2 Video n Scaling Factor Register (VnUDS_SCALE) ... 30-97
30.2.21.3 Video n Passband Register (VnUDS_PASS_BWIDTH) ... 30-101
30.2.21.4 Video n UDS Output Size Clipping Register (VnUDS_CLIP_SIZE) ... 30-103
30.2.22 Video n Lookup Table Pointer (VnLUTP) ... 30-105
30.2.23 Video n Lookup Table Data Register (VnLUTD) ... 30-106
30.2.24 RGB-YC Conversion Coefficient Registers ... 30-107
30.2.24.1 Video n RGB → Y Calculation Setting Register 1 (VnYCCR1) ... 30-107
30.2.24.2 Video n RGB → Y Calculation Setting Register 2 (VnYCCR2) ... 30-108
30.2.24.3 Video n RGB → Y Calculation Setting Register 3 (VnYCCR3) ... 30-109
30.2.24.4 Video n RGB → Cb Calculation Setting Register 1 (VnCBCCR1) ... 30-110
30.2.24.5 Video n RGB → Cb Calculation Setting Register 2 (VnCBCCR2) ... 30-111
30.2.24.6 Video n RGB → Cb Calculation Setting Register 3 (VnCBCCR3) ... 30-112
30.2.24.7 Video n RGB → Cr Calculation Setting Register 1 (VnCRCCR1) ... 30-113
30.2.24.8 Video n RGB → Cr Calculation Setting Register 2 (VnCRCCR2) ... 30-114
30.2.24.9 Video n RGB → Cr Calculation Setting Register 3 (VnCRCCR3) ... 30-115
30.3 Operation ... 30-116
30.3.1 Input Interface ... 30-116
30.3.2 Error Correction ... 30-125
30.3.3 Capture Mode ... 30-125
30.3.4 Size Clipping ... 30-126
30.3.5 Vertical Scaling ... 30-126
30.3.6 Horizontal Scaling ... 30-126
30.3.7 Color Conversion Function ... 30-127
30.3.8 Image Data Format Conversion Functions ... 30-130
30.3.9 Internal Field Signal Generation ... 30-133
30.3.10 Output Data Format ... 30-134
30.3.11 Endian Conversion ... 30-145
30.3.12 Module Standby Mode ... 30-147
30.3.13 Transition to Module Standby Mode ... 30-147
30.3.14 Cancellation of Module Standby Mode and Restarting of Video Input Module ... 30-147
30.3.15 Interrupts ... 30-147
30.3.16 Input and Output of YCbCr-422 Format ... 30-149
30.3.17 Initialize Procedure ... 30-156
30.3.18 Capture Stop Procedure ... 30-158
30.3.19 Capture Restarting procedure ... 30-159
30.4 Usage Notes ... 30-161
30.4.1 Specification ... 30-161

30.4.2 Limitations on Usage 30-167

31. Video Decoding Processor for inter-device video transfer (iVDP1C) 31-1
31.1 Overview 31-1
31.1.1 Features 31-2
31.1.2 Connected Module 31-4
31.2 Usage Notes 31-5
31.2.1 Limitations on Software Reset, Module Standby and power-shutoff 31-5
31.2.2 Note on input bitstream for decoding 31-5

32. Video Codec Processor (VCP4) 32-1
32.1 Overview 32-1
32.1.1 Features 32-4
32.1.2 Connected Module 32-11
32.2 Usage Notes 32-12
32.2.1 Limitations on Software Reset, Module Standby and power-shutoff 32-12
32.2.2 Note on input bitstream for decoding 32-12

33. Video Signal Processor (VSP2) 33-1
33.1 Overview 33-1
33.1.1 Features 33-1
33.1.1.1 Features of VSPI 33-2
33.1.1.2 Features of VSPBD [RZ/G2H] 33-3
33.1.1.3 Features of VSPBC [RZ/G2H] 33-3
33.1.1.4 Features of VSPB [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E] 33-4
33.1.1.5 Features of VSPD 33-5
33.1.1.6 Features of VSPDL [RZ/G2H, RZ/G2N] 33-5
33.1.2 Block diagram 33-7
33.1.2.1 Block diagram of each VSP 33-7
33.1.2.2 Memory Access Unit (MAU) 33-13
33.1.2.3 Command Transfer Unit (CTU) 33-13
33.1.2.4 Read Pixel Formatter (RPF) 33-13
33.1.2.5 Data Path Router (DPR) 33-14
33.1.2.6 Super Resolution Unit (SRU) 33-14
33.1.2.7 Up Down Scalar (UDS) 33-14
33.1.2.8 Look Up Table (LUT) 33-14
33.1.2.9 Blend ROP Unit (BRU) 33-15
33.1.2.10 Blend ROP Sub Unit (BRS) 33-16
33.1.2.11 Write Pixel Formatter (WPF) 33-17
33.1.2.12 Cubic Look Up table (CLU) 33-17
33.1.2.13 Hue Saturation value Transform (HST) 33-17
33.1.2.14 Hue Saturation value Inverse transform (HSI) 33-17
33.1.2.15 Histogram Generator -One dimension (HGO) 33-17
33.1.2.16 Histogram Generator-Two dimension (HGT) 33-18
33.1.2.17 Display Unit InterFace (LIF) 33-18
33.1.2.18 SHarPness (SHP) 33-18
33.1.2.19 InterLeaVer (ILV) 33-18
33.1.2.20 Detail Function 33-18
33.1.3 External Pins 33-24
33.1.4 Register Configuration 33-24
33.1.5 Connected Module 33-38
33.2 Register Description 33-39
33.2.1 Notational Conventions for Registers and Bit Fields 33-39
33.2.2 Register Classification 33-39

33.2.3 Restrictions on Access to Registers and Lookup Tables ... 33-40
33.2.4 General Control Registers ... 33-41
33.2.4.1 VSP2 Start Registers n (VI6_CMDn: n = 0, 1) ... 33-41
33.2.4.2 Clock Control Register 0 (VI6_CLK_CTRL0) ... 33-44
33.2.4.3 Clock Control Register 1 (VI6_CLK_CTRL1) ... 33-45
33.2.4.4 Dynamic Clock Stop Control Register (VI6_CLK_DCSWT) ... 33-46
33.2.4.5 Dynamic Clock Stop Disable Register 0 (VI6_CLK_DCSM0) ... 33-47
33.2.4.6 Dynamic Clock Stop Disable Register 1 (VI6_CLK_DCSM1) ... 33-48
33.2.4.7 Software Reset Register (VI6_SRESET) ... 33-49
33.2.4.8 Module Reset Enable Register 0 (VI6_MRESET_ENB0) ... 33-50
33.2.4.9 Module Reset Enable Register 1 (VI6_MRESET_ENB1) ... 33-51
33.2.4.10 Module Reset Issuing Register (VI6_MRESET) ... 33-52
33.2.4.11 Operating Status Register (VI6_STATUS) ... 33-53
33.2.4.12 WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0, 1) ... 33-54
33.2.4.13 WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0, 1) ... 33-55
33.2.4.14 Display-n Interrupt Enable Register (VI6_DISPn_IRQ_ENB: n = 0, 1) ... 33-57
33.2.4.15 Display-n Interrupt Status Register (VI6_DISPn_IRQ_STA: n = 0, 1) ... 33-58
33.2.5 Display List Control Registers ... 33-59
33.2.5.1 Display List Control Register (VI6_DL_CTRL) ... 33-59
33.2.5.2 Display List-n Header Address Register (VI6_DL_HDR_ADDRn: n = 0, 1) ... 33-61
33.2.5.3 Display List-n Data Swapping Register (VI6_DL_SWAPn: n = 0, 1) ... 33-62
33.2.5.4 Extended Display List-n Control Register (VI6_DL_EXT_CTRLn: n = 0, 1) ... 33-64
33.2.5.5 Display List Body Size Register-n (VI6_DL_BODY_SIZEn: n = 0) ... 33-65
33.2.5.6 Display List-n Header Reference Address Register (VI6_DL_HDR_REF_ADDRn: n = 0, 1) 33-66
33.2.6 RPF Control Registers ... 33-67
33.2.6.1 RPFn Basic Read Size Registers (VI6_RPFn_SRC_BSIZE) ... 33-67
33.2.6.2 RPFn Extended Read Size Registers (VI6_RPFn_SRC_ESIZE) ... 33-69
33.2.6.3 RPFn Input Format Registers (VI6_RPFn_INFMT) ... 33-70
33.2.6.4 RPFn Data Swapping Registers (VI6_RPFn_DSWAP) ... 33-80
33.2.6.5 RPFn Display Location Registers (VI6_RPFn_LOC) ... 33-82
33.2.6.6 RPFn α Plane Selection Control Registers (VI6_RPFn_ALPH_SEL) ... 33-84
33.2.6.7 RPFn Virtual Plane Color Information Registers (VI6_RPFn_VRTCOL_SET) ... 33-91
33.2.6.8 RPFn Mask Control Registers (VI6_RPFn_MSKCTRL) ... 33-92
33.2.6.9 RPFn IROP-SRC Input Value Registers 0 (VI6_RPFn_MSKSET0) ... 33-94
33.2.6.10 RPFn IROP-SRC Input Value Registers 1 (VI6_RPFn_MSKSET1) ... 33-95
33.2.6.11 RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL) ... 33-96
33.2.6.12 RPFn Color Keying Color Setting Registers-m (VI6_RPFn_CKEY_SETm: m = 0, 1) ... 33-98
33.2.6.13 RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE) ... 33-100
33.2.6.14 RPFn Source α Memory Stride Setting Registers (VI6_RPFn_SRCM_ASTRIDE) ... 33-102
33.2.6.15 RPFn Source Y/RGB Address Registers (VI6_RPFn_SRCM_ADDR_Y) ... 33-103
33.2.6.16 RPFn Source Chroma Address Registers 0 (VI6_RPFn_SRCM_ADDR_C0) ... 33-104
33.2.6.17 RPFn Source Chroma Address Registers 1 (VI6_RPFn_SRCM_ADDR_C1) ... 33-105
33.2.6.18 RPFn Source α Address Registers (VI6_RPFn_SRCM_ADDR_AI) ... 33-106
33.2.6.19 RPFn Bus Access Control Registers (VI6_RPFn_BAC) ... 33-107
33.2.6.20 RPFn Multiple Alpha Control (VI6_RPFn_MULT_ALPH) ... 33-108
33.2.7 WPF Control Registers ... 33-110
33.2.7.1 WPFn-Source-RPF Registers (VI6_WPFn_SRCRPF) ... 33-110
33.2.7.2 WPFn Horizontal Input Size Clipping Registers (VI6_WPFn_HSZCLIP) ... 33-112
33.2.7.3 WPFn Vertical Input Size Clipping Registers (VI6_WPFn_VSZCLIP) ... 33-114
33.2.7.4 WPFn Output Format Registers (VI6_WPFn_OUTFMT) ... 33-116
33.2.7.5 WPFn Data Swapping Registers (VI6_WPFn_DSWAP) ... 33-125
33.2.7.6 WPFn Rounding Control Registers (VI6_WPFn_RNDCTRL) ... 33-126
33.2.7.7 WPF0 Rotation Control Registers (VI6_WPF0_ROT_CTRL) ... 33-128

33.2.7.8 WPFn Destination Y Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_Y) . 33-129
33.2.7.9 WPFn Destination C Plane Memory Stride Registers (VI6_WPFn_DSTM_STRIDE_C) . 33-130
33.2.7.10 WPFn Destination Y/RGB Address Registers (VI6_WPFn_DSTM_ADDR_Y) 33-131
33.2.7.11 WPFn Destination Chroma Address Registers 0 (VI6_WPFn_DSTM_ADDR_C0) 33-134
33.2.7.12 WPFn Destination Chroma Address Registers 1 (VI6_WPFn_DSTM_ADDR_C1) 33-135
33.2.7.13 WPFn LIF Write Back Control Registers (VI6_WPFn_WRBCK_CTRL: n = 0, 1) 33-136
33.2.8 DPR Control Registers 33-137
33.2.8.1 Concept of DPR Settings 33-137
33.2.8.2 RPFn Routing Register (VI6_DPR_RPFn_ROUTE : n = 0, 1, 2, 3, 4) 33-141
33.2.8.3 WPFn Timing Control Register (VI6_DPR_WPFn_FPORCH: n = 0, 1) 33-142
33.2.8.4 {mod} Routing Register (VI6_DPR_{mod}_ROUTE: {mod} = ILV_BRS, SRU, UDS, LUT, CLU, HST, HSI, BRU, SHP) 33-143
33.2.8.5 {mod} Sampling Point Register (VI6_DPR_{mod}_SMPPT: {mod} = HGO, HGT) 33-144
33.2.9 SRU Control Registers 33-145
33.2.9.1 Super Resolution Control Register 0 (VI6_SRU_CTRL0) 33-145
33.2.9.2 Super Resolution Control Register 1 (VI6_SRU_CTRL1) 33-147
33.2.9.3 Super Resolution Control Register 2 (VI6_SRU_CTRL2) 33-148
33.2.10 UDS Control Registers 33-149
33.2.10.1 Scaling Control Registers (VI6_UDS_CTRL) 33-149
33.2.10.2 Scaling Factor Registers (VI6_UDS_SCALE) 33-152
33.2.10.3 α Data Threshold Setting Registers (VI6_UDS_ALPTH) 33-155
33.2.10.4 α Data Replacing Value Setting Registers (VI6_UDS_ALPVAL) 33-156
33.2.10.5 Passband Registers (VI6_UDS_PASS_BWIDTH) 33-157
33.2.10.6 Scaling Filter Horizontal Phase Registers (VI6_UDS_HPHASE) 33-158
33.2.10.7 2D IPC Setting Register (VI6_UDS_IPC) 33-159
33.2.10.8 UDS Horizontal Input Clipping Registers (VI6_UDS_HSZCLIP) 33-161
33.2.10.9 UDS Output Size Clipping Registers (VI6_UDS_CLIP_SIZE) 33-162
33.2.10.10 Color Fill Register (VI6_UDS_FILL_COLOR) 33-164
33.2.11 LUT Control Register 33-165
33.2.11.1 LUT Control Register (VI6_LUT_CTRL) 33-165
33.2.12 CLU Control Register 33-168
33.2.12.1 CLU Control Register (VI6_CLU_CTRL) 33-168
33.2.13 HST Control Register 33-172
33.2.13.1 HST Control Register (VI6_HST_CTRL) 33-172
33.2.14 HSI Control Register 33-173
33.2.14.1 HSI Control Register (VI6_HSI_CTRL) 33-173
33.2.15 BRU Control Registers 33-174
33.2.15.1 BRU Input Control Register (VI6_BRU_INCTRL) 33-174
33.2.15.2 Size Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_SIZE) 33-178
33.2.15.3 Display Location Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_LOC) 33-179
33.2.15.4 Color Information Register of BRU Input Virtual RPF (VI6_BRU_VIRRPF_COL) 33-180
33.2.15.5 BRU Control Registers (VI6_BRUm_CTRL: m = A, B, C, D, E) 33-182
33.2.15.6 BRU Blend Control Registers (VI6_BRUm_BLD: m = A, B, C, D, E) 33-184
33.2.15.7 BRU Raster Operation Control Register (VI6_BRU_ROP) 33-186
33.2.16 HGO Control Registers 33-187
33.2.16.1 HGO Detection Window Offset Register (VI6_HGO_OFFSET) 33-187
33.2.16.2 HGO Detection Window Size Register (VI6_HGO_SIZE) 33-189
33.2.16.3 HGO Mode Register (VI6_HGO_MODE) 33-190
33.2.16.4 HGO LB Detection Threshold Register (VI6_HGO_LB_TH) 33-194
33.2.16.5 HGO Horizontal Position Register for LB Detection Zone-n (VI6_HGO_LBn_H: n = 0, 1, 2, 3) 33-195
33.2.16.6 HGO Vertical Position Register for LB Detection Zone-n (VI6_HGO_LBn_V: n = 0, 1, 2, 3) 33-197

33.2.16.7 HGO Component-m Histogram Register (VI6_HGO_m_HISTO_n: n = 0 to 63: m = R, G, B) 33-198
33.2.16.8 HGO Component-m Min/Max Value Register (VI6_HGO_m_MAXMIN: m = R, G, B) . 33-200
33.2.16.9 HGO Component-m Sum Register (VI6_HGO_m_SUM: m = R, G, B) 33-201
33.2.16.10 HGO Component-m LB Detection Result Register (VI6_HGO_m_LB_DET: m = R, G, B) .. 33-202
33.2.16.11 HGO Y/MaxRGB Extended Histogram Address Register (VI6_HGO_EXT_HIST_ADDR) . 33-203
33.2.16.12 HGO Y/MaxRGB Extended Histogram Data Register (VI6_HGO_EXT_HIST_DATA) . 33-204
33.2.16.13 HGO Write Buffer Side (VI6_HGO_WBUFS) 33-205
33.2.16.14 HGO Read Buffer Side (VI6_HGO_RBUFS) 33-206
33.2.16.15 HGO Histogram Storing Address Register (VI6_HGO_HISTADD) 33-207
33.2.16.16 HGO Histogram Swapping Register (VI6_HGO_HSWAP) 33-208
33.2.16.17 HGO Parameter Register Reset (VI6_HGO_REGRST) 33-209
33.2.17 HGT Control Registers 33-210
33.2.17.1 HGT Detection Window Offset Register (VI6_HGT_OFFSET) 33-210
33.2.17.2 HGT Detection Window Size Register (VI6_HGT_SIZE) 33-212
33.2.17.3 HGT Mode Register (VI6_HGT_MODE) 33-213
33.2.17.4 HGT Hue Area Register (VI6_HGT_HUE_AREA_n: n = 0 to 5) 33-216
33.2.17.5 HGT LB Detection Threshold Register (VI6_HGT_LB_TH) 33-218
33.2.17.6 HGT Horizontal Position Register for LB Detection Zone-n (VI6_HGT_LBn_H : n = 0, 1, 2, 3) 33-219
33.2.17.7 HGT Vertical Position Register for LB Detection Zone-n (VI6_HGT_LBn_V: n = 0, 1, 2, 3)..... 33-221
33.2.17.8 HGT Histogram Register (VI6_HGT_HISTO_m_n: m = 0 to 5, n = 0 to 31) 33-222
33.2.17.9 HGT Max/Min Value Register (VI6_HGT_MAXMIN) 33-223
33.2.17.10 HGT Sum Register (VI6_HGT_SUM) 33-224
33.2.17.11 HGT LB Detection Result Register (VI6_HGT_LB_DET) 33-225
33.2.17.12 HGT Parameter Register Reset (VI6_HGT_REGRST) 33-226
33.2.17.13 HGT Write Buffer Side (VI6_HGT_WBUFS) 33-227
33.2.17.14 HGT Read Buffer Side (VI6_HGT_RBUFS) 33-228
33.2.17.15 HGT Histogram Storing Address Register (VI6_HGT_HISTADD) 33-229
33.2.17.16 HGT Histogram Swapping Register (VI6_HGT_HSWAP) 33-230
33.2.18 ILV Control Register 33-231
33.2.18.1 ILV Control Register (VI6_ILV_CTRL) 33-231
33.2.19 BRS Control Registers 33-233
33.2.19.1 BRS Input Control Register (VI6_BRS_INCTRL) 33-233
33.2.19.2 Size Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_SIZE) 33-236
33.2.19.3 Display Location Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_LOC) 33-237
33.2.19.4 Color Information Register of BRS Input Virtual RPF (VI6_BRS_VIRRPF_COL) 33-238
33.2.19.5 BRS Control Registers (VI6_BRSm_CTRL: m = A, B) 33-239
33.2.19.6 BRS Blend Control Registers (VI6_BRSm_BLD: m = A, B) 33-241
33.2.20 LIF Control Registers 33-243
33.2.20.1 LIFn Control Register (VI6_LIFn_CTRL) 33-243
33.2.20.2 LIFn Clock Stop Buffer Control Register (VI6_LIFn_CSBTH) 33-245
33.2.20.3 LIF0 Buffer Attribute Register (VI6_LIF0_LBA) 33-246
33.2.21 SHP control registers 33-247
33.2.21.1 SHP Control Register0 (VI6_SHP_CTRL0) 33-247
33.2.21.2 SHP Control Register1 (VI6_SHP_CTRL1) 33-250
33.2.21.3 SHP Control Register2 (VI6_SHP_CTRL2) 33-251
33.2.22 VSP internal registers 33-252
33.2.22.1 IP Version Register (VI6_IP_VERSION) 33-252
33.2.23 RPFn OSD-CLUT Table 33-253
33.2.24 LUT table 33-253

33.2.25 CLU table address register and table data register 33-253
33.3 Operation 33-254
33.3.1 Registers to set fixed value 33-254
33.3.2 Concept of VSP2 Operation Starting and Stopping 33-254
33.3.3 Display List 33-257
33.3.3.1 Functional Description 33-257
33.3.3.2 Normal Display List Mode 33-259
33.3.3.3 Header-less Display List Mode 33-265
33.3.3.4 Restrictions on Display List Usage 33-265
33.3.4 Interrupt Processing 33-265
33.3.5 Lookup Table Settings 33-266
33.3.5.1 OSD-CLUT or LUT 33-266
33.3.5.2 CLU Table 33-267
33.3.6 Linked with DU 33-270
33.3.6.1 Operation flow of VSPD and DU 33-270
33.3.6.2 Controlling Two Register Planes Using Display Lists 33-273
33.3.6.3 Auto display function (AUTO-DISP) 33-275
33.3.6.4 Auto field function (AUTO-FLD) 33-283
33.3.7 Image partition for VSPI processing 33-288
33.3.7.1 Necessity of image partition 33-288
33.3.7.2 Auto execution by using display list 33-290
33.3.7.3 Start Reservation for VSPI 33-292
33.3.7.4 Reading overlapped pixels and clipping discontinuous line 33-296
33.3.7.5 The number of taps for each function’s filter in horizontal direction 33-297
33.3.7.6 Horizontal size clipping registers for image partition 33-305
33.3.7.7 Histogram of HGO/HGT 33-306
33.3.7.8 Restriction when VSPI image partition is used 33-307
33.3.8 Start Reservation for VSPBD, VSPBC, VSPBS or VSPB 33-308
33.3.9 The step to read HGO histogram registers of 256 step mode by indirect addressing 33-310
33.4 Usage Notes 33-311
33.4.1 Assignment in Memory Space 33-311
33.4.2 Limitations on Software Reset and Module Standby 33-311
33.4.3 Input Image Size 33-311
33.4.4 Output Image Size 33-314
33.4.5 Configuration of VSP2 33-316
33.4.6 Performance of VSP2 33-321
33.4.6.1 Performance of VSPI 33-321
33.4.6.2 Performance of VSPBD, VSPBC or VSPB 33-321
33.4.6.3 Performance of VSPD or VSPDL 33-322
33.4.7 Legend of terms 33-323

35.3.1 Features 35-5
35.3.2 Block Diagram 35-7
35.3.3 IP Set and Bus Access Functions 35-7
35.3.4 Register Configuration 35-8
35.3.5 Connected Module 35-9
35.3.6 Register Description 35-10
35.3.6.1 FCP_VCR: FCP Version Control Register 35-10
35.3.6.2 FCP_CFG0: FCPV Configuration Register 0 35-11
35.3.6.3 FCP_RST: FCP Reset Register 35-12
35.3.6.4 FCP_STA: FCP Status Register 35-13
35.3.7 Operation 35-14
35.3.7.1 Operation Control Setting IP set VSPI+FCPVI 35-14
35.3.7.2 Operation Control Setting for IP set VSPB+FCPVB 35-15
35.3.7.3 Operation Control Setting for IP set VSPD+FCPVD, VSPDL+FCPVD 35-16
35.3.7.4 Reset Operation 35-17
35.3.7.5 Register Settings and Restrictions on Connected VSP 35-17
35.3.8 Memory Layout of FCNL Image Data 35-21
35.3.8.1 In Cases of VI6_WPF0_OUTFMT.ROT [2:0] = 0, 1, 2, 3, 6, 7 35-21
35.3.8.2 In Cases of VI6_WPF0_OUTFMT.ROT [2:0] = 4, 5 35-22
35.3.9 Usage Notes 35-23
35.3.9.1 Manipulating FCPV+VSP with CPG module stop, software reset 35-23
35.4 FCP for FDP (FCPF) 35-24
35.4.1 Features 35-24
35.4.2 Block Diagram 35-25
35.4.3 IP set and bus access functions 35-25
35.4.4 Register Configuration 35-26
35.4.5 Connected Module 35-28
35.4.6 Register Descriptions 35-29
35.4.6.1 FCP_VCR: FCP Version Control Register 35-29
35.4.6.2 FCP_RST: FCP Reset Register 35-30
35.4.6.3 FCP_STA: FCP Status Register 35-31

35.4.6.4 FCP_TL_CTRL: FCP Tile/Linear Control Register 35-32
35.4.6.5 FCP_PICINFO1: FCP Picture Information 1 35-33
35.4.6.6 FCP_BA_ANC_m {m: Y0, Y1, Y2, C}: FCP Base Address Ancillary information of plane m 35-34
35.4.6.7 FCP_BA_REF_m {m: Y0, Y1, Y2, C}: FCP Base Address Reference picture of plane m.. 35-35
35.4.7 Operation 35-36
35.4.7.1 Operation Control Setting for the IP set FCPF+FDP 35-36
35.4.7.2 Reset Operation 35-37
35.4.7.3 Register settings and restrictions on connected IP (FDP) 35-38
35.4.7.4 Decode data 35-40
35.4.7.5 FCNL image data 35-45
35.4.7.6 Operation status 35-45
35.4.8 Usage Notes 35-46
35.4.8.1 Manipulating FCPF+FDP with CPG module stop, software reset 35-46

36. Display Unit (DU) 36-1
36.1 Overview 36-1
36.1.1 Features 36-1
36.1.2 Block Diagram 36-4
36.1.3 External Pins 36-7
36.1.4 Register Configuration 36-13
36.1.5 Connected Module 36-27
36.2 Register Description 36-28
36.2.1 Display Unit System Control Registers 36-29
36.2.2 Display Timing Generation Registers 36-80
36.2.3 Display Attribute Registers 36-92
36.2.4 Display Plane Registers 36-97
36.2.5 Dual Display Output Control Registers 36-106
36.2.6 External Synchronization Control Registers 36-117
36.2.7 YC-RGB Conversion Coefficient Registers 36-124
36.3 Operation 36-133
36.3.1 Configuration of Output Screen 36-133
36.3.2 Display On/Off 36-134
36.3.3 Plane Parameter 36-135
36.3.4 Data Format for Input 36-136
36.3.5 Data Formats for Output 36-138
36.3.6 Superimposing of Planes 36-139
36.3.7 Sync Mode 36-140
36.3.8 Dual Display Output 36-142
36.3.9 YC Format Display 36-146
36.3.10 Display Timing Generation 36-149
36.3.11 CSYNC [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 36-151
36.3.12 Scan Method 36-152
36.3.13 Color Detection 36-156
36.3.14 External Sync Control [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 36-157
36.3.15 Output Signal Timing Adjustment 36-158
36.4 Usage Notes 36-159
36.4.1 Module Standby Mode 36-159
36.4.2 Transition to Module Standby Mode 36-159
36.4.3 Release from Module Standby Mode and Restarting Display 36-159
36.4.4 Acquisition of External Sync Signal [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 36-159
36.4.5 Restrictions on Changing the Synchronization of the External SYNC Signal [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 36-160
36.4.6 Note on Register Settings 36-160

36.4.7 Transition to Display operation stop by DRES bit in DSYSRn 36-160

41.2 Register Description ... 41-7
41.2.1 Control Register (SSICRn) ... 41-7
41.2.2 Status Register (SSISRn) ... 41-13
41.2.3 Transmit Data Register (SSITDRn) ... 41-17
41.2.4 Receive Data Register (SSIRDRn) ... 41-18
41.2.5 WS Mode Register (SSIWSRn) ... 41-19
41.2.6 FS Mode Register (SSIFMRn) ... 41-21
41.2.7 FS Status Register (SSIFSRn) ... 41-22
41.2.8 Control Register Extend (SSICREm) (m = 0 to 4, 9) ... 41-23
41.3 Operation ... 41-24
41.3.1 Bus Format ... 41-24
41.3.2 Operating Modes ... 41-41
41.3.3 Transmit Operation ... 41-42
41.3.4 Receive Operation ... 41-45
41.3.5 Serial Bit Clock Control ... 41-48
41.4 Usage Notes ... 41-49
41.4.1 Limitations from Overflow during Receive DMA Operation ... 41-49
41.4.2 Limitations on Combinations of Modes Related to Common Pins to SSI7 and SSI8 ... 41-49
41.4.3 Limitations on Slave Mode Operation ... 41-50

41.4.4 Limitations on Changes to Settings ... 41-50
41.4.5 Stopping or Resuming Transmission ... 41-50
41.4.6 Stable period of SCK and WS ... 41-51
41.4.7 About CLK_FS input clock ... 41-51

42. Audio Clock Generator (ADG) ... 42-1
42.1 Overview ... 42-1
42.1.1 Features ... 42-1
42.1.2 Block Diagram ... 42-2
42.1.3 External Pins ... 42-4
42.1.4 Register Configuration ... 42-5
42.1.5 Connected Module ... 42-7
42.2 Register Description ... 42-8
42.2.1 BRGA Baud Rate Setting Register (BRRA) ... 42-9
42.2.2 BRGB Baud Rate Setting Register (BRRB) ... 42-10
42.2.3 BRG Clock Select Register (BRGCKR) ... 42-11
42.2.4 Audio Clock Select Register 0 (AUDIO_CLK_SEL0) ... 42-13
42.2.5 Audio Clock Select Register 1 (AUDIO_CLK_SEL1) ... 42-17
42.2.6 Audio Clock Select Register 2 (AUDIO_CLK_SEL2) ... 42-21
42.2.7 Timing Signal Enable Register (TIM_EN) ... 42-23
42.2.8 SRC Input Timing Select Register 0 (SRCIN_TIMSEL0) ... 42-24
42.2.9 SRC Input Timing Select Register 1 (SRCIN_TIMSEL1) ... 42-28
42.2.10 SRC Input Timing Select Register 2 (SRCIN_TIMSEL2) ... 42-32
42.2.11 SRC Input Timing Select Register 3 (SRCIN_TIMSEL3) ... 42-36
42.2.12 SRC Input Timing Select Register 4 (SRCIN_TIMSEL4) ... 42-40
42.2.13 SRC Output Timing Select Register 0 (SRCOUT_TIMSEL0) ... 42-44
42.2.14 SRC Output Timing Select Register 1 (SRCOUT_TIMSEL1) ... 42-48
42.2.15 SRC Output Timing Select Register 2 (SRCOUT_TIMSEL2) ... 42-52
42.2.16 SRC Output Timing Select Register 3 (SRCOUT_TIMSEL3) ... 42-56
42.2.17 SRC Output Timing Select Register 4 (SRCOUT_TIMSEL4) ... 42-60
42.2.18 CMD Output Timing Select Register (CMDOUT_TIMSEL) ... 42-64
42.2.19 AVB Clock Select Register (AVBCKR) ... 42-69
42.2.20 AVB sync select Register 0 (AVB_SYNC_SEL0) ... 42-71
42.2.21 AVB sync select Register 1 (AVB_SYNC_SEL1) ... 42-72
42.2.22 AVB sync select Register 2 (AVB_SYNC_SEL2) ... 42-73
42.2.23 AVB sync divide Register 0 (AVB_SYNC_DIV0) ... 42-74
42.2.24 AVB sync divide Register 1 (AVB_SYNC_DIV1) ... 42-75
42.2.25 AVB clock divider comparison value register 0 (AVB_CLK_DIV0) ... 42-76
42.2.26 AVB clock divider comparison value register 1 (AVB_CLK_DIV1) ... 42-77
42.2.27 AVB clock divider comparison value register 2 (AVB_CLK_DIV2) ... 42-78
42.2.28 AVB clock divider comparison value register 3 (AVB_CLK_DIV3) ... 42-79
42.2.29 AVB clock divider comparison value register 4 (AVB_CLK_DIV4) ... 42-80
42.2.30 AVB clock divider comparison value register 5 (AVB_CLK_DIV5) ... 42-81
42.2.31 AVB clock divider comparison value register 6 (AVB_CLK_DIV6) ... 42-82
42.2.32 AVB clock divider comparison value register 7 (AVB_CLK_DIV7) ... 42-83
42.2.33 AVB clock divider configuration register (AVB_CLK_CONFIG) ... 42-84
42.3 Operation ... 42-85
42.4 Usage Notes ... 42-89
42.4.1 Note on using AUDIO_CLK and Input/Output timing signal in stable condition ... 42-89
42.4.2 Note on using ZA2ϕ ... 42-89

43. Sampling Rate Converter Unit (SCU) ... 43-1
43.1 Overview ... 43-1
43.1.1 Features ... 43-1

43.1.2 Block Diagram 43-3
43.1.3 External Pins 43-3
43.1.4 Register Configuration 43-4
43.1.5 Connected Module 43-13
43.2 Register Description 43-14
43.2.1 SRCm(in/out)_BUSIF_MODE Register (SRCm(in/out)_BUSIF_MODE) 43-15
43.2.2 SRCm_BUSIF_DALIGN Register (SRCm_BUSIF_DALIGN) 43-17
43.2.3 SRCn_BUSIF_DALIGN Register (SRCn_BUSIF_DALIGN) 43-21
43.2.4 SRCm_MODE Register (SRCm_MODE) 43-22
43.2.5 SRCm Control Register (SRCm_CONTROL) 43-23
43.2.6 SRCm Status Register (SRCm_STATUS) 43-24
43.2.7 SRCn Status Register (SRCn_STATUS) 43-26
43.2.8 SRCm Interrupt Enable Register 0 (SRCm_INT_ENABLE0) 43-27
43.2.9 SRCn Interrupt Enable Register 0 (SRCn_INT_ENABLE0) 43-29
43.2.10 CMDn out_BUSIF_MODE Register (CMDn out_BUSIF_MODE) 43-30
43.2.11 CMDn_BUSIF_DALIGN Register (CMDn_BUSIF_DALIGN) 43-32
43.2.12 CMDn_ROUTE_SELECT Register (CMDn_ROUTE_SELECT) 43-35
43.2.13 CMDn Control Register (CMDn_CONTROL) 43-37
43.2.14 SCU_SYSTEM Status Register 0 (SCU_SYSTEM_STATUS0) 43-38
43.2.15 SCU_SYSTEM Interrupt Enable Register 0 (SCU_SYSTEM_INT_ENABLE0) 43-41
43.2.16 SCU_SYSTEM Status Register 1 (SCU_SYSTEM_STATUS1) 43-43
43.2.17 SCU_SYSTEM Interrupt Enable Register 1 (SCU_SYSTEM_INT_ENABLE1) 43-46
43.2.18 SRCm Software Reset Register (SRCm_SWRSR) 43-48
43.2.19 SRCm SRC Initialization Register (SRCm_SRCIR) 43-49
43.2.20 SRCm Audio Information Register (SRCm_ADINR) 43-50
43.2.21 SRCm IFS Control Register (SRCm_IFSCR) 43-52
43.2.22 SRCm IFS Value Setting Register (SRCm_IFSVR) 43-53
43.2.23 SRCm SRC Control Register (SRCm_SRCCR) 43-54
43.2.24 SRCm Buffer Size DATA RAM Setting Register (SRCm_BSDSR) 43-55
43.2.25 SRCm Buffer Size DATA RAM Setting Register (SRCm_BSDSR) 43-56
43.2.26 SRCm Buffer Size IJEC RAM Setting Register (SRCm_BSISR) 43-57
43.2.27 CTUn Software Reset Register (CTUn_SWRSR) 43-58
43.2.28 CTUn CTU Initialization Register (CTUn_CTUIR) 43-59
43.2.29 CTUn Audio Information Register (CTUn_ADINR) 43-60
43.2.30 CTUn CTU Pass Mode Register (CTUn_CPMDR) 43-61
43.2.31 CTUn Scale Mode Register (CTUn_SCMDR) 43-66
43.2.32 CTUn Scale Value e00 Register (CTUn_SV00R) 43-67
43.2.33 CTUn Scale Value e01 Register (CTUn_SV01R) 43-68
43.2.34 CTUn Scale Value e02 Register (CTUn_SV02R) 43-69
43.2.35 CTUn Scale Value e03 Register (CTUn_SV03R) 43-70
43.2.36 CTUn Scale Value e04 Register (CTUn_SV04R) 43-71
43.2.37 CTUn Scale Value e05 Register (CTUn_SV05R) 43-72
43.2.38 CTUn Scale Value e06 Register (CTUn_SV06R) 43-73
43.2.39 CTUn Scale Value e07 Register (CTUn_SV07R) 43-74
43.2.40 CTUn Scale Value e10 Register (CTUn_SV10R) 43-75
43.2.41 CTUn Scale Value e11 Register (CTUn_SV11R) 43-76
43.2.42 CTUn Scale Value e12 Register (CTUn_SV12R) 43-77
43.2.43 CTUn Scale Value e13 Register (CTUn_SV13R) 43-78
43.2.44 CTUn Scale Value e14 Register (CTUn_SV14R) 43-79
43.2.45 CTUn Scale Value e15 Register (CTUn_SV15R) 43-80
43.2.46 CTUn Scale Value e16 Register (CTUn_SV16R) 43-81
43.2.47 CTUn Scale Value e17 Register (CTUn_SV17R) 43-82
43.2.48 CTUn Scale Value e20 Register (CTUn_SV20R) 43-83
43.2.49 CTUn Scale Value e21 Register (CTUn_SV21R) 43-84

43.2.50 CTUn Scale Value e22 Register (CTUn_SV22R) 43-85
43.2.51 CTUn Scale Value e23 Register (CTUn_SV23R) 43-86
43.2.52 CTUn Scale Value e24 Register (CTUn_SV24R) 43-87
43.2.53 CTUn Scale Value e25 Register (CTUn_SV25R) 43-88
43.2.54 CTUn Scale Value e26 Register (CTUn_SV26R) 43-89
43.2.55 CTUn Scale Value e27 Register (CTUn_SV27R) 43-90
43.2.56 CTUn Scale Value e30 Register (CTUn_SV30R) 43-91
43.2.57 CTUn Scale Value e31 Register (CTUn_SV31R) 43-92
43.2.58 CTUn Scale Value e32 Register (CTUn_SV32R) 43-93
43.2.59 CTUn Scale Value e33 Register (CTUn_SV33R) 43-94
43.2.60 CTUn Scale Value e34 Register (CTUn_SV34R) 43-95
43.2.61 CTUn Scale Value e35 Register (CTUn_SV35R) 43-96
43.2.62 CTUn Scale Value e36 Register (CTUn_SV36R) 43-97
43.2.63 CTUn Scale Value e37 Register (CTUn_SV37R) 43-98
43.2.64 MIXp Software Reset Register (MIXp_SWRSR) 43-99
43.2.65 MIXp MIX Initialization Register (MIXp_MIXIR) 43-100
43.2.66 MIXp Audio Information Register (MIXp_ADINR) 43-101
43.2.67 MIXp MIX Mode Register (MIXp_MIXMR) 43-102
43.2.68 MIXp MIX Volume Period Register (MIXp_MVPDR) 43-103
43.2.69 MIXp MIX Decibel A Register (MIXp_MDBAR) 43-105
43.2.70 MIXp MIX Decibel B Register (MIXp_MDBBR) 43-106
43.2.71 MIXp MIX Decibel C Register (MIXp_MDBCR) 43-107
43.2.72 MIXp MIX Decibel D Register (MIXp_MDBDR) 43-108
43.2.73 MIXp MIX Decibel Enable Register (MIXp_MDBER) 43-109
43.2.74 MIXp MIX Status Register (MIXp_MIXSR) 43-110
43.2.75 DVCp Software Reset Register (DVCp_SWRSR) 43-111
43.2.76 DVCp DVU Initialization Register (DVCp_DVUIR) 43-112
43.2.77 DVCp Audio Information Register (DVCp_ADINR) 43-113
43.2.78 DVCp DVU Control Register (DVCp_DVUCR) 43-115
43.2.79 DVCp Zero Cross Mute Control Register (DVCp_ZCMCR) 43-116
43.2.80 DVCp Volume Ramp Control Register (DVCp_VRCTR) 43-118
43.2.81 DVCp Volume Ramp Period Register (DVCp_VRPDR) 43-120
43.2.82 DVCp Volume Ramp Decibel Register (DVCp_VRDBR) 43-122
43.2.83 DVCp Volume Ramp Wait Time Register (DVCp_VRWTR) 43-123
43.2.84 DVCp Volume Value Setting 0 Register (DVCp_VOL0R) 43-124
43.2.85 DVCp Volume Value Setting 1 Register (DVCp_VOL1R) 43-125
43.2.86 DVCp Volume Value Setting 2 Register (DVCp_VOL2R) 43-126
43.2.87 DVCp Volume Value Setting 3 Register (DVCp_VOL3R) 43-127
43.2.88 DVCp Volume Value Setting 4 Register (DVCp_VOL4R) 43-128
43.2.89 DVCp Volume Value Setting 5 Register (DVCp_VOL5R) 43-129
43.2.90 DVCp Volume Value Setting 6 Register (DVCp_VOL6R) 43-130
43.2.91 DVCp Volume Value Setting 7 Register (DVCp_VOL7R) 43-131
43.2.92 DVCp DVU Enable Register (DVCp_DVUER) 43-132
43.2.93 DVCp DVU Status Register (DVCp_DVUSR) 43-133
43.2.94 DVCp Interrupt Enable Register (DVCp_DVIER) 43-135
43.2.95 SRCm in Write Data Register (SRCm in_BUSIF) 43-137
43.2.96 SRCm out Read Data Register (SRCm out_BUSIF) 43-137
43.2.97 CMDn out Read Data Register (CMDn out_BUSIF) 43-138
43.3 Operation 43-139
43.3.1 Procedure for Initializing the SCU 43-139
43.3.2 Procedure for Starting and Stopping Transfer by the SCU 43-142
43.3.3 Data Format for Data Transfer BUSIF 43-143
43.3.4 Changing Data Order in Channel Units 43-144
43.3.5 SRC Block 43-147

43.3.6 CMD Block 43-157
43.3.7 Functional Blocks in CMD 43-158
43.3.8 Input Data Timing and Output Data Timing 43-179
43.4 Usage Notes 43-180
43.4.1 Notes on Fixed Value related to SCU registers 43-180
43.4.2 Note on generation and selection of timing signal 43-180

44. Direct Memory Access Controller for Audio (Audio-DMAC) 44-1
44.1 Overview 44-1
44.1.1 Features 44-1
44.1.2 External Pins 44-2
44.1.3 Register Configuration 44-2
44.1.4 Connected Modules 44-19
44.2 Register Description 44-20
44.2.1 DMA Interrupt Status Register for Lower-Numbered Channels (DMAISTA_L) 44-20
44.2.2 DMA Interrupt Status Register for Higher-Numbered Channels (DMAISTA_U) 44-22
44.2.3 DMA Secure Control Register for Lower-Numbered Channels (DMASEC_L) 44-24
44.2.4 DMA Secure Control Register Higher-Numbered Channels (DMASEC_H) 44-26
44.2.5 DMA Operation Register for Lower-Numbered Channels (DMAOR_L) 44-28
44.2.6 DMA Operation Register for Higher-Numbered Channels (DMAOR_U) 44-30
44.2.7 DMA Channel Clear Register for Lower-Numbered Channels (DMACHCLR_L) 44-32
44.2.8 DMA Channel Clear Register for Higher-Numbered Channels (DMACHCLR_U) 44-33
44.2.9 DPRAM Secure Control Register for Lower-Numbered Channels (DMADPSEC_L) 44-34
44.2.10 DPRAM Secure Control Register for Higher-Numbered Channels (DMADPSEC_U) 44-35
44.2.11 DMA Source Address Registers 0 to 31 (DMASAR_0 to DMASAR_31) 44-36
44.2.12 DMA Destination Address Registers 0 to 31 (DMADAR_0 to DMADAR_31) 44-37
44.2.13 DMA Transfer Count Registers 0 to 31 (DMATCR_0 to DMATCR_31) 44-38
44.2.14 DMA Transfer Count Registers B_0 to 31 (DMATCRB_0 to DMATCRB_31) 44-39
44.2.15 DMA Transfer Size Registers 0 to 31 (DMATSR_0 to DMATSR_31) 44-39
44.2.16 DMA Transfer Size Registers B_0 to 31 (DMATSRB_0 to DMATSRB_31) 44-39
44.2.17 DMA Channel Control Registers 0 to 31 (DMACHCR_0 to DMACHCR_31) 44-41
44.2.18 DMA Channel Control Register B_0 to 31 (DMACHCRB_0 to DMACHCRB_31) 44-45
44.2.19 DMA Buffer Control Registers 0 to 31 (DMABUFCR_0 to DMABUFCR_31) 44-47
44.2.20 DMA Extended Resource Selectors 0 to 31 (DMARS_0 to DMARS_31) 44-48
44.2.21 DMA Descriptor Base Address Registers 0 to 31 (DMADPBASE_0 to DMADPBASE_31) 44-49
44.2.22 DMA Descriptor Control Registers 0 to 31 (DMADPCR_0 to DMADPCR_31) 44-50
44.2.23 DMA Fixed Source Address Registers 0 to 31 (DMAFIXSAR_0 to DMAFIXSAR_31) 44-51
44.2.24 DMA Fixed Destination Address Registers 0 to 31 (DMAFIXDAR_0 to DMAFIXDAR_31) 44-51
44.2.25 DMA Fixed Descriptor Base Address Registers 0 to 31 (DMAFIXDPBASE_0 to DMAFIXDPBASE_31) 44-52
44.2.26 Descriptor Memory (DescriptorMEM) 44-52
44.2.27 Secure function Secure Status register for channel 0 to 15 (DMASES_L) 44-53
44.2.28 Secure function Secure Status register for channel 16 to 31 (DMASES_U) 44-54
44.2.29 Secure function Salve Error Address register for channel 0 to 15 (DMASEDDR_L) 44-55
44.2.30 Secure function Salve Error Address register for channel 16 to 31 (DMASEDDR_U) 44-55
44.2.31 Secure function Error Master ID register for channel 0 to 15 (DMASEMID_L) 44-56
44.2.32 Secure function Error Master ID register for channel 16 to 31 (DMASEMID_U) 44-56
44.3 Operation 44-57
44.3.1 DMA Transfer Requests 44-57
44.3.2 Channel Priority 44-65
44.3.3 Slow Speed Mode 44-65
44.3.4 Descriptor Memory 44-65
44.3.5 Transmission Flow 44-74
44.3.6 Total Size Transmission 44-75

44.4 Usage Notes 44-77

45. Audio-DMAC-Peripheral-Peripheral (Audio-DMACpp) 45-1
45.1 Overview 45-1
45.1.1 Features 45-1
45.1.2 Block Diagram 45-2
45.1.3 External Pins 45-3
45.1.4 Register Configuration 45-4
45.1.5 Connected Module 45-5
45.2 Register Description 45-6
45.2.1 PDMA Source Address n Register (PDMASARn) 45-6
45.2.2 PDMA Destination Address n Register (PDMADARn) 45-7
45.2.3 PDMA Channel Control n Register (PDMACHCRn) 45-8
45.2.4 PDMA Source Address n Register (extended) (PDMASAREn) 45-9
45.2.5 PDMA Destination Address n Register (extended) (PDMADAREn) 45-10
45.2.6 PDMA Channel Control n Register (extended) (PDMACHCREn) 45-11
45.3 Operation 45-12
45.3.1 Register Settings 45-12
45.3.2 Setting Flow 45-19
45.4 Usage Notes 45-20

46. EthernetAVB-IF 46-1
46.1 Overview 46-1
46.1.1 Features 46-1
46.1.2 Block Diagram 46-2
46.1.3 External Pins 46-4
46.1.4 Register Configuration 46-5
46.1.5 Connected Module 46-10
46.2 Register Description 46-11
46.2.1 AVB-DMAC Mode Register (CCC) 46-11
46.2.2 Descriptor Base Address Table Register (DBAT) 46-13
46.2.3 Descriptor Base Address Load Request Register (DLR) 46-14
46.2.4 AVB-DMAC Status Register (CSR) 46-17
46.2.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21) 46-20
46.2.6 Error Status Register (ESR) 46-21
46.2.7 AVB-DMAC Product Specific Register (APSR) 46-23
46.2.8 Receive Configuration Register (RCR) 46-24
46.2.9 Receive Queue Configuration Register i (RQCi) (i = 0 to 4) 46-27
46.2.10 Receive Padding Configuration Register (RPC) 46-32
46.2.11 Reception Truncation Configuration register (RTC) 46-33
46.2.12 Unread frame counter warning level register (UFCW) 46-34
46.2.13 Unread frame counter stop level register (UFCS) 46-35
46.2.14 Unread Frame Counter Register i (UFCVi) (i = 0 to 4) 46-36
46.2.15 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4) 46-38
46.2.16 Separation Filter Offset Register (SFO) 46-39
46.2.17 Separation Filter Pattern Register i (SFPi) (i = 0 to 31) 46-40
46.2.18 Separation Filter Value register i (SFVi) (i = 0 to 1) 46-41
46.2.19 Separation Filter Mask Register i (SFMi) (i = 0 or 1) 46-42
46.2.20 Separation Filter Load register (SFL) 46-43
46.2.21 Current Incremental Address Register r (CIARr) (r = 0 to 17) 46-44
46.2.22 Last Incremental Address Register r (LIARr) (r = 0 to 17) 46-45
46.2.23 Transmit Configuration Register (TGC) 46-46
46.2.24 Transmit Configuration Control Register (TCCR) 46-48
46.2.25 Transmit Status Register (TSR) 46-51

46.2.26 E-MAC status FIFO Access register (MFA) 46-54
46.2.27 Time Stamp FIFO Access Register 0 (TFA0) 46-56
46.2.28 Time Stamp FIFO Access Register 1 (TFA1) 46-57
46.2.29 Time Stamp FIFO Access Register 2 (TFA2) 46-58
46.2.30 Version and Release Register (VRR) 46-59
46.2.31 CBS Increment Value Register c (CIVRc) (c = 0 or 1) 46-60
46.2.32 CBS Decrement Value Register c (CDVRc) (c = 0 or 1) 46-61
46.2.33 CBS Upper Limit Register c (CULc) (c = 0 or 1) 46-62
46.2.34 CBS Lower Limit Register c (CLLc) (c = 0 or 1) 46-63
46.2.35 Descriptor Interrupt Control Register (DIC) 46-64
46.2.36 Descriptor Interrupt Status Register (DIS) 46-66
46.2.37 Error Interrupt Control Register (EIC) 46-68
46.2.38 Error Interrupt Status Register (EIS) 46-71
46.2.39 Receive Interrupt Control Register 0 (RIC0) 46-76
46.2.40 Receive Interrupt Status Register 0 (RIS0) 46-78
46.2.41 Receive Interrupt Control Register 1 (RIC1) 46-80
46.2.42 Receive Interrupt Status Register 1 (RIS1) 46-84
46.2.43 Receive Interrupt Control Register 2 (RIC2) 46-91
46.2.44 Receive Interrupt Status Register 2 (RIS2) 46-95
46.2.45 Transmit Interrupt Control Register (TIC) 46-98
46.2.46 Transmit Interrupt Status Register (TIS) 46-101
46.2.47 Interrupt Summary Status Register (ISS) 46-105
46.2.48 Common Interrupt Enable register (CIE) 46-109
46.2.49 Reception Interrupt Control register 3 (RIC3) 46-111
46.2.50 Reception Interrupt Status register 3 (RIS3) 46-115
46.2.51 gPTP Configuration Control Register (GCCR) 46-120
46.2.52 gPTP Maximum Transit Time Configuration Register (GMTT) 46-123
46.2.53 gPTP Presentation Time Comparison Register (GPTC) 46-124
46.2.54 gPTP Timer Increment Configuration Register (GTI) 46-125
46.2.55 gPTP timer offset register i (GTOi) (i = 0 to 2) 46-126
46.2.56 gPTP Interrupt Control Register (GIC) 46-127
46.2.57 gPTP interrupt status register (GIS) 46-132
46.2.58 gPTP Captured Presentation Time register (GCPT) 46-139
46.2.59 gPTP Timer Capture Register i (GCTi) (i = 0 to 2) 46-140
46.2.60 gPTP Status Register (GSR) 46-141
46.2.61 gPTP Interrupt Enable register (GIE) 46-146
46.2.62 gPTP Interrupt Disable register (GID) 46-150
46.2.63 gPTP Interrupt Line selection register (GIL) 46-154
46.2.64 gPTP Avtp Capture Prescaler register (GACP) 46-158
46.2.65 gPTP Presentation Time FIFO register i (GPTFi) (i = 0 to 3) 46-159
46.2.66 gPTP Captured Avtp Time register i (GCATi) (i = 0 to 15) 46-160
46.2.67 Descriptor Interrupt Line selection register (DIL) 46-161
46.2.68 Error Interrupt Line selection register (EIL) 46-163
46.2.69 Transmission Interrupt Line selection register (TIL) 46-165
46.2.70 Descriptor Interrupt Enable register (DIE) 46-166
46.2.71 Descriptor Interrupt Disable register (DID) 46-169
46.2.72 Error Interrupt Enable register (EIE) 46-172
46.2.73 Error Interrupt Disable register (EID) 46-174
46.2.74 Reception Interrupt Enable register 0 (RIE0) 46-176
46.2.75 Reception Interrupt Disable register 0 (RID0) 46-179
46.2.76 Reception Interrupt Enable register 1 (RIE1) 46-182
46.2.77 Reception Interrupt Disable register 1 (RID1) 46-185
46.2.78 Reception Interrupt Enable register 2 (RIE2) 46-188
46.2.79 Reception Interrupt Disable register 2 (RID2) 46-191

46.2.80 Transmission Interrupt Enable register (TIE) 46-194
46.2.81 Transmission Interrupt Disable register (TID) 46-196
46.2.82 Reception Interrupt Enable register 3 (RIE3) 46-198
46.2.83 Reception Interrupt Disable register 3 (RID3) 46-201
46.2.84 E-MAC Mode Register (ECMR) 46-204
46.2.85 Receive Frame Length Register (RFLR) 46-207
46.2.86 E-MAC Status Register (ECSR) 46-208
46.2.87 E-MAC Interrupt Permission Register (ECSIPR) 46-210
46.2.88 PHY Interface Register (PIR) 46-211
46.2.89 PHY Status Register (PSR) 46-212
46.2.90 PHY_INT Polarity Register (PIPR) 46-213
46.2.91 Automatic PAUSE frame register (APR) 46-214
46.2.92 Manual PAUSE Frame Register (MPR) 46-215
46.2.93 PAUSE Frame Transmit Counter (PFTCR) 46-216
46.2.94 PAUSE Frame Receive Counter (PFRCR) 46-217
46.2.95 Automatic PAUSE frame retransmit count register (TPAUSER) 46-218
46.2.96 PAUSE frame transmit times counter (PFTTCR) 46-219
46.2.97 E-MAC Mode Register 2 (GECMR) 46-220
46.2.98 E-MAC Address High Register (MAHR) 46-221
46.2.99 E-MAC Address Low Register (MALR) 46-222
46.2.100 Transmit retry over counter register (TROCR) 46-223
46.2.101 CRC Error Frame Receive Counter Register (CEFCR) 46-224
46.2.102 Frame Receive Error Counter Register (FRECR) 46-225
46.2.103 Too-Short Frame Receive Counter Register (TSFRCR) 46-226
46.2.104 Too-Long Frame Receive Counter Register (TLFRCR) 46-227
46.2.105 Residual-Bit Frame Receive Counter Register (RFCR) 46-228
46.2.106 Multicast Address Frame Receive Counter Register (MAFCR) 46-229
46.3 Operation 46-230
46.3.1 AVB-DMAC Operating Modes 46-231
46.3.2 Common Control for Transmission and Reception 46-235
46.3.3 Descriptors 46-243
46.3.4 Control in Reception 46-255
46.3.5 Transmission Control 46-270
46.3.6 CBS (Credit-Based Shaping) 46-285
46.3.7 Time Synchronization 46-291
46.3.8 Support for IEEE 1722 46-294
46.3.9 Flow Control 46-305
46.3.10 Magic Packet Detection 46-306
46.3.11 Interrupts 46-307
46.3.12 Flows of Operations 46-313
46.3.13 Connection to PHY-LSI 46-326
46.3.14 Usage Notes 46-331
46.4 Usage Notes 46-332
46.4.1 Checksum Calculation of Ethernet Frames 46-332
46.4.2 Data Transfer Function Stops after Read Access Error 46-333
46.4.3 Power Down Request 46-334

47. Controller Area Network Interface (CAN interface) 47-1
47.1 Overview 47-1
47.1.1 Features 47-1
47.1.2 Block Diagram 47-3
47.1.3 External Pins 47-5
47.1.4 Connected Module 47-5
47.1.5 Register Configuration 47-6

47.2 Register Description ... 47-10
47.2.1 CANi Control Register (CiCTLR) (i = 0, 1) ... 47-10
47.2.2 CANi Clock Select Register (CiCLKR) (i = 0, 1) ... 47-15
47.2.3 CANi Bit Configuration Register (CiBCR) (i = 0, 1) ... 47-16
47.2.4 CANi Mask Register k (CiMKRk) (i = 0, 1; k = 0 to 9) ... 47-18
47.2.5 CANi FIFO Received ID Compare Registers (CiFIDCR0 and CiFIDCR1) (i = 0, 1) ... 47-20
47.2.6 CANi Mask Invalid Registers (CiMKIVLR0 and CiMKIVLR1) (i = 0, 1) ... 47-22
47.2.7 CANi Mailbox Register j (CiMBj) (i = 0, 1; j = 0 to 63) ... 47-24
47.2.8 CANi Mailbox Interrupt Enable Registers (CiMIER0 and CiMIER1) (i = 0, 1) ... 47-28
47.2.9 CANi Message Control Register j (CiMCTLj) (i = 0, 1; j = 0 to 63) ... 47-31
47.2.10 CANi Receive FIFO Control Register (CiRFCR) (i = 0, 1) ... 47-36
47.2.11 CANi Receive FIFO Pointer Control Register (CiRFPCR) (i = 0, 1) ... 47-39
47.2.12 CANi Transmit FIFO Control Register (CiTFCR) (i = 0, 1) ... 47-40
47.2.13 CANi Transmit FIFO Pointer Control Register (CiTFPCR) (i = 0, 1) ... 47-43
47.2.14 CANi Status Register (CiSTR) (i = 0, 1) ... 47-44
47.2.15 CANi Mailbox Search Mode Register (CiMSMR) (i = 0, 1) ... 47-47
47.2.16 CANi Mailbox Search Status Register (CiMSSR) (i = 0, 1) ... 47-48
47.2.17 CANi Channel Search Support Register (CiCSSR) (i = 0, 1) ... 47-50
47.2.18 CANi Acceptance Filter Support Register (CiAFSR) (i = 0, 1) ... 47-51
47.2.19 CANi Error Interrupt Enable Register (CiEIER) (i = 0, 1) ... 47-52
47.2.20 CANi Error Interrupt Factor Judge Register (CiEIFR) (i = 0, 1) ... 47-54
47.2.21 CANi Receive Error Count Register (CiRECR) (i = 0, 1) ... 47-58
47.2.22 CANi Transmit Error Count Register (CiTECR) (i = 0, 1) ... 47-59
47.2.23 CANi Error Code Store Register (CiECSR) (i = 0, 1) ... 47-60
47.2.24 CANi Time Stamp Register (CiTSR) (i = 0, 1) ... 47-62
47.2.25 CANi Test Control Register (CiTCR) (i = 0, 1) ... 47-63
47.2.26 CANi Interrupt Status Register (CiISR) (i = 0, 1) ... 47-66
47.2.27 CANi Interrupt Enable Register (CiIER) (i = 0, 1) ... 47-68
47.2.28 CANi Mailbox Search Mask Register (CiMBSMR) (i = 0, 1) ... 47-69
47.2.29 CANi Parity Error Control Register (CiPECR) (i = 0, 1) ... 47-70
47.2.30 CANi Parity Error Address Capture Register (CiPEACR) (i = 0, 1) ... 47-72
47.3 Operating Mode ... 47-73
47.3.1 CAN Reset Mode ... 47-74
47.3.2 CAN Halt Mode ... 47-75
47.3.3 CAN Sleep Mode ... 47-76
47.3.4 CAN Operation Mode (Excluding Bus-Off State) ... 47-76
47.3.5 CAN Operation Mode (Bus-Off State) ... 47-77
47.4 CAN Communication Speed Configuration ... 47-78
47.4.1 CAN Clock Configuration ... 47-78
47.4.2 Bit Timing Configuration ... 47-78
47.4.3 Bit-rate ... 47-79
47.5 Mailbox and Mask Register Structure ... 47-80
47.6 Acceptance Filtering and Masking Function ... 47-82
47.7 Reception and Transmission ... 47-85
47.7.1 Reception ... 47-86
47.7.2 Transmission ... 47-88
47.8 CAN Interrupt ... 47-89
47.9 CAN module can support Parity Check ... 47-93
47.9.1 Overview ... 47-93
47.9.2 Recommend Usage ... 47-93
47.9.3 Failure Control ... 47-93

48. CAN-FD ... 48-1
48.1 Overview ... 48-1

48.1.1 Functional Overview ... 48-1
48.1.2 Interface Mode ... 48-5
48.2 Block Diagram ... 48-6
48.3 External Pins ... 48-7
48.4 Connected module ... 48-7
48.5 Features of RS-CANFD ... 48-8
48.5.1 Register Base Address ... 48-8
48.6 Registers Configuration (classical CAN mode) ... 48-9
48.6.1 List of Registers ... 48-9
48.7 Register Description (classical CAN mode) ... 48-15
48.7.1 Details of Interface Mode Related Registers ... 48-15
48.7.1.1 RSCFDnCFDGRMCFG - Global Interface Mode Select Register ... 48-15
48.7.2 Details of Channel Related Registers ... 48-16
48.7.2.1 RSCFDnCmCFG — Channel Configuration Register (m = 0, 1) ... 48-16
48.7.2.2 RSCFDnCmCTR — Channel Control Register (m = 0 or 1) ... 48-18
48.7.2.3 RSCFDnCmSTS — Channel Status Register (m = 0 or 1) ... 48-23
48.7.2.4 RSCFDnCmERFL — Channel Error Flag Register (m = 0 or 1) ... 48-25
48.7.3 Details of Global Related Registers ... 48-29
48.7.3.1 RSCFDnGCFG - Global Configuration Register ... 48-29
48.7.3.2 RSCFDnGCTR — Global Control Register ... 48-32
48.7.3.3 RSCFDnGSTS — Global Status Register ... 48-34
48.7.3.4 RSCFDnGERFL — Global Error Flag Register ... 48-35
48.7.3.5 RSCFDnGTSC — Global Timestamp Counter Register ... 48-37
48.7.3.6 RSCFDnGTINTSTS0 — Global TX Interrupt Status Register 0 ... 48-38
48.7.3.7 RSCFDnGTINTSTS1 — Global TX Interrupt Status Register 1 ... 48-41
48.7.4 Details of Receive Rule Related Registers ... 48-42
48.7.4.1 RSCFDnGAFLECTR — Receive Rule Entry Control Register ... 48-42
48.7.4.2 RSCFDnGAFLCFG0 — Receive Rule Configuration Register 0 ... 48-43
48.7.4.3 RSCFDnGAFLCFG1 — Receive Rule Configuration Register 1 ... 48-44
48.7.4.4 RSCFDnGAFLIDj — Receive Rule ID Register (j = 0 to 15) ... 48-45
48.7.4.5 RSCFDnGAFLMj — Receive Rule Mask Register (j = 0 to 15) ... 48-47
48.7.4.6 RSCFDnGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15) ... 48-48
48.7.4.7 RSCFDnGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15) ... 48-50
48.7.5 Details of Receive Buffer Related Registers ... 48-51
48.7.5.1 RSCFDnRMNB - Receive Buffer Number Register ... 48-51
48.7.5.2 RSCFDnRMNDy — Receive Buffer New Data Register (y = 0) ... 48-52
48.7.5.3 RSCFDnRMIDq — Receive Buffer ID Register (q = 0 to 31) ... 48-53
48.7.5.4 RSCFDnRMPTRq — Receive Buffer Pointer Register (q = 0 to 31) ... 48-54
48.7.5.5 RSCFDnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 31) ... 48-55
48.7.5.6 RSCFDnRMDF1_q — Receive Buffer Data Field 1 Register (q = 0 to 31) ... 48-56
48.7.6 Details of Receive FIFO Buffer Related Registers ... 48-57
48.7.6.1 RSCFDnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) 48-57
48.7.6.2 RSCFDnRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) ... 48-59
48.7.6.3 RSCFDnRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) ... 48-61
48.7.6.4 RSCFDnRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7) ... 48-62
48.7.6.5 RSCFDnRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7) ... 48-63
48.7.6.6 RSCFDnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7) ... 48-64
48.7.6.7 RSCFDnRFDF1_x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7) ... 48-65
48.7.7 Details of Transmit/Receive FIFO Buffer Related Registers ... 48-66
48.7.7.1 RSCFDnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5) ... 48-66
48.7.7.2 RSCFDnCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5) ... 48-70
48.7.7.3 RSCFDnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5) ... 48-74

48.7.7.4 RSCFDnCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5) 48-76
48.7.7.5 RSCFDnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5) 48-78
48.7.7.6 RSCFDnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register (k = 0 to 5) 48-80
48.7.7.7 RSCFDnCFDF1_k — Transmit/receive FIFO Buffer Access Data Field 1 Register (k = 0 to 5) 48-81
48.7.8 Details of FIFO Status Related Registers 48-82
48.7.8.1 RSCFDnFESTS — FIFO Empty Status Register 48-82
48.7.8.2 RSCFDnFFSTS — FIFO Full Status Register 48-84
48.7.8.3 RSCFDnFMSTS — FIFO Message Lost Status Register 48-86
48.7.8.4 RSCFDnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register 48-88
48.7.8.5 RSCFDnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register 48-89
48.7.8.6 RSCFDnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register 48-90
48.7.9 Details of Transmit Buffer Related Registers 48-91
48.7.9.1 RSCFDnTMCp — Transmit Buffer Control Register (p = 0 to 31) 48-91
48.7.9.2 RSCFDnTMSTSp — Transmit Buffer Status Register (p = 0 to 31) 48-93
48.7.9.3 RSCFDnTMIDp — Transmit Buffer ID Register (p = 0 to 31) 48-94
48.7.9.4 RSCFDnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31) 48-96
48.7.9.5 RSCFDnTMDF0_p — Transmit Buffer Data Field 0 Register (p = 0 to 31) 48-98
48.7.9.6 RSCFDnTMDF1_p — Transmit Buffer Data Field 1 Register (p = 0 to 31) 48-99
48.7.9.7 RSCFDnTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0) 48-100
48.7.10 Details of Transmit Buffer Status Related Registers 48-102
48.7.10.1 RSCFDnTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0) 48-102
48.7.10.2 RSCFDnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0) 48-104
48.7.10.3 RSCFDnTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0) 48-106
48.7.10.4 RSCFDnTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0) 48-108
48.7.11 Details of Transmit Queue Related Registers 48-110
48.7.11.1 RSCFDnTXQCCm — Transmit Queue Configuration and Control Register (m = 0 or 1) 48-110
48.7.11.2 RSCFDnTXQSTSm — Transmit Queue Status Register (m = 0 or 1) 48-112
48.7.11.3 RSCFDnTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 or 1) 48-114
48.7.12 Details of Transmit History Related Registers 48-115
48.7.12.1 RSCFDnTHLCCm — Transmit History Configuration and Control Register (m = 0 or 1) 48-115
48.7.12.2 RSCFDnTHLSTSm — Transmit History Status Register (m = 0 or 1) 48-117
48.7.12.3 RSCFDnTHLPCTRm — Transmit History Pointer Control Register (m = 0 or 1) 48-119
48.7.12.4 RSCFDnTHLACCm — Transmit History Access Register (m = 0 or 1) 48-120
48.7.13 Details of Test Related Registers 48-121
48.7.13.1 RSCFDnGTSTCFG — Global Test Configuration Register 48-121
48.7.13.2 RSCFDnGTSTCTR — Global Test Control Register 48-122
48.7.13.3 RSCFDnGLOCKK — Global Lock Key Register 48-123
48.7.13.4 RSCFDnRPGACCr — RAM Test Page Access Register (r = 0 to 63) 48-124
48.8 Registers Configuration (CAN FD mode) 48-125
48.8.1 List of Registers 48-125
48.9 Register Description (CAN FD mode) 48-131
48.9.1 Details of Interface Mode Related Registers 48-131
48.9.1.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register 48-131
48.9.2 Details of Channel Related Registers 48-132
48.9.2.1 RSCFDnCFDCmNCFG — Channel Normal Bit Rate Configuration Register (m = 0 or 1) 48-132
48.9.2.2 RSCFDnCFDCmCTR — Channel Control Register (m = 0 or 1) 48-134

48.9.2.3 RSCFDnCFDCmSTS — Channel Status Register (m = 0 or 1) 48-139
48.9.2.4 RSCFDnCFDCmERFL — Channel Error Flag Status Register (m = 0 or 1) 48-142
48.9.2.5 RSCFDnCFDCmDCFG — Channel Data Bit Rate Configuration Register (m = 0 or 1)... 48-146
48.9.2.6 RSCFDnCFDCmFDCFG — Channel CAN FD Configuration Register (m = 0 or 1) 48-148
48.9.2.7 RSCFDnCFDCmFDCTR — Channel CAN FD Control Register (m = 0 or 1)..... 48-152
48.9.2.8 RSCFDnCFDCmFDSTS — Channel CAN FD Status Register (m = 0 or 1)..... 48-153
48.9.2.9 RSCFDnCFDCmFDCRC — Channel CAN FD CRC Register (m = 0 or 1)..... 48-155
48.9.3 Details of Global Related Registers 48-156
48.9.3.1 RSCFDnCFDGCFG — Global Configuration Register 48-156
48.9.3.2 RSCFDnCFDGCTR — Global Control Register..... 48-159
48.9.3.3 RSCFDnCFDGSTS — Global Status Register..... 48-161
48.9.3.4 RSCFDnCFDGERFL — Global Error Flag Register 48-163
48.9.3.5 RSCFDnCFDGTSC — Global Timestamp Counter Register 48-165
48.9.3.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0..... 48-166
48.9.3.7 RSCFDnCFDGTINTSTS1 — Global TX Interrupt Status Register 1..... 48-169
48.9.4 Details of Receive Rule Related Registers..... 48-170
48.9.4.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register 48-170
48.9.4.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0..... 48-171
48.9.4.3 RSCFDnCFDGAFLCFG1 — Receive Rule Configuration Register 1..... 48-172
48.9.4.4 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)..... 48-173
48.9.4.5 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)..... 48-175
48.9.4.6 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register (j = 0 to 15)..... 48-176
48.9.4.7 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register (j = 0 to 15)..... 48-178
48.9.5 Details of Receive Buffer Related Registers..... 48-179
48.9.5.1 RSCFDnCFDRMNB — Receive Buffer Number Register 48-179
48.9.5.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register (y = 0) 48-180
48.9.5.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 31)..... 48-181
48.9.5.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register (q = 0 to 31) 48-182
48.9.5.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register (q = 0 to 31)..... 48-184
48.9.5.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register (b = 0 to 4, q = 0 to 31)..... 48-185
48.9.6 Details of Receive FIFO Buffer Related Registers 48-186
48.9.6.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7) 48-186
48.9.6.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register (x = 0 to 7) 48-188
48.9.6.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register (x = 0 to 7) ... 48-190
48.9.6.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register (x = 0 to 7)..... 48-191
48.9.6.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register (x = 0 to 7)..... 48-192
48.9.6.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register (x = 0 to 7)..... 48-194
48.9.6.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register (d = 0 to 15, x = 0 to 7)..... 48-195
48.9.7 Details of Transmit/Receive FIFO Buffer Related Registers..... 48-196
48.9.7.1 RSCFDnCFDCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5)..... 48-196
48.9.7.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register (k = 0 to 5)..... 48-200
48.9.7.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register (k = 0 to 5) 48-204
48.9.7.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register (k = 0 to 5)..... 48-206
48.9.7.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register (k = 0 to 5) 48-208
48.9.7.6 RSCFDnCFDCFFDCSTSk — Transmit/receive FIFO CAN FD Configuration and Status Register (k = 0 to 5) 48-211

48.9.7.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 5) ... 48-213
48.9.8 Details of FIFO Status Related Registers ... 48-214
48.9.8.1 RSCFDnCFDFESTS — FIFO Empty Status Register ... 48-214
48.9.8.2 RSCFDnCFDFFSTS — FIFO Full Status Register ... 48-216
48.9.8.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register ... 48-218
48.9.8.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ... 48-220
48.9.8.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register ... 48-221
48.9.8.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register ... 48-222
48.9.9 Details of FIFO DMA Related Registers ... 48-223
48.9.9.1 RSCFDnCFDCDTCT — DMA Enable Register ... 48-223
48.9.9.2 RSCFDnCFDCDTSTS — DMA Status Register ... 48-225
48.9.10 Details of Transmit Buffer Related Registers ... 48-227
48.9.10.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 31) ... 48-227
48.9.10.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 31) ... 48-229
48.9.10.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register (p = 0 to 31) ... 48-231
48.9.10.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register (p= 0 to 31) ... 48-233
48.9.10.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register (p = 0 to 31) ... 48-235
48.9.10.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register (b = 0 to 4, p = 0 to 31) ... 48-237
48.9.10.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register (y = 0) ... 48-238
48.9.11 Details of Transmit Buffer Status Related Registers ... 48-240
48.9.11.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register (y = 0) ... 48-240
48.9.11.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register (y = 0) ... 48-242
48.9.11.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register (y = 0) ... 48-244
48.9.11.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register (y = 0) ... 48-246
48.9.12 Details of Transmit Queue Related Registers ... 48-248
48.9.12.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register (m = 0 or 1) ... 48-248
48.9.12.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register (m = 0 or 1) ... 48-250
48.9.12.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register (m = 0 or 1) ... 48-252
48.9.13 Details of Transmit History Related Registers ... 48-253
48.9.13.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register (m = 0 or 1) ... 48-253
48.9.13.2 RSCFDnCFDTHLSTSm — Transmit History Status Register (m = 0 or 1) ... 48-255
48.9.13.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register (m = 0 or 1) ... 48-257
48.9.13.4 RSCFDnCFDTHLACCm — Transmit History Access Register (m = 0 or 1) ... 48-258
48.9.14 Details of Test Related Registers ... 48-259
48.9.14.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register ... 48-259
48.9.14.2 RSCFDnCFDGTSTCTR — Global Test Control Register ... 48-260
48.9.14.3 RSCFDnCFDGLOCKK — Global Lock Key Register ... 48-261
48.9.14.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register (r = 0 to 63) ... 48-262
48.10 Interrupt Sources and DMA Triggers ... 48-263
48.10.1 Interrupt Sources ... 48-263
48.10.2 DMA Triggers (CAN FD Mode Only) ... 48-266
48.11 CAN Modes ... 48-267
48.11.1 Global Modes ... 48-267

48.11.1.1 Global Stop Mode ... 48-268
48.11.1.2 Global Reset Mode ... 48-268
48.11.1.3 Global Test Mode ... 48-269
48.11.1.4 Global Operating Mode ... 48-269
48.11.2 Channel Modes ... 48-270
48.11.2.1 Channel Stop Mode ... 48-271
48.11.2.2 Channel Reset Mode ... 48-271
48.11.2.3 Channel Halt Mode ... 48-271
48.11.2.4 Channel Communication Mode ... 48-272
48.11.2.5 Bus Off State ... 48-273
48.11.3 Registers Initialized by Transition to CAN Mode ... 48-274
48.12 Reception Function ... 48-276
48.12.1 Data Processing Using the Receive Rule Table ... 48-276
48.12.1.1 Acceptance Filter Processing ... 48-278
48.12.1.2 DLC Filter Processing ... 48-278
48.12.1.3 Routing Processing ... 48-279
48.12.1.4 Label Addition Processing ... 48-279
48.12.1.5 Mirror Function Processing ... 48-279
48.12.1.6 Timestamp ... 48-279
48.13 Transmission Function ... 48-281
48.13.1 Transmit Priority Determination ... 48-282
48.13.2 Transmission Using Transmit Buffers ... 48-282
48.13.2.1 Transmit Abort Function ... 48-282
48.13.2.2 One-Shot Transmission Function (Retransmission Disabling Function) ... 48-282
48.13.2.3 Transmit Buffer Merge Mode (CAN FD Mode Only) ... 48-283
48.13.3 Transmission Using FIFO Buffers ... 48-283
48.13.3.1 Interval Transmission Function ... 48-283
48.13.4 Transmission Using Transmit Queues ... 48-286
48.13.5 Padding Transmit Data (CAN FD Mode Only) ... 48-286
48.13.6 Transmit History Function ... 48-286
48.14 Gateway Function ... 48-288
48.14.1 CAN-CAN FD Gateway (CAN FD Mode Only) ... 48-288
48.15 Test Function ... 48-289
48.15.1 Standard Test Mode ... 48-289
48.15.2 Listen-Only Mode ... 48-289
48.15.3 Self-Test Mode (Loopback Mode) ... 48-290
48.15.3.1 Self-Test Mode 0 (External Loopback Mode) ... 48-290
48.15.3.2 Self-Test Mode 1 (Internal Loopback Mode) ... 48-290
48.15.4 Limited Operation Mode (CAN FD Mode Only) ... 48-291
48.15.5 RAM Test ... 48-291
48.15.6 Inter-Channel Communication Test ... 48-291
48.15.6.1 CRC Error Test ... 48-292
48.16 RS-CANFD Setting Procedure ... 48-293
48.16.1 Initial Settings ... 48-293
48.16.1.1 Setting a Clock ... 48-294
48.16.1.2 Setting Bit Timing ... 48-294
48.16.1.3 Setting Communication Speed ... 48-296
48.16.1.4 Setting Receive Rules ... 48-298
48.16.1.5 Setting Buffers ... 48-299
48.16.1.6 Transmit Delay Correction (CAN FD Mode Only) ... 48-302
48.16.2 Reception Procedure ... 48-303
48.16.2.1 Receive Buffer Reading Procedure ... 48-303
48.16.2.2 FIFO Buffer Reading Procedure ... 48-304
48.16.2.3 Procedure for Reading FIFO Buffers by the DMA Transfer ... 48-307

48.16.3 Transmission Procedure 48-308
48.16.3.1 Procedure for Transmission from Transmit Buffers 48-308
48.16.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers 48-311
48.16.3.3 Procedure for Transmission from the Transmit Queue 48-315
48.16.3.4 Transmit History Buffer Reading Procedure 48-315
48.16.4 Test Settings 48-316
48.16.4.1 Self-Test Mode Setting Procedure 48-316
48.16.4.2 Procedure for Releasing the Protection 48-316
48.16.4.3 RAM Test Setting Procedure 48-318
48.16.4.4 Inter-Channel Communication Test Setting Procedure 48-319
48.17 Usage Notes 48-320

51.1.2 Block Diagram ... 51-3
51.1.3 External Pins ... 51-4
51.1.4 Register Configuration ... 51-5
51.2 Register Description ... 51-6
51.2.1 Receive Shift Register (HSRSR) ... 51-6
51.2.2 Receive FIFO Data Register (HSFRDR) ... 51-7
51.2.3 Transmit Shift Register (HSTSR) ... 51-7
51.2.4 Transmit FIFO Data Register (HSFTDR) ... 51-8
51.2.5 Serial Mode Register (HSSMR) ... 51-9
51.2.6 Serial Control Register (HSSCR) ... 51-11
51.2.7 Serial Status Register (HSFSR) ... 51-14
51.2.8 Bit Rate Register (HSBRR) ... 51-19
51.2.9 FIFO Control Register (HSFCR) ... 51-20
51.2.10 FIFO Data Count Register (HSFDR) ... 51-21
51.2.11 Serial Port Register (HSSPTR) ... 51-22
51.2.12 Line Status Register (HSLSR) ... 51-24
51.2.13 Sampling Rate Register (HSSRR) ... 51-26
51.2.14 Serial Error Register (HSRER) ... 51-27
51.2.15 RTS Output Active Trigger Register (HSRTGR) ... 51-28
51.2.16 Receive FIFO Data Count Trigger Register (HSRTRGR) ... 51-28
51.2.17 Transmit FIFO Data Count Trigger Register (HSTTRGR) ... 51-29
51.3 Operation ... 51-30
51.3.1 Operation in Asynchronous Serial Communication Mode ... 51-30
51.3.2 HSCIF Interrupt Sources and the DMAC ... 51-39
51.4 Usage Notes ... 51-40
51.5 Baud Rate Generator for External Clock (BRG) ... 51-44
51.5.1 Overview ... 51-44
51.5.2 Block Diagram ... 51-44
51.5.3 BRG Register Configuration ... 51-45
51.5.3.1 Frequency Division Register (DL) ... 51-45
51.5.3.2 Clock Select Register (CKS) ... 51-47
51.5.4 Restrictions in BRG ... 51-48

52. I2C Bus Interface (I2C) 52-1
52.1 Overview 52-1
52.1.1 Features 52-1
52.1.2 External Pins 52-3
52.1.3 Register Configuration 52-4
52.2 Register Description 52-6
52.2.1 Slave Control Register (ICSCR) 52-7
52.2.2 Slave Status Register (ICSSR) 52-8
52.2.3 Slave Interrupt Enable Register (ICSIER) 52-10
52.2.4 Slave Address Register (ICSAR) 52-11
52.2.5 Master Control Register (ICMCR) 52-12
52.2.6 Master Status Register (ICMSR) 52-14
52.2.7 Master Interrupt Enable Register (ICMIER) 52-16
52.2.8 Master Address Register (ICMAR) 52-17
52.2.9 Clock Control Register (ICCCR) 52-18
52.2.10 Receive and Transmit Data Registers (ICRXD and ICTXD) 52-20
52.2.11 Clock Control Register 2 (ICCCR2) 52-21
52.2.12 SCL Mask Control Register (ICMPR) 52-23
52.2.13 SCL HIGH Control Register (ICHPR) 52-24
52.2.14 SCL LOW Control Register (ICLPR) 52-25
52.2.15 DMA Enable Register (ICDMAER) 52-26
52.2.16 First Bit Setup Cycle Register (ICFBSCR) 52-28
52.3 Operation 52-29
52.3.1 Data and Clock Filters 52-29
52.3.2 Clock Generator 52-29
52.3.3 Master/Slave Interfaces 52-29
52.3.4 Software Status Interlocking 52-29
52.3.5 I2C Bus Data Format 52-30
52.3.6 7-Bit Address Format 52-31
52.3.7 10-Bit Address Format 52-32
52.3.8 Master Transmit Operation 52-33
52.3.9 Master Receive Operation 52-37
52.4 Programming Examples 52-39
52.4.1 Master Transmitter 52-39
52.4.2 Master Receiver 52-42
52.4.3 Master Transmitter—Repeated START—Master Receiver 52-45
52.4.4 Slave Transmitter 52-49
52.4.5 Slave Receiver 52-51
52.4.6 DMA Mode - Master Transmit Operation 52-53
52.4.7 DMA Mode – Master Receive Operation 52-56
52.4.8 DMA Mode – Slave Transmit Operation 52-60
52.4.9 DMA Mode – Slave Receive Operation 52-62
52.5 Usage Notes 52-64
52.5.1 Usage note for Multi-Master 52-64
52.5.2 Usage note for SCL frequency calculation equation 52-64
52.5.3 Usage note for Pull-up resistance 52-64
52.5.4 Usage note for the transmission and reception procedure 52-65
52.5.5 Usage note for DMA mode of Receive Operation 52-65

53. IIC Bus Interface for PMIC (IIC for PMIC) 53-1
53.1 Overview 53-1
53.1.1 Features 53-1
53.1.2 External Pins 53-3
53.1.3 Register Configuration 53-4

53.2 Register Description ... 53-9
53.2.1 IIC Bus Data Register (ICDR) ... 53-9
53.2.2 IIC Bus Control Register (ICCR) ... 53-10
53.2.3 IIC Bus Status Register (ICSR) ... 53-12
53.2.4 IIC Interrupt Control Register (ICIC) ... 53-15
53.2.5 IIC Clock Control Register Low (ICCL) ... 53-17
53.2.6 IIC Clock Control Register High (ICCH) ... 53-17
53.2.7 IIC Automatic Transmission interrupt Mask Register (ICIMSK) ... 53-18
53.2.8 IIC Automatic Transmission Interrupt Flag Register (ICINT) ... 53-19
53.2.9 IIC Automatic Transmission Processing Enabling Register (ICACE) ... 53-20
53.2.10 IIC Automatic Transmission Timer Control Register 1 (ICTMC1) ... 53-21
53.2.11 IIC Automatic Transmission Timer Control Register 2 (ICTMC2) ... 53-22
53.2.12 IIC Automatic Transmission Wait Control Register (ICTMCW) ... 53-23
53.2.13 IIC Automatic Transmission Transmit Start Register (ICSTART) ... 53-24
53.2.14 IIC Automatic Transmission Transmit Control Register (ICATFR) ... 53-25
53.2.15 IIC Automatic Transmission Transmit Time Register 1 (ICATSET1) ... 53-26
53.2.16 IIC Automatic Transmission Transmit Time Register 2 (ICATSET2) ... 53-27
53.2.17 IIC Automatic Transmission Receive Time Register 1 (ICARSET1) ... 53-28
53.2.18 IIC Automatic Transmission Receive Time Register 2 (ICARSET2) ... 53-29
53.2.19 IIC Automatic Transmission Transmit Data 00 to 09 (ICATD00 to ICATD09) ... 53-29
53.2.20 IIC Automatic Transmission Transmit Data 10 to 19 (ICATD10 to ICATD19) ... 53-29
53.2.21 IIC Automatic Transmission Receipt Data 00 to 09 (ICARD00 to ICARD09) ... 53-30
53.2.22 IIC Automatic Transmission Receipt Data 10 to 19 (ICARD10 to ICARD19) ... 53-30
53.2.23 Transfer Rate ... 53-31
53.3 Operation ... 53-33
53.3.1 I2C Bus Data Format ... 53-33
53.3.2 Master Transmit Operation (Using WAIT Function) ... 53-35
53.3.3 Master Receive Operation (Using WAIT Function) ... 53-38
53.3.4 IIC Continuous Transmission by DMA ... 53-43
53.3.5 IIC Continuous Receive by DMA ... 53-45
53.3.6 Automatic transfer mode ... 53-47
53.3.7 Automatic transfer mode by DMA ... 53-49
53.3.8 Synchronizing SCL Line ... 53-51
53.3.9 Noise Canceller ... 53-52
53.3.10 Arbitration Lost Operation ... 53-53
53.3.11 Non-Acknowledge Operation ... 53-55
53.3.12 Wait Operation ... 53-57
53.4 Usage Notes ... 53-58

54. Clock-Synchronized Serial Interface with FIFO (MSIOF) ... 54-1
54.1 Overview ... 54-1
54.1.1 Features ... 54-1
54.1.2 Block diagram ... 54-2
54.1.3 External Pins ... 54-3
54.1.4 Register Configuration ... 54-5
54.1.5 Connected Module ... 54-6
54.2 Register Description ... 54-7
54.2.1 MSIOF Transmit Mode Register 1 (SITMDR1) ... 54-8
54.2.2 MSIOF Transmit Mode Register 2 (SITMDR2) ... 54-11
54.2.3 MSIOF Transmit Mode Register 3 (SITMDR3) ... 54-12
54.2.4 MSIOF Receive Mode Register 1 (SIRMDR1) ... 54-13
54.2.5 MSIOF Receive Mode Register 2 (SIRMDR2) ... 54-15
54.2.6 MSIOF Receive Mode Register 3 (SIRMDR3) ... 54-16
54.2.7 MSIOF Control Register (SICTR) ... 54-17

54.2.8 MSIOF Transmit Clock Select Register (SITSCR) 54-21
54.2.9 MSIOF Transmit FIFO Data Register (SITFDR) 54-22
54.2.10 MSIOF Receive FIFO Data Register (SIRFDR) 54-23
54.2.11 MSIOF Status Register (SISTR) 54-24
54.2.12 MSIOF Interrupt Enable Register (SIIER) 54-28
54.2.13 MSIOF FIFO Control Register (SIFCTR) 54-30
54.3 Operation 54-32
54.3.1 Operating Mode 54-32
54.3.2 Serial Clocks 54-32
54.3.3 Serial Timing 54-33
54.3.4 Transfer Data Allocation to Registers 54-35
54.3.5 FIFO 54-36
54.3.6 Transmit and Receive Procedures 54-38
54.3.7 Interrupts 54-45
54.3.8 Transmit and Receive Timing 54-46
54.3.9 SPI 54-48
54.3.10 IIS 54-50
54.4 Usage Notes 54-51
54.4.1 Notes for Using SPI Mode 54-51
54.4.2 Notes for Using SPI slave Mode 54-51
54.4.3 Notes for Transmitting Audio data via MSIOF 54-52
54.4.4 Notes on Fixed Value related to MSIOF registers 54-52

55. PWM 55-1
55.1 Overview 55-1
55.1.1 Features 55-1
55.1.2 Block Diagram 55-2
55.1.3 External Pins 55-3
55.1.4 Register Configuration 55-4
55.2 Register Description 55-5
55.2.1 PWM Control Register (PWMCR) 55-6
55.2.2 PWM Count Register (PWMCNT) 55-8
55.3 Operation 55-9
55.4 Usage Notes 55-11

56. SPI Multi I/O Bus Controller (RPC-IF) 56-1
56.1 Overview 56-1
56.1.1 Features 56-1
56.1.2 Block Diagram 56-2
56.1.3 External Pins 56-3
56.1.4 Register Configuration 56-4
56.2 Register Description 56-7
56.2.1 Common Control Register (CMNCR) 56-7
56.2.2 SSL Delay Register (SSLDR) 56-10
56.2.3 Data Read Control Register (DRCR) 56-12
56.2.4 Data Read Command Setting Register (DRCMR) 56-14
56.2.5 Data Read Extended Address Setting Register (DREAR) 56-15
56.2.6 Data Read Option Setting Register (DROPR) 56-16
56.2.7 Data Read Enable Setting Register (DRENR) 56-17
56.2.8 Manual Mode Control Register (SMCR) 56-20
56.2.9 Manual Mode Command Setting Register (SMCMR) 56-22
56.2.10 Manual Mode Address Setting Register (SMADR) 56-23
56.2.11 Manual Mode Option Setting Register (SMOPR) 56-24
56.2.12 Manual Mode Enable Setting Register (SMENR) 56-25

56.2.13 Manual Mode Read Data Register 0 (SMRDR0) ... 56-29
56.2.14 Manual Mode Read Data Register 1 (SMRDR1) ... 56-30
56.2.15 Manual Mode Write Data Register 0 (SMWDR0) ... 56-31
56.2.16 Manual Mode Write Data Register 1 (SMWDR1) ... 56-32
56.2.17 Common Status Register (CMNSR) ... 56-33
56.2.18 Data Read Dummy Cycle Setting Register (DRDMCR) ... 56-34
56.2.19 Data Read DDR Enable Register (DRDRENR) ... 56-35
56.2.20 Manual Mode Dummy Cycle Setting Register (SMDMCR) ... 56-37
56.2.21 Manual Mode DDR Enable Register (SMDRENR) ... 56-38
56.2.22 PHY Control Register (PHYCNT) ... 56-40
56.2.23 PHY Timing Offset Register 1 (PHYOFFSET1) ... 56-43
56.2.24 Timing Offset Register 2 (PHYOFFSET2) ... 56-44
56.2.25 PHY Interrupt Register (PHYINT) ... 56-45
56.2.26 Address Division Register 1 (ADD_DIV1) ... 56-47
56.2.27 Address Division Register 2 (ADD_DIV2) ... 56-48
56.2.28 Address Division Register 3 (ADD_DIV3) ... 56-49
56.2.29 Secure Configuration Register (SEC_CONF) ... 56-50
56.2.30 Access Right Register (ARIGHT) ... 56-52
56.2.31 Secure Command Register (SEC_CMDn (n = 0 to 15)) ... 56-53
56.2.32 Non-Secure Command Register (NON_SEC_CMDn (n = 0 to 15)) ... 56-54
56.2.33 Erase Command List Register (ERASELISTn (n = 1, 2)) ... 56-55
56.2.34 Write Command List Register (WRITELISTn (n = 1, 2)) ... 56-56
56.3 Operation ... 56-57
56.3.1 System Configuration ... 56-57
56.3.2 Address Map ... 56-61
56.3.3 32-Bit Address Area in the Serial Flash Memory ... 56-62
56.3.4 Operating Modes ... 56-63
56.3.5 External Address Space Read Mode ... 56-64
56.3.6 Read Cache ... 56-69
56.3.7 Manual Mode ... 56-70
56.3.8 Command Sequence ... 56-73
56.3.9 Data Pin Control ... 56-81
56.3.10 QSPIn_SSL Pin Control ... 56-83
56.3.11 QSPIn_SPCLK Pin Control ... 56-83
56.3.12 Flags ... 56-84
56.3.13 Write Buffer Operation ... 56-84
56.3.14 Data Alignment with Octal-SPI flash memory ... 56-86
56.3.15 Supported Serial Flash Protocol ... 56-87
56.3.16 Supported Octal-SPI Flash Protocol ... 56-87
56.3.17 DDR operation ... 56-88
56.3.18 Security function ... 56-89
56.3.19 PHY register interface ... 56-91
56.4 Usage Notes ... 56-104
56.4.1 Transfer to Read Data while the Signal on the QSPIn_SSL Pin is Negated ... 56-104
56.4.2 Transfer to Read Data while the Signal on the QSPIn_SSL Pin is Asserted ... 56-104
56.4.3 Notes on Starting Transfer from the QSPIn_SSL Retained State in Manual Mode ... 56-104
56.4.4 RPC_RESET# operation ... 56-104
56.4.5 Software Reset after Module Stop operation ... 56-105
56.4.6 DMA transfer ... 56-105
56.4.7 Frequency change ... 56-105
56.4.8 QSPI1 pins switched to high impedance [RZ/G2M V1.3] (not RZ/G2M V3.0) ... 56-105

57. SD Card/MMC Interfaces ... 57-1
57.1 Overview ... 57-1

57.1.1 Features ... 57-1
57.1.2 Block Diagram ... 57-2
57.1.3 External Pins ... 57-3
57.1.4 Register Configuration ... 57-5
57.2 Usage Notes ... 57-6

58. rawNAND Controller (R-NANDC) ... 58-1
58.1 Overview ... 58-1
58.1.1 Features ... 58-1
58.1.2 Block Diagram ... 58-3
58.1.3 External Pins ... 58-5
58.1.4 Register Configuration ... 58-6
58.1.5 Connected Module ... 58-8
58.2 Register Description ... 58-9
58.2.1 Controller commands register (COMMAND) ... 58-9
58.2.2 Main configurations register (CONTROL) ... 58-10
58.2.3 GENERIC_SEQ register (GEN_SEQ_CTRL) ... 58-13
58.2.4 Controller status register (STATUS) ... 58-15
58.2.5 LUN per device status register (LUN_STATUS_0) ... 58-17
58.2.6 Interrupts mask register (INT_MASK) ... 58-18
58.2.7 Interrupts status register (INT_STATUS) ... 58-20
58.2.8 ECC module control register (ECC_CTRL) ... 58-22
58.2.9 ECC module status register (ECC_STAT) ... 58-23
58.2.10 ECC offset in the spare area register (ECC_OFFSET) ... 58-24
58.2.11 ECC error level counter register (ECC_CNT) ... 58-25
58.2.12 Column/row address registers (ADDR[1:0]_COL, ADDR[1:0]_ROW) ... 58-26
58.2.13 Page size value register (DATA_SIZE) ... 58-28
58.2.14 FIFO module interface register (FIFO_DATA) ... 58-30
58.2.15 Bad block management (BBM) module control register (BBM_CTRL) ... 58-31
58.2.16 Records table pointer register (DEV0_PTR) ... 58-32
58.2.17 Records table size register (DEV0_SIZE) ... 58-33
58.2.18 DMA base address - least significant part register (DMA_ADDR_L) ... 58-34
58.2.19 DMA counter initial value register (DMA_CNT) ... 58-35
58.2.20 DMA control register (DMA_CTRL) ... 58-36
58.2.21 DMA trigger level value register (DMA_TRIG_TLVL) ... 58-37
58.2.22 Mask register for the READ STATUS commands (STATUS_MASK) ... 58-38
58.2.23 Command sequence timing configuration register 0 (TIME_SEQ_0) ... 58-39
58.2.24 Command sequence timing configuration register 1 (TIME_SEQ_1) ... 58-40
58.2.25 Generic command sequence timing configuration register 0 (TIME_GEN_SEQ_0) ... 58-41
58.2.26 Generic command sequence timing configuration register 1 (TIME_GEN_SEQ_1) ... 58-43
58.2.27 Generic command sequence timing configuration register 2 (TIME_GEN_SEQ_2) ... 58-45
58.2.28 Generic command sequence timing configuration register 3 (TIME_GEN_SEQ_3) ... 58-47
58.2.29 Timing configuration register (TIMINGS_ASYN) ... 58-48
58.2.30 Data register (DATA_REG) ... 58-49
58.2.31 Data register size selection register (DATA_REG_SIZE) ... 58-50
58.2.32 FIFO module control register (FIFO_INIT) ... 58-51
58.2.33 FIFO module status register (FIFO_STATE) ... 58-52
58.2.34 MLUN register (MLUN) ... 58-53
58.2.35 CMD ID initial value register (CMD_MARK) ... 58-54
58.2.36 Memory device control register (MEM_CTRL) ... 58-55
58.3 Operation ... 58-56
58.3.1 Command Generation ... 58-56
58.3.2 Generic Command Sequence ... 58-67
58.3.3 Instructions ... 58-70

58.3.4 Multi LUN Work Mode ... 58-90
58.3.5 Remapping Mechanism ... 58-90
58.3.6 Interrupts Mechanism ... 58-92
58.3.7 Setup and Configuration ... 58-94
58.4 Functional Details ... 58-104
58.4.1 Block Diagram ... 58-104
58.4.2 DMA Module ... 58-105
58.4.3 ECC Module ... 58-111
58.4.4 BCH Algorithm Implementation ... 58-112
58.5 Usage Notes ... 58-113
58.5.1 Initial Setting ... 58-113
58.5.2 Clock Stop ... 58-114

59. Serial-ATA Gen3 ... 59-1
59.1 Overview ... 59-1
59.1.1 Features ... 59-1
59.1.2 Block Diagram ... 59-1
59.1.3 External Pins ... 59-2
59.1.4 Register Configuration ... 59-3
59.1.5 Connected Module ... 59-5
59.2 Register Description ... 59-6
59.2.1 Note on the Access to the Registers Allocated to H'1018 to H'10A8 ... 59-6
59.2.2 ATAPI Control Register (ATAPI_CONTROL1) ... 59-7
59.2.3 ATAPI Status Register (ATAPI_STATUS) ... 59-9
59.2.4 Interrupt Enable Register (ATAPI_INT_ENABLE) ... 59-11
59.2.5 Descriptor Table Base Address Register (ATAPI_DTB_ADR) ... 59-12
59.2.6 DMA Start Address Register (ATAPI_DMA_START_ADR) ... 59-15
59.2.7 DMA Transfer Count Register (ATAPI_DMA_TRANS_CNT) ... 59-16
59.2.8 ATAPI Control 2 Register (ATAPI_CONTROL2) ... 59-17
59.2.9 ATAPI Signal Status Register (ATAPI_SIG_ST) ... 59-18
59.2.10 Byte Swap Register (ATAPI_BYTE_SWAP) ... 59-19
59.2.11 BIST Config Register (BISTCONF) ... 59-20
59.2.12 Shadow Data Register (DATA) (SDATA) ... 59-21
59.2.13 Shadow Error Register (SERR[Read Mode]) (SSERR[Read Mode]) ... 59-22
59.2.14 Shadow Features Register (SFEATURES[Write Mode]) (SSFEATURES[Write Mode]) ... 59-23
59.2.15 Shadow Sector CNT Register (SECCNT) (SSECCNT) ... 59-24
59.2.16 Shadow LBA Low Register (LBALOW) (SLBALOW) ... 59-25
59.2.17 Shadow LBA Mid Register (LBAMID) (SLBAMID) ... 59-26
59.2.18 Shadow LBA High Register (LBAHIGH) (SLBAHIGH) ... 59-27
59.2.19 Shadow Device/Head Register (DEVHEAD) (SDEVHEAD) ... 59-28
59.2.20 Shadow Status Register (SSTATUS [Read Mode]) (SSSTATUS [Read Mode]) ... 59-29
59.2.21 Shadow Command Register (SCOM [Write Mode]) (SSCOM [Write Mode]) ... 59-30
59.2.22 Shadow alternate status register (SALTSTS [Read Mode]) (SSALTSTS [Read Mode]) ... 59-31
59.2.23 Shadow Device Control Register (SDEVCON [Write Mode]) (SSDEVCON [Write Mode]) ... 59-32
59.2.24 SATA Extend ICC Register (SATAEICCR) ... 59-33
59.2.25 SATA Extend Auxiliary Register (SATAEAUXR) ... 59-33
59.2.26 SATA Extend DEVSLP Register (SATAEDEVSLPR) ... 59-34
59.2.27 SCR SStatus Register (SCRSSTS) ... 59-35
59.2.28 SCR SError Register (SCRSERR) ... 59-36
59.2.29 SCR SControl Register (SCRSCON) ... 59-38
59.2.30 SCR SActive Register (SCRSACT) ... 59-40
59.2.31 SATA INT Status Register (SATAINTSTAT) ... 59-41
59.2.32 SATA INT Mask Register (SATAINTMASK) ... 59-43
59.2.33 PHY STOP Register (PHYSTOP) ... 59-44

59.2.34 Rx DMA Setup FIS Dword0 Register (DMADW0) ... 59-45
59.2.35 Rx DMA Setup FIS Dword1 Register (DMADW1) ... 59-46
59.2.36 Rx DMA Setup FIS Dword2 Register (DMADW2) ... 59-46
59.2.37 Rx DMA Setup FIS Dword3 Register (DMADW3) ... 59-47
59.2.38 Rx DMA Setup FIS Dword4 Register (DMADW4) ... 59-47
59.2.39 Rx DMA Setup FIS Dword5 Register (DMADW5) ... 59-48
59.2.40 Rx DMA Setup FIS Dword6 Register (DMADW6) ... 59-48
59.3 Operation ... 59-49
59.3.1 Power Management Mode ... 59-49
59.3.2 Device Sleep ... 59-49
59.3.3 Initialization ... 59-50
59.3.4 Interrupt Modes ... 59-51
59.3.5 Interrupt Processing Flow ... 59-53
59.3.6 Endian ... 59-58
59.3.7 SATA BIST Modes ... 59-59
59.3.8 Operation Flow ... 59-61
59.3.9 Resets ... 59-63
59.3.10 Extended ATA Registers ... 59-64
59.3.11 Signature of the Shadow Register (INFORMATIVE) ... 59-64
59.3.12 Reference Clock Source ... 59-65
59.4 Usage Notes ... 59-66
59.4.1 Host Termination ... 59-66
59.4.2 Clock Input in the Partial and Slumber States ... 59-66

60. USB2.0 Host (EHCI/OHCI) ... 60-1
60.1 Overview ... 60-1
60.1.1 Features ... 60-1
60.1.1.1 OTG Function ... 60-2
60.1.1.2 Battery Charging Function ... 60-2
60.1.1.3 Core Setting ... 60-2
60.1.1.4 Host/Peripheral Switching Specifications ... 60-2
60.1.2 External Pins ... 60-3
60.1.3 Register Configuration ... 60-4
60.1.3.1 Register Attributes ... 60-4
60.1.3.2 Address Mappings ... 60-4
60.1.3.3 Register Configuration ... 60-6
60.1.4 Connected Module ... 60-8
60.2 Register Description ... 60-9
60.2.1 OHCI Operational Registers ... 60-9
60.2.1.1 HcRevision Register (offset: H'000) ... 60-9
60.2.1.2 HcControl Register (offset: H'004) ... 60-10
60.2.1.3 HcCommandStatus Register (offset: H'008) ... 60-13
60.2.1.4 HcInterruptStatus Register (offset: H'00C) ... 60-15
60.2.1.5 HcInterruptEnable Register (offset: H'010) ... 60-17
60.2.1.6 HcInterruptDisable Register (offset: H'014) ... 60-20
60.2.1.7 HcHCCA Register (offset: H'018) ... 60-22
60.2.1.8 HcPeriodCurrentED Register (offset: H'01C) ... 60-23
60.2.1.9 HcControlHeadED Register (offset: H'020) ... 60-24
60.2.1.10 HcControlCurrentED Register (offset: H'024) ... 60-25
60.2.1.11 HcBulkHeadED Register (offset: H'028) ... 60-26
60.2.1.12 HcBulkCurrentED Register (offset: H'02C) ... 60-27
60.2.1.13 HcDoneHead Register (offset: H'030) ... 60-28
60.2.1.14 HcFmInterval Register (offset: H'034) ... 60-29
60.2.1.15 HcFmRemaining Register (offset: H'038) ... 60-30

60.2.1.16 HcFmNumber Register (offset: H'03C) ... 60-31
60.2.1.17 HcPeriodicStart Register (offset: H'040) ... 60-32
60.2.1.18 HcLSThreshold Register (offset: H'044) ... 60-33
60.2.1.19 HcRhDescriptorA Register (offset: H'048) ... 60-34
60.2.1.20 HcRhDescriptorB Register (offset: H'04C) ... 60-36
60.2.1.21 HcRhStatus Register (offset: H'050) ... 60-37
60.2.1.22 HcRhPortStatus[1] Register (offset: H'054) ... 60-40
60.2.2 EHCI Controller Capability Registers ... 60-44
60.2.2.1 HCIVERSION/CAPLENGTH Register (offset: H'100) ... 60-44
60.2.2.2 HCSPARAMS Register (offset: H'104) ... 60-45
60.2.2.3 HCCPARAMS Register (offset: H'108) ... 60-46
60.2.2.4 HCSP-PORTROUTE Register (offset: H'10C) ... 60-48
60.2.3 EHCI Operational Registers ... 60-49
60.2.3.1 USBCMD Register (offset: H'120) ... 60-49
60.2.3.2 USBSTS Register (offset: H'124) ... 60-52
60.2.3.3 USBINTR Register (offset: H'128) ... 60-55
60.2.3.4 FRINDEX Register (offset: H'12C) ... 60-57
60.2.3.5 CTRLDSSEGMENT Register (offset: H'130) ... 60-58
60.2.3.6 PERIODICLISTBASE Register (offset: H'134) ... 60-59
60.2.3.7 ASYNCLISTADDR Register (offset: H'138) ... 60-60
60.2.3.8 CONFIGFLAG Register (offset: H'160) ... 60-61
60.2.3.9 PORTSC[1] Register (offset: H'164) ... 60-62
60.2.4 AHB Bridge Registers ... 60-68
60.2.4.1 INT_ENABLE Register (offset: H'200) ... 60-68
60.2.4.2 INT_STATUS Register (offset: H'204) ... 60-69
60.2.4.3 AHB_BUS_CTR Register (offset: H'208) ... 60-70
60.2.4.4 USBCTR Register (offset: H'20C) ... 60-72
60.2.5 Core Defined Registers ... 60-73
60.2.5.1 REVID Register (offset: H'300) ... 60-73
60.2.5.2 Register Enable/Clock Gating Control Register (offset: H'304) ... 60-74
60.2.5.3 Suspend Control Register (offset: H'308) ... 60-75
60.2.5.4 Suspend/Resume Timer Setting Register (offset: H'30C) ... 60-77
60.2.5.5 Overcurrent Detection Timer Setting Register (offset: H'310) ... 60-78
60.2.5.6 SBRN, FLADJ, PORTWAKECAP Register (offset: H'314) ... 60-79
60.2.6 UCOM Registers ... 60-80
60.2.6.1 Common Control Register (offset: H'800) ... 60-80
60.2.6.2 OTG-BC Interrupt Status Register (offset: H'804) ... 60-81
60.2.6.3 OTG-BC Interrupt Enable Register (offset: H'808) ... 60-83
60.2.6.4 VBUS Control Register (offset: H'80C) ... 60-85
60.2.6.5 Line Control Port1 Register (offset: H'810) ... 60-87
60.2.6.6 BC Control Port1 Register (offset: H'820) ... 60-89
60.2.6.7 ADP Control Register (offset: H'830) ... 60-91
60.3 Clock Specifications ... 60-93
60.3.1 Clock Gating Specifications ... 60-93
60.3.1.1 Overview ... 60-93
60.3.1.2 NONUSE_CLK_MSK Function Specifications ... 60-93
60.3.1.3 PERI_CLK_MSK and HOST_CLK_MSK Function Specifications ... 60-94
60.4 Reset Specifications ... 60-95
60.4.1 Input Reset Specifications ... 60-95
60.5 Interrupt Specifications ... 60-96
60.5.1 Interrupt Signal List ... 60-96
60.5.2 Interrupt Sources and Control ... 60-97
60.5.2.1 U2H_INT Assertion Source and Control ... 60-97
60.5.2.2 U2H_OHCI_INT Assertion Sources and Control ... 60-97

60.5.2.3 U2H_EHCI_INT Assertion Sources and Control 60-99
60.5.2.4 U2H_WAKEON_INT Assertion Sources and Control 60-100
60.5.2.5 U2H_OBINT Assertion Sources and Control 60-101
60.5.3 Interrupt Signal Deassertion Timing 60-103
60.5.3.1 Connection of Interrupt Signal Lines 60-103
60.6 Power Management 60-104
60.6.1 Controlling SUSPENDM and SLEEPM Pins of UTMI+ PHY 60-104
60.6.2 Controlling Clock Gating Function 60-104
60.7 OTG Control 60-105
60.7.1 Conditions for Using This Module for OTG 60-105
60.7.1.1 Core Pin and define Item Settings 60-105
60.7.1.2 ID Pin Connections 60-105
60.7.1.3 Port Power (VBUS) Control and Connection with External Power-Supply IC 60-105
60.7.1.4 OTG System Configuration Example 60-106
60.7.2 Initial Setting Procedure 60-107
60.7.2.1 OTG Initial Setting Procedure 60-107
60.7.3 A-Device/B-Device Recognition Procedure 60-108
60.7.3.1 A-Device/B-Device Recognition Procedure 60-108
60.7.4 Disconnect Detection Procedure 60-109
60.7.4.1 Disconnect Detection Procedure 60-109
60.7.5 HNP Control Procedure (Conforming to OTG Revision 2.0) 60-110
60.7.5.1 HNP Control Procedure for A-Device (Switching from A-Host to A-Peripheral) 60-110
60.7.5.2 HNP Control Procedure for A-Device (Switching from A-Peripheral to A-Host) 60-112
60.7.5.3 HNP Control Procedure for B-Device (Switching from B-Peripheral to B-Host) 60-113
60.7.5.4 HNP Control Procedure for B-Device (Switching from B-Host to B-Peripheral) 60-114
60.7.6 SRP Control Procedure (Conforming to OTG Revision 2.0) 60-116
60.7.6.1 SRP Control Procedure for A-Device 60-116
60.7.6.2 SRP Control Procedure for B-Device 60-117
60.8 Battery Charging Control 60-118
60.8.1 Conditions for Using Battery Charging Function in this Module 60-118
60.8.1.1 Limitations on Support of Charging Ports 60-118
60.8.1.2 Portable Device Control 60-118
60.8.2 Controlling Method 60-119
60.8.2.1 How to Control 60-119
60.9 Operation 60-128
60.9.1 Power control and Initialization 60-128
60.9.2 Transfer Overview 60-128

61. USB High-Speed Module (HS-USB) 61-1
61.1 Overview 61-1
61.1.1 Features 61-1
61.1.2 External Pins 61-3
61.1.3 Register Configuration 61-4
61.1.4 Connected Module 61-9
61.2 Register Description 61-10
61.2.1 System Configuration Control Register (SYSCFG) 61-11
61.2.2 CPU Bus Wait Register (BUSWAIT) 61-13
61.2.3 System Configuration Status Register (SYSSTS) 61-14
61.2.4 Device State Control Register (DVSTCTR) 61-15
61.2.5 Test Mode Register (TESTMODE) 61-16
61.2.6 CFIFO Port Register (CFIFO) 61-17
61.2.7 FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL, D2FIFOSEL, D3FIFOSEL) 61-18

61.2.8 FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR, D2FIFOCTR, D3FIFOCTR) 61-24
61.2.9 Interrupt Enable Register 0 (INTENB0) 61-26
61.2.10 BRDY Interrupt Enable Register (BRDYENB) 61-28
61.2.11 NRDY Interrupt Enable Register (NRDYENB) 61-30
61.2.12 BEMP Interrupt Enable Register (BEMPENB) 61-32
61.2.13 SOF Output Configuration Register (SOFCFG) 61-34
61.2.14 Interrupt Status Register 0 (INTSTS0) 61-35
61.2.15 BRDY Interrupt Status Register (BRDYSTS) 61-38
61.2.16 NRDY Interrupt Status Register (NRDYSTS) 61-40
61.2.17 BEMP Interrupt Status Register (BEMPSTS) 61-42
61.2.18 Frame Number Register (FRMNUM) 61-44
61.2.19 µ Frame Number Register (UFRMNUM) 61-45
61.2.20 USB Address Register (USBADDR) 61-46
61.2.21 USB Request Type Register (USBREQ) 61-47
61.2.22 USB Request Value Register (USBVAL) 61-47
61.2.23 USB Request Index Register (USBINDX) 61-48
61.2.24 USB Request Length Register (USBLENG) 61-48
61.2.25 DCP Maximum Packet Size Register (DCPMAXP) 61-49
61.2.26 DCP Control Register (DCPCTR) 61-50
61.2.27 Pipe Window Select Register (PIPESEL) 61-53
61.2.28 Pipe Configuration Register (PIPECFG) 61-54
61.2.29 Pipe Buffer Register (PIPEBUF) 61-58
61.2.30 Pipe Maximum Packet Size Register (PIPEMAXP) 61-60
61.2.31 Pipe Cycle Control Register (PIPEPERI) 61-61
61.2.32 Pipe n Control Register (PIPEnCTR) (n = 1 to F) 61-62
61.2.33 Pipe n Transaction Counter Enable Register (PIPEnTRE) (n = 1 to 5, 9 to F) 61-70
61.2.34 Pipe n Transaction Counter Register (PIPEnTRN) (n = 1 to 5, 9 to F) 61-71
61.2.35 Low Power Status register (LPSTS) 61-72
61.2.36 Battery Charging Control Register (BCCTRL) 61-73
61.2.37 USB General Control Register (UGCTRL) 61-75
61.2.38 USB General Control Register 2 (UGCTRL2) 61-76
61.2.39 USB General Status Register (UGSTS) 61-77
61.2.40 USB XTAL/EXTTAL control register (USB20_CLKSET0) 61-78
61.3 Operation 61-79
61.3.1 System Control and Oscillation Control 61-79
61.3.2 Interrupt Function 61-82
61.3.3 Pipe Control 61-92
61.3.4 FIFO Buffer Memory 61-98
61.3.5 Control Transfer (DCP) 61-105
61.3.6 Bulk Transfer (Pipes 1 to 5, 9 to F) 61-106
61.3.7 Interrupt Transfer (Pipes 6 to 8) 61-107
61.3.8 Isochronous Transfer (Pipes 1, 2) 61-107
61.3.9 SOF Interpolation Function 61-113
61.4 Guidelines for Designing USB2.0 Hi-Speed Boards 61-114
61.4.1 USB Transmission Line 61-114
61.4.2 Power Supply and Ground Pattern 61-114
61.4.3 Oscillation 61-114
61.4.4 VBUS 61-115
61.4.5 TXRTUNEn/USB_RREF Pin 61-115
61.5 Battery Charging Control 61-116

62. USB High-Speed DMAC (USB-DMAC) 62-1
62.1 Overview 62-1

62.1.1 Features ... 62-1
62.1.2 Block Diagram ... 62-3
62.1.3 Register Configuration ... 62-4
62.2 Register Description ... 62-6
62.2.1 DMAn VCR Register (USBDMAn_VCR) ... 62-6
62.2.2 DMAn Software Reset Register (USBDMAn_SWR) ... 62-7
62.2.3 DMAn Interrupt Source Register (USBDMAn_DMICR) ... 62-8
62.2.4 DMAn Source Address Registers 0 and 1 (USBDMAn_SAR_0/1) ... 62-10
62.2.5 DMAn Destination Address Registers 0 and 1 (USBDMAn_DAR_0/1) ... 62-10
62.2.6 DMAn Transfer Count Registers 0 and 1 (USBDMAn_TCR_0/1) ... 62-11
62.2.7 DMAn Timeout Count Registers 0 and 1 (USBDMAn_TOCNTR_0/1) ... 62-12
62.2.8 DMAn Timeout Constant Registers 0 and 1 (USBDMAn_TOCSTR_0/1) ... 62-13
62.2.9 DMAn Channel Control Registers 0 and 1 (USBDMAn_CHCR_0/1) ... 62-14
62.2.10 DMAn Final Transaction Valid Data Transfer Enable Registers 0 and 1 (USBDMAn_TEND_0/1) ... 62-17
62.2.11 DMAn Operation Register (USBDMAn_DMAOR) ... 62-18
62.3 Operation ... 62-20
62.3.1 Interrupt/Error Detection Function ... 62-20
62.3.2 DMA Transfer Function ... 62-28
62.4 DDM (Descriptor DMAC) ... 62-38
62.4.1 DDM Register Configuration ... 62-39
62.4.2 DDM Register Description ... 62-42
62.4.2.1 DDM Interrupt Source Mask Register (DDIREQMSK) ... 62-42
62.4.2.2 DDM Interrupt Source Register (DDIREQSTA) ... 62-45
62.4.2.3 DDM CHm Start Source Mask Registers (DDINTMSKm1) ... 62-48
62.4.2.4 DDM CHm Descriptor Pointer (DDPTRm) ... 62-49
62.4.2.5 DDM CHm Control Register (DDCTRLm) ... 62-50
62.4.3 Internal RAM ... 62-51
62.4.4 Principles of Operation ... 62-51

63. USB3.0 Host Controller ... 63-1
63.1 Overview ... 63-1
63.1.1 Features ... 63-2
63.1.2 External Pins ... 63-4
63.1.3 Register Configuration ... 63-5
63.1.3.1 Register Attributes ... 63-5
63.1.3.2 Register Overview ... 63-5
63.1.3.3 USB3.0 Host Register Configuration ... 63-6
63.1.3.4 USB3.0 Peripheral Register Configuration ... 63-11
63.1.3.5 PHY Register Configuration ... 63-14
63.1.4 Connected Module ... 63-15
63.2 Register Description ... 63-16
63.2.1 USB3.0 Host Register ... 63-16
63.2.1.1 Host Controller Capability Register (HCSPARAMS0) ... 63-16
63.2.1.2 Host Controller Capability Register (HCSPARAMS1) ... 63-17
63.2.1.3 Host Controller Capability Register (HCSPARAMS2) ... 63-18
63.2.1.4 Host Controller Capability Register (HCSPARAMS3) ... 63-19
63.2.1.5 Host Controller Capability Register (HCCPARAMS) ... 63-20
63.2.1.6 Host Controller Capability Register (DBOFF) ... 63-22
63.2.1.7 Host Controller Capability Register (RSTOFF) ... 63-23
63.2.1.8 Host Controller Operational Register (USBCMD) ... 63-24
63.2.1.9 Host Controller Operational Register (USBSTS) ... 63-26
63.2.1.10 Host Controller Operational Register (PAGESIZE) ... 63-28
63.2.1.11 Host Controller Operational Register (DNCTRL) ... 63-28

63.2.1.12 Host Controller Operational Register (CRCRL) 63-29
63.2.1.13 Host Controller Operational Register (CRCRH) 63-30
63.2.1.14 Host Controller Operational Register (DCBAAPL) 63-30
63.2.1.15 Host Controller Operational Register (DCBAAPH) 63-31
63.2.1.16 Host Controller Operational Register (CONFIG) 63-31
63.2.1.17 AXI Host Control Register (AXH_CON) 63-32
63.2.1.18 AXI Host Control Status Register (AXH_STA) 63-33
63.2.1.19 Pseudo PCI Class Code Register (CLASS_CODE) 63-34
63.2.1.20 Frame Length Adjustment Register (FLADJ) 63-34
63.2.1.21 Host Interrupt Register (HOST_INT) 63-35
63.2.1.22 Host Interrupt Enable Register (INT_ENA) 63-36
63.2.1.23 Latency Tolerance Reporting Register (LTR) 63-37
63.2.1.24 Battery Charging Register (BTR_CHRG) 63-38
63.2.1.25 FW Version Register (FW_VER) 63-39
63.2.1.26 FW Download Control & Status Register (DL_CTRL) 63-40
63.2.1.27 FW Data0 Register (FW_DATA0) 63-41
63.2.1.28 FW Data1 Register (FW_DATA1) 63-41
63.2.1.29 Core Control 3 Register (CORE_CTRL3) 63-42
63.2.1.30 UTMI Plus Vendor Control Interface Set Register (VENDOR_CON_SET) 63-43
63.2.1.31 UTMI Plus Vendor Control Interface Status Register (VENDOR_CON_STA) 63-43
63.2.1.32 Port1 Status and Control Register (PORTSC1) 63-44
63.2.1.33 Port1 Status and Control Register (PORTPMSC1) 63-48
63.2.1.34 Port1 Status and Control Register (PORTPLI) 63-49
63.2.1.35 Port2 Status and Control Register (PORTSC2) 63-50
63.2.1.36 Port2 Status and Control Register (PORTPMSC2) 63-54
63.2.1.37 xHCI Extended Capabilities Register (USBLEGSUP) 63-56
63.2.1.38 xHCI Extended Capabilities Register (USBLEGCTLSTS) 63-57
63.2.1.39 xHCI Extended Capabilities Register (HCEXTDCAP1) 63-58
63.2.1.40 xHCI Extended Capabilities Register (HCEXTDCAP2) 63-58
63.2.1.41 xHCI Extended Capabilities Register (HCEXTDCAP3) 63-59
63.2.1.42 xHCI Extended Capabilities Register (HCEXTDCAP4) 63-60
63.2.1.43 xHCI Extended Capabilities Register (HCEXTDCAP5) 63-61
63.2.1.44 xHCI Extended Capabilities Register (HCEXTDCAP6) 63-61
63.2.1.45 xHCI Extended Capabilities Register (HCEXTDCAP7) 63-62
63.2.1.46 xHCI Extended Capabilities Register (HCEXTDCAP8) 63-63
63.2.1.47 xHCI Extended Capabilities Register (HCEXTDCAP9) 63-64
63.2.1.48 xHCI Extended Capabilities Register (HCEXTDCAP10) 63-65
63.2.1.49 xHCI Extended Power Management Capability Register (HCEXTDPWMNGCAP1) 63-66
63.2.1.50 xHCI Extended Power Management Capability Register (HCEXTDPWMNGCAP2) 63-67
63.2.1.51 xHCI Extended Power Management Capability Register (HCEXTDPWMNGCAP3) 63-68
63.2.1.52 xHCI Extended Power Management Capability Register (HCEXTDPWMNGCAP4) 63-68
63.2.1.53 xHCI Extended Power Management Capability Register (DCID) 63-69
63.2.1.54 xHCI Extended Power Management Capability Register (DCDB) 63-70
63.2.1.55 xHCI Extended Power Management Capability Register (DCERSTSZ) 63-70
63.2.1.56 xHCI Extended Power Management Capability Register (DCERSTBA0) 63-71
63.2.1.57 xHCI Extended Power Management Capability Register (DCERSTBA1) 63-71
63.2.1.58 xHCI Extended Power Management Capability Register (DCERDP0) 63-72
63.2.1.59 xHCI Extended Power Management Capability Register (DCERDP1) 63-72
63.2.1.60 xHCI Extended Power Management Capability Register (DCCTRL) 63-73
63.2.1.61 xHCI Extended Power Management Capability Register (DCST) 63-74
63.2.1.62 xHCI Extended Power Management Capability Register (DCPORTSC) 63-75
63.2.1.63 xHCI Extended Power Management Capability Register (DCCP0) 63-76
63.2.1.64 xHCI Extended Power Management Capability Register (DCCP1) 63-77
63.2.1.65 Host Controller Runtime Register (MFINDEX) 63-77

63.2.1.66 Host Controller Runtime Register (IMAN) 63-78
63.2.1.67 Host Controller Runtime Register (IMOD) 63-79
63.2.1.68 Host Controller Runtime Register (ERSTSZ) 63-79
63.2.1.69 Host Controller Runtime Register (ERSTBA_L) 63-80
63.2.1.70 Host Controller Runtime Register (ERSTBA_H) 63-80

63.2.1.74 Host Controller Doorbell Register (DOORBELL1-32) 63-83
63.2.2 USB3.0 Peripheral Register 63-84
63.2.2.1 AXI Control Register (AXI_CON) 63-84
63.2.2.2 AXI Status Register (AXI_STA) 63-86
63.2.2.3 AXI Interrupt Status Register (AXI_INT_STA) 63-88
63.2.2.4 AXI Interrupt Enable Register (AXI_INT_ENA) 63-90
63.2.2.5 DMA Interrupt Status Register (DMA_INT_STA) 63-92
63.2.2.6 DMA Interrupt Enable Register (DMA_INT_ENA) 63-93
63.2.2.7 Data Enable Status Register (DATAEN_STA) 63-94
63.2.2.8 AXI Common Input Register (AXI_COM_IN) 63-94
63.2.2.9 AXI Common Output Register (AXI_COM_OUT) 63-95
63.2.2.10 DMA Ch0 Control Register1 (DMA_Ch0_CON1) 63-96
63.2.2.11 DMA Ch0 PRD Address Register1 (DMA_Ch0_PRD_ADR1) 63-97
63.2.2.12 DMA Ch0 Control Register2 (DMA_Ch0_CON2) 63-98
63.2.2.13 DMA Ch0 PRD Address Register2 (DMA_Ch0_PRD_ADR2) 63-99
63.2.2.14 DMA Ch0 Control Register3 (DMA_Ch0_CON3) 63-100
63.2.2.15 DMA Ch0 PRD Address Register3 (DMA_Ch0_PRD_ADR3) 63-101
63.2.2.16 DMA Ch0 Control Register4 (DMA_Ch0_CON4) 63-102
63.2.2.17 DMA Ch0 PRD Address Register4 (DMA_Ch0_PRD_ADR4) 63-103
63.2.2.18 USB Common Control Register (USB_COM_CON) 63-104
63.2.2.19 USB20 Control Register (USB20_CON) 63-106
63.2.2.20 USB30 Control Register (USB30_CON) 63-109
63.2.2.21 USB Status Register (USB_STA) 63-112
63.2.2.22 USB20 Frame No. Register (USB20_FRAME) 63-113
63.2.2.23 DRD Common Control Register (DRD_CON) 63-114
63.2.2.24 DRD Common Control 2 Register (DRD_CON2) 63-117
63.2.2.25 USB Interrupt Status 1 Register (USB_INT_STA_1) 63-119
63.2.2.26 USB Interrupt Status 2 Register (USB_INT_STA_2) 63-121
63.2.2.27 USB Interrupt Enable 1 Register (USB_INT_ENA_1) 63-122
63.2.2.28 USB Interrupt Enable 2 Register (USB_INT_ENA_2) 63-123
63.2.2.29 Setup Data 0 Register (STUP_DAT_0) 63-124
63.2.2.30 Setup Data 1 Register (STUP_DAT_1) 63-124
63.2.2.31 USB30 TP_Send Data 0 Register (USB3_TPDAT_0) 63-125
63.2.2.32 USB30 TP_Send Data 1 Register (USB3_TPDAT_1) 63-125
63.2.2.33 USB30 TP_Send Data 2 Register (USB3_TPDAT_2) 63-126
63.2.2.34 USB20 LPM Status Register (USB20_LPM_STA) 63-127
63.2.2.35 USB30 Vendor Device Test Register (USB30_VND_DEV) 63-128
63.2.2.36 USB30 Vendor Defined Data 0 Register (USB30_VND_DAT_0) 63-128
63.2.2.37 USB30 Vendor Defined Data 1 Register (USB30_VND_DAT_1) 63-129
63.2.2.38 EPC Version Register (USB_VER) 63-129
63.2.2.39 Scratch Pad Register (USB_SCRATCH) 63-130
63.2.2.40 USB OTG Status Register (USB_OTG_STA) 63-130
63.2.2.41 USB OTG Interrupt Status Register (USB_OTG_INT_STA) 63-131
63.2.2.42 USB OTG Interrupt Enable Register (USB_OTG_INT_ENA) 63-132
63.2.2.43 PIPE0 Mode Setting Register (P0_MOD) 63-133
63.2.2.44 PIPE0 Control Register (P0_CON) 63-134

63.2.2.45 PIPE0 Status Register (P0_STA) 63-136
63.2.2.46 PIPE0 Interrupt Status Register (P0_INT_STA) 63-137
63.2.2.47 PIPE0 Interrupt Enable Register (P0_INT_ENA) 63-139
63.2.2.48 UTMI Plus Vendor Control Interface Set Register (VENDOR_CON_SET) 63-140
63.2.2.49 UTMI Plus Vendor Control Interface Status Register (VENDOR_CON_STA) 63-140
63.2.2.50 PIPE0 Length Register (P0_LNG) 63-141
63.2.2.51 PIPE0 Read Register (P0_READ) 63-142
63.2.2.52 PIPE0 Write Register (P0_WRITE) 63-143
63.2.2.53 DRD Power Control Register (DRD_PW_CON) 63-143
63.2.2.54 PIPE Common Setting Register (PIPE_COM) 63-144
63.2.2.55 PIPEn Mode Setting Register (Pn_MOD) 63-145
63.2.2.56 PIPEn RAM Mapping Register (Pn_RAMMAP) 63-146
63.2.2.57 PIPEn Control Register (Pn_CON) 63-148
63.2.2.58 PIPEn Status Register (Pn_STA) 63-151
63.2.2.59 PIPEn Interrupt Status Register (Pn_INT_STA) 63-152
63.2.2.60 PIPEn Interrupt Enable Register (Pn_INT_ENA) 63-155
63.2.2.61 PIPEn Reserved Packet Register (Pn_RSVPKT) 63-157
63.2.2.62 PIPEn Length Register (Pn_LNG) 63-158
63.2.2.63 PIPEn Read Register (Pn_READ) 63-159
63.2.2.64 PIPEn Write Register (Pn_WRITE) 63-160
63.2.2.65 PIPEn Stream ID Register (Pn_STREAM) 63-161
63.2.2.66 PIPEn NRDY Stream ID Register (Pn_NRDYSTRM) 63-162
63.2.2.67 Port Status and Control Register (PORTSC) 63-163
63.2.2.68 Port PM Status and Control Register (PORTPMSC) 63-165
63.2.2.69 Port Link Information Register (PORTLI) 63-168
63.2.2.70 SSIF Command Register (SSIFCMD) 63-169
63.2.2.71 SSIF Link Setting 2 Register (SSIFLINKSET2) 63-171
63.2.2.72 SSIF Link Setting 3 Register (SSIFLINKSET3) 63-172
63.2.2.73 SSIF Link Setting 4 Register (SSIFLINKSET4) 63-173
63.2.3 PHY Register 63-174
63.2.3.1 USB30 Clock Setting Register (USB30_CLKSET0) 63-174
63.2.3.2 USB30 Clock Setting Register (USB30_CLKSET1) 63-175
63.2.3.3 USB30 SSC Setting Register (USB30_SSC_SET) 63-176
63.2.3.4 USB30 PHY Enable Register (USB30_PHY_ENABLE) 63-177
63.2.3.5 USB30 VBUS Enable Register (USB30_VBUS_EN) 63-177
63.3 Operation 63-178
63.3.1 Reset 63-178
63.3.1.1 Host Controller core 63-179
63.3.1.2 Peripheral Controller core 63-179
63.3.1.3 PHY Reset 63-179
63.4 Description of Host Functions 63-181
63.4.1 FW Download 63-181
63.4.1.1 Download Data Format 63-181
63.4.1.2 System Interface 63-183
63.4.2 Battery Charging 63-185
63.4.2.1 A-Device side (Charging Port Device) 63-185
63.4.3 Power Management 63-188
63.4.3.1 Power Management Capability 63-188
63.4.3.2 Low Power Management of Receiver Detection 63-188
63.4.3.3 Power Control for Each State 63-189
63.4.3.4 Clock Termination by USB3PHY and LTSSM State 63-190
63.4.3.5 Flow of System Suspend and Resume 63-191
63.4.4 Power Control 63-192
63.4.4.1 VBUS On 63-192

63.4.4.2 VBUS Off 63-192
63.4.4.3 Over Current Detection 63-192
63.4.5 Structure of Notification for Elements of Interrupt 63-193
63.4.6 Implementation Constraint of Host Core 63-194
63.5 Example of Transaction 63-195
63.5.1 Bulk OUT Transaction 63-195
63.5.2 Bulk IN Transaction 63-196
63.6 Power IC Interface Connection 63-197
63.6.1 Usable Power IC type 63-197
63.7 Descriptions of functions 63-198
63.7.1 VBUS Connection 63-198
63.7.2 Functions of EPC 63-200
63.7.2.1 Buffering for transmission and reception on USB 63-200
63.7.2.2 Handshake 63-201
63.7.3 USB3.0/USB2.0 connection 63-203
63.7.4 Power Management Control 63-205
63.7.4.1 USB3.0 Power Control 63-205
63.7.4.2 USB3.0 Power State Control 63-207
63.7.4.3 USB2.0 Power State Control 63-214
63.7.5 AXI DMA Transfer Control 63-217
63.7.5.1 OUT Transfer 63-217
63.7.5.2 IN Transfer 63-218
63.7.5.3 Two PRD tables for one group of transfer 63-220
63.7.5.4 DMA Transfer using EXTPRD_EN 63-221
63.7.5.5 Example of transfer using bus master function 63-223
63.7.5.6 Finishing the process for PRD table and its conditions 63-224
63.7.5.7 Case of error 63-225
63.7.5.8 Ordering of transactions 63-225
63.7.5.9 Write Transfer with all zero strobe 63-226
63.7.5.10 Interrupts 63-227
63.7.6 List of Interrupt factors 63-228
63.7.7 Zero Length Packet (ZLP) 63-232
63.7.7.1 Definition of Zero Length Packet 63-232
63.7.7.2 Transfer of ZLP support mode 63-232
63.7.7.3 In the configuration with AXI-IF 63-232
63.7.8 Physical Region Descriptor (PRD) Table 63-234
63.8 Example of Software flow 63-238
63.8.1 Outline of software flow 63-238
63.8.2 Initialization 63-239
63.8.3 Interrupt process 63-241
63.8.3.1 Interrupt handler process 63-241
63.8.3.2 USB Connection 63-243
63.8.3.3 USB Disconnection 63-246
63.8.3.4 Warm Reset Process 63-247
63.8.3.5 Hot Reset Process 63-250
63.8.3.6 USB2.0 Bus Reset Process 63-252
63.8.4 Control Transfer 63-257
63.8.4.1 No Data Control Process 63-259
63.8.4.2 Control Write Process 63-261
63.8.4.3 Control Read Process 63-263
63.8.5 Bulk Transfer 63-265
63.8.5.1 Bulk-IN Process 63-266
63.8.5.2 Bulk-OUT Process 63-268
63.8.5.3 Stream Bulk Process 63-270

63.8.5.4 SuperSpeed UASP Non-Data Transfer 63-276
63.8.5.5 SuperSpeed UASP Data-IN transfer 63-277
63.8.5.6 SuperSpeed UASP Data-OUT transfer 63-278
63.8.6 Interrupt Transfer 63-279
63.8.6.1 Interrupt IN Transfer 63-280
63.8.7 DMA Transfer 63-282
63.8.7.1 Settings for DMA transfer 63-282
63.8.8 Power Management 63-284
63.8.8.1 Suspend in USB3.0 (transition of state from U0 to U3) 63-284
63.8.8.2 Resume in USB3.0 (from U3 to U0: Initiated by host) 63-286
63.8.8.3 Resume in USB3.0 (from U3 to U0: Initiated by device) 63-287
63.8.8.4 Function Suspend 63-288
63.8.8.5 Function Remote Wakeup 63-289
63.8.8.6 USB3.0-PHY (PLL) Wakeup Process 63-291
63.8.8.7 Suspend in USB2.0 63-292
63.8.8.8 Resume in USB2.0 (Initiated by host) 63-293
63.8.8.9 Resume in USB2.0 (Initiated by device) 63-294
63.8.8.10 USB2.0 PHY (PLL) Wakeup Process 63-295
63.8.8.11 Process of transition from U0 to U1/U2 in USB3.0 (Initiated by device) 63-296
63.8.9 Device Requests 63-298
63.8.9.1 Clear Feature 63-298
63.8.9.2 Get Configuration 63-300
63.8.9.3 Get Descriptor 63-300
63.8.9.4 Get Interface 63-300
63.8.9.5 Get Status 63-300
63.8.9.6 Set Address 63-303
63.8.9.7 Set Configuration 63-303
63.8.9.8 Set Descriptor 63-303
63.8.9.9 Set Feature 63-304
63.8.9.10 Set Interface 63-305
63.8.9.11 Set Isochronous Delay 63-306
63.8.9.12 Set SEL 63-306
63.8.9.13 Synch Frame 63-306
63.8.10 BOT Control 63-307
63.8.10.1 Overall 63-307
63.8.10.2 BOT assistance mode 63-307
63.8.10.3 BOT Process 63-308
63.9 Instructions and Directions for Use 63-310
63.9.1 Method of Specifying RAM Mapping 63-310
63.9.2 Example of Setting 63-311
63.9.3 Register Access 63-312

64. RCLK Watchdog Timer (RWDT) 64-1

Main Revisions and Additions in this Edition ..... Revision History-1

1. Overview

1.1 Introduction

The RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E includes:

RZ/G2H

- Four 1.5-GHz Arm® Cortex®-A57 MPCore™ cores,
- Four 1.2-GHz Arm® Cortex®-A53 MPCore™ cores,
- Memory controller for LPDDR4-3200 with 32 bits × 2 channels,
- 1 channel for HDMI1.4b output (option) and 1 channel for RGB888 output and 1channel for LVDS,
- 2 channels MIPI-CSI2 Video Input, 2 channels digital Video Input,
- Serial ATA interface,
- USB3.0 × 1 channel and USB2.0 × 2 channels,

RZ/G2M V1.3 RZ/G2M V3.0

- Two 1.5-GHz Arm® Cortex®-A57 MPCore™ cores,
- Four 1.2-GHz Arm® Cortex®-A53 MPCore™ cores,
- Memory controller for LPDDR4-3200 with 32 bits × 2 channels,
- 1 channel for HDMI1.4b output (option) and 1channel for RGB888 output and 1channel for LVDS,
- 2 channels MIPI-CSI2 Video Input, 2channels digital Video Input,
- USB3.0 × 1 channel and USB2.0 × 2 channels,

RZ/G2N

- Two 1.5-GHz Arm® Cortex®-A57 MPCore™ cores,
- Memory controller for LPDDR4-3200 with 32 bits × 1 channel,
- 1 channel for HDMI1.4b output (option) and 1channel for RGB888 output and 1channel for LVDS,
- 2 channels MIPI-CSI2 Video Input, 2 channels digital Video Input,
- Serial ATA interface,
- USB3.0 × 1 channel and USB2.0 × 2 channels,

RZ/G2E

- Two 1.2-GHz Arm® Cortex®-A53 MPCore™ cores,
- Memory controller for DDR3L-1856 * with 32 bits × 1 channel,
- 1 channel for RGB888 output and 2 channels for LVDS,
- 1 channel MIPI-CSI2 Video Input, 2 channels digital Video Input,
- USB3.0 × 1 channel and USB2.0 × 1 channel,

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

- 800-MHz Arm® Cortex®-R7 core (option),
- Three-dimensional graphics engines,
- Sound processing units,
- SD host interface,
- PCI Express interface,
- Video processing units,
- CAN interface, and

- EthernetAVB interface.

* : The “DDR3L-1856” indicates the DDR3L-SDRAM bus interface which operates at a frequency of 928 MHz in this manual.

Note: Arm and Cortex are registered trademark of Arm Limited. All other brands or product names are the property of their respective holders.

Remarks: For items noted as "option", please contact a Renesas Electronics sales representative.

1.2 List of Specifications

1.2.1 Arm Core

Item	Description
System CPU Cortex-A57 RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N	RZ/G2H • Arm Cortex-A57 Quad MPCore 1.5 GHz • L2 cache 2 Mbytes (ECC) RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • Arm Cortex-A57 Dual MPCore 1.5 GHz • L2 cache 1 Mbytes (ECC) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • L1 I/D cache 48/32 Kbytes (Parity/ECC) • NEON™/VFPv4 supported • Security extension supported • Virtualization supported • Armv8 architecture
System CPU Cortex-A53 RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2E	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 • Arm Cortex-A53 Quad MPCore 1.2 GHz • L1 I/D cache 32/32 KBytes (Parity/ECC), L2 cache 512 Kbytes (ECC) RZ/G2E • Arm Cortex-A53 Dual MPCore 1.2 GHz • L1 I/D cache 32/32 KBytes (Parity/ECC), L2 cache 256 Kbytes (ECC) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2E • NEON™/VFPv4 supported • Security extension supported • Virtualization supported • Armv8 architecture
Debug and Trace (For All Products)	• JTAG/SWD I/F supported RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 • ETM-A57/A53 supported (each CPU) RZ/G2N • ETM-A57 supported RZ/G2E • ETM-A53 supported RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • ETF 16 KBytes for program flow trace (each cluster)

1.2.2 CPU Core Peripherals

Item	Description
Clock Pulse Generator (CPG) (For All Products)	• Generates the clocks from external clock (EXTAL). RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N — Maximum Cortex-A57 clock: 1.5 GHz RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2E — Maximum Cortex-A53 clock: 1.2 GHz RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E — Maximum 3DGE clock: 600 MHz RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N — Maximum AXI-bus clock: 400 MHz — Maximum SDRAM bus clock: 1600 MHz (LPDDR4-3200) — Maximum media clock: 400 MHz RZ/G2E — Maximum AXI-bus clock: 266 MHz — Maximum SDRAM bus clock: 928 MHz (DDR3L-1856) — Maximum media clock: 266 MHz RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • System-CPU shut down mode control supported • Module-standby mode supported • Includes module reset registers to control reset operation of individual on-chip peripheral modules
System Controller (SYSC) (For All Products)	• Shuts down and restores power to target modules Target modules: RZ/G2H — Cortex-A57 (with independent shutting down of CPUs 0, 1, 2, 3, and SCU+L2 cache) * RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N — Cortex-A57 (with independent shutting down of CPUs 0, 1 and SCU+L2 cache) * RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 — Cortex-A53 (with independent shutting down of CPUs 0, 1, 2, 3, and SCU+L2 cache) * — 3DGE — VCP RZ/G2E — Cortex-A53 (with independent shutting down of CPUs 0, 1 and SCU+L2 cache) * *: SCU and L2 cache are treated as one power-domain. When CPU is working, SCU+L2 cache cannot be powered off. • Low leakage standby mode supported
RESET (For All Products)	• Includes one reset-signal external output port for external modules • Includes Boot Address Register, etc.

Item	Description
Pin function controller (PFC) (For All Products)	• Setting multiplexed pin functions for LSI pins Function of the LSI pin selectable by setting the registers in the PFC module • Module selection Enable and disable the functions of LSI pins to which pin functions from multiple pin groups are assigned by setting the registers in the PFC module. • Pull-up/down control for each LSI pin On/off and up/down of the pull register on each LSI pin can be controlled by setting the registers in the PFC module.Control of SDIO functions SDIO functions, including the driving ability of pins for the SDIF, can be controlled by setting registers of the PFC.
General-purpose I/O (GPIO) (For All Products)	• General-purpose I/O ports • Supports GPIO interrupts
Thermal sensor / Chip Internal Voltage Monitor (THS/CIVM *) (For All Products)	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • 3 channels of thermal sensor RZ/G2E • 1 channel of thermal sensor RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Programmable 3 temperature level for the sensor, to indicate the temperature level • Interrupt when the temperature reaches programmed * : RZ/G2E does not support CIVM.

1.2.3 External Bus Module

Item	Description
External Bus Controller for EX-Bus (LBSC) (For All Products)	• EX-BUS interface: max. 16-bit bus RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • Frequency: 66 MHz or 44.4 MHz RZ/G2E • Frequency: 66 MHz RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • External area divided into several areas and managed — Allocation to space of area 0, area 1 — Area 0 supports 1-MByte memory space (startup mode). — I/F settings, bus width settings, and wait state insertion are possible for each area. • SRAM interface — Wait states can be inserted through register settings. Period of waiting is set in cycle unit, and the maximum value is 15. — EX_WAIT pin can be used for wait state insertion. — Connectable bus widths: 16 bits or 8 bits • Supports external buffer enable/direction control • Supports Burst ROM interface • Supports Byte-control SRAM interface
External Flash Controller (For All Products)	• Supports RPC-IF (Reduced Pin Count interface) flash memory or QSPI flash memory RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N Max. Frequency 160 MHz (320MB/s) for RPC-IF, 80 MHz (80MB/s)* for QSPI (QSPI0) RZ/G2E Max. Frequency 150 MHz (300MB/s) for RPC-IF, 80 MHz (80MB/s) for QSPI (QSPI0) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E Dual QSPI operation for two 4-bit serial flash memories is also available; 80 MHz (160MB/s)* for Dual QSPI (QSPI0+QSPI1). Note. *: For RZ/G2M V1.3, 40MB/s for QSPI, 80MB/s for dual QSPI. The RZ/G2M V1.3 does not support QSPI-DDR operation.

Item	Description
External Bus Controller for LPDDR4/DDR3L SDRAM (DBSC4) (For All Products)	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • LPDDR4-3200 can be connected directly. Note. The LPDDR4X (JESD209-4-1) is not supported. RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 • 2 channels (32-bit bus mode) • Memory Size: Up to 8GB * RZ/G2N • 1 channel (32-bit bus mode) • Memory Size: Up to 4GB * RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N * : LPDDR4-SDRAM compliant with JEDEC JESD209-4B. (Supports memory with sizes from 4 Gbits to 16 Gbits per channel of DBSC4.) RZ/G2E • DDR3L-1856 can be connected directly. • 1 channel (32-bit bus mode) • Memory Size: Up to 2 GB RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Auto Refresh/Self Refresh/Partial Array Self Refresh supported • Auto Pre-charge Mode • DDR Back Up supported • Cache memory for DDR-Memory access efficiency • Memory access protection for secure/safety regions • Decompression of visual near lossless compressed image • ECC supported

1.2.4 Internal Bus Module

Item	Description
AXI-bus (For All Products)	• On-chip main bus — Bus protocol: AXI3 with QoS control RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N — Frequency: 400 MHz — Bus width: 512 bits/256 bits/128 bits RZ/G2E — Frequency: 266 MHz — Bus width: 256 bits/128 bits/64 bits • On-chip CPU bus RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 — CoreLink™ CCI-Kipling Cache Coherent Interconnect — Bus protocol: AMBA®4 ACE™ and ACE-Lite™ — Frequency: 800 MHz — Bus width: 128 bits RZ/G2N — Bus protocol: AXI3 — Frequency: 800 MHz — Bus width: 128 bits RZ/G2E — Bus protocol: AXI3 — Frequency: 533 MHz — Bus width: 128 bits
Direct Memory Access Controller for System (SYS-DMAC) (For All Products)	• 16 channels for PeriW domain (SYDM0) • 32 channels for PeriE domain (SYDM1, 2) • Address space: 4 GBytes on architecture • Data transfer length: Byte, word (2 Bytes), longword (4 Bytes), 8 Bytes, 16 Bytes, 32 Bytes and 64 Bytes • Maximum number of transfer times: 16,777,215 times • Transfer request: Selectable from on-chip peripheral module request and auto request • Bus mode: Selectable from normal mode and slow mode • Priority: Selectable from fixed channel priority mode and round-robin mode • Interrupt request: Supports interrupt request to CPU at the end of data transfer • Repeat function: Automatically resets the transfer source, destination, and count at the end of DMA transfer (by descriptor function) • Descriptor function (each channel) supported • MMU (each channel) supported • Channel bandwidth arbiter (each channel)

Item	Description
Boot (For All Products)	• System startup with selectable boot mode at power-on reset • Either external ROM boot (area 0) or on-chip ROM boot can be selected through MD pin on development chip. • In on-chip ROM boot, RPC-IF or QSPI serial ROM boot is supported. • Program downloaded to internal memory (System RAM) • Autorun function for the downloaded program • About detail information of BOOT, refer to Section 24 (Boot) and Appendix B (Active sequence).
Direct Memory Access Controller for Audio (Audio-DMAC) (For All Products)	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • 32 channels • asdm0: 16 channels • asdm1: 16 channels RZ/G2E • 16 channels • asdm0: 16 channels RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Address space: 4 GBytes on architecture • Data transfer length: Byte, word (2 Bytes), longword (4 Bytes), 8 Bytes, 16 Bytes, 32 Bytes and 64 Bytes • Maximum number of transfer times: 16,777,215 times • Transfer request: Selectable from on-chip peripheral module request and auto request • Bus mode: Selectable from normal mode and slow mode • Priority: Selectable from fixed channel priority mode and round-robin mode • Interrupt request: Supports interrupt request to CPU at the end of data transfer • Repeat function: Automatically resets the transfer source, destination, and count at the end of DMA transfer (by descriptor function) • Descriptor function (each channel) supported • MMU (each channel) supported • Channel bandwidth arbiter (each channel)
Audio-DMAC-Peripheral-Peripheral (For All Products)	• Audio-DMAC (for transfer from Peripheral to Peripheral) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • 29 channels + 29 (extended) channels for audio domain RZ/G2E • 29 (extended) channels for audio domain RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • Data transfer length: longword (4 Bytes) • Transfer count: Transfer count is not specified (DMA transfer is made from the transfer-start to transfer-stop settings.). • Transfer request: Selectable from on-chip audio peripheral module request • Priority: round-robin mode • Interrupt request: not supports interrupt request to CPU at the end of data transfer

Item	Description	
IPMMU (For All Products)	• An IPMMU is a memory management unit (MMU) which provides address translation and access protection functionalities to processing units and interconnect networks.	
Interrupt Controller (INTC) (For All Products)	INTC-AP (For All Products; for AP-System core Cortex-A57/Cortex-A53)	— 7 interrupt pins which can detect external interrupts — Max. 480 shared peripheral interrupts supported — Fall/rise/high level/low level detection is selectable — On-chip peripheral interrupts: Priority can be specified for each module — 16 software interrupts that have been generated and 6 private peripheral interrupts supported — 32-level priority selectable — Trust Zone supported

1.2.5 Internal Memory

Item	Description
System RAM (For All Products)	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RAM of 384 KBytes RZ/G2E RAM of 128 KBytes

1.2.6 Graphics Units

Item	Description
3D Graphics Engine (3DGE)	RZ/G2H • Imagination Technologies PowerVR Series6XT GX6650 • Max. Frequency. 600 MHz • Drastically performance improvements for sophisticated graphics and GPU computer • Reducing power consumption even further through advanced power saving mechanisms • Lowest memory bandwidth in the industry with compression technologies • Ultra HD deep color GPU Support APIs: OpenGL ES 3.1, (OpenCL 1.2 EP) • 7.2 Gpix/s, 300 Mpoly/s, 288 GFLOPS RZ/G2M V1.3 RZ/G2M V3.0 • Imagination Technologies PowerVR Series 6XT GX6250 • Max. Frequency 600 MHz • Drastically performance improvements for sophisticated graphics and GPU computer • Reducing power consumption even further through advanced power saving mechanisms • Lowest memory bandwidth in the industry with compression technologies • Ultra HD deep color GPU Support APIs: OpenGL ES 3.1, (OpenCL 1.2 EP) • 2.4 Gpix/s, 300 Mpoly/s, 96 GFLOPS RZ/G2N • Imagination Technologies PowerVR Series 7XE GE7800 • Max. Frequency. 600 MHz • Drastically performance improvements for sophisticated graphics and GPU computer • Reducing power consumption even further through advanced power saving mechanisms • Lowest memory bandwidth in the industry with compression technologies • Ultra HD deep color GPU Support APIs: OpenGL ES 3.1, (OpenCL 1.2 EP) • 2.4 Gpix/s, 200 Mpoly/s, 38.4 GFLOPS RZ/G2E • Imagination Technologies PowerVR Series 8XE GE8300 • Max. Frequency. 600 MHz • Drastically performance improvements for sophisticated graphics and GPU computer • Reducing power consumption even further through advanced power saving mechanisms • Lowest memory bandwidth in the industry with compression technologies • Ultra HD deep color GPU Support APIs: OpenGL ES 3.1, (OpenCL 1.2 EP) • 2.4 Gpix/s, 200 Mpoly/s, 19.2 GFLOPS

Item	Description	
Display Unit (DU) (For All Products)	Display channel	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N 3 independently controllable channels RZ/G2E 2 independently controllable channels
	Interface	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • HDMI 1 channel (option) • LVDS 1 channel RZ/G2E • LVDS 2 channels RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Digital RGB 1 channel (8-bit precision for each RGB color)
	LVDS interface (per channel)	• Output: compliant with TIA/EIA-644; five pairs of differential output (four pairs of data and one pair of clock) • Operating frequency: Dotclk 148.5 MHz
	HDMI (option)	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • Support HDMI 1.4b class transfer rate, up to 3D format 1080p60/4Kp30 • Dotclk 297 MHz
	Screen size and number of composite planes per channel	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • Maximum screen size: 3840 × 2160 RZ/G2E • Maximum screen size: 1920 × 1080 (also depends on frame rate) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Number of planes specifiable: 5 (VSP2 processing) • Number of planes specifiable: 1 (DU)
	CRT scanning method	Non-interlaced
	Synchronization method	Master
	Internal color palette (VSP2)	• Includes four color palette planes which can display 256 of 260 thousands colors at the same time.
	Output display numbers	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • Three output channels (resolutions for different displays) RZ/G2E • Two output channels RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • Output on rising and falling edges of the synchronizing signal (resolution for the same display) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • 8-bit precision for each RGB color
	Blending ratio settings (VSP2)	Number of color palette planes with blending ratio: 4
	Dot clock	Switchable between external input and internal clock

Item	Description	
Video Input Module (VIN) (For All Products)	MIPI-CSI2 interface	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • 2 channels (4 lane × 1 channel, 2 lane × 1 channel) • Interleaving by 4 VC (virtual channel) supported • Filtering by DT (data type) supported • YUV422 8/10bit, RGB888, Embedded 8bit, User Defined 8bit are supported • 1.5 Gbps/Lane RZ/G2E • 1 channel (2 lane × 1 channel) • Interleaving by 2 VC (virtual channel) supported • Filtering by DT (data type) supported • YUV422 8/10bit, RGB888, Embedded 8bit, User Defined 8bit are supported • 1.1 Gbps/Lane

Item	Description	
Video Input Module (VIN) (For All Products)	digital interface	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • 2 channels (RGB/YCbCr) • Dotclk 100 MHz • ITU-R BT.601 interface: 8-, 10- (same size only (not scaling)), 12- (same size only (not scaling)) 16-, 20- (same size only (not scaling)) or 24-bit (same size only (not scaling)), YCbCr422, 18-bit RGB666, 24-bit RGB888 • ITU-R BT.656 interface: 8-, 10- (same size only (not scaling)), or 12-bit (same size only (not scaling)) YCbCr422 • ITU-R BT.1358 interface: 16-, 20- (same size only (not scaling)), or 24-bit (same size only (not scaling)) YCbCr422 • ITU-R BT.709 interface: 8-, 10- (same size only (not scaling)), 12- (same size only (not scaling)) 16-, 20- (same size only (not scaling)) or 24-bit (same size only (not scaling)) YCbCr422, 18-bit RGB666, 24-bit RGB888 About Digital RGB channel usage combination, Refer as follows cases. CASE1 VIN-A8bit + VIN-B8/12/16 CASE2 VIN-A12bit + VIN-B8/12/16 CASE3 VIN-A16bit + VIN-B8/12 RZ/G2E • 2 channels (RGB/YCbCr) • Dotclk 100 MHz • ITU-R BT.601 interface: 8-, 10- (same size only (not scaling)), or 12-bit (same size only (not scaling)) YCbCr422, RGB666, RGB888 • ITU-R BT.656 interface: 8-, 10- (same size only (not scaling)), or 12-bit (same size only (not scaling)) YCbCr422 • ITU-R BT.1358 interface: 16-, 20- (same size only (not scaling)), or 24-bit (same size only (not scaling)) YCbCr422 • ITU-R BT.709 interface: 8-, 10- (same size only (not scaling)), or 12-bit (same size only (not scaling)) YCbCr422, RGB666, RGB888
Video Input Module (VIN) (For All Products)	Capturing function	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N Up to 8 input images can be captured (using VC, DT filtering) RZ/G2E Up to 2 input images can be captured (using VC, DT filtering)
	Clipping function	Up to 4096 × 4096
	Horizontal scaling	Up to two times, but only scaling down is possible for HD1080i or HD1080p data. (one input only)
	Vertical scaling	Up to three times, but only scaling down is possible for HD1080i or HD1080p data. (one input only)
	Output format	RGB-565, ARGB-1555, ARGB8888, YCbCr422, RGB888, YCbCr420 YC separation, and extraction of the Y component

1.2.7 Video Processing

Item	Description
Video Signal Processor (VSPI) (For All Products)	RZ/G2H VSPI has the following features. 2 sets of VSPI are integrated. 500 Mpix/s process rate per 1 VSPI Supports 4K (3840 pixels × 2160 lines) processing RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N VSPI has the following features. 1 set of VSPI is integrated. 500 Mpix/s process rate per 1 VSPI Supports 4K (3840 pixels × 2160 lines) processing RZ/G2E VSPI has the following features. 1 set of VSPI is integrated. 125 Mpix/s process rate per 1 VSPI Supports Full HD (1920 pixels × 1080 lines) processing RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E (1) Supports Various Data Formats and Conversion — Supports YCbCr444/422/420, RGB, αRGB, αplane — Color space conversion and changes to the number of colors by dithering — Color keying — Supports combination between pixel alpha and global alpha — Supports generating pre multiplied alpha (2) Video Processing — Up and down scaling with arbitrary scaling ratio — Super resolution processing — Image rotation/reversal function: Reverses an image vertically/horizontally or rotates it by 90°/270° (3) Picture Quality/Color Correction with 1D/3D Look Up Table (LUT) — Hue, brightness, and saturation adjustment — 1D and 2D histogram Following functions will be supported by Renesas software portfolio. — Dynamic γ correction and gain correction — Correction of color (to adjust skin tones or colors in memory) (4) Visual near lossless image compression supported — 50% of bandwidth is diminished

Item	Description
Video Signal Processor (VSPB) (For All Products)	RZ/G2H VSPB has the following features. 2 sets of VSPB are integrated. 500 Mpix/s process rate (output rate) per 1 VSPB. Supports 4K (3840 pixels × 2160 lines) processing RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N VSPB has the following features. 1 set of VSPB is integrated. 500 Mpix/s process rate (output rate) per 1 VSPB. Supports 4K (3840 pixels × 2160 lines) processing RZ/G2E VSPB has the following features. 1 set of VSPB is integrated. 125 Mpix/s process rate (output rate) per 1 VSPB. Supports Full HD (1920 pixels × 1080 lines) processing RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E (1) Supports Various Data Formats and Conversion — Supports YCbCr444/422/420, RGB, αRGB, αplane — Color space conversion and changes to the number of colors by dithering — Color keying — Supports combination between pixel alpha and global alpha — Supports generating pre multiplied alpha (2) Video Processing — Blending of 5 picture layers and raster operations (ROPs) — Vertical flipping (3) Picture Quality/Color Correction with 1D/3D Look Up Table (LUT) — 1D and 2D histogram Following functions will be supported by Renesas software portfolio. — Dynamic γ correction and gain correction — Correction of color (to adjust skin tones or colors in memory) (4) Visual near lossless image compression supported — 50% of bandwidth is diminished

Item	Description
Video Signal Processor (VSPD) (For All Products)	RZ/G2H VSPD has the following features. 1 set of VSPD is integrated. Supports 4K (3840 pixels × 2160 lines) resolution. RZ/G2M V1.3 RZ/G2M V3.0 VSPD has the following features. 3 sets of VSPD are integrated. Supports 4K (3840 pixels × 2160 lines) resolution. RZ/G2N VSPD has the following features. 1 set of VSPD is integrated. Supports 4K (3840 pixels × 2160 lines) resolution. RZ/G2E VSPD has the following features. 2 sets of VSPD are integrated. Supports Full HD (1920 pixels × 1080 lines) resolution. RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E (1) Supports Various Data Formats and Conversion — Supports YCbCr444/422/420, RGB, αRGB, αplane — Color space conversion and changes to the number of colors by dithering — Color keying — Supports combination between pixel alpha and global alpha — Supports generating pre multiplied alpha (2) Video processing — Blending of 5 picture layers and raster operations (ROPs) — Vertical flipping in case of output to memory (3) Direct connection to display module RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N — Supports 4096 pixels in horizontal direction RZ/G2E — Supports 2048 pixels in horizontal direction RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E — Writing back image data which is transferred to Display Unit (DU) to memory
Video Signal Processor (VSPDL) RZ/G2H RZ/G2N	VSPDL has the following features. 1 set of VSPDL is integrated. (1) Supports various data formats and conversion — Supports YCbCr444/422/420, RGB, αRGB, αplane — Color space conversion and changes to the number of colors by dithering — Color keying — Supports combination between pixel alpha and global alpha — Supports generating pre multiplied alpha (2) Video processing — Blending of five picture layers and raster operations (ROPs) (3) Direct connection to display module — Supports two display output interfaces — Supports 2048 pixels in horizontal direction — Writing back image data which is transferred to Display Unit (DU) to memory

Item	Description
Video Codec Processor (VCP4) (For All Products)	The VCP4 is a multi-codec module which provides encoding and decoding capabilities on the basis of multiple video coding schemes, e.g., H.265/HEVC, H.264/AVC. This IP (Intellectual Property) is a multi codec that processes the frame or each field by controlling software for VCP4 executed on host CPU. • The VCP4 has the following features: Support for multiple codecs H.265/HEVC MP (Main Profile) decoding H.264/MPEG-4 AVC HP (High Profile) and MVC SHP (Stereo High Profile) encoding and decoding • Support for up to 4K resolutions (H.265 and H.264) Multiple channel processing: RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N When iVDP1C is used: (H.264/H.265 1920 × 1080p × 120 fps) When iVDP1C is not used: (H.265 1920 × 1080p × 120 fps) + (H.264 1920 × 1080p × 120 fps) RZ/G2E When iVDP1C is not used: (H.264/H.265 1920 × 1080p × 60 fps) When iVDP1C is used: (H.264/H.265 1920 × 1080p × 30 fps) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E Note: “1920 × 1080p × 120 fps” can be replaced as “3840 × 2160p × 30 fps”. “1920 × 1080p × 60 fps” can be replaced as “1280 × 720p × 120 fps”. “1920 × 1080p × 30 fps” can be replaced as “1280 × 720p × 60 fps”. Maximum performance will change with securable bus bandwidth. RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Data handling on a picture-by-picture basis Encodes/decodes data one picture (frame or field) at a time. • High picture quality Supports the H.264 high-efficiency coding tools (CABAC, 8 × 8 frequency conversion, and quantization matrix). High-efficiency motion vector detection by a combination of discrete search and trace search Optimal-mode selection by Rate-Distortion (RD) cost evaluation Picture quality control based on activity analysis results which match visual models • Low power dissipation Dynamically disables the clocks for the entire VCP4. Dynamically disables the clocks for individual submodules. • Includes its own reference data cache • Lossless image compression for reference picture is supported Use the software from Renesas to handle VCP4 functions.

Item	Description
Video Decoding Processor for inter-device video transfer (iVDP1C) (For All Products)	• Low-latency decoder H.264/AVC, JPEG • Color format 4:2:0/4:2:2 • Bit depth 8/10/12bits • Performance: RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N 1280 pixels × 960 lines × 30 frames/second × 4 channels (regardless of when VCP4 is used or not) RZ/G2E 1280 pixels × 960 lines × 30 frames/second × 2 channels (when VCP4 is not used) 1280 pixels × 960 lines × 30 frames/second × 1 channel (when VCP4 is used) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Max. resolution: 1920 pixels × 1088 lines • Includes its own reference data cache • Lossless image compression for reference picture is supported if bit depth is 8 bits Use the software from Renesas to handle iVDP1C functions.
Fine Display Processor (FDP1) (For All Products)	The FDP1 is the de-interlacing module which converts the interlaced video to progressive video, and has the following features. RZ/G2H (1) Supports 2 channels 500 Mpix/s for output performance per 1 FDP1 RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N (1) Supports 1 channel 500 Mpix/s for output performance per 1 FDP1 RZ/G2E (1) Supports 1 channel 125 Mpix/s for output performance per 1 FDP1 RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E (2) Supports various data formats — Input: YCbCr444/422/420 — Output: YCbCr444/422/420 and RGB/αRGB (3) 8190 pixels x 8190 lines video processing performance (4) High image quality de-interlacing algorithm — Motion adaptive de-interlacing — Accurate still detection — Diagonal line interpolation (DLI) (5) Visual near lossless image compression supported 50% of bandwidth is diminished

1.2.8 Sound Interface

Item	Description	
Sampling Rate Converter Unit (SCU) (For All Products)	Overall specification	• Includes ten SRC modules — Supports the quality suitable for audio sound (High-sound-quality type) (THD+N -132dB): six modules — Supports the quality suitable for voice sound (general-sound-quality type) (THD+N -96dB): four modules • The SRC module is capable of correcting phase change and delay (timing jitter) generated during data transfer over external memories or external devices. • The channel count conversion unit (CTU), mixer (MIX), and digital mute and volume function (DVC) can be used on two fixed output channels.
	Sampling rate conversion (SRC)	• Capable of asynchronous sampling rate conversion • Supports resolutions up to 24 bits • Two kinds of filter type for SRC. — Supports the quality suitable for audio sound (High-sound-quality type) (THD+N -132dB): Realized the filter by passband -1dB@0.4575FS, cutoff -18dB@0.5FS. — Supports the quality suitable for voice sound (general-sound-quality type) (THD+N -96dB): Realized the filter by passband -1dB@0.4561FS, cutoff -72dB@0.5FS. (Characteristics of each filter is written in the equivalent/up-sampling cases.) • Automatically generates antialiasing filter coefficients • For monaural to eight-channel sound sources
Sampling Rate Converter Unit (SCU) (For All Products)	Channel count conversion unit (CTU)	• Downmixing and splitter functions — Conversion of eight input channels into four output channels — Conversion of six input channels into two output channels — Conversion of two input channels into four sets of two output channels — Conversion of one input channel into eight sets of one output channel — No conversion
	Mixer (MIX)	• Mixing (adds) two to four sources into one • Ratio for adding sources is selectable • Ratio is dynamically changeable • Mixing with volume ramp is available (ramp period is selectable)

Item	Description	
	Digital volume and mute function (DVC)	• Volume control function including digital volume, volume ramp, and zero-crossing mute • The digital volume function is specified by a 24-bit fixed-point value within the range from 0 to 8 times (mute, or -120 to 18 dB) • The volume ramp function can be used for soft mute, fade-in, fade-out, or desired volume adjustment • The volume ramp period can be changed within the sampling range from the 0th to 23rd power of 2 • The zero-crossing mute function silences the sound at the zero-crossing point of the audio data

Item	Description	
Serial Sound Interface Unit (SSIU) (For All Products)	Overall specification	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Includes ten SSI modules functioning as interfaces with external devices. — Supports short and long formats for monaural — Supports TDM format (six modules of ten modules can be used for this function) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • Max. 16 independent monaural sound sources in a TDM format can be in TDM format. RZ/G2E • Max. 8 independent monaural sound sources in a TDM format can be in TDM format.
	Serial sound interface (SSI)	• 10 channels • Max. SCK frequency 15.1 MHz (for slave input) or 12.5 MHz (for master output) • Operating mode: non-compressed mode (Not support compressed mode) • Supports versatile serial audio formats (I2S/left justified/right justified) • Supports master/slave functions • Programmable word clock, bit clock generation functions • Multichannel format functions (up to four channels) • Supports 8-/16-/18-/20-/22-/24-bit data formats • Supports TDM mode • Supports WS continue mode • The DMA controller or interrupts control the transfer of data to and from the SSI module. • Supports short and long frames for monaural data (valid data lengths are 8 and 16 bits) • Up to nine independent clock signals can be input.
Audio Clock Generator (ADG) (For All Products)	Selection or division of audio clock signals	

1.2.9 Storage

<table>
<tr><th>Item</th><th>Description</th></tr>
<tr><td>USB2.0 Host
(For All Products)</td><td>RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N
• 2 channels (Host only 1 channel/Host-Function 1 channel)
• USB Host (EHCI/OHCI) 2 LINK
RZ/G2E

Item	Description
SD host Interface (For All Products)	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • 4 channels RZ/G2E • 3 channels RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Supports SDR104 class transfer rate Does not support CPRM • Supports SD memory/SDIO interface • Error check function: CRC7 (command/response), CRC16 (data) • Max. Frequency 200 MHz • Card detection function • Supports write protection • SD-binding function — Compliant with Content Protection for Recordable Media Specification in revision 0.92 of the SD-Binding Part of the SD Memory Card Book • SD-SD content protection — Compliant with Content Protection for Recordable Media Specification in revision 0.92 of the SD-SD part of the SD Memory Card Book
Multimedia Card Interface (MMC) (For All Products)	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • 2 channels • eMMC 5.0 base, Support HS400 class transfer rate RZ/G2E • 1 channel • eMMC 5.0 base, Support HS400 class transfer rate RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • eMMC controllable • Data bus: 1/4/8-bit MMC mode (not support SPI mode) • Support block transfer (not support stream transfer) • Block size in multiple block transfer: 512 Bytes
rawNAND Controller RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E	• The NAND Flash Memory Interface controller implements the function of a high level interface to one NAND flash device. It supports the functionality of the high speed NAND Flash devices described in the ONFI 1.x specifications.

1.2.10 Network

Item	Description
Controller Area Network Interface (CAN interface) (For All Products)	• 2 channels • Supports CAN specification 2.0B • Maximum bit rate: 1 Mbps • Message box — Normal mode: 32 receive-only mailboxes and 32 mailboxes for transmission/reception — FIFO mode: 32 receive-only mailboxes and 24 mailboxes for transmission/reception, 4-stage FIFO for transmission, and 4-stage FIFO for reception • Reception — Data frame and remote frame can be received. — Selectable receiving ID format — Selectable overwrite mode (message overwritten) or overrun mode (message discarded) • Acceptance filter — Mask can be enabled or disabled for each mailbox. • Transmission — Data frame and remote frame can be transmitted. — Selectable transmitting ID format (only standard ID, only extended ID, or both IDs) — Selectable ID priority mode or mailbox number priority mode • Sleep mode for reducing power consumption
CAN-FD (For All Products)	• 2 channels • 8 Mbps (CAN clock 40 MHz)
PCIE Controller (For All Products)	• PCI Express Base Specification Revision 2.0 • PHY integrated RZ/G2H RZ/G2N • 1 Lane × 2 channels (one of PHY is shared with Serial ATA) RZ/G2M V1.3 RZ/G2M V3.0 • 1 Lane × 2 channels RZ/G2E • 1 Lane × 1 channel
EthernetAVB-IF (For All Products)	• Supports IEEE802.1BA, IEEE802.1AS, IEEE802.1Qav and IEEE1722 functions • Magic packet detection • Supports Reception Filtering to separate streaming frames from different sources • Supports interface conforming to IEEE802.3 PHY RGMII (Reduced Gigabit Media Independent Interface) • RGMII v1.3 • Supports transfer at 1000 Mbps and 100 Mbps.

1.2.11 Timer

Item	Description
RCLK Watchdog Timer (For All Products)	• 1 channel • Internal 16-bit watchdog timer operated by RCLK • Programmable overflow time period: more than 1 hour count capable
16-Bit Timer Pulse Unit (TPU) (For All Products)	• 4-channels 16-bit timers • Each channel outputs PWM
System Watchdog Timer (For All Products)	• 1 channel • Internal 16-bit watchdog timer • Programmable overflow time period: more than 1 hour count capable initial counter value 171[s]
Compare Match Timer Type0 (CMT0) (For All Products)	• 2 channels • 32-bit timer (16 bits/32 bits can be selected) • Source clock: RCLK clock • Compare match function provided • Interrupt requests
Compare Match Timer Type1 (CMT1) (For All Products)	• 8 channels • 48-bit timer (16 bits/32 bits/48 bits can be selected) • Source clock: RCLK/system clock • Compare match function provided • Interrupt requests
Compare match timer 2 (CMT2) (For All Products)	(same as CMT1)
Compare match timer 3 (CMT3) (For All Products)	(same as CMT1)
System Timer (For All Products)	• 32-bit timer, 1 channel (16 bits/32 bits can be selected) • Compare match function provided • Interrupt requests
System up-time clock (For All Products)	• 1 channel • Internal 32-bit timer • Programmable overflow time period: maximum 24 hours
Timer Unit (TMU) (For All Products)	• 15 channels • 32-bit timer • Auto-reload type 32-bit down counter • Internal prescaler • Interrupt request • 2 channels for input capture

1.2.12 Peripheral Module

Item	Description
IIC Bus Interface for PMIC (IIC for PMIC) (For All Products)	• 1 PMIC channel for dedicated buffer • Supports single master transmission/reception • Interrupt request • Automatic transfer by wakeup control
I2C Bus Interface (I2C) (For All Products)	RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N • 7 channels • 4 channels for buffers with a slew rate (channel 0, 3, 4, 5 for dedicated buffers) • 3 channels for LVTTL buffers (channels 1, 2, 6 for ordinary buffers) RZ/G2E • 8 channels • 2 channels for buffers with a slew rate (channel 0, 3 for dedicated buffers) • 6 channels for LVTTL buffers (channels 1, 2, 4, 5, 6, 7 for ordinary buffers) RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • NXP I2C bus interface method supported • Master/slave functions • Multi-master functions • Transfer rate up to 400 kbps supported • Programmable clock generation from the system clock • Master and Slave function DMA supported

Item	Description	
Serial communication interface with FIFO (SCIF) (For All Products)	Overall specification	• 6 channels • Asynchronous, clock-synchronized modes • Asynchronous serial communication mode The SCIF performs serial data communication based on a character-by-character asynchronous system. This feature enables serial data communication with standard asynchronous communication chips that support Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). There is a choice of eight serial data transfer formats. — Data length: 7 bits or 8 bits — Stop bits: 1 bit or 2 bits — Parity: Even/odd/none — Receive error detection: Parity, framing, and overrun errors — Break detection: A break is detected when a framing error lasts for more than 1 frame length at Space 0 (low level). When a framing error occurs, a break can also be detected by reading the RX pin level directly from the serial port register (SCSPTR). • Clock synchronous serial communication mode The SCIF performs serial data communication synchronized with a clock. This feature enables serial data communication with other LSIs that support synchronous communication. There is a single serial data communication format for clock synchronous serial communication. — Data length: 8 bits — Receive error detection: Overrun errors • Full-duplex communication capability The SCIF has an independent transmitter and receiver that enable simultaneous transmission and reception. The transmitter and receiver both have a 16-stage FIFO buffer structure, enabling continuous serial data transmission and reception. • On-chip baud rate generator, enabling any bit rate to be selected The SCIF enables choice of a clock source for transmission/reception: a clock from the on-chip baud rate generator based on the internal clock or an external clock. • Eight interrupt sources The SCIF has eight types of interrupt sources. receive-data-ready, receive-FIFO-data-full, break, transmit-FIFO-data-empty, transmit-end, receive-error, overrun-error and time-out and enables any of them to be requested independently. • DMA data transfer When the transmit FIFO register is empty or the receive FIFO register has received data, issuing a DMA transfer request activates the DMA controller (DMAC) to execute a data transfer. • In asynchronous mode using channels 0, 1, 3, and 4, modem control functions (RTS and CTS) are stored. • RTS and CTS are not implemented for SCIF2 and SCIF5.

Item	Description	
Serial Communication Interface with FIFO (SCIF) (For All Products)	Overall specification	• The amount of data in the transmit/receive FIFO registers and the number of receive errors in receive data in the receive FIFO register are available. • In asynchronous mode, a receive data ready (DR) or a timeout error (TO) can be detected during reception.
Clock-Synchronized Serial Interface with FIFO (MSIOF) (For All Products)	• 4 channels • Internal 32-bit × 64-stage transmit FIFOs/internal 32-bit × 256-stage receive FIFOs • Supports master and slave modes • Internal prescaler RZ/G2H • Supports serial formats: SPI (master and slave modes) RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E • Supports serial formats: IIS, SPI (master and slave modes) • Interrupt request, DMAC request	
High Speed Serial Communication Interface with FIFO (HSCIF) (For All Products)	• 5 channels • Asynchronous serial communication mode • Capable of full-duplex communication • On-chip baud rate generator, enabling any bit rate to be selected • Eight interrupt sources • DMA data transfer • Modem control functions (HRTS# and HCTS#) are stored. • The amount of data in the transmit/receive FIFO registers and the number of receive errors in receive data in the receive FIFO register are available. • A receive data ready (DR) or a timeout error (TO) can be detected during reception.	
PWM (For All Products)	• 7 channels • High-level width (10 bits) of PWM output can be set. • Output cycle periods (10 bits) of PWM can be set. • Periods in the range from two to 2^{24} × 1023 cycles of the Pϕ clock can be set. • Continuous pulse or single pulse output selectable	

1.2.13 Others

Item	Description
Boundary Scan (For All Products: option)	• Boundary scan based on IEEE 1149.1 via JTAG interface is supported. Note that some module pins are not available on this boundary scan.

3. Mode Pin Settings (RZ/G2H)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

Table 3.1 TEST2 and TEST1 Settings

Test2	Test1	Mode Select
0	0	Normal operation
0	1	Setting prohibited
1	0	Setting prohibited
1	1	Setting prohibited

Table 3.2 BSMODE Settings

BSMODE	JTAG pin Operating Mode Switching
0	Normal operation
1	Operates in boundary scan mode. When PRESET# is at low level, pin IO control is disabled.

Table 3.3 MD0 Settings

MD0	Reserved, fixed to 0

Table 3.4 MD4, MD3, MD2, MD1 Settings

MD4	MD3	MD2	MD1	Boot Device Selection
—	—	—	—	See the Boot section.

Table 3.5 MD5 Settings

MD5	Reserved (See the Boot section.)
0	Setting prohibited
1	Normal boot

Table 3.6 MD7 and MD6 Settings

MD7	MD6	Master Boot Processor Selection (See the Boot section.)
0	0	Cortex-A57 boot
0	1	Cortex-A53 boot
1	0	Setting prohibited
1	1	Setting prohibited

Table 3.7 MD8 Settings

MD8	EXBUS Data Bus Width
0	8-bit
1	16-bit

Table 3.8 MD9 Settings

MD9	EXTAL/XTAL Pin Setting (See the Clock Pulse Generator section.)
0	Inputs an external clock to the EXTAL pin.
1	Connects the crystal resonator to the EXTAL and XTAL pin

Table 3.9 MD21, MD20, MD11, MD10 and MDT[1:0] Settings

MD21	MD20	MD11	MD10	MDT[1:0]	JTAG Selection
—	—	—	—	—	See the Debug and Trace section.

Table 3.10 MD14 and MD13 Settings

MD14	MD13	Clock Frequency Selection
—	—	See the Clock Pulse Generator section.

Table 3.11 MD15 Settings

MD15	Initial ARMv8 Execution State Selection (See the Boot section.)
0	AArch32
1	AArch64

Table 3.12 MD16 Settings

MD16	Reserved, fixed to 1

Table 3.13 MD18 Settings

MD18	External Bus Clock Frequency Setting (See the Clock Pulse Generator section.)
0	Division ratio = 1/24 of the PLL1 oscillation frequency
1	Division ratio = 1/36 of the PLL1 oscillation frequency

Table 3.14 MD19 and MD17 Settings

		LPDDR4 Data Transfer Rate
MD19	**MD17**	**LPDDR4**
0	0	DDR3200
0	1	DDR2800
1	0	Setting prohibited
1	1	DDR1600

Table 3.15 MD27 and MD22 Settings

MD27	MD22	DDR Phy Pin-mux Setting
0	0	LPDDR4
0	1	Setting prohibited
1	0	Setting prohibited
1	1	Setting prohibited

Table 3.16 MD25 Settings

MD25	Reserved, fixed to 0

Table 3.17 MD23 Settings

MD23	Reserved, fixed to 0

Table 3.18 MD26 Settings

MD26	Reserved, fixed to 0

Table 3.19 MD28 Settings

MD28	Select RCLK Source
0	CLK from inside
1	from EXTALR

Table 3.20 MD12 Settings

MD12	Select PCIE or SATA
0	PCIexpress
1	SATA

4. Mode Pin Settings (RZ/G2M V1.3, RZ/G2M V3.0)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

Table 4.1 TEST2 and TEST1 Settings

TEST2	TEST1	Mode Select
0	0	Normal operation
0	1	Setting prohibited
1	0	Setting prohibited
1	1	Setting prohibited

Table 4.2 BSMODE Settings

BSMODE	JTAG Pin Operating Mode Switching
0	Normal operation
1	Operates in boundary scan mode. When PRESET# is at low level, pin IO control is disabled

Table 4.3 MD0 Settings

MD0	Reserved, fixed to 0

Table 4.4 MD4, MD3, MD2 and MD1 Settings

MD4	MD3	MD2	MD1	Boot Device Selection
—	—	—	—	See the Boot section

Table 4.5 MD5 Settings

MD5	Reserved (See the Boot section.)
0	Setting prohibited
1	Normal boot

Table 4.6 MD7 and MD6 Settings

MD7	MD6	Master Boot Processor Selection (See the Boot section.)
0	0	Cortex-A57 boot

7. AP-System Core

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

7.1 Overview

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0

The AP-System core is a core block equipped with Arm Cortex-A53 and Arm Cortex-A57. For details on the functions of Cortex-A53 and Cortex-A57, see the relevant Technical Reference Manual.

RZ/G2E

The AP-System core is a core block equipped with Arm Cortex-A53. For details on the functions of Cortex-A53, see the relevant Technical Reference Manual.

RZ/G2N

The AP-System core is a core block equipped with Arm Cortex-A57. For details on the functions of Cortex-A57, see the relevant Technical Reference Manual.

7.1.1 Features

7.1.1.1 Cortex-A57 CPU cluster

Table 7.1 shows the feature of Cortex-A57 CPU cluster in AP-System Core.

7.1.1.3 Cache Coherent Interconnect (CCI-500)

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0

Cache coherent interconnect combines interconnect and coherency function. It can connect two ACE masters, one ACE-Lite masters and three AXI4 slaves.
Table 7.3 shows the module connection of each ports. In order to improve the performance of the coherency access, snoop filter is implemented. For details, refer to the following document.

RZ/G2H
"CoreLink CCI-500 Cache Coherent Interconnect Revision r1p0 Technical Reference Manual" (corelink_cci500_cache_coherent_interconnect_technical_reference_manual_100023_0100_00_en.pdf). 3.4 Address map

RZ/G2M V1.3 RZ/G2M V3.0
"CoreLink CCI-500 Cache Coherent Interconnect Revision r0p1 Technical Reference Manual" (corelink_cci500_cache_coherent_interconnect_technical_reference_manual_100023_0001_00_en.pdf). 3.4 Address map

RZ/G2N RZ/G2E

The bus interconnect is connected to Cortex-A53.

7.1.1.4 Generic Counter

For the general explanation about Generic Counter, and the details of the relation between Generic Counter and Generic Timer, refer to the Arm manual. In this chapter, it is explained that the frequency for count-up of the Generic Counter. The Generic Counter serves as the CoreSight Timestamp function as well as Generic Timer.

7.1.2 Block Diagram

Figure 7.1, Figure 7.2 and Figure 7.3 show the block diagram of AP-System Core.

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0

Note: For details, refer to DDI0487A_b_armv8_arm.pdf, Appendix I1 System Level Implementation of the Generic Timer.

7.1.5 Connected Module

Table 7.7 shows the connected modules to AP-System Core. As for the feature of the connected modules, refer to the chapter of each modules.

Table 7.7 Connected Modules

Module Name	Connected Module Name	Connected Module Function
AP-System Core	APMU	Power On/Off sequence Clock supply
	SYSC	Power On/Off sequence
	RST	Boot address mode setting CPU reset control
	INTC-AP	Interrupt handling
	Debug and Trace	Debug function

7.2 Register Description

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

As for register description of AP-System Core, refer to the following documents.

- RZ/G2H CoreLink CCI-500 Cache Coherent Interconnect Revision r1p0 Technical Reference Manual
- RZ/G2M V1.3 RZ/G2M V3.0 CoreLink CCI-500 Cache Coherent Interconnect Revision r0p0 Technical Reference Manual
- Arm Architecture Reference Manual Armv8, for Armv8-A architecture profile

7.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

7.3.1 Boot Address Setting

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0

In AArch32 mode, boot address can be controlled by CA57/53BAR and CA57/53BAR2 register in RESET(RST). In AArch64 mode, boot address can also be controlled by CA57/53CPUnBARH/L registers in RST. About the initial value of these registers, refer to section 17, RESET(RST).

RZ/G2E

In AArch32 mode, boot address can be controlled by CA53BAR and CA53BAR2 register in RESET(RST). In AArch64 mode, boot address can also be controlled by CA53CPUnBARH/L registers in RST. About the initial value of these registers, refer to section 17, RESET(RST).

RZ/G2N

In AArch32 mode, boot address can be controlled by CA57BAR and CA57BAR2 register in RESET(RST). In AArch64 mode, boot address can also be controlled by CA57CPUnBARH/L registers in RST. About the initial value of these registers, refer to section 17, RESET(RST).

7.3.2 Power-Up/Down Mechanism

The AP-System core supports the following five power modes.

- AP-System core power down mode
  RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0
  (CPUs and L2 Cache shutdown: A2BS = OFF (Cortex-A57)/A2LS = OFF (Cortex-A53))
  RZ/G2E
  (CPUs and L2 Cache shutdown: A2LS = OFF (Cortex-A53))
  RZ/G2N
  (CPUs and L2 Cache shutdown: A2BS = OFF (Cortex-A57))
- Core standby mode (each CPU)
- Sleep mode (clock stop, each CPU)
- L2 shutdown mode
- Normal Operation mode

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

In AP-System core power down mode, the power of the AP-System core area is shut down. This mode is intended to be used at long-time wait, and achieves the reduction of power consumption including leakage current cut-off. The system boots up from the reset vector at its return from AP-System core power down mode. For detail of the AP-system core power down control, see section 14, System Controller (SYSC).

In Core standby mode, all memories including L1 cache of the relevant CPU do not keep its contents, but the power of the SRAM of level 2 cache is supplied to keep its contents.

In L2 shutdown mode, all power of CPUs and L2 in cluster is shut down. So contents of both L1s and L2 are not retained.

For details of Core standby mode and L2 shutdown mode, see section 13, Advanced Power Management Unit for AP-System Core (APMU).

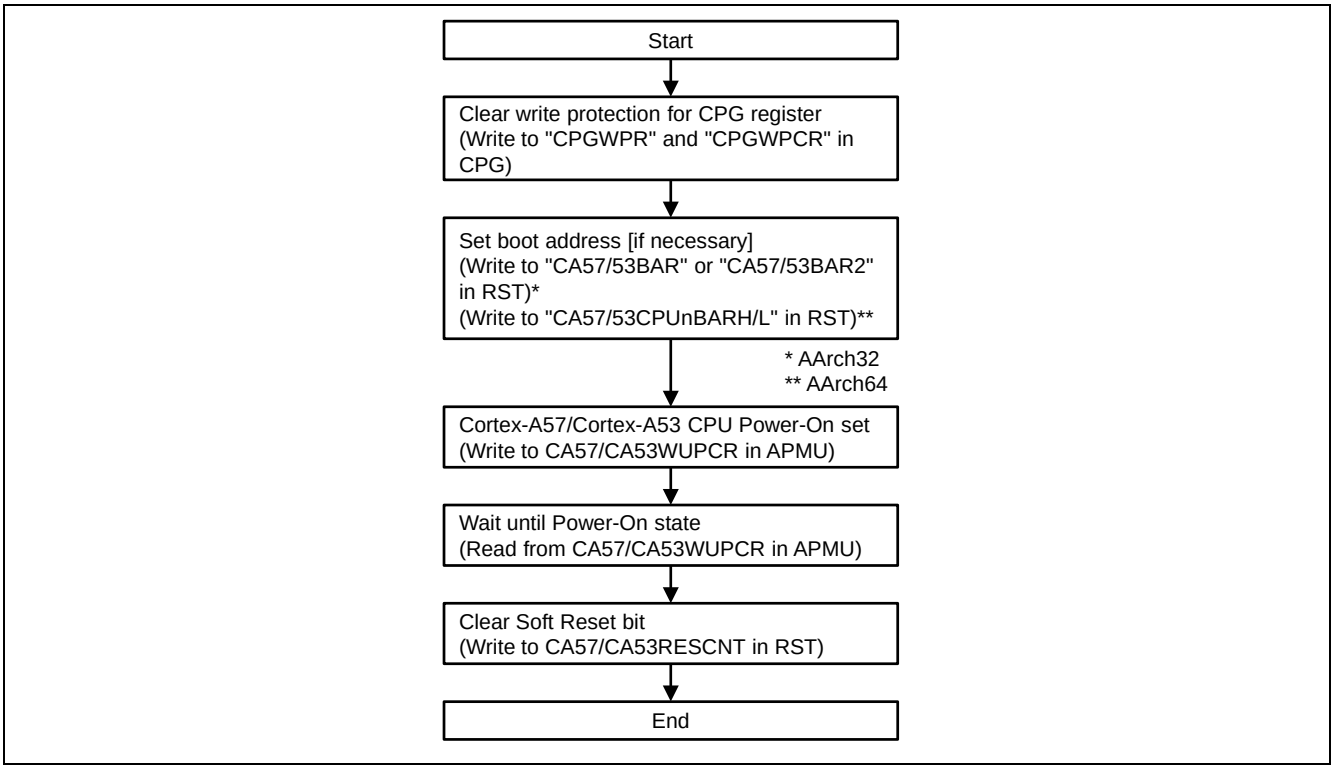

Figure 7.4 Cortex-A57/Cortex-A53 CPU core power-on sequence

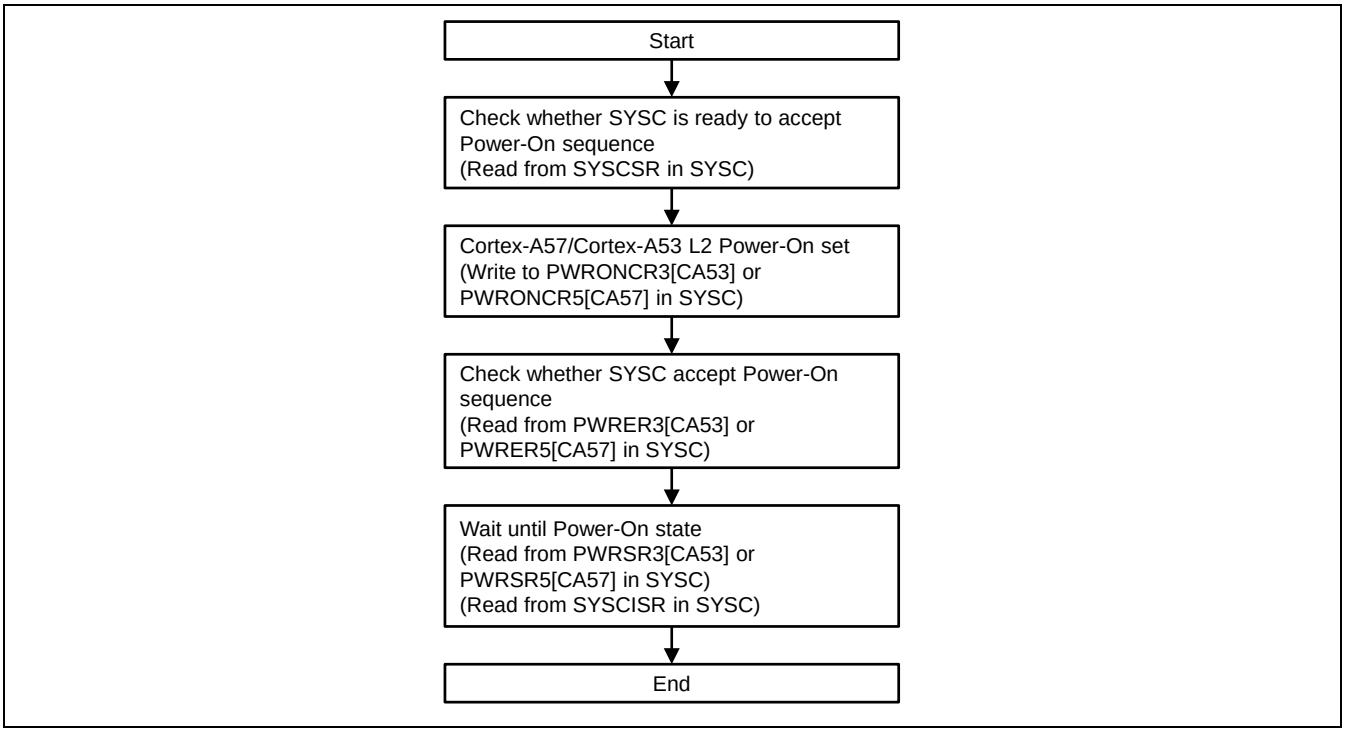

Figure 7.5 Cortex-A57/Cortex-A53 L2 power-on sequence

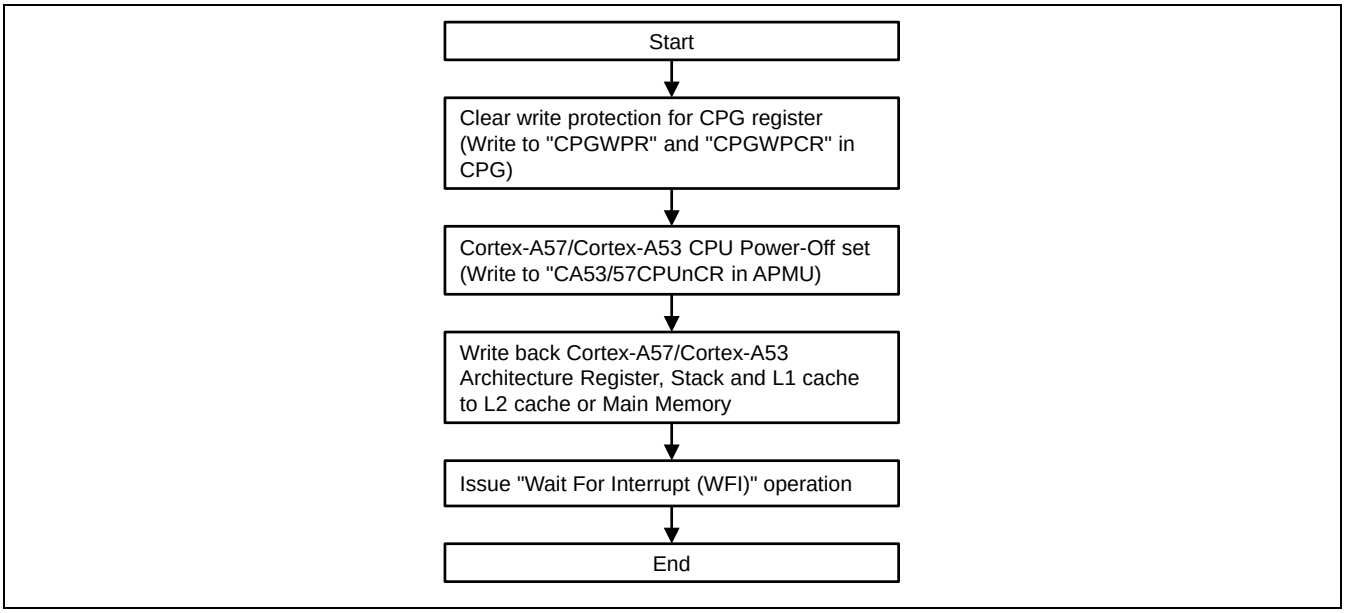

Figure 7.6 Cortex-A57/Cortex-A53 CPU core power-off sequence

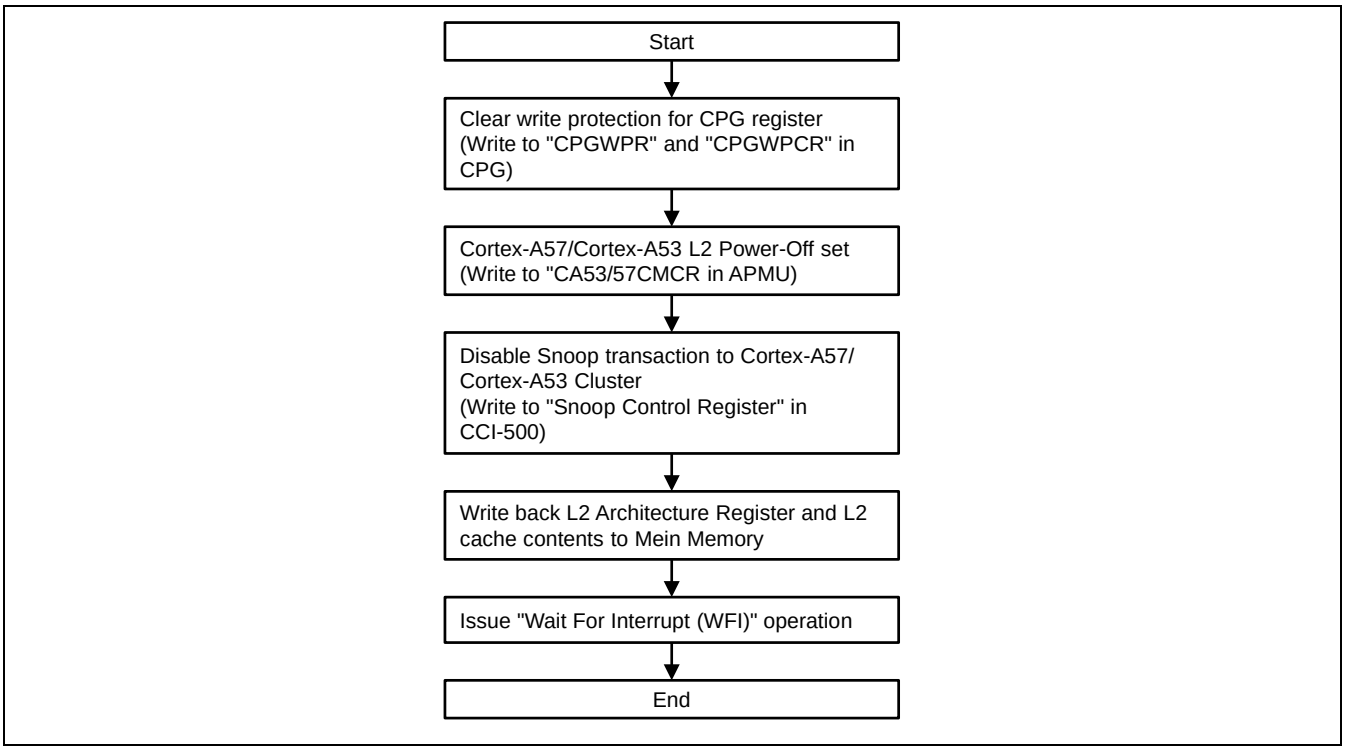

Figure 7.7 Cortex-A57/Cortex-A53 L2 power-off sequence

7.3.3 Switching between AArch32 and AArch64

Each CPU in AP-System core can be switched between AArch32 state and AArch64 state using warm reset. In order to switch between AArch32 and AArch64 safely, it is recommended to use the below sample code. In addition, interrupts and debug requests for this core should be disabled in advance.

```
MOV   Wy, #3          ; #3 : for AArch64, #2 : for AArch32, y : any register
DSB                   ; ensure all memory transactions are completed
MSR   RMR_ELx, Wy     ; request the reset
ISB                   ; synchronization for changing to RMR
      loop
WFI                   ; in order to issue warm reset
B     loop
```

Note: Refer to the “Arm Architecture reference manual” in detail.
In case of Cortex-A53 and Cortex-A57, RMR_ELx is RMR_EL3

7.3.4 Maximum Outstanding Setting of CCI-500

CCI-500 can adjust maximum number of outstanding request as shown in Table 7.8. Set the same or lower value listed in Table 7.8.

Table 7.8 Maximum Number of Outstanding Request (CCI-500)

		RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
Slave port 0	Read/Write	32	32	—	—
Slave port 1	Read/Write	32	32	—	—
Slave port 2	Read/Write	32	32	—	—
Slave port 3	Read/Write	32	—	—	—

7.3.5 System Address Map

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0

The CCI-500 has the system address map. The address spaces defined in this map are split into 11 regions. The connection to each master port is defined by the value of ADDRMAP[32:0] in advance.

Table 7.9 shows System Address MAP of CCI-500. For the detail of address map, see the following document.

RZ/G2H

“CoreLink CCI-500 Cache Coherent Interconnect Revision r1p0 Technical Reference Manual” (corelink_cci500_cache_coherent_interconnect_technical_reference_manual_100023_0100_00_en.pdf). 3.4 Address map

RZ/G2M V1.3 RZ/G2M V3.0

“CoreLink CCI-500 Cache Coherent Interconnect Revision r0p1 Technical Reference Manual” (corelink_cci500_cache_coherent_interconnect_technical_reference_manual_100023_0001_00_en.pdf). 3.4 Address map

Table 7.9 System Address Map for CCI-500

Address Region	Address Range	Destination
REGION 0	H'00_0000_0000 to H'00_3FFF_FFFF	Master port 0 (Peripheral)
REGION 1	H'00_4000_0000 to H'00_BFFF_FFFF	Master port 1/2 (Main Memory) [4KB split]
REGION 2	H'00_C000_0000 to H'00_DFFF_FFFF	Master port 0 (Peripheral)
REGION 3	H'00_E000_0000 to H'00_E62F_FFFF	Master port 0 (Peripheral)
REGION 4	H'00_E630_0000 to H'00_E63F_FFFF	Master port 1/2 (System RAM) [4KB split]
REGION 5	H'00_E640_0000 to H'00_FFFF_FFFF	Master port 0 (Peripheral)
REGION 6	H'01_0000_0000 to H'0F_FFFF_FFFF	Master port 1/2 (Main Memory) [4KB split]
REGION 7	H'10_0000_0000 to H'14_FFFF_FFFF	Master port 0 (Peripheral)
REGION 8	H'15_0000_0000 to H'1E_FFFF_FFFF	Master port 0 (Peripheral)
REGION 9	H'1F_0000_0000 to H'1F_FFFF_FFFF	Master port 0 (Peripheral)
REGION 10	H'20_0000_0000 to H'FF_FFFF_FFFF	Master port 0 (Peripheral)

7.3.6 Frequency for Counting Up of Generic Counter

The generic timer counts up by one every clock edge of the following frequency continuously.

Table 7.10 Frequency for count-up

	RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
Count-up clock frequency	EXTAL × 1/2	EXTAL × 1/2	EXTAL × 1/2	EXTAL × 1/2

The operating frequency of EXTAL is decided by mode pin setting. For details, see section 8.1.5 Clock Operating Modes, PLL Initial Multiplication Ratio description.

7.3.7 How to Start a Generic Counter

Set bit 0 in CNTCR to 1 to start the Generic Counter when the CPU is placed in the secure mode.

7.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

7.4.1 L2 Cache Setting for Cortex-A57

Notes for L2 cache setting for Cortex-A57 are follows:

- The default value of “Tag RAM latency” is 2 cycles. You must change it to 3 cycles by accessing L2CTLR.
- The default value of “Data RAM setup” is 0 cycles. In case of RZ/G2H, you must change it to 1 cycle by accessing L2CTLR.
- The default value of “Data RAM latency” is 2 cycles. You must change it to 4 cycles by accessing L2CTLR.

Table 7.11 shows the L2 cache setting for Cortex-A57

Table 7.11 L2 Cache Setting for Cortex-A57

	RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
Tag RAM latency (cycle)	3	3	3	—
Data RAM latency (cycle)	4	4	4	—
Data RAM setup (cycle)	1	0	0	—

7.4.2 Memory Attribute

The following is restriction on the memory attributes in the case of the memory write access. If you ignore the restriction, the write access will cause unexpected results. There is not restriction in case of the read access.

External memories accessed via LBSC

The memory attribute must be the below.

- Device-nGnRnE(default)({TEX,C,B} = B’0_0000)(*)
- Shareable/Non-Shareable Device-nGnRE({TEX,C,B} = B’0_0001 or B’0_1000)(*)

Note: * In case that “Memory Region Remap” is enabled in OS, the bit pattern of {TEX,C,B} is different.

8. Pin Function Controller (PFC)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

8.1 Overview

The pin function controller (PFC) is a module that consists of registers for selecting the function of the multiplexed pins and controlling the pull-up resistor on each LSI pin.

8.1.1 Features

- Setting multiplexed pin functions for LSI pins

  Function of the RZ/G 2nd Generation pin selectable by setting the registers in the PFC module

  (The function of the LSI pin can be selected by the GPIO/peripheral function select registers 0 to 7 (GPSR0 to GPSR7) and peripheral function select registers 0 to 18 (IPSR0 to IPSR18) in the PFC module. For details, see sections 8.2.2, GPIO/Peripheral Function Select Register (GPSR0-7) through 8.2.3, Peripheral Function Select Register 0-18 (IPSR0-18).)
- DRV control for each LSI pin

  DRV control resistors can control the driving abilities of pins.

  DRV control resistors on each LSI pin can be controlled by setting the registers in the PFC module. (Selection is handled by the output drive select register (DRVCTRL0-24). For details, see sections 8.2.4, DRV Control Register 0-24 (DRVCTRL0-24).
- POC control for each LSI pin

  POC control registers must be set according to IO voltage level that is supplied to the pin.

  POC control resistors on each LSI pin can be controlled by setting the registers in the PFC module. (Selection is handled by the IO voltage level select register (POCCTRL0). For details, see sections 8.2.5, POC Control Register 0 (POCCTRL0).
- TDSEL control for each LSI pin

  TDSEL control registers can control the driving abilities of pins in use for the SDHI.

  TDSEL control resistors on each LSI pin can be controlled by setting the registers in the PFC module. (Selection is handled by the return path for SDHI clock drive select register (TDSELCTRL0). For details, see sections 8.2.6, TDSEL Control Register 0 (TDSELCTRL0).
- Pull-up/down control for each LSI pin.

  PUEN registers can on/off control of the pull resistors.

  On/off of the pull resistors on each LSI pin can be controlled by setting the registers in the PFC module.

  (Selection is handled by the Pull-on/off select register (PUEN0-6). For details, see sections 8.2.7, LSI pin pull-enable register 0-6 (PUEN0-6).

  PUD registers can pull-up/pull-down control of the pull resistors.

  Pull-up/Pull-down control resistors on each LSI pin can be controlled by setting the registers in the PFC module.

  (Selection is handled by the Pull-up/down select register (PUD0-6). For details, see sections 8.2.8, LSI pin pull-up/down control Register 0-6 (PUD0-6).
- Module selection

  Module Select Register can select the group for multiple LSI pins with multiplexed pin functions.

  Enable and disable the functions of RZ/G 2nd Generation LSI pins to which pin functions from multiple pin groups are assigned by setting the registers in the PFC module.

  (Selection is handled by the module select register (MOD_SEL0-2). For details, see sections 8.2.9, Module Select Register 0-2 (MOD_SEL0-2).

- Notes on configuring multiplexed pin functions
  The multiplexed LSI pins (MOD_SEL0-2, GPSR0-7, IPSR0-18) must be set in the initial sequence (*).
  Switching multiplexed LSI pins during operation is not guaranteed.
  *: The initial sequence is Appendix B.(3)
- Module clock
  Module clock is S3D4ϕ.

8.1.2 Block Diagram

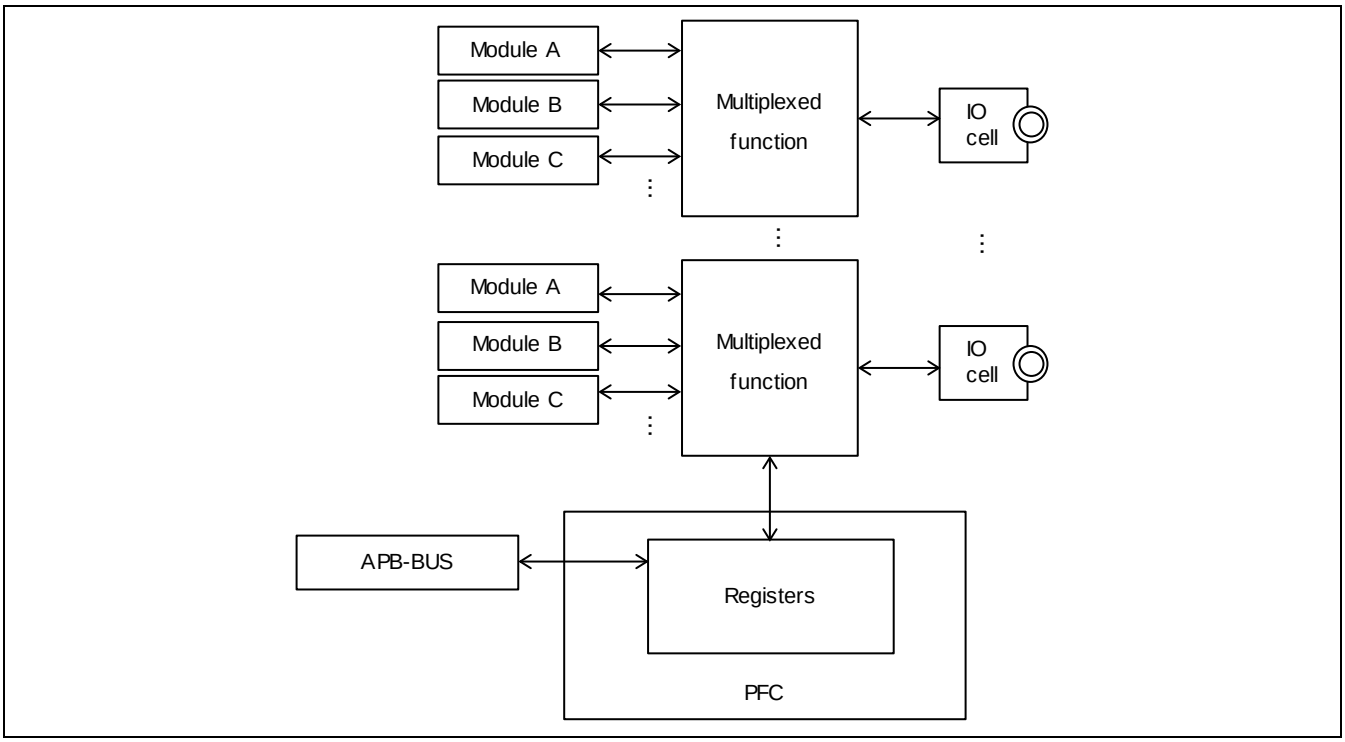

Figure 8.1 PFC Block Configuration

8.1.3 External Pins

PFC does not have External Pins.

8.1.4 Register Configuration

All the registers in the PFC are mapped into the APB bus space. Table 8.1 shows the configuration of the registers provided in the PFC. Details on each register in the PFC are given in sections 8.2.1 to 8.2.9.

Table 8.1 Configuration of Registers in PFC

			Initial Value					
Name	Abbr.	R/W	RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	Address	Access Size	Condition
LSI Multiplexed Pin Setting Mask Register	PMMR	R/W	H'0000_0000	H'0000_0000	H'0000_0000	H'E606_0000	32	—
GPIO/Peripheral Function Select register 0	GPSR0	R/W	H'0000_FFFF (when md[4:1] = B'0000), H'0000_0000 (when md[4:1] ≠ B'0000)	H'0000_FFFF (when md[4:1] = B'0000), H'0000_0000 (when md[4:1] ≠ B'0000)	H'0000_FFFF (when md[4:1] = B'0000), H'0000_0000 (when md[4:1] ≠ B'0000)	H'E606_0100	32	—

8.1.5 Connected Module

Table 8.2 Connected module

Module name	Connected module name	Function of connected module
PFC	AP-System Core	Access the Registers
	CPG	Output clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset

8.2 Register Description

[Legend]

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R:	Read-only. The write value should always be 0.
R/WC0:	Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
W:	Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.
—/W:	Write-only. The read value is undefined.

All the bits are active high unless otherwise specified, and deactivated on reset.

All access to registers is made in longword units.

The write value to a reserved bit should always be 0.

8.2.1 LSI Multiplexed Pin Setting Mask Register (PMMR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: PMMR enables/disables writing to the multiplexed pin setting registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MPM [31]	MPM [30]	MPM [29]	MPM [28]	MPM [27]	MPM [26]	MPM [25]	MPM [24]	MPM [23]	MPM [22]	MPM [21]	MPM [20]	MPM [19]	MPM [18]	MPM [17]	MPM [16]

Note: * n = 0-18

Bit	R/W	Description
31 to 0	R/W	The functions of the LSI pins are selected according to the table below. For the initial values of these registers, refer to Table 8.1, and change the initial values if necessary.

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

IPSR register must not set "—", "Reserved" and IPSR = H'E, F.

Note 1 Different for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N

2 These bits are reserved. There is no effect setting any value from B'0000(H'0) to B'1101(H'D) to the bits.

8.2.4 DRV Control Register 0-24 (DRVCTRL0-24)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: DRVCTRL0-24 controls the driving abilities of pins. This setting is related to only the output.

Output buffer					Output buffer		
			Drive capability				
			Operating condition				
DRV1	DRV2	DRV3	for 1.8 V	for 3.3 V	DRV1	DRV2	Drive capability
L	L	L	2/8	2/8	L	L	1/4
H	L	L	2/8	2/8	H	L	2/4
L	H	L	3/8	3/8	L	H	3/4
H	H	L	4/8	4/8	H	H	Full
L	L	H	5/8	5/8			
H	L	H	6/8	6/8			
L	H	H	7/8	7/8			
H	H	H	Full	Full			

The value of these bits must be 11 in the case of 2bit (DRV2, DRV1).

The value of these bits must be 111 in the case of 3bit (DRV3, DRV2, DRV1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note: * Different for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N

8.2.5 POC Control Register 0 (POCCTRL0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: Each bit in POCCTRL0 must be set according to IO voltage level that is supplied to the pin.

0: 1.8v 1: 3.3v

Supply voltage	Setting register	Usage
1.8v	0	Possible
1.8v	1	Do not use
3.3v	0	Do not set (broken)
3.3v	1	Possible

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POC0 [31]	POC0 [30]	POC0 [29]	POC0 [28]	POC0 [27]	POC0 [26]	POC0 [25]	POC0 [24]	POC0 [23]	POC0 [22]	POC0 [21]	POC0 [20]	POC0 [19]	POC0 [18]	POC0 [17]	POC0 [16]
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POC0 [15]	POC0 [14]	POC0 [13]	POC0 [12]	POC0 [11]	POC0 [10]	POC0 [9]	POC0 [8]	POC0 [7]	POC0 [6]	POC0 [5]	POC0 [4]	POC0 [3]	POC0 [2]	POC0 [1]	POC0 [0]
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

Note: The power domain is common for SD channels.
When you use an unused port as GPIO, you must be careful about the voltage.

8.2.6 TDSEL Control Register 0 (TDSELCTRL0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: TDSELCTRL0 controls the driving abilities of pins in use for the SDHI.
This function is delay adjustment of the SDHI clock return path for the LSI inside.

TDSEL1	TDSEL0	TDOUT Target delay
L	L	10pF (@1.8 V operation)
H	L	20pF (@1.8 V operation)
L	H	30pF (@1.8 V operation)
H	H	40pF (@1.8 V operation)

The value of these bits must be 00.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8.2.7 LSI pin pull-enable register 0-6 (PUEN0-6)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: PUEN0-6 performs on/off control of the pull resistors.

0: Pull-up/down function is disabled.

1: Pull-up/down function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PUENn* [31]	PUENn* [30]	PUENn* [29]	PUENn* [28]	PUENn* [27]	PUENn* [26]	PUENn* [25]	PUENn* [24]	PUENn* [23]	PUENn* [22]	PUENn* [21]	PUENn* [20]	PUENn* [19]	PUENn* [18]	PUENn* [17]	PUENn* [16]
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: * Different for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N

8.2.9 Module Select Register 0-2 (MOD_SEL0-2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Function: MOD_SEL0-2 selects the group for multiple LSI pins with multiplexed pin functions.

Each input or input/output signal are assigned to two or more groups of pins. Select one of these groups when using these signals. Do not use the module pins in the unselected group; if a module pin in the unselected group is used, correct operation is not guaranteed. Group is “Set value” of Table 8.19.

For some modules, however, although the output signals are assigned to two or more groups of pins, there is no bit for selecting the group. Select one of these pins for each output signal through the corresponding peripheral function select register. Also note that each pin can only be used in combination with the other input or input/output pins of the same group. Correct operation is not guaranteed when a pin is used in combination with pins from other groups. If this is not the case, correct operation is not guaranteed.

RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

8.3.1 Function Setting for Multiplexed Pins

Setting the LSI multiplexed pin setting mask register (PMMR) is necessary before setting each of the GPIO/peripheral function select registers GPSR0 to GPSR7, peripheral function select registers IPSR0 to IPSR18, DRV control registers DRVCTRL0-24, TDSEL control registers TDSELCTRL0, POC control register POCCTRL0 and Module select register MOD_SEL0-2. Specifically, the inverse of the value to be set in the select register must be written to the LSI multiplexed pin setting mask register. Otherwise, the GPIO/peripheral function select registers 0 to 7 (GPSR0 to GPSR7) and peripheral function select registers 0 to 18 (IPSR0 to IPSR18) cannot be set. IPSR0 to IPSR18, and MOD_SEL0 to MOD_SEL2 registers shall be set before setting GPSR0 to GPSR7 registers in case that they need to be configured. MOD_SEL0 to MOD_SEL2 registers can be set either earlier or later than setting IPSR0 to IPSR18 registers.

(1) Procedure for changing pin function from GPIO to peripheral function

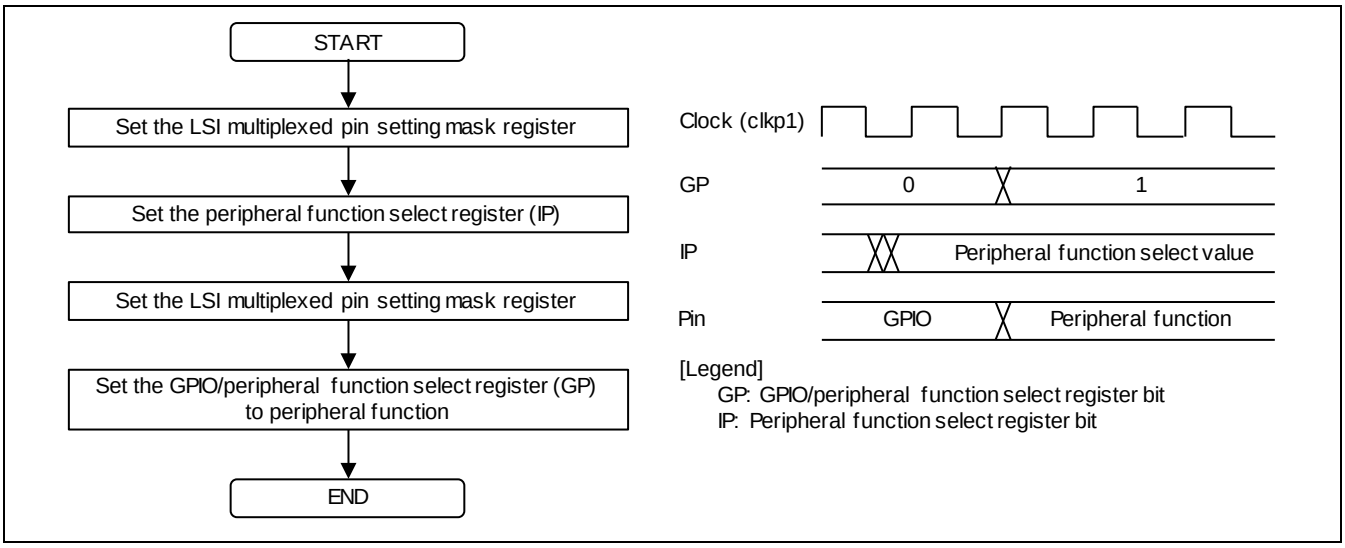

Figure 8.2 Procedure for Changing Pin Function from GPIO to Peripheral Function

(2) Procedure for changing pin function from peripheral function to GPIO

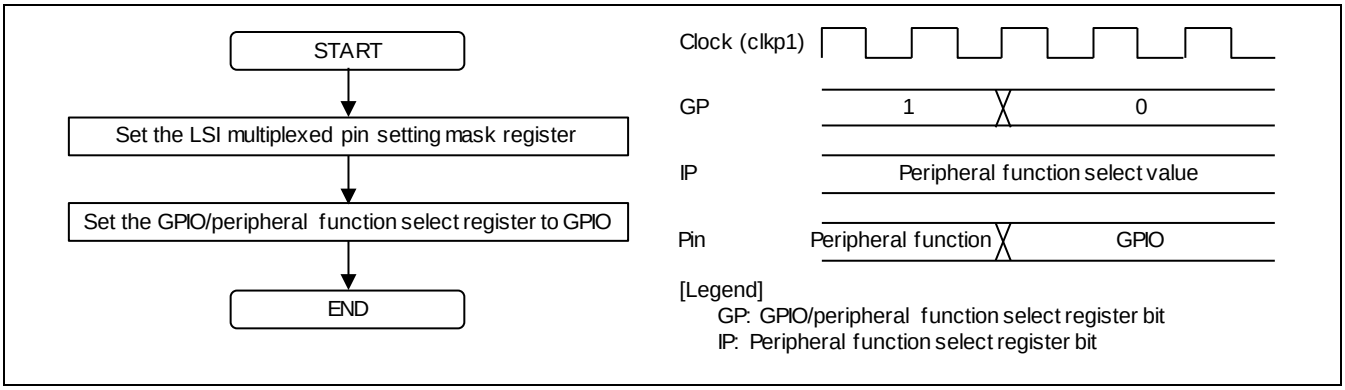

Figure 8.3 Procedure for Changing Pin Function from Peripheral function to GPIO

(3) Procedure 1 for changing pin function from one peripheral function to another peripheral function

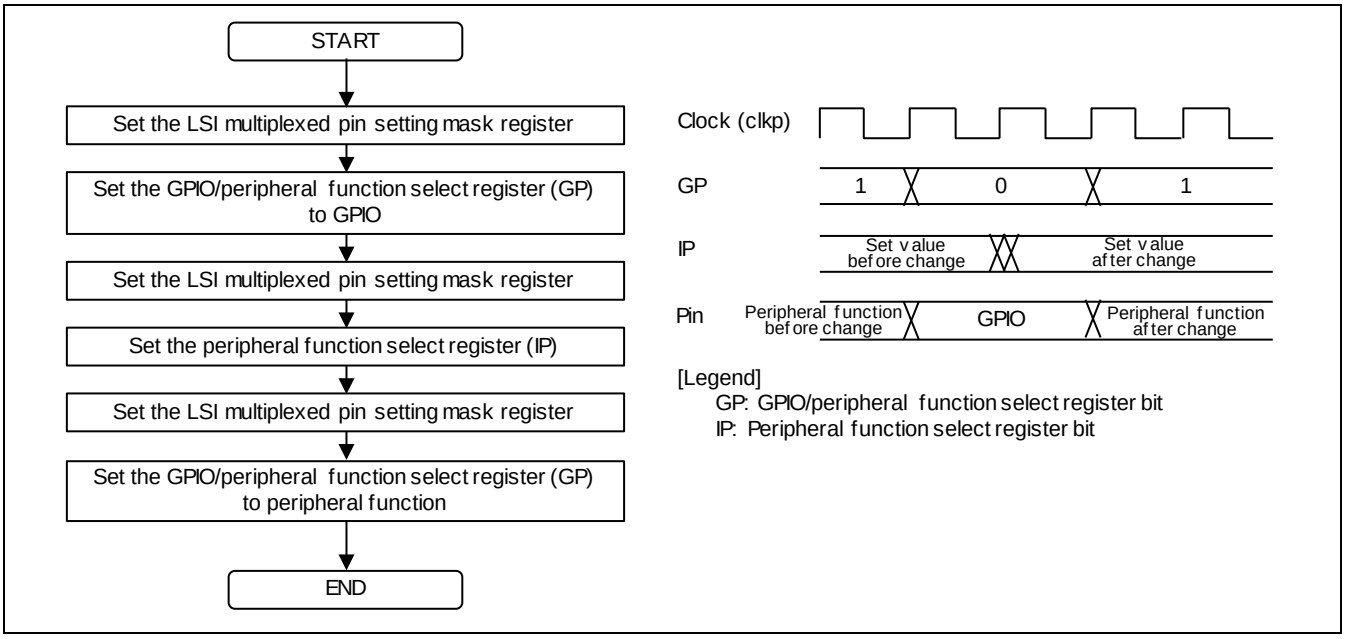

Figure 8.4 Procedure for Changing Pin Function from One Peripheral Function to Another Peripheral Function (with GPIO Setting)

8.3.2 Setting Pull-Up/Down Resistors

The LSI pin pull-on/off control registers 0 to 6 (PUEN0 to PUEN6) and pull-up/down control registers 0 to 6 (PUD0 to PUD6) are used.

8.4 Usage Note

8.4.1 Notes for Using I2C0/3/5

When using the I2C0/3/5, the external connected devices must be 3.3-V compatible devices even though using the I2C0/3/5 system with 1.8-V.
If not using 3.3-V compatible devices, the external devices may be permanently damaged at a power-on reset.

Note.

1. The default functions of I2C0/3/5 pins after a power-on reset are GPIOs and pulled-up by 3.3-V through the VDDQ33 until they are specified for the I2C function or pulled-up off when other than I2C function is selected.
2. During the I2C0/3/5 pins are default state, i.e., GPIOs pins and pulled-up at 3.3-V, the voltage of external devices connected to these pins shall be up to 3.3-V through the VDDQ33.

Note that an internal leakage current of the I2C0/3/5 will be up to 55uA from the 3.3-V line to the 1.8-V line of each I2C block until the pulled-up off.

9. Pin Function Controller (PFC)

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N **RZ/G2E**

9.1 Overview

The pin function controller (PFC) is a module that consists of registers for selecting the function of the multiplexed pins and controlling the pull-up resistor on each LSI pin.

9.1.1 Features

- Setting multiplexed pin functions for LSI pins

  Function of the RZ/G2E pin selectable by setting the registers in the PFC module (The function of the LSI pin can be selected by the GPIO/peripheral function select registers 0 to 6 (GPSR0 to GPSR6) and peripheral function select registers 0 to 15 (IPSR0 to IPSR15) in the PFC module. For details, see sections 9.2.2, GPIO/Peripheral Function Select Register 0-6 (GPSR0-6) through 9.2.3, Peripheral Function Select Register 0-15 (IPSR0-15).)
- POC control for each LSI pin

  POC control registers must be set according to IO voltage level that is supplied to the pin.

  POC control resistors on each LSI pin can be controlled by setting the registers in the PFC module. (Selection is handled by the IO voltage level select registers 0, 2 (POCCTRL0, POCCTRL2). For details, see sections 9.2.5, POC Control Register 0 (POCCTRL0) through 9.2.6, POC Control Register 2 (POCCTRL2).
- TDSEL control for each LSI pin

  TDSEL control registers can control the driving abilities of pins in use for the SDHI.

  TDSEL control resistors on each LSI pin can be controlled by setting the registers in the PFC module. (Selection is handled by the return path for clock drive select register 0 (TDSELCTRL0). For details, see section 9.2.7, TDSEL Control Register 0 (TDSELCTRL0).
- Pull-up/down control for each LSI pin.

  PUEN registers can on/off control of the pull resistors.

  On/off of the pull resistors on each LSI pin can be controlled by setting the registers in the PFC module.

  (Selection is handled by the Pull-on/off select registers 0 to 5 (PUEN0 to PUEN 5). For details, see section 9.2.8, LSI pin pull-enable register 0-5 (PUEN0-5).

  PUD registers can pull-up/pull-down control of the pull resistors.

  Pull-up/Pull-down control resistors on each LSI pin can be controlled by setting the registers in the PFC module.

  (Selection is handled by the Pull-up/down select registers 0 to 5 (PUD0 to PUD 5). For details, see section 9.2.9, LSI pin pull-up/down control Register 0-5 (PUD0-5).
- Module selection

  Module Select Register can select the group for multiple LSI pins with multiplexed pin functions.

  Enable and disable the functions of RZ/G2E LSI pins to which pin functions from multiple pin groups are assigned by setting the registers in the PFC module.

  (Selection is handled by the module select register 0 to 1 (MOD_SEL0 to MOD_SEL1). For details, see section 9.2.10, Module Select Register 0-1 (MOD_SEL0-1).
- Notes on configuring multiplexed pin functions

  The multiplexed LSI pins (MOD_SEL0-1, GPSR0-6, IPSR0-15) must be set in the initial sequence (*).

  Switching multiplexed LSI pins during operation is not guaranteed.

  *: The initial sequence is Appendix B.(3)
- Module clock

  Module clock is S3D4ϕ.

9.1.2 Block Diagram

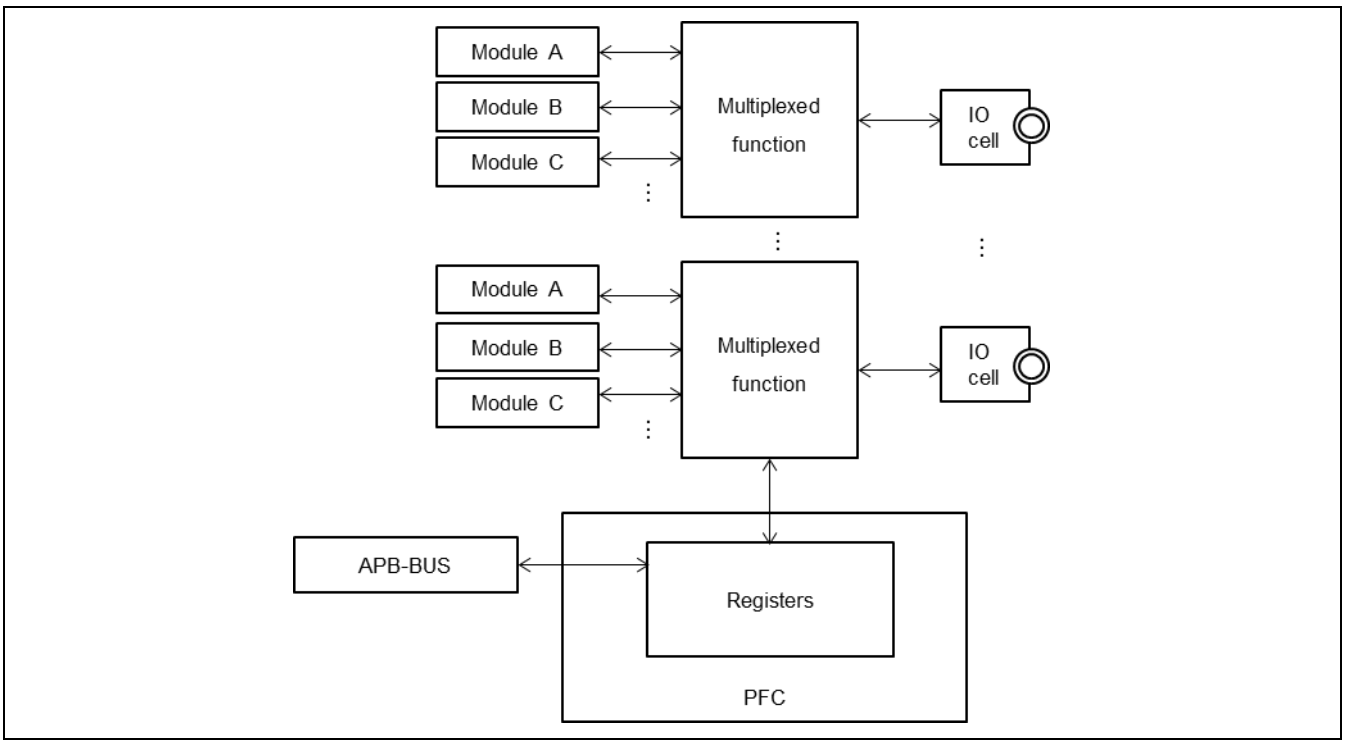

Figure 9.1 PFC Block Configuration

9.1.3 External Pins

PFC does not have External Pins.

9.1.4 Register Configuration

All the registers in the PFC are mapped into the APB bus space. Table 9.1 shows the configuration of the registers provided in the PFC. Details on each register in the PFC are given in sections 9.2.1 to 9.2.10.

Table 9.1 Configuration of Registers in PFC

9.1.5 Connected Module

Table 9.2 Connected module

Module name	Connected module name	Function of connected module
PFC	AP-System Core	Access the Registers
	CPG	Output clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset

9.2 Register Description

[Legend]

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R:	Read-only. The write value should always be 0.
R/WC0:	Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
W:	Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.
—/W:	Write-only. The read value is undefined.

All the bits are active high unless otherwise specified, and deactivated on reset.

All access to registers is made in longword units.

The write value to a reserved bit should always be 0.

9.2.1 LSI Multiplexed Pin Setting Mask Register (PMMR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: PMMR enables/disables writing to the multiplexed pin setting registers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MPM[31]	MPM[30]	MPM[29]	MPM[28]	MPM[27]	MPM[26]	MPM[25]	MPM[24]	MPM[23]	MPM[22]	MPM[21]	MPM[20]	MPM[19]	MPM[18]	MPM[17]	MPM[16]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MPM[15]	MPM[14]	MPM[13]	MPM[12]	MPM[11]	MPM[10]	MPM[9]	MPM[8]	MPM[7]	MPM[6]	MPM[5]	MPM[4]	MPM[3]	MPM[2]	MPM[1]	MPM[0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MPM[31:0]	H'0000_0000	R/W	Multiplexed Pin Setting Mask Writing a value to any register from among the GPIO/peripheral function select registers GPSR0 to GPSR6, peripheral function select registers IPSR0 to IPSR15, TDSEL control register TDSELCTRL0, Module select register MOD_SEL0 to MOD_SEL1 and POC control register POCCTRL0, POCCTRL2 is enabled by writing the inverse of the value to this register.

Note: This register must be set before setting each of the GPIO/peripheral function select registers GPSR0 to GPSR6, peripheral function select registers IPSR0 to IPSR15, TDSEL control register TDSELCTRL0, POC control register POCCTRL0, POCCTRL2 and Module select register MOD_SEL0 to MOD_SEL1.

9.2.2 GPIO/Peripheral Function Select Register 0-6 (GPSR0-6)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: GPSR0-6 selects the functions of the multiplexed LSI pins.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note: * n = 0-15

Bit	R/W	Description
31 to 0	R/W	The functions of the LSI pins are selected according to the table below.

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

IPSR register must not set "—", "Reserved" and IPSR = H'9, H’A, H’B, H’C, H’D, H’E, H’F.

9.2.4 DRV Control Register 0-24 (DRVCTRL8-10)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: DRVCTRL8-10 controls the driving abilities of pins. This setting is related to only the output.

Output buffer		
DRV1	DRV2	Drive capability
L	L	1/4
H	L	2/4
L	H	3/4
H	H	Full

The value of these bits must be B’11 in the case of 2bit (DRV2, DRV1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DRVn* [31]	DRVn* [30]	DRVn* [29]	DRVn* [28]	DRVn* [27]	DRVn* [26]	DRVn* [25]	DRVn* [24]	DRVn* [23]	DRVn* [22]	DRVn* [21]	DRVn* [20]	DRVn* [19]	DRVn* [18]	DRVn* [17]	DRVn* [16]

9.2.5 POC Control Register 0 (POCCTRL0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: Each bit in POCCTRL0 must be set according to IO voltage level that is supplied to the pin.

It must be set to match the voltage of VDDQ_MMC.

0: 1.8v 1: 3.3v

Supply voltage	Setting register	Usage
1.8v	0	Possible
1.8v	1	Do not use
3.3v	0	Do not set (broken)
3.3v	1	Possible

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POCn* [31]	POCn* [30]	POCn* [29]	POCn* [28]	POCn* [27]	POCn* [26]	POCn* [25]	POCn* [24]	POCn* [23]	POCn* [22]	POCn* [21]	POCn* [20]	POCn* [19]	POCn* [18]	POCn* [17]	POCn* [16]

bit1	POC_SD0_CMD	1
bit0	POC_SD0_CLK	1

9.2.6 POC Control Register 2 (POCCTRL2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: Each bit in POCCTRL2 must be set according to IO voltage level that is supplied to the pin.

It must be set to match the voltage of VDDQ25_AVB0.

0: 2.5v 1: 3.3v

Supply voltage	Setting register	Usage
2.5v	0	Possible
2.5v	1	Do not use
3.3v	0	Do not set (broken)
3.3v	1	Possible

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	POC2_VREF
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

9.2.7 TDSEL Control Register 0 (TDSELCTRL0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: TDSELCTRL0 controls the driving abilities of pins in use for the SDHI.
This function is delay adjustment of the SDHI clock return path for the LSI inside.

TDSEL1	TDSEL0	TDOUT
		Target delay
L	L	10pF (@1.8 V operation)
H	L	20pF (@1.8 V operation)
L	H	30pF (@1.8 V operation)
H	H	40pF (@1.8 V operation)

The value of these bits must be 00.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TDSEL0[31]	TDSEL0[30]	TDSEL0[29]	TDSEL0[28]	TDSEL0[27]	TDSEL0[26]	TDSEL0[25]	TDSEL0[24]	TDSEL0[23]	TDSEL0[22]	TDSEL0[21]	TDSEL0[20]	TDSEL0[19]	TDSEL0[18]	TDSEL0[17]	TDSEL0[16]
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TDSEL0[15]	TDSEL0[14]	TDSEL0[13]	TDSEL0[12]	TDSEL0[11]	TDSEL0[10]	TDSEL0[9]	TDSEL0[8]	TDSEL0[7]	TDSEL0[6]	TDSEL0[5]	TDSEL0[4]	TDSEL0[3]	TDSEL0[2]	TDSEL0[1]	TDSEL0[0]
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: To enable this register to be set, appropriately set the multiplexed pin setting mask register (PMMR) immediately before setting this register.

Table 9.8 Configuration of Registers in TDSELCTRL0

	TDSELCTRL0	Initial value

9.2.8 LSI pin pull-enable register 0-5 (PUEN0-5)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: PUEN0-5 performs on/off control of the pull resistors.

0: Pull-up/down function is disabled.

1: Pull-up/down function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PUENn* [31]	PUENn* [30]	PUENn* [29]	PUENn* [28]	PUENn* [27]	PUENn* [26]	PUENn* [25]	PUENn* [24]	PUENn* [23]	PUENn* [22]	PUENn* [21]	PUENn* [20]	PUENn* [19]	PUENn* [18]	PUENn* [17]	PUENn* [16]

Note: * pull-up only

9.2.9 LSI pin pull-up/down control Register 0-5 (PUD0-5)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: PUD0-5 performs pull-up/pull-down control of the pull resistors.

0: Pull-down is enabled.

1: Pull-up is enabled.

9.2.10 Module Select Register 0-1 (MOD_SEL0-1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

Function: MOD_SEL0-1 selects the group for multiple LSI pins with multiplexed pin functions.

Each input or input/output signals are assigned to two or more groups of pins. Select one of these groups when using these signals. Do not use the module pins in the unselected group; if a module pin in the unselected group is used, correct operation is not guaranteed. Group is “Set value” of Table 9.12. and Table 9.13.

For some modules, however, although the output signals are assigned to two or more groups of pins, there is no bit for selecting the group. Select one of these pins for each output signal through the corresponding peripheral function select register. Also note that each pin can only be used in combination with the other input or input/output pins of the same group. Correct operation is not guaranteed when a pin is used in combination with pins from other groups. If this is not the case, correct operation is not guaranteed.

9.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N **RZ/G2E**

9.3.1 Function Setting for Multiplexed Pins

Setting the LSI multiplexed pin setting mask register (PMMR) is necessary before setting each of the GPIO/peripheral function select registers GPSR0 to GPSR6, peripheral function select registers IPSR0 to IPSR13, POC control registers POCCTRL0, POCCTRL2, TDSEL control registers TDSELCTRL0 and Module select register MOD_SEL0-1. Specifically, the inverse of the value to be set in the select register must be written to the LSI multiplexed pin setting mask register. Otherwise, the GPIO/peripheral function select registers 0 to 6 (GPSR0 to GPSR6) and peripheral function select registers 0 to 13 (IPSR0 to IPSR13) cannot be set.

(1) Procedure for changing pin function from GPIO to peripheral function

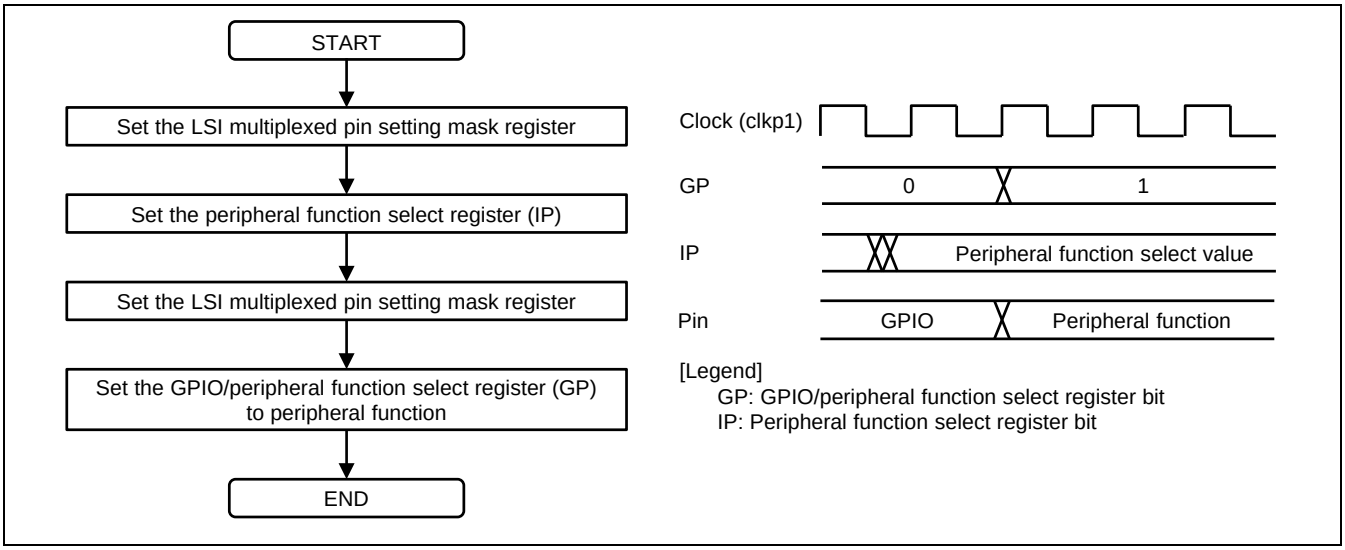

Figure 9.2 Procedure for Changing Pin Function from GPIO to Peripheral Function

(2) Procedure for changing pin function from peripheral function to GPIO

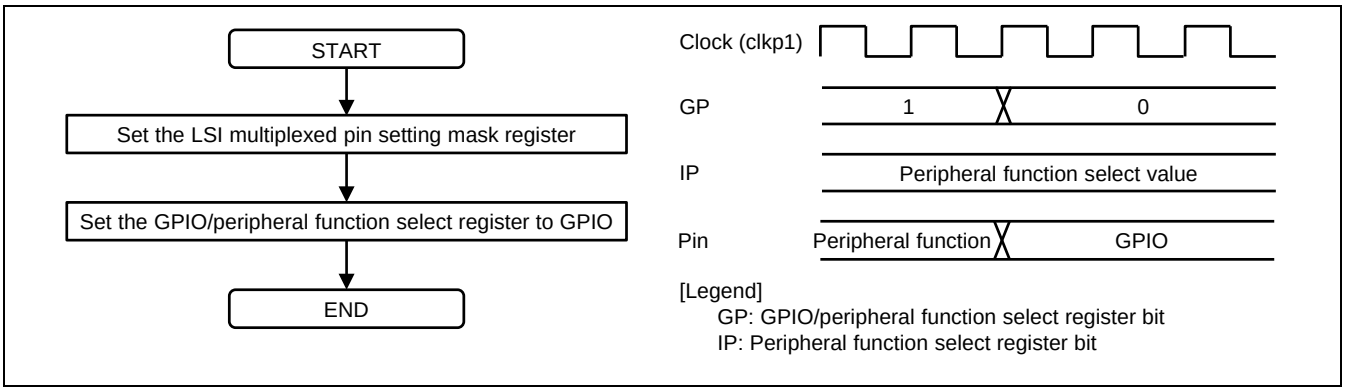

Figure 9.3 Procedure for Changing Pin Function from Peripheral function to GPIO

(3) Procedure 1 for changing pin function from one peripheral function to another peripheral function

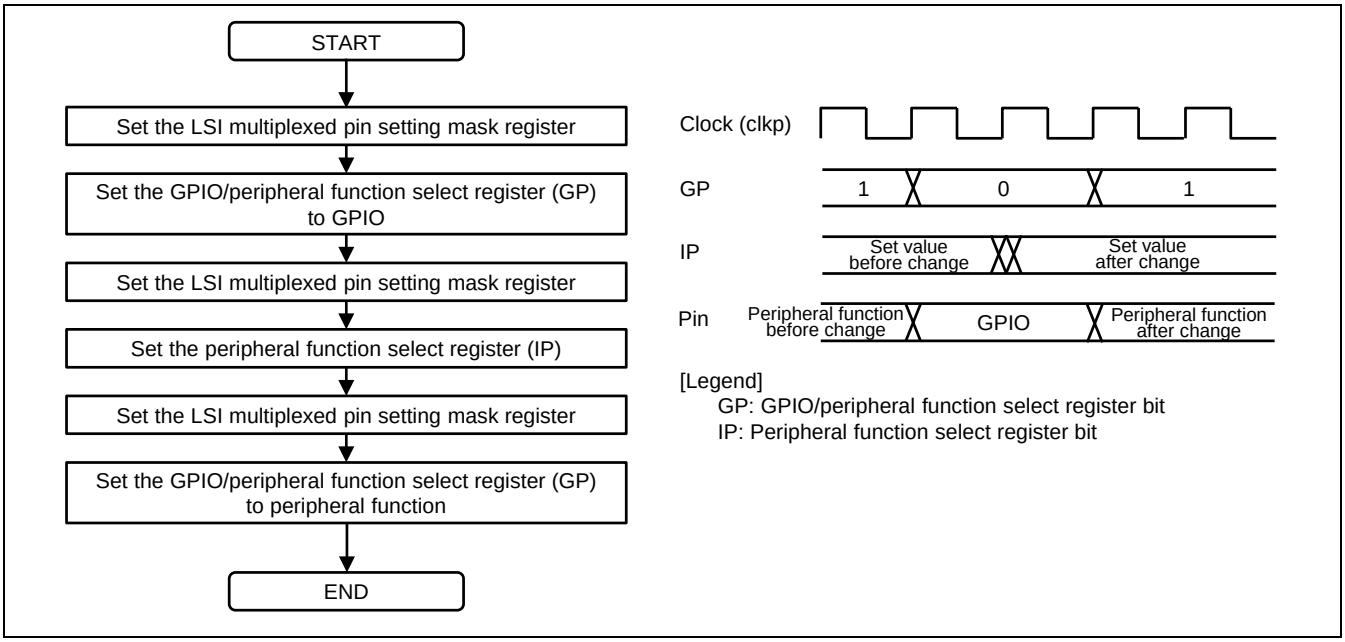

Figure 9.4 Procedure for Changing Pin Function from One Peripheral Function to Another Peripheral Function (with GPIO Setting)

9.3.2 Setting Pull-Up/Down Resistors

The LSI pin pull-on/off control registers 0 to 5 (PUEN0 to PUEN5) and pull-up/down control registers 0 to 5 (PUD0 to PUD5) are used.

10. General-Purpose Input/Output Ports (GPIO)

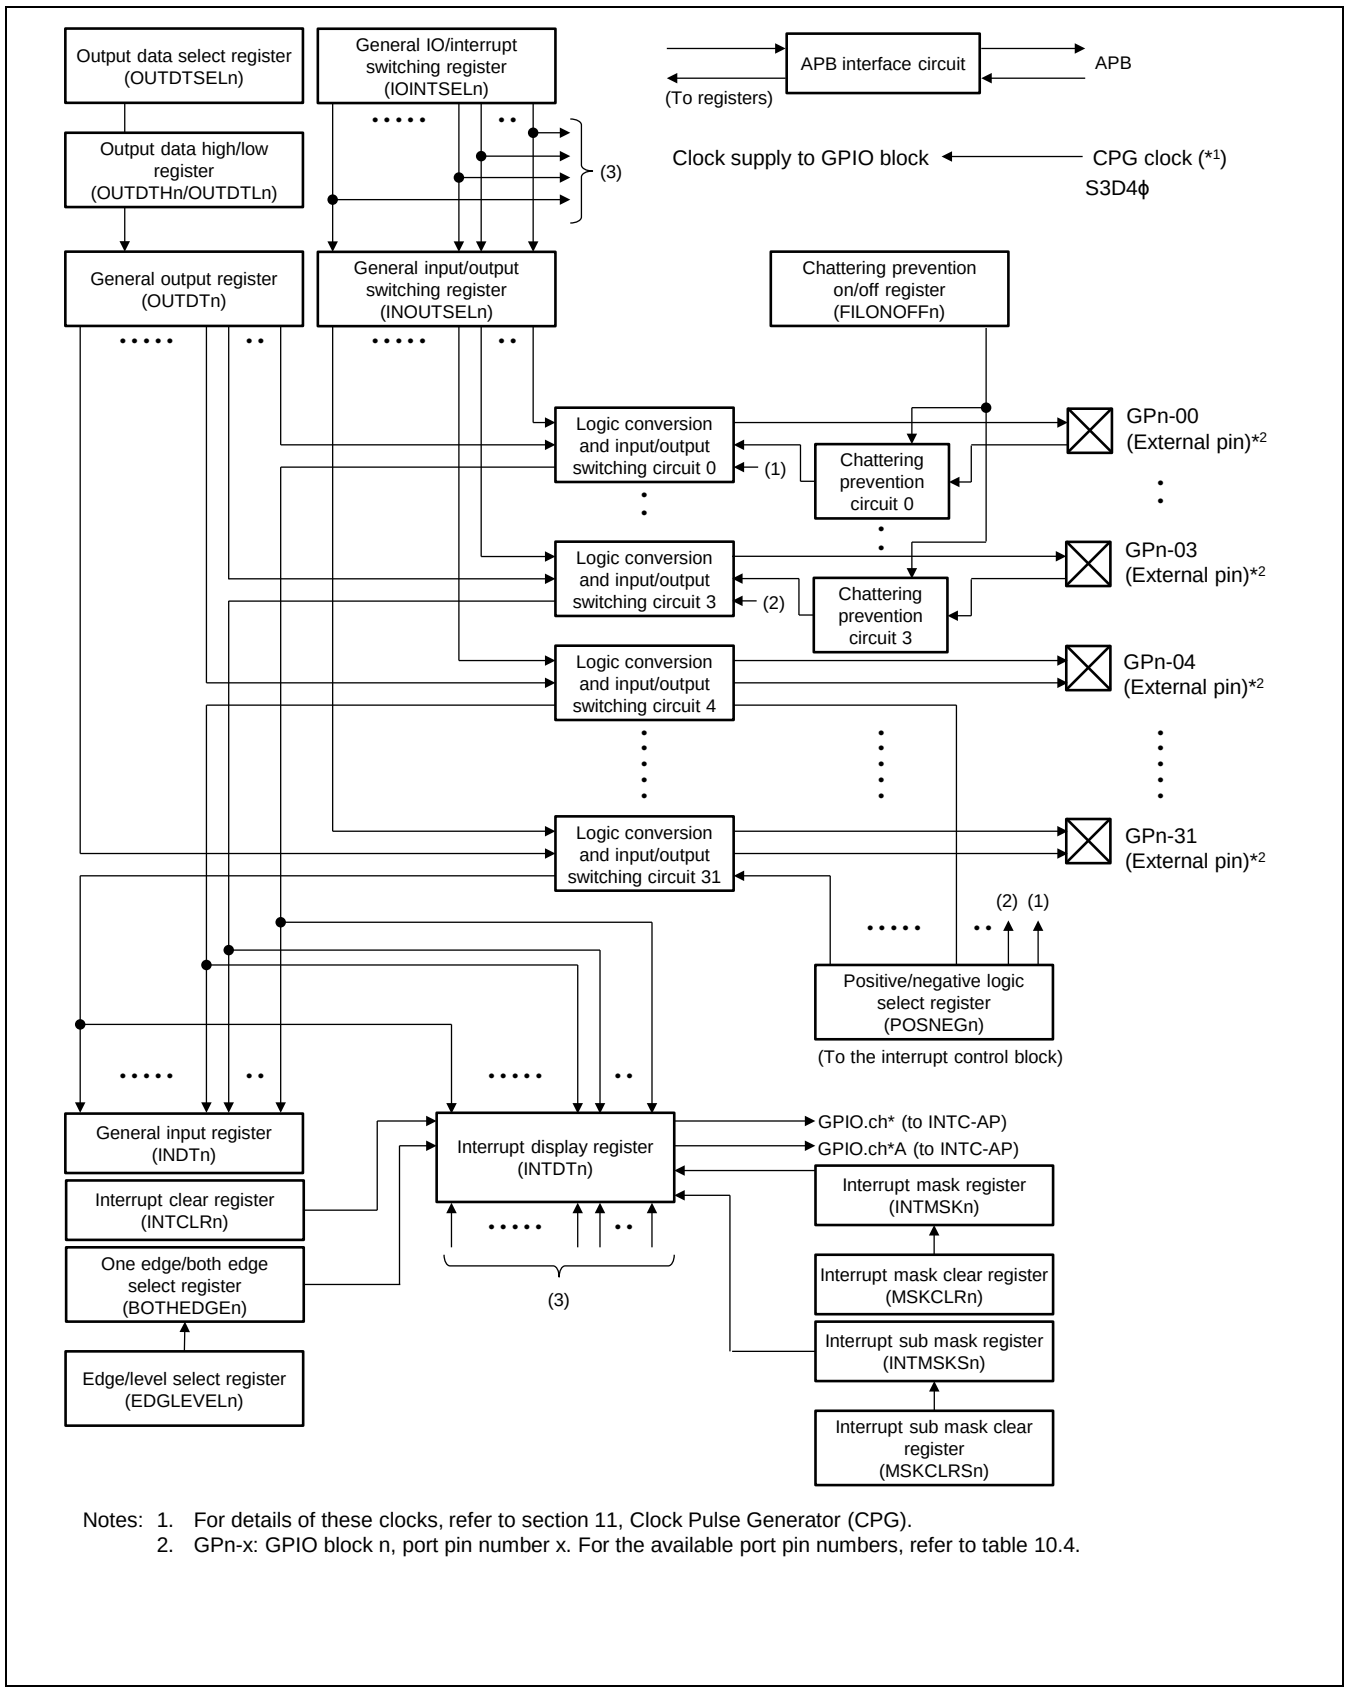
RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

10.1 Overview

10.1.1 Features

The second generation RZ/G series products have up to eight GPIO blocks (RZ/G2E series product has up to seven GPIO blocks), each of which is a functional block that supports up to 32 port pins for general input/output and interrupt input. (A maximum of 156 ports pins for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, and RZ/G2N, and 132 ports pins for RZ/G2E in total can be used. Note that the port pins are multiplexed.) When the relevant register is written to, a signal is output via the corresponding general output port pin. When a signal is input via the general input port pin, the corresponding register indicates the value of the input signal; specifically, when an interrupt is input via a general port pin, the relevant register indicates that it is currently receiving an interrupt input, and an interrupt is also requested to the CPU core via the interrupt control block. The functions (modes) can be assigned to each port pin as desired by some setting the corresponding registers. It is also possible to select the signal polarity (positive or negative logic) and the interrupt detection condition (one edge/both edge or level) for each port. In this LSI, general output data mode of GPIO can be set in normal mode (outputting data as normal) or high/low level data output mode. Particularly, a filtering function to prevent external chattering is also available for port pins 0 to 3 in input modes for each GPIO block. Module clock is S3D4ϕ for all channels.

10.1.2 Block Diagram



Notes: 1. For details of these clocks, refer to section 11, Clock Pulse Generator (CPG).
2. GPn-x: GPIO block n, port pin number x. For the available port pin numbers, refer to table 10.4.

Figure 10.1 GPIO Block Configuration (1)

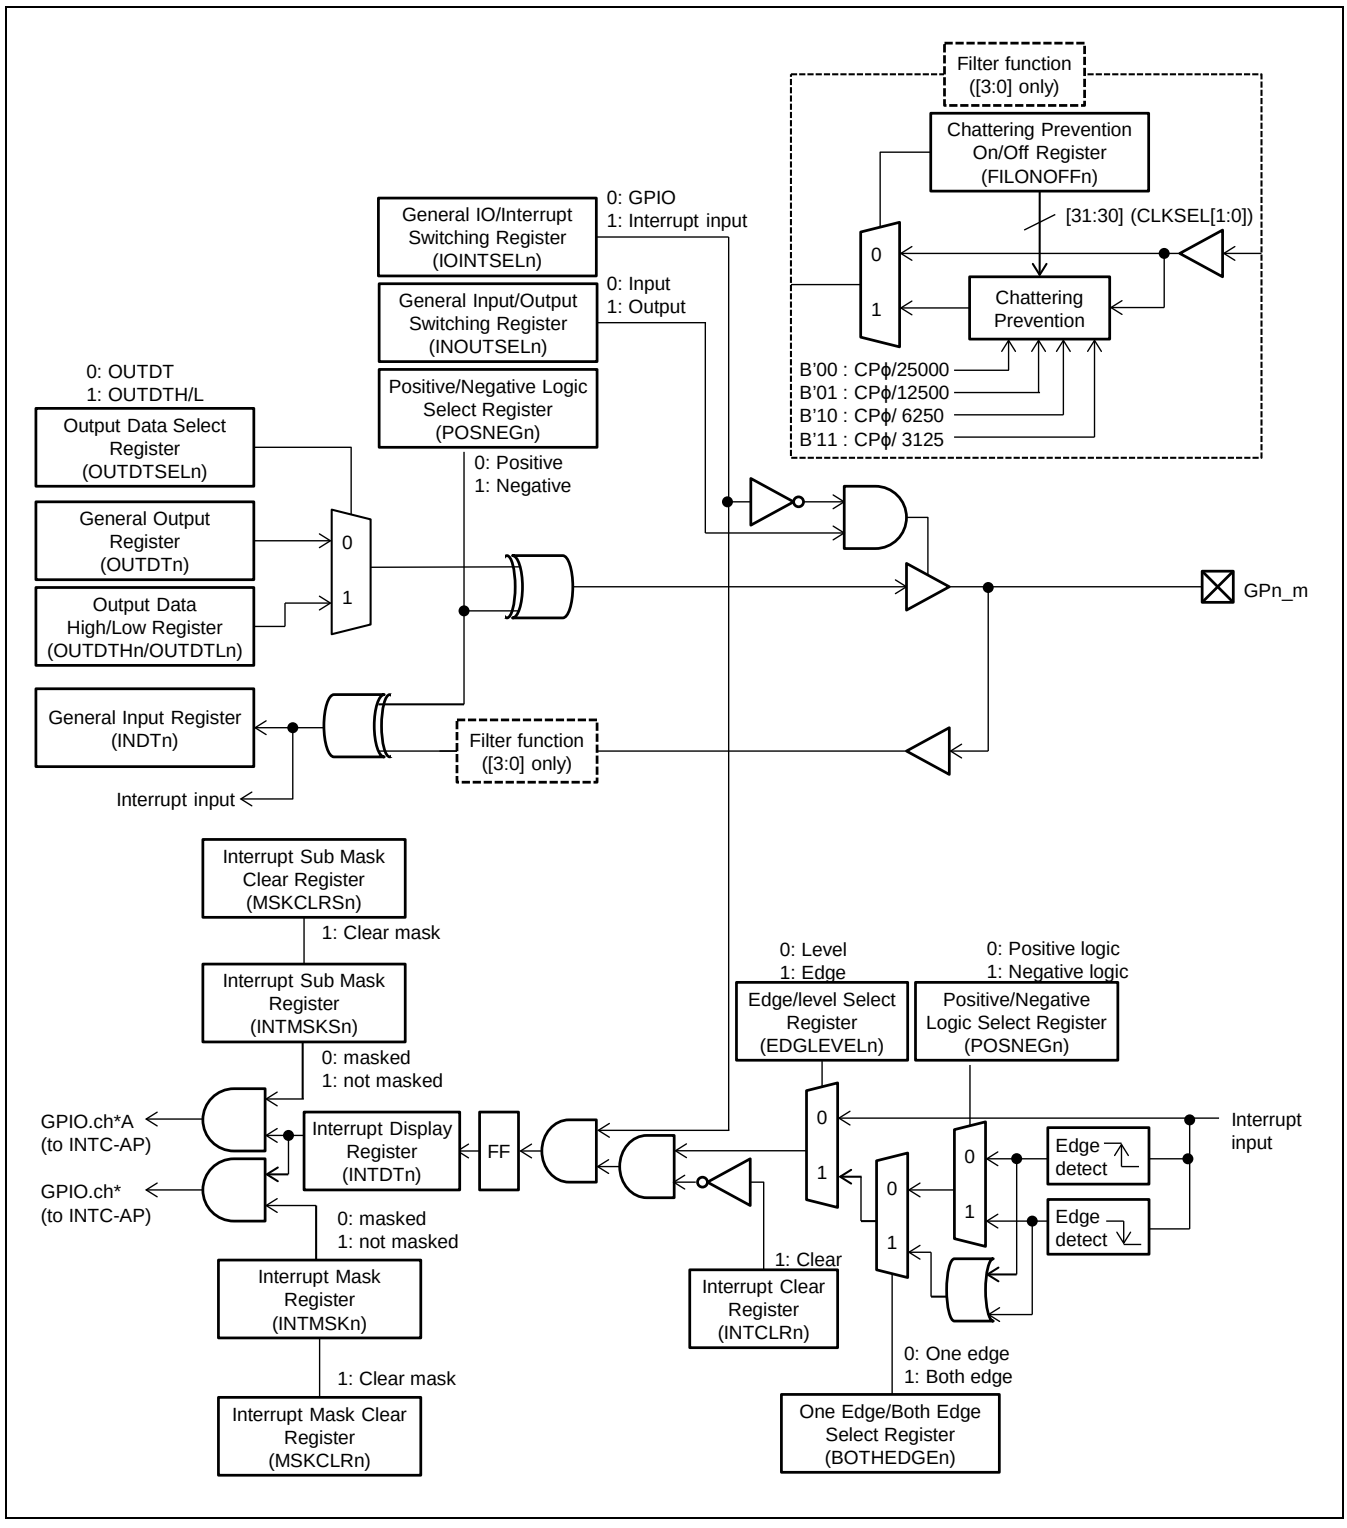


Figure 10.2 GPIO Block Configuration (2)

10.1.3 External Pins

Table 10.1 shows the pin configuration of the GPIO.

Table 10.1 Pin Configuration

				Second Generation RZ/G Series Products			
	I/O	Function	Descriptions	RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
GP0_00 to GP7_03	I/O	IO/interrupt input ports	General input/output and interrupt input	√	√	√	—
GP0_00 to GP6_13	I/O	IO/interrupt input ports	General input/output and interrupt input	—	—	—	√

10.1.4 Register Configuration

Each GPIO block incorporates seventeen 32-bit registers. These registers can be accessed via the APB interface. Table 10.2 describes all the GPIO block registers.

Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined.

10.1.5 Connected Module

Table 10.3 Connected module

Module name	Connected module name	Function of connected module
GPIO	AP-System Core	Access the Registers
	CPG	Output clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-AP	Control to interrupt

10.2 Register Description

10.2.1 General IO/Interrupt Switching Register n (IOINTSEL0 to IOINTSELn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

IOINTSEL selects either general input/output mode or interrupt input mode for each of the port pins 0 to 31 of the GPIO block. When general input/output mode is selected for a port, it is also necessary to select either input or output mode for the port using the corresponding bit in the general input/output switching register. When interrupt input mode is selected for a port, the setting of the general input/output switching register for the port is ignored.

[Hardware default value: H'0000_0000 = general input/output mode is selected for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IOINTSEL[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IOINTSEL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	IOINTSEL [31:0]	H'0000_0000	R/W	Selects either general input/output mode or interrupt input mode for each port using the bits corresponding to the port numbers. 0: General input/output mode. 1: Interrupt input mode.

Note: Unused bits should be set to the initial values.

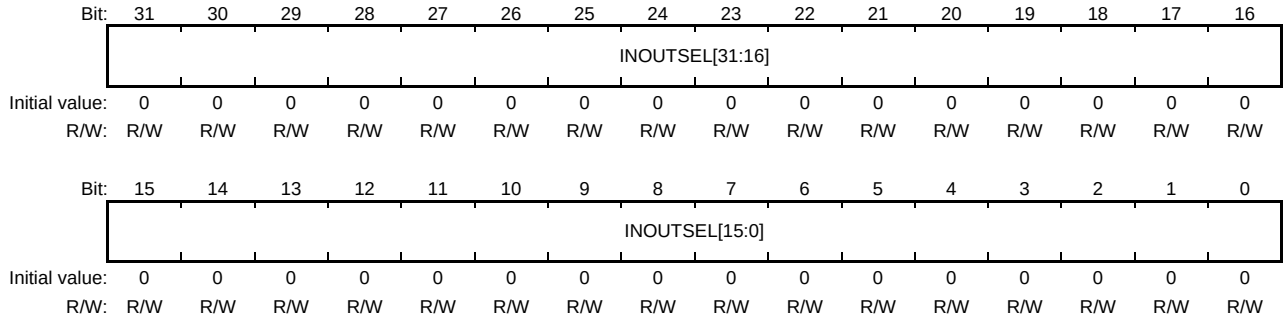
10.2.2 General Input/Output Switching Register n (INOUTSEL0 to INOUTSELn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

INOUTSEL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register. Specifically, INOUTSEL selects either general input or general output mode for a port using the bit corresponding to the port number. The INOUTSEL bits can be written to only when the corresponding bits in the general IO/interrupt switching register are 0. Note that after general input/output mode is changed to interrupt input mode, INOUTSEL retains the setting but is read as 0.

[Hardware default value: H'0000_0000 = general input mode is selected for all the ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INOUTSEL [31:0]	H'0000_0000	R/W	Selects either general input mode or general output mode for each port using the bits corresponding to the port numbers. 0: General input mode 1: General output mode

Note: Unused bits should be set to the initial values.

10.2.3 General Output Register n (OUTDT0 to OUTDTn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

OUTDT is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register. Specifically, the value of the bit in OUTDT corresponding to the port number is inverted or not inverted depending on the setting of the positive/negative logic select register before being output from the corresponding port pin. Note that the polarity of the output signal should previously be set using the corresponding bit in the positive/negative logic select register. This register must be set after the output data select register is appropriately set to choose level of output data.

[Hardware default value: H'0000_0000 = 0 is output from all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OUTDT[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OUTDT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDT[31:0]	H'0000_0000	R/W	Allows the port to output the value set in the bit corresponding to the port number when the port is appropriately set by IOINTSEL0 to IOINTSELn, INOUTSEL0 to INOUTSELn and OUTDTSEL0 to OUTDTSELn. 0: 0 is output. 1: 1 is output.

Note: The values set in OUTDT are not directly output from the GPIO pins; the above set values are processed according to the settings of the positive/negative logic select register before being output.
Unused bits should be set to the initial values.
About write of output data: Output data can be selected exclusively of OUTDT or OUTDTH / OUTDTL, based on OUTDTSEL setting.
About read of output data: Either of OUTDT and OUTDTH / OUTDTL read as the actual output data.

10.2.4 General Input Register n (INDT0 to INDTn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

INDT is a register that can read the status of General-Purpose Input / Output Ports.

Each bit reflects the value received through the corresponding port pin.

Note that when a bit in the positive/negative logic select register is 1, the corresponding bit in INDT indicates the inverted value of the input signal.

[Hardware default value: state of the signals input to the port pins.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INDT[31:16]															
Initial value:	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INDT[15:0]															
Initial value:	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*	*
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INDT[31:0]	*	R	Each bit reflects the value received through the corresponding port pin. 0: Input is 0. (assuming positive logic) 1: Input is 1. (assuming positive logic)

Note: Unused bits should be set to the initial values.
* State of the signals input to the port pins.

10.2.5 Interrupt Display Register n (INTDT0 to INTDTn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

INTDT is valid only when interrupt input mode is selected by the general IO/interrupt switching register. Specifically, when an interrupt is input via a port pin when INTDT is valid, the bit in INTDT corresponding to the port indicates whether the port has received an interrupt input or not. In interrupt input mode, the polarity and detection conditions (one edge/both edge or level) of the external input signal can be set for each port pin. Before using a port pin for interrupt input, the corresponding bits in the positive/negative logic select register and edge/level select register (one edge/both edge register should be appropriately configured if edge detection mode is selected) should be set, respectively.

If a port is set for edge detection using the corresponding bit in the edge/level select register, even when an external pulse interrupt signal is input, the corresponding bit in INTDT holds the input using the FF and allows the level interrupt signal to be output to the interrupt control block.

To stop all the interrupt signal outputs, all the bits in the interrupt clear register corresponding to the bits in INTDT currently indicating the reception of the corresponding interrupt signals should be cleared to 0. Note that if a port is set for level detection using the corresponding bit in the edge/level select register and an external level interrupt signal is input, the corresponding bit in INTDT does not use the FF to hold the input. Therefore, when an external input signal is stopped, the corresponding bit in INTDT is cleared automatically. When all the bits in INTDT are turned off (= 0), the GPIO stops outputting all the interrupt signals.

[Hardware default value: H’0000_0000 = no interrupt signals are input from ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTDT[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTDT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTDT[31:0]	H’0000_0000	R	Each bit indicates the input of an interrupt signal on the corresponding port pin. 0: No interrupt signal has been input. 1: Interrupt signal has been input.

Conditions of Indicating Interrupt Input:

1. For level-sensitive interrupt input (EDGLEVEL = 0)
   — External input signals are constantly monitored and indicated. (When the negative logic is selected, the inverted value of the external input signal is indicated.)
2. For edge-sensitive interrupt input (EDGLEVEL = 1)
   — Clearing condition: When the interrupt clear register is cleared, indication is cleared regardless of the positive/negative logic select register.

— Setting condition: With the positive logic (POSNEG = 0), when the rising edge of an external interrupt signal is detected, the interrupt input is indicated. With the negative logic (POSNEG = 1), when the falling edge is detected, the interrupt input is indicated. With both edge mode (BOTHEDGE = 1), when either the rising or falling edge, the interrupt input is indicated.

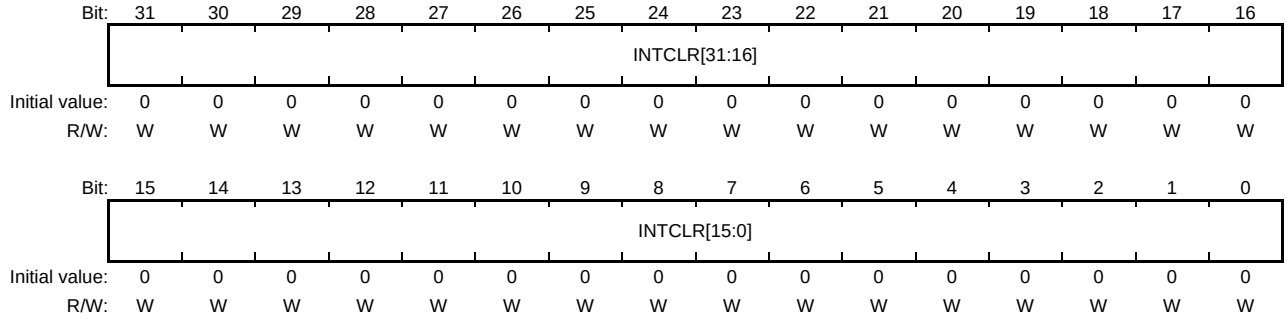
10.2.6 Interrupt Clear Register n (INTCLR0 to INTCLRn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

When the interrupt display register is currently indicates the reception of the interrupt input on the port for which the edge detection is selected by the edge/level select register (with configuring for one edge/both edge select register) in interrupt input mode, INTCLR clears the indication. Specifically, writing 1 to the bits in INTCLR corresponding to port numbers can clear the corresponding bits in the interrupt display register. However, when the interrupt display register is currently indicates the reception of the interrupt input on the port for which the level detection is selected by the edge/level select register, writing 1 to the corresponding bits in INTCLR cannot clear the corresponding bits in the interrupt display register. Only writing 1 to INTCLR is effective; INTCLR is always read as 0.

[Hardware default value: H'0000_0000 = interrupt indication is cleared for no ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTCLR [31:0]	H'0000_0000	W	Writing 1 to bits corresponding to port numbers clears the corresponding bits in the interrupt display register. 0: No effect 1: Interrupt display register bit is cleared.

Note: Unused bits should be set to the initial values.

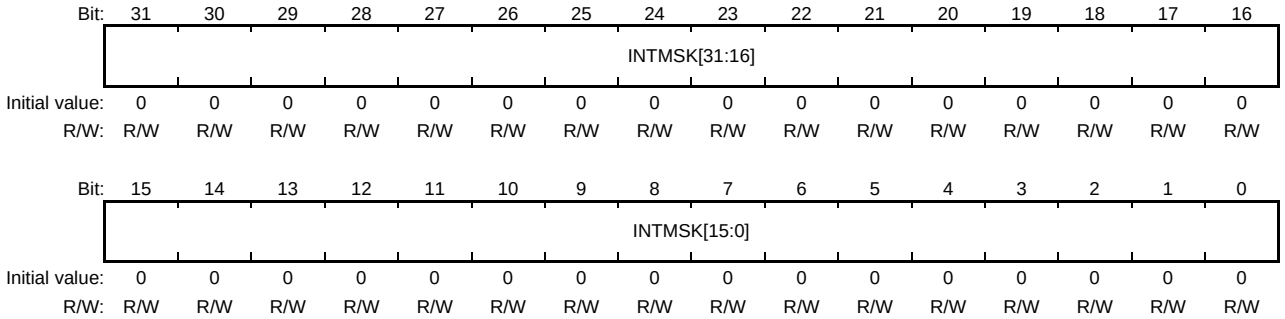
10.2.7 Interrupt Mask Register n (INTMSK0 to INTMSKn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]
* 0 to 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], 0 to 6 [RZ/G2E]

INTMSK masks the interrupt requests indicated by the interrupt display register of GPIO.ch*. Interrupts can be separately masked using the corresponding bits in INTMSK. When all the bits currently indicating the reception of the interrupt signals are masked, no interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt mask clear register. Only writing 0 to this register is effective.

[Hardware default value: H'0000_0000 = all the ports are masked.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTMSK [31:0]	H'0000_0000	R/W	Setting a mask to the bit disables the corresponding interrupt signal to be output to the interrupt control block. 0: Interrupt is masked. 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values.

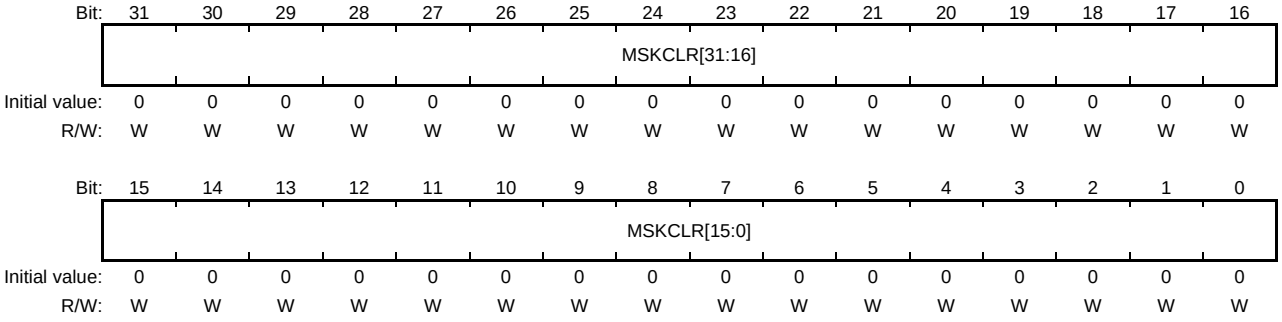
10.2.8 Interrupt Mask Clear Register n (MSKCLR0 to MSKCLRn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]
* 0 to 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], 0 to 6 [RZ/G2E]

MSKCLR cancels masks that are set by the interrupt mask register of GPIO.ch*. Each mask can be canceled (cleared) by writing 1 to the corresponding bit in MSKCLR. Only writing 1 to MSKCLR is effective; MSKCLR is always read as 0.

[Hardware default value: H'0000_0000 = interrupt masks are cleared for no ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKCLR [31:0]	H'0000_0000	W	Setting a mask to the bit disables the corresponding interrupt signal to be output to the interrupt control block. 0: No effect 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values. (When GPIO is not selected by the pin multiplex settings, do not cancel the interrupt mask.)

10.2.9 Positive/Negative Logic Select Register n (POSNEG0 to POSNEGn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

POSNEG selects the polarity (positive or negative logic) of each port pin in general input mode, general output mode, or interrupt input mode. POSNEG should be set before mode selection.

[Hardware default value: H'0000_0000 = positive logic is selected for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POSNEG[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POSNEG[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	POSNEG [31:0]	H'0000_0000	R/W	Selects the polarity (positive or negative logic) of each port pin. 0: Positive logic 1: Negative logic

Note: Unused bits should be set to the initial values.

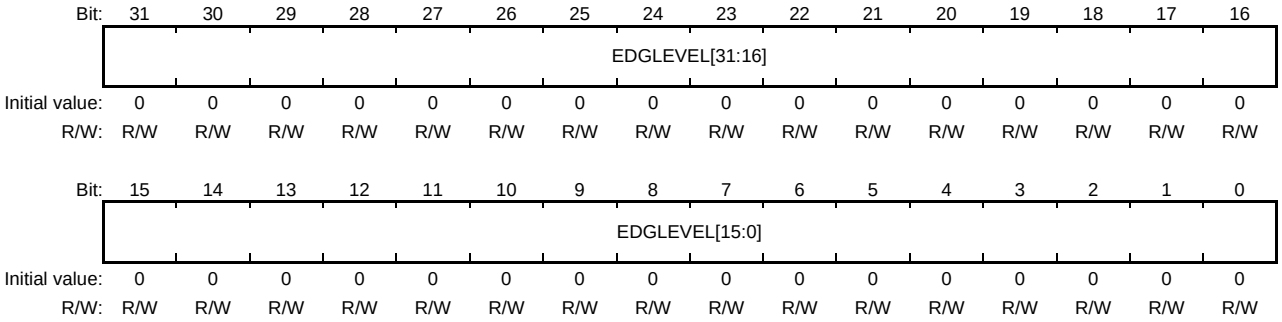
10.2.10 Edge/level Select Register n (EDGLEVEL0 to EDGLEVELn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

EDGLEVEL is valid only for the ports for which interrupt input mode is selected by the general IO/interrupt switching register. Specifically, EDGLEVEL selects the detection conditions (edge or level) of the interrupt input signal on each port pin for which interrupt input mode is selected. EDGLEVEL should be set before selection of interrupt input mode.

[Hardware default value: H'0000_0000 = level detection is selected for all the ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EDGLEVEL [31:0]	H'0000_0000	R/W	Selects the level or edge as detection conditions of the interrupt input signal on each port pin for which interrupt input mode is selected. 0: Level 1: Edge

Note: Unused bits should be set to the initial values.

10.2.11 Chattering Prevention On/Off Register n (FILONOFF0 to FILONOFFn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Notes: 1. n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]
2. Some restrictions apply.

FILONOFF prevents chattering input to the port pins 0 to 3 of each GPIO block and controls frequency of filter clock (generated from peripheral clock S3D4ϕ) for chattering prevention function. For details, refer to section 10.3.3, Handling of Input Signals on Port Pins.

[Hardware default value: H'0000_0000 = chattering prevention function is turned off for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	CLKSEL[1:0]	B'00	R/W	Filter clock frequency setting B'00: S3D4ϕ /66000. B'01: S3D4ϕ /33000. B'10: S3D4ϕ /16500. B'11: S3D4ϕ /8250.
29 to 4	—	—	R	Reserved
3 to 0	FILONOFF [3:0]	B'0000	R/W	Enables or disables the chattering prevention function. 0: Chattering prevention function is disabled. 1: Chattering prevention function is enabled. The bits FILONOFF[n] (n = 0 to 3) are used to control the port pin n.

Note: Unused bits should be set to the initial values.

10.2.12 Interrupt Sub Mask Register n (INTMSKS0 to INTMSKSn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]
* 0 to 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], 0 to 6 [RZ/G2E]

INTMSKS masks the alternative interrupt requests indicated by the interrupt display register of GPIO.ch*A. Interrupts can be separately masked using the corresponding bits in INTMSKS. When all the bits currently indicating the reception of the interrupt signals are masked, no alternative interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt sub mask clear register. Only writing 0 to this register is effective.

[Hardware default value: H'0000_0000 = all the ports are masked.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	INTMSKS[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INTMSKS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	INTMSKS [31:0]	H'0000_0000	R/W	Setting a mask to the bit disables the corresponding alternative interrupt signal to be output to the interrupt control block. 0: Interrupt is masked. 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values.

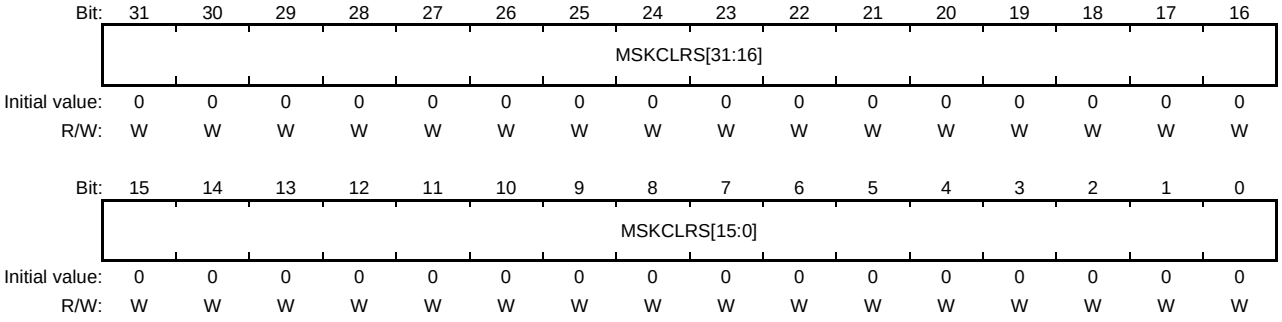
10.2.13 Interrupt Sub Mask Clear Register n (MSKCLRS0 to MSKCLRSn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]
* 0 to 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], 0 to 6 [RZ/G2E]

MSKCLRS cancels masks that are set by the interrupt sub mask register of GPIO.ch*A. Each mask can be canceled (cleared) by writing 1 to the corresponding bit in MSKCLRS. Only writing 1 to MSKCLRS is effective; MSKCLRS is always read as 0.

[Hardware default value: H'0000_0000 = alternative interrupt masks are cleared for no ports.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKCLRS [31:0]	H'0000_0000	W	Setting a mask to the bit disables the corresponding alternative interrupt signal to be output to the interrupt control block. 0: No effect 1: Interrupt is not masked.

Note: Unused bits should be set to the initial values. (When GPIO is not selected by the pin multiplex settings, do not cancel the alternative interrupt mask.)

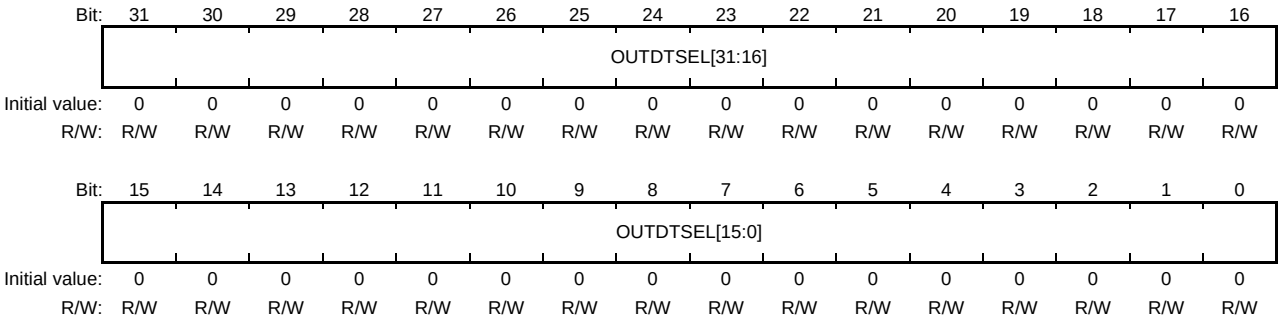
10.2.14 Output Data Select Register n (OUTDTSEL0 to OUTDTSELn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

OUTDTSEL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register. OUTDTSEL selects if OUTDT or OUTDTH/OUTDTL will be the output data of GPIO. When choosing OUTDT, configuration is performed as described in section 10.2.3, General Output Register n (OUTDT0 to OUTDTn). When choosing OUTDTH/OUTDTL, output data will be output by writing the appropriate data to the corresponding bits in OUTDTH or OUTDTL. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be set before writing data to OUTDTH/OUTDTL registers.

[Hardware default value: H'0000_0000 = Out data register is used to output data.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTSEL [31:0]	H'0000_0000	R/W	Choosing whether output data is output by general output register OUTDT or output data high register OUTDTH/output data low register OUTDTL. 0: General output register is used to output the data. 1: Output data high register and output data low register is used to output the data.

Note: Unused bits should be set to the initial values.

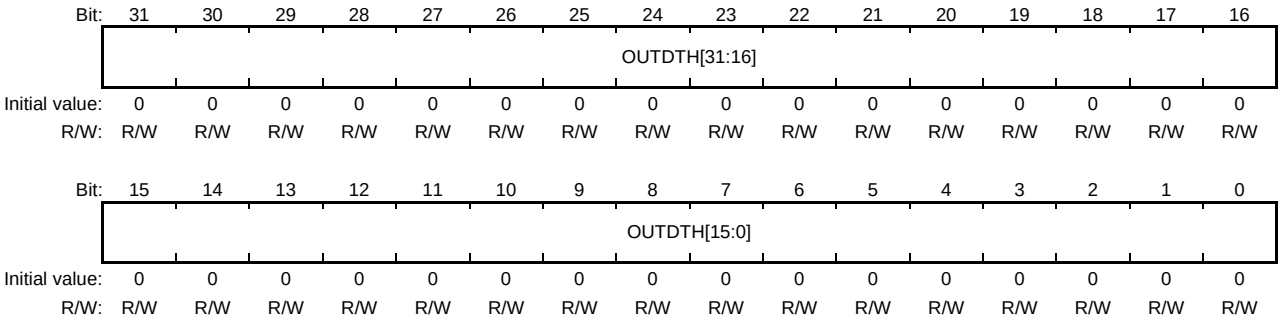
10.2.15 Output Data High Register n (OUTDTH0 to OUTDTHn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

OUTDTH is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register, and the output data select register OUTDTSEL is configured to choose OUTDTH/OUTDTL register to output the data of GPIO. Only writing 1 to OUTDTH is effective. Otherwise, setting makes no changes. Reading OUTDTH returns the values of the latest data set to OUTDTH or OUTDTL right before that. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be written and read after output data select register OUTDTSEL is set. Reading OUTDTH without appropriately configuring OUTDTSEL can return value of OUTDT register.

[Hardware default value: H'0000_0000 = 0 is output from all the ports with setting OUTDTSEL.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTH [31:0]	H'0000_0000	R/W	Outputting high value data. 0: Invalid data. 1: Valid data.

Note: Unused bits should be set to the initial values.

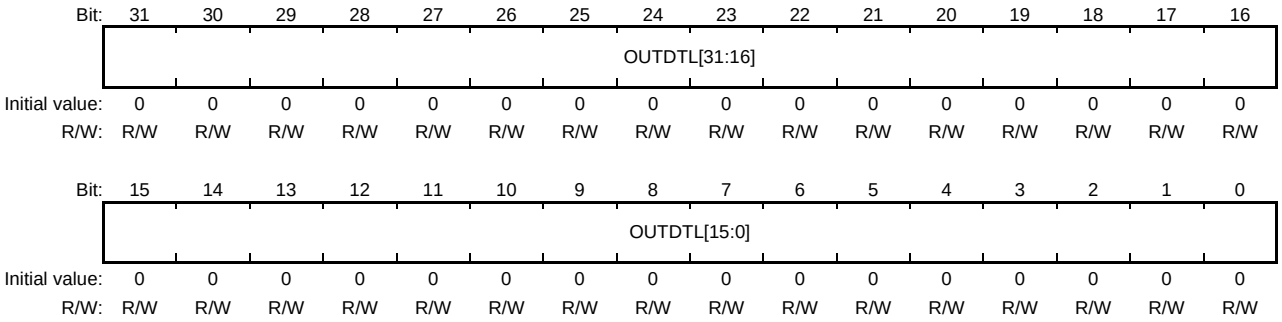
10.2.16 Output Data Low Register n (OUTDTL0 to OUTDTLn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

OUTDTL is valid only for the ports for which general input/output mode is selected by the general IO/interrupt switching register and then general output mode is selected by the general input/output switching register, and the output data select register OUTDTSEL is configured to choose OUTDTH/OUTDTL register to output the data of GPIO. Only writing 0 to OUTDTL is effective. Otherwise, setting makes no changes. Reading OUTDTL returns the values of the latest data set to OUTDTL or OUTDTH right before that. Note that the polarity of the output signal should be previously set using the corresponding bit in the positive/negative logic select register. Furthermore, this register should be written or read after output data select registers OUTDTSEL is set. Reading OUTDTH without appropriately configuring OUTDTSEL can return value of OUTDT register.

[Hardware default value: H'0000_0000 = 0 is output from all the ports with setting OUTDTSEL.]



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	OUTDTL [31:0]	H'0000_0000	R/W	Outputting low value data. 0: Valid data. 1: Invalid data.

Note: Unused bits should be set to the initial values.

10.2.17 One Edge/Both Edge Select Register n (BOTHEDGE0 to BOTHEDGEn)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: n = 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 6 [RZ/G2E]

BOTHEDGE is valid only when the edge detection mode is selected by the edge/level select registers. Specially, BOTHEDGE selects the detection condition (one edge or both edges) of the interrupt input signal on each port pin for which interrupt input mode (selected by the general IO/interrupt switching registers) and edge detection mode are selected. BOTHEDGE should be set before selection of interrupt input mode.

[Hardware default value: H'0000_0000 = both edge detection mode is disabled for all the ports.]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BOTHEDGE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BOTHEDGE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BOTHEDGE [31:0]	H'0000_0000	R/W	Selecting one edge or both edge detection condition of the interrupt input signal on each port pin for which interrupt input mode and edge detection mode are selected. 0: One edge. 1: Both edges.

Note: Unused bits should be set to the initial values.

10.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

10.3.1 Port Pin Specifications

Each GPIO block is provided with up to 32 port pins for general input/output and external interrupt input ports. Table 10.4 specifies these pins.

10.3.2 Operations in Each Mode

10.3.2.1 Mode Switching

Two registers are used to switch modes of the general IO/interrupt input pins of the GPIO blocks. Each register is provided with up to 32 bits each controlling one of the GPIOn* port pins. The general IO/interrupt switching register is first used to select either general input/output mode or interrupt input mode for each port pin. When general input/output mode is selected, the setting of the relevant bit in the second register, i.e., the general input/output switching register, is used. Specifically, when a bit in the general input/output switching register is set for general output mode, the corresponding port pin is turned to the output direction and the route is formed so that the set value in the corresponding bit in the general output register should be output via the pin. Likewise, when set for the general input mode, the corresponding port pin is turned to the input direction and the route is formed so that the value received via the pin should be indicated by the corresponding bit in the general input register. When interrupt input mode is selected, the corresponding port pin is turned to the input direction and the route is formed so that the reception of the signal input via the pin should be indicated by the interrupt display register. Here, the setting of the second register, i.e., the general input/output switching register, is invalid.

Note: * n = 0 to 7 [RZ/G2H], [RZ/G2M V1.3], [RZ/G2M V3.0], [RZ/G2N], n = 0 to 6 [RZ/G2E]

10.3.2.2 General Input/Output Mode

When a port is set for general input/output mode using the corresponding bit in the general IO/interrupt switching register, the corresponding port serves as a general input/output pin. In general input/output mode, either mode can be selected using the corresponding bit in the general input/output switching register. When a port is set for general output mode, the port outputs the value set in the corresponding bit in the general output register or output data high/output data low register with appropriate configuring in output data select register. Here, the polarity of the actual output signal is determined by the setting of the corresponding bit in the positive/negative logic select register. When a port is set for general input mode, the polarity of the input signal is also determined by the setting of the corresponding bit in the positive/negative logic select register. The general input register indicates the value accordingly. Note that the general input register does not hold the input signal using the FF.

10.3.2.3 Interrupt Input Mode

When a port is set for interrupt input mode using the corresponding bit in the general IO/interrupt switching register, the corresponding port serves as an interrupt input pin. In interrupt input mode, when the port receives an external interrupt, the corresponding bit in the interrupt display register indicates the input of an interrupt signal on the corresponding port pin, and an interrupt signal is output to the interrupt control block. In this mode, the polarity and detection conditions (edge or level) of the external input signal can be set for each port. The corresponding bits in the positive/negative logic select register and edge/level select register, one edge/both edge select register should be used to set the polarity and detection conditions, respectively.

If a port is set for edge detection using the corresponding bit in the edge/level select register, even when an external pulse interrupt signal is input, the corresponding bit in the interrupt display register holds the input using the FF and allows the level interrupt signal to be output to the interrupt control block. To stop all the interrupt signal outputs, all the bits in the interrupt clear register corresponding to the bits in the interrupt display register currently indicating the reception of the corresponding interrupt signals should be cleared to 0. Note that if a port is set for level detection using the corresponding bit in the edge/level select register and an external level interrupt signal is input, the corresponding bit in the interrupt display register does not use the FF to hold the input.

Interrupts indicated by the interrupt display register can be separately masked using the corresponding bits in the interrupt mask register and the interrupt sub mask register. When all the bits currently indicating the reception of the interrupt signals are masked, no interrupt signals are output to the interrupt control block. Masks can be canceled by writing 1 to the corresponding bits in the interrupt mask clear register or the interrupt sub mask clear register depending on the interrupt mask register or the interrupt sub mask register is used.

10.3.3 Handling of Input Signals on Port Pins

10.3.3.1 Chattering

In general input mode and interrupt input modes, a filtering function can be used for the port pins 0 to 3 of each GPIO block to prevent external chattering input. Specifically, when a bit in the chattering prevention on/off register is set to use the function, the external input to the corresponding port pin is sampled four consecutive times based on the filter clock signal, which is internally generated by the GPIO. The external input is canceled except when the active input is detected four consecutive times. Therefore, when a filtering function is used, input to the port pins 0 to 3 of each GPIO block need to be at least four sampling clock cycles long (The sampling clock is generated from peripheral clock/k, where k is determined by FILONOFFn.CLKSEL.).

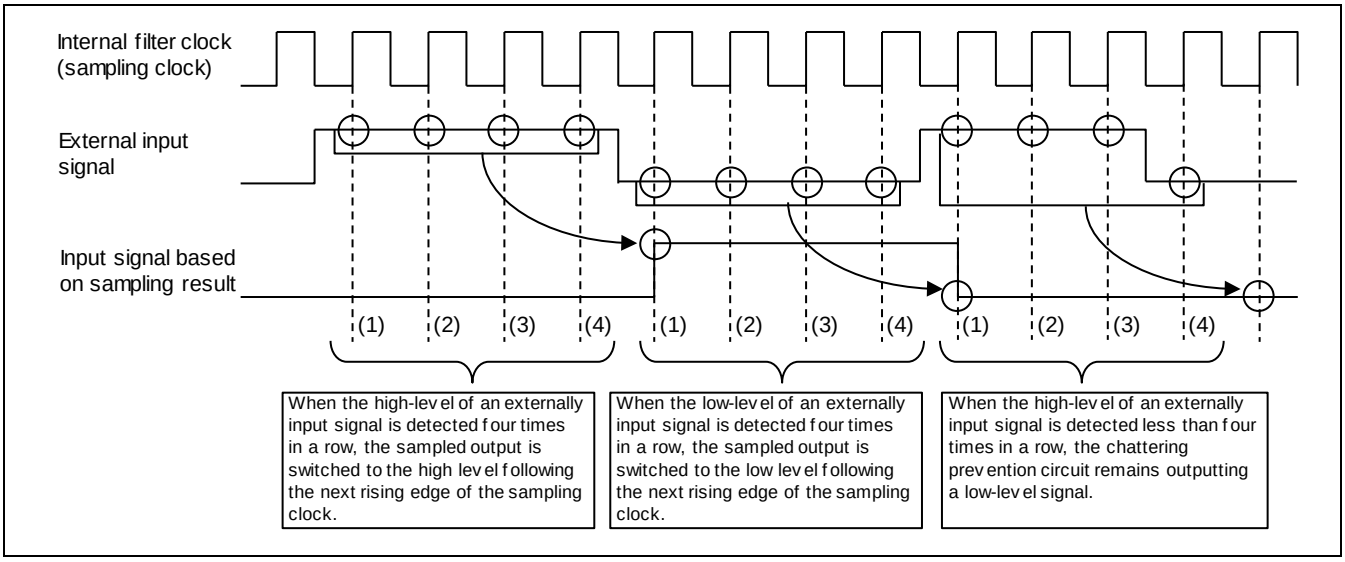

Figure 10.3 Sampling Timing Chart

10.3.3.2 Input Signal Synchronization

In general input mode and interrupt input mode, external input signals on all port pins are synchronized with the GPIO clock (S3D4ϕ).

10.3.4 Interrupt Display Timing Charts

Figure 10.4 shows the interrupt display timing and Figure 10.5 shows the note on the timing. In both figures, the positive logic and edge-sensitive input are assumed.

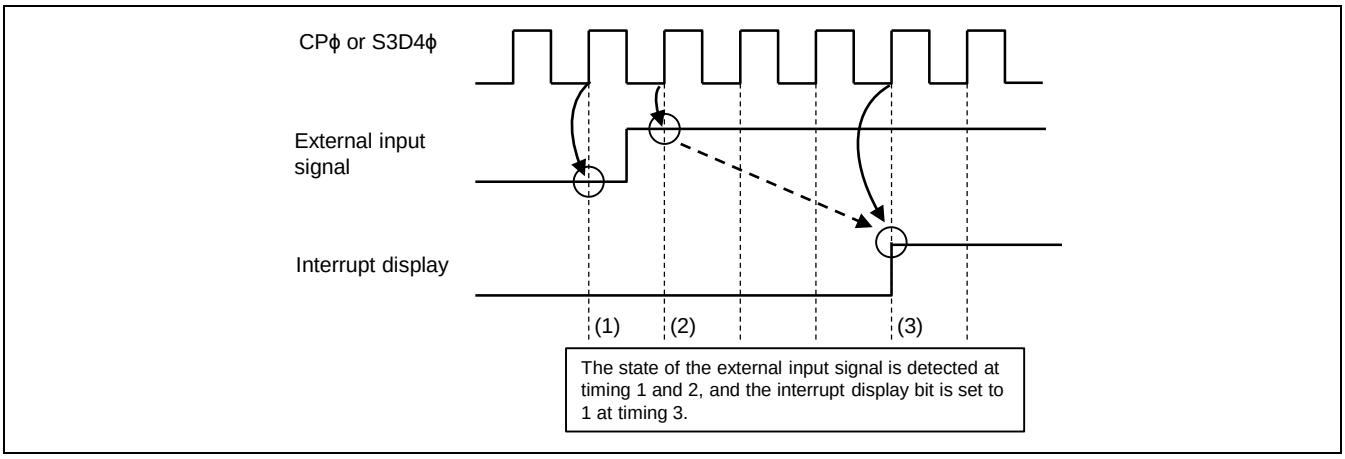

Figure 10.4 Interrupt Display Timing

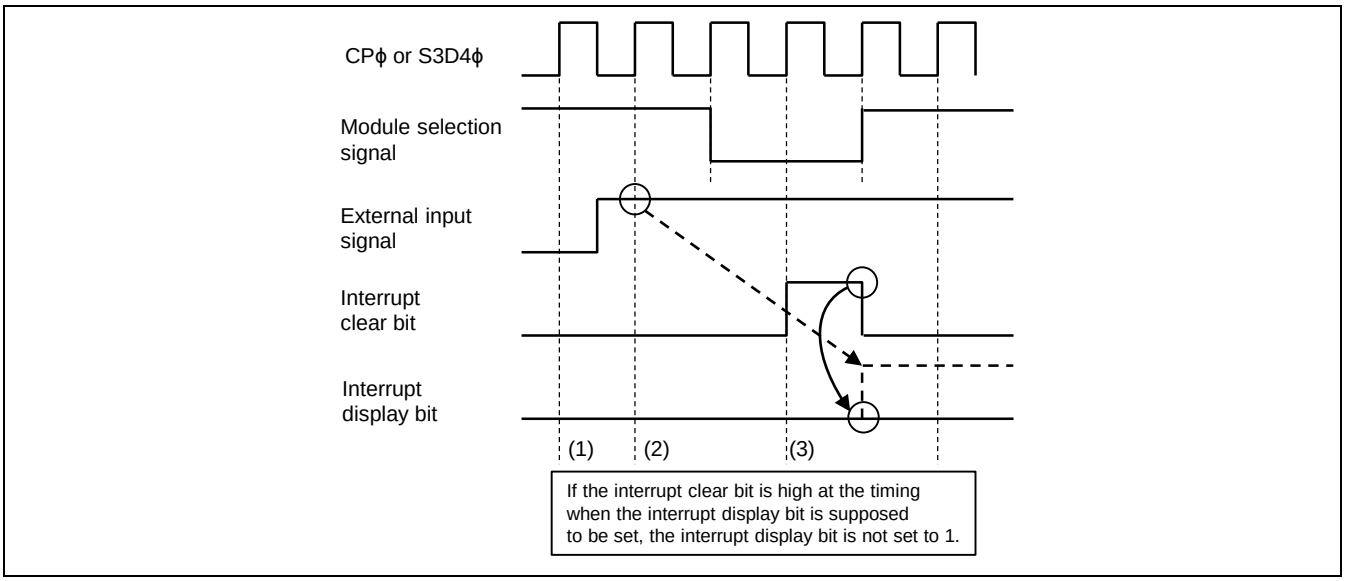

Figure 10.5 Note on Interrupt Display Timing

10.3.5 Using GPIO

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

The following sections describe how to use the GPIO. If the GPIO is not used according to the procedures shown here, operations are not guaranteed.

10.3.5.1 Setting Edge-Sensitive Interrupt Input Mode

For setting edge-sensitive interrupt input mode, refer to the procedure shown in Figure 10.6.

Note that an unexpected interrupt might be generated in the module if setting (1), (2), (3) or (4) in the flowchart is changed. When changing the setting, (5) and (6) should be done.

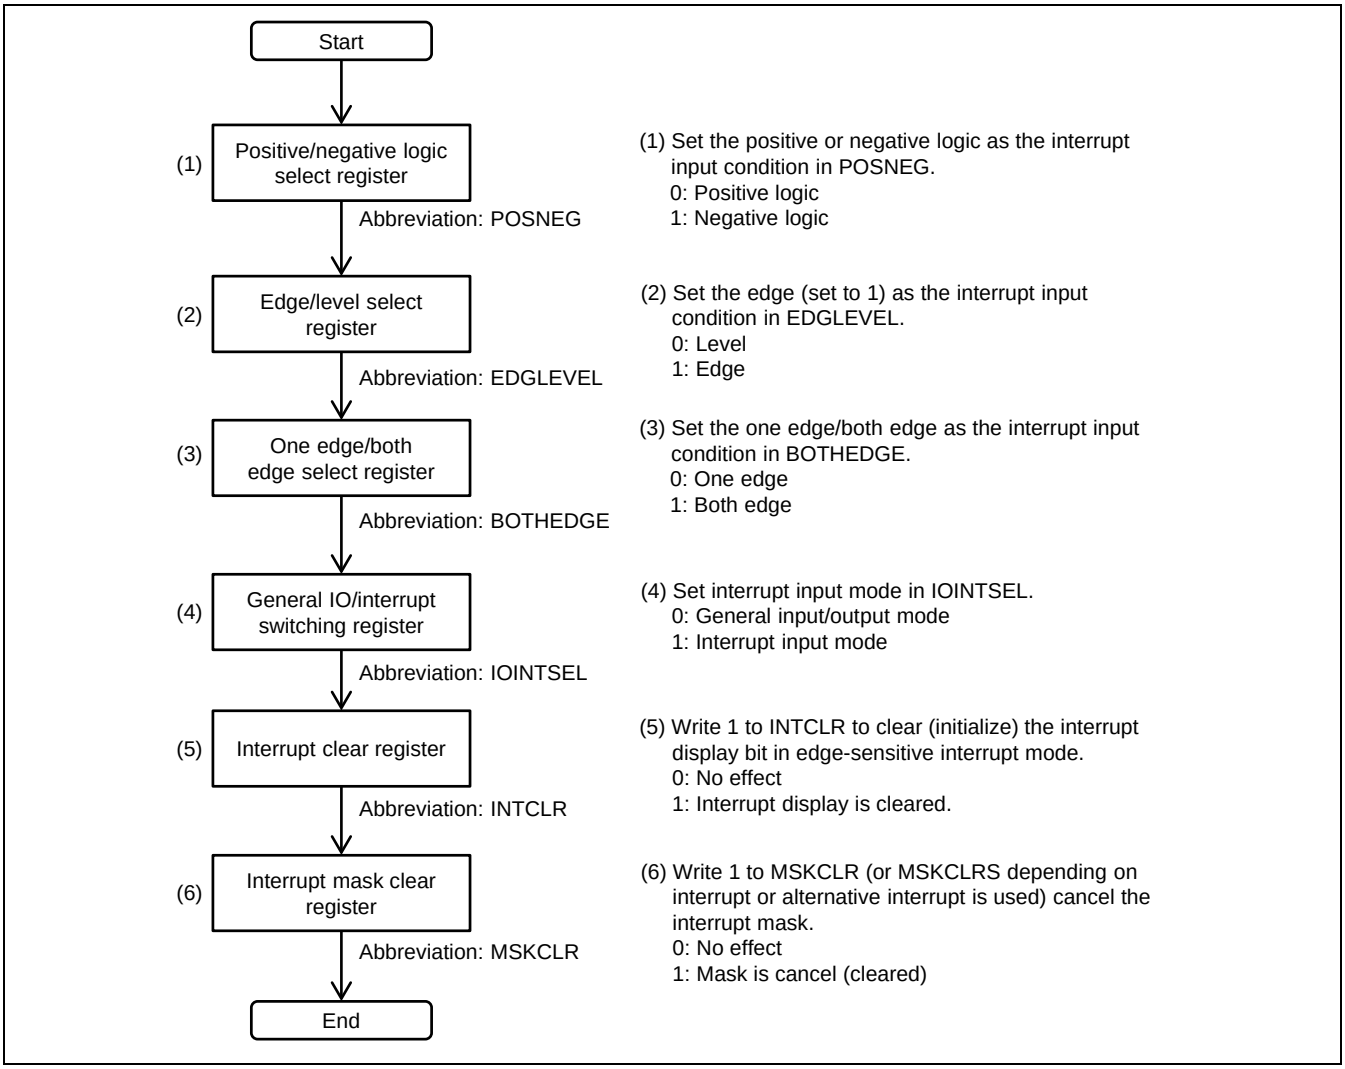

Figure 10.6 Flowchart of Setting the GPIO to Edge-Sensitive Interrupt Input Mode

10.3.5.2 Setting Level-Sensitive Interrupt Input Mode

For setting level-sensitive interrupt input mode, refer to the procedure shown in Figure 10.7.

Note that when an external level-sensitive interrupt input signal is stopped, the corresponding interrupt is canceled automatically. In level-sensitive interrupt input mode, the interrupt clear register is invalid.

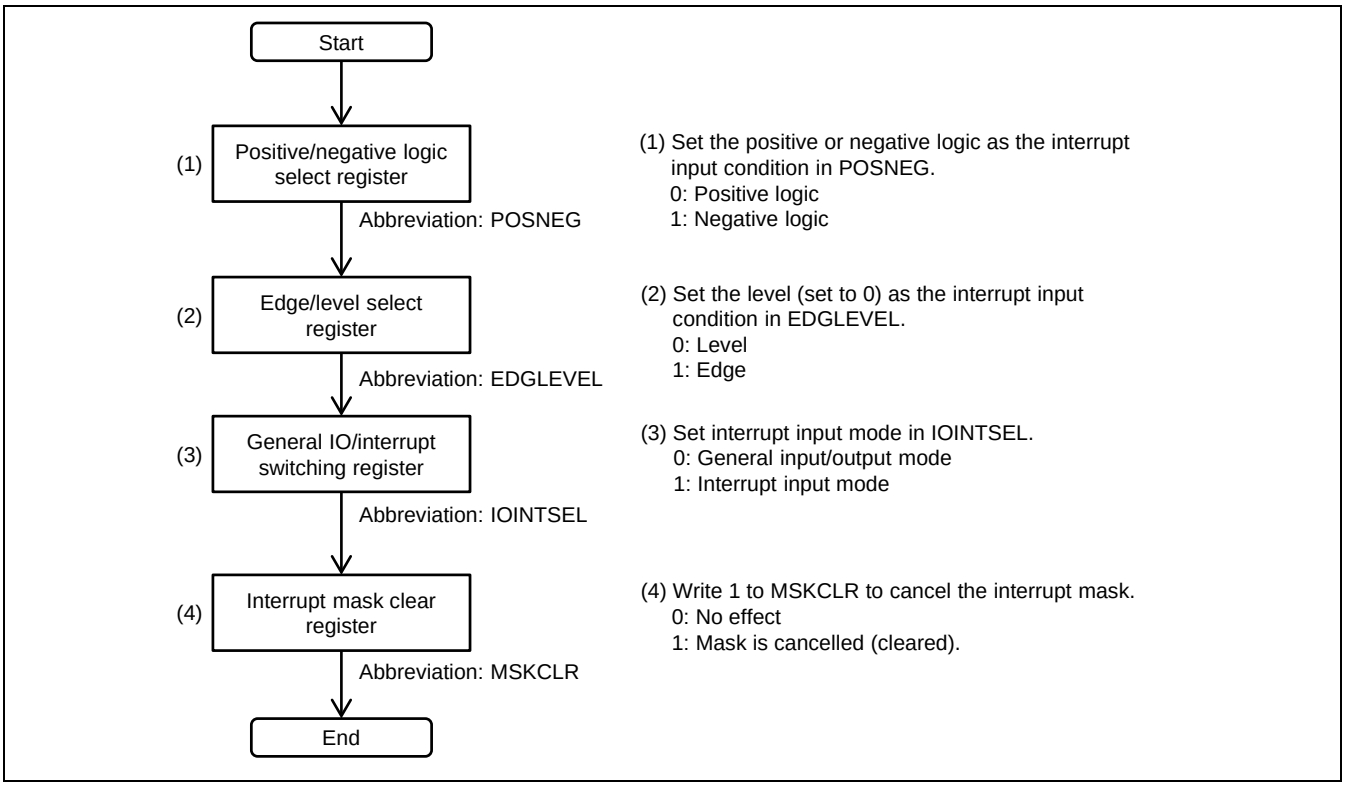

Figure 10.7 Flowchart of Setting the GPIO to Level-Sensitive Interrupt Input Mode

10.3.5.3 Setting General Output Mode

For setting general output mode, refer to the procedure shown in Figure 10.8.

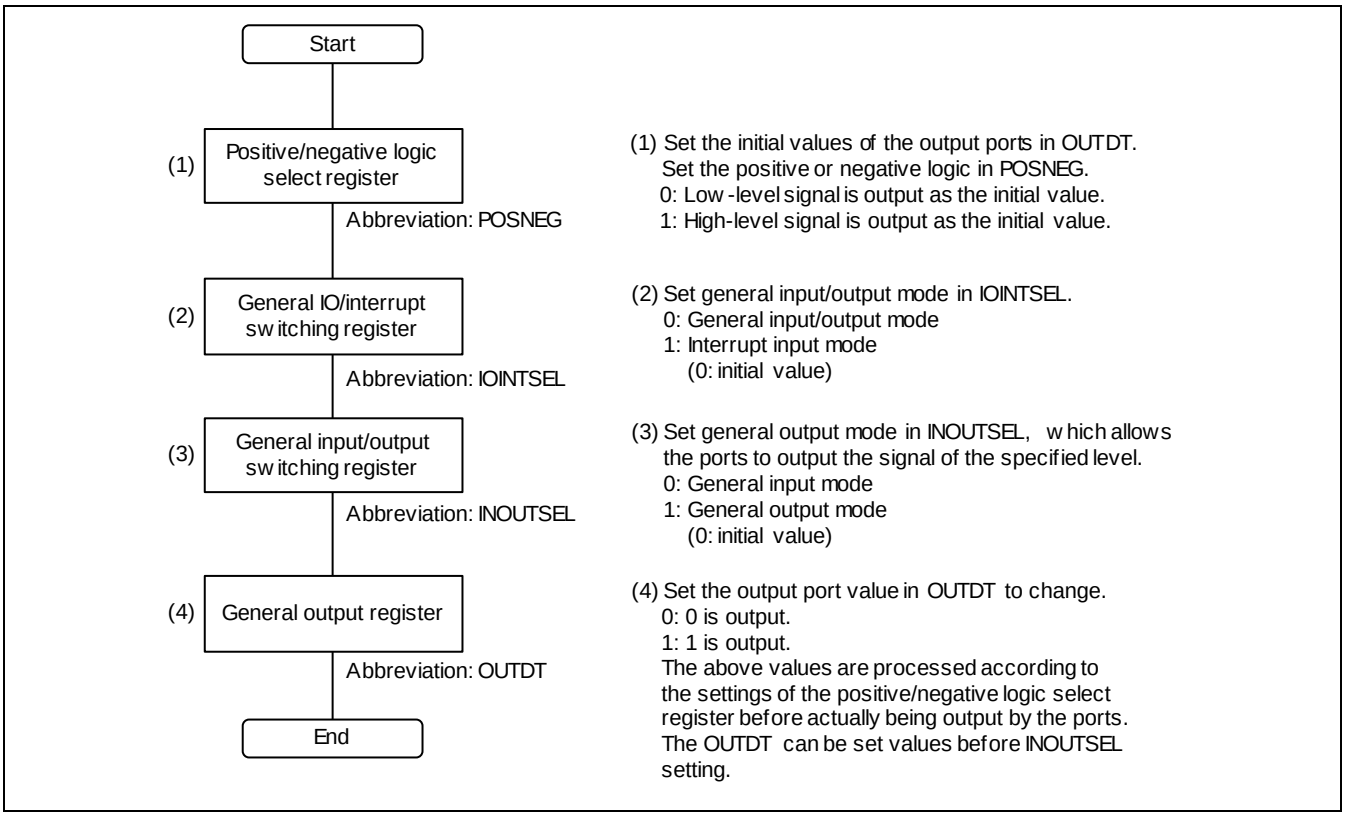

Figure 10.8 Flowchart of Setting the GPIO to General Output Mode

10.3.5.4 Setting Output data high/Output data low Mode

For setting output data high/output data low mode, refer to the procedure shown in Figure 10.9.

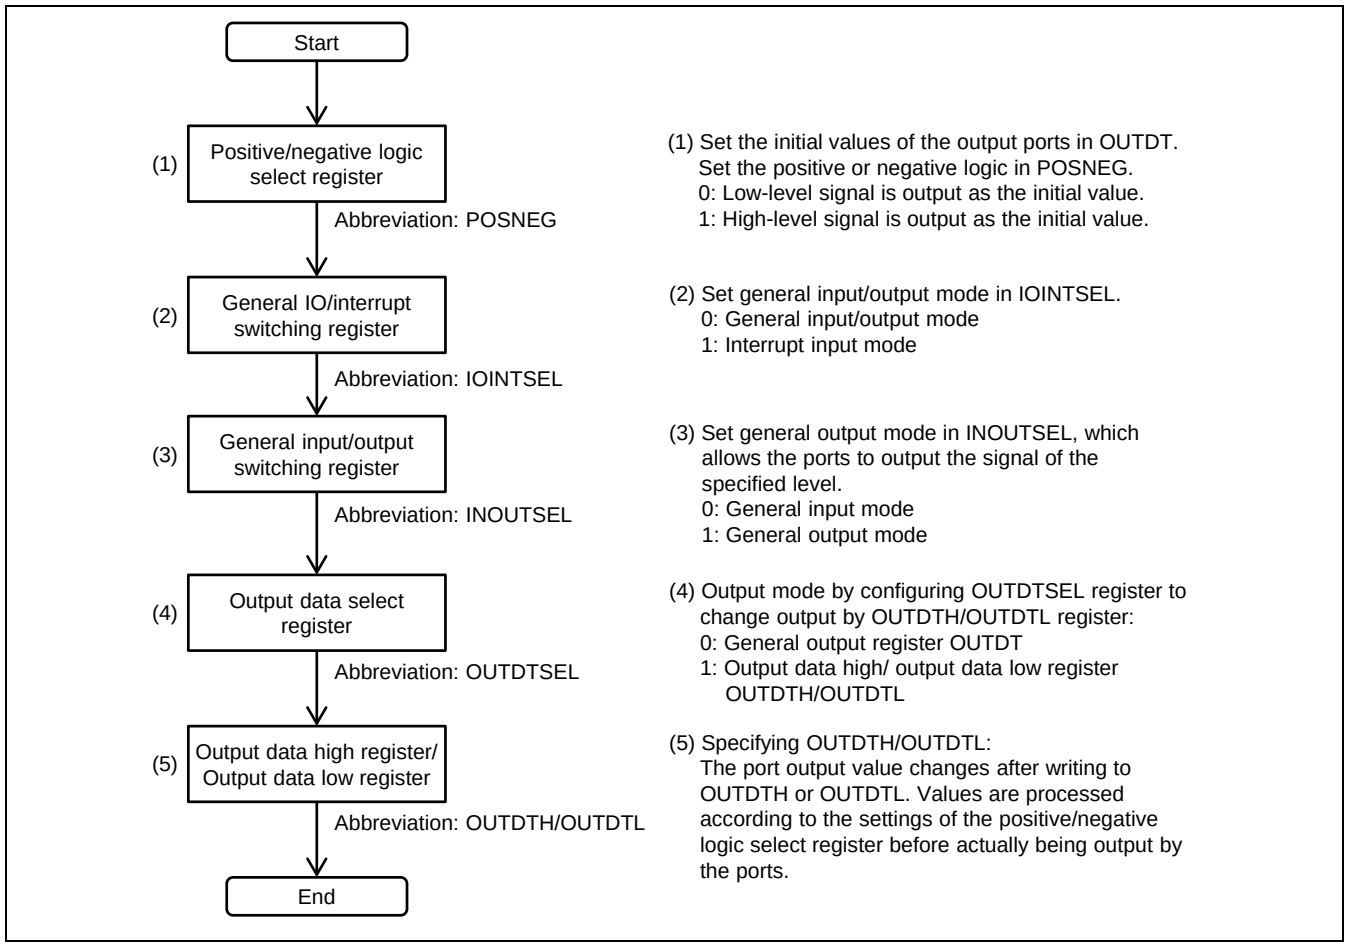

Figure 10.9 Flowchart of Setting the GPIO to Output data high/ Output data low Mode

10.3.5.5 Setting General Input Mode

For setting general input mode, refer to the procedure shown in Figure 10.10.

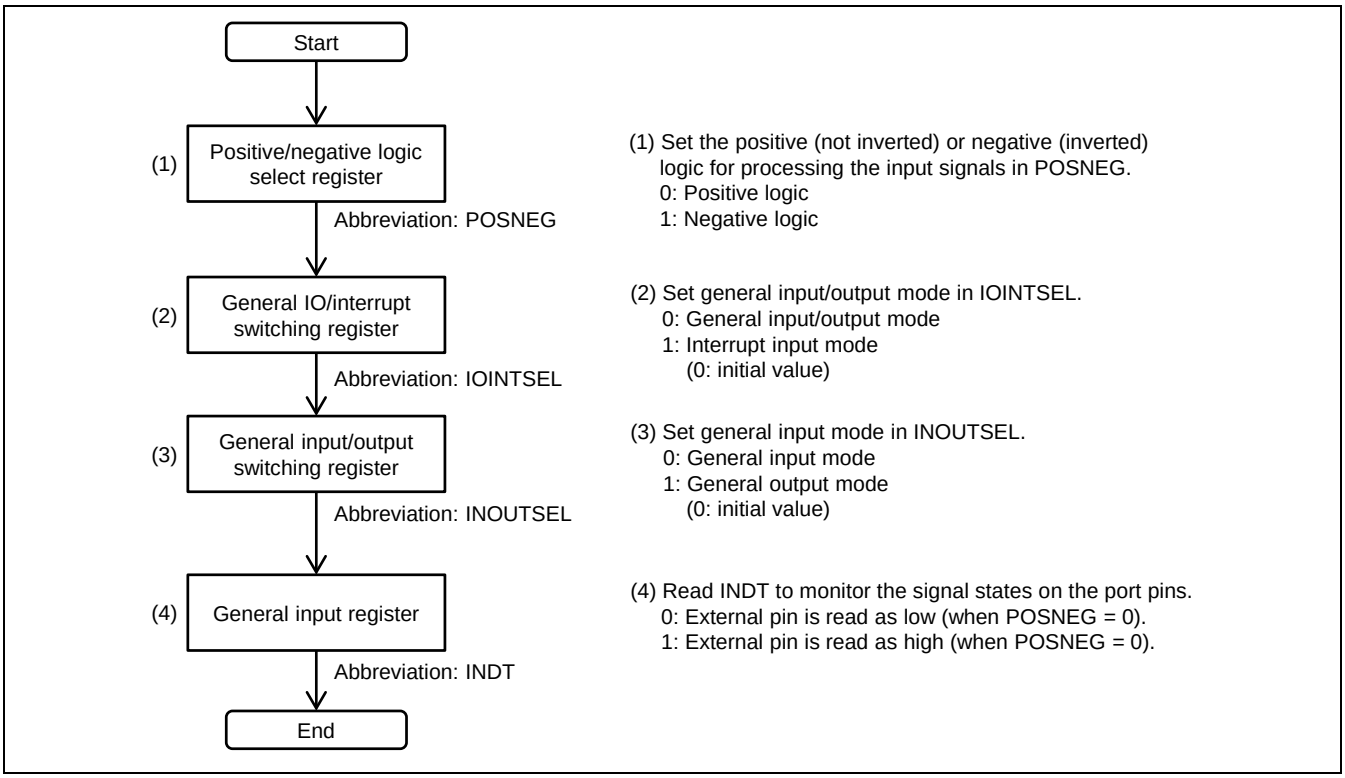

Figure 10.10 Flowchart of Setting the GPIO to General Input Mode

11. Clock Pulse Generator (CPG)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

11.1 Overview

This LSI has a clock pulse generator (CPG). The CPG consists of oscillators, PLL circuit n (n = 0 to 4), clock dividers, and the control circuit. The CPG generates various clocks used by this LSI.

11.1.1 Features

- Generates various clocks for LSI internal operation.
  - 5 PLLs for common/application part modules [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]
    4 PLLs for common/application part modules [RZ/G2N]
    2 PLLs and 1 SSCG PLL for common/application part modules [RZ/G2E]
  - SYS-CPU divider, common divider and DDR divider for system basic operation.
  - Dedicated dividers for special clock
- Controls clock supply to modules according to the module status (power supply status, etc.)
- There are registers related to secure and safety.

11.1.2 Block Diagram

A block diagram of the CPG is shown in Figure 11.1 to 11.4.

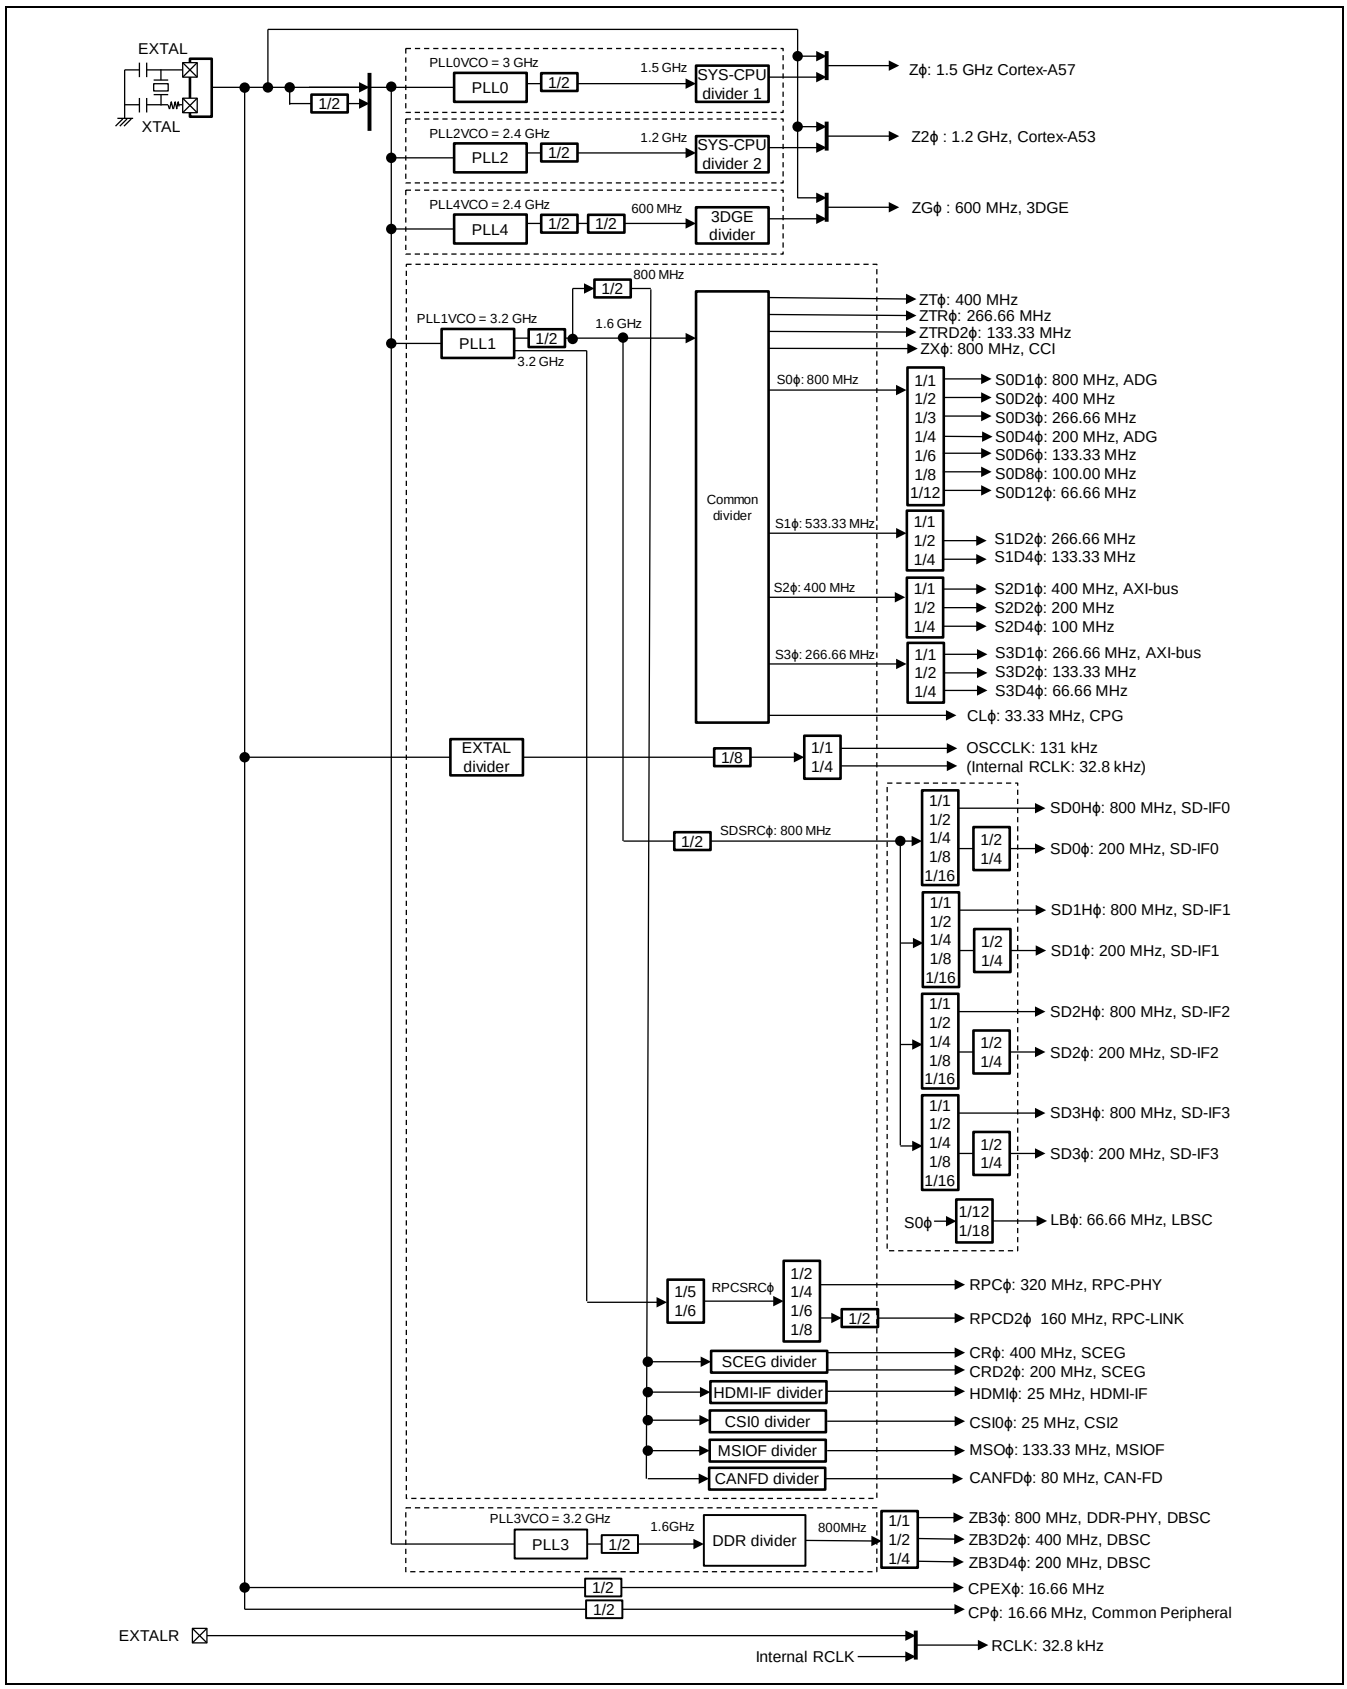

Figure 11.1 Block Diagram of CPG (RZ/G2H)

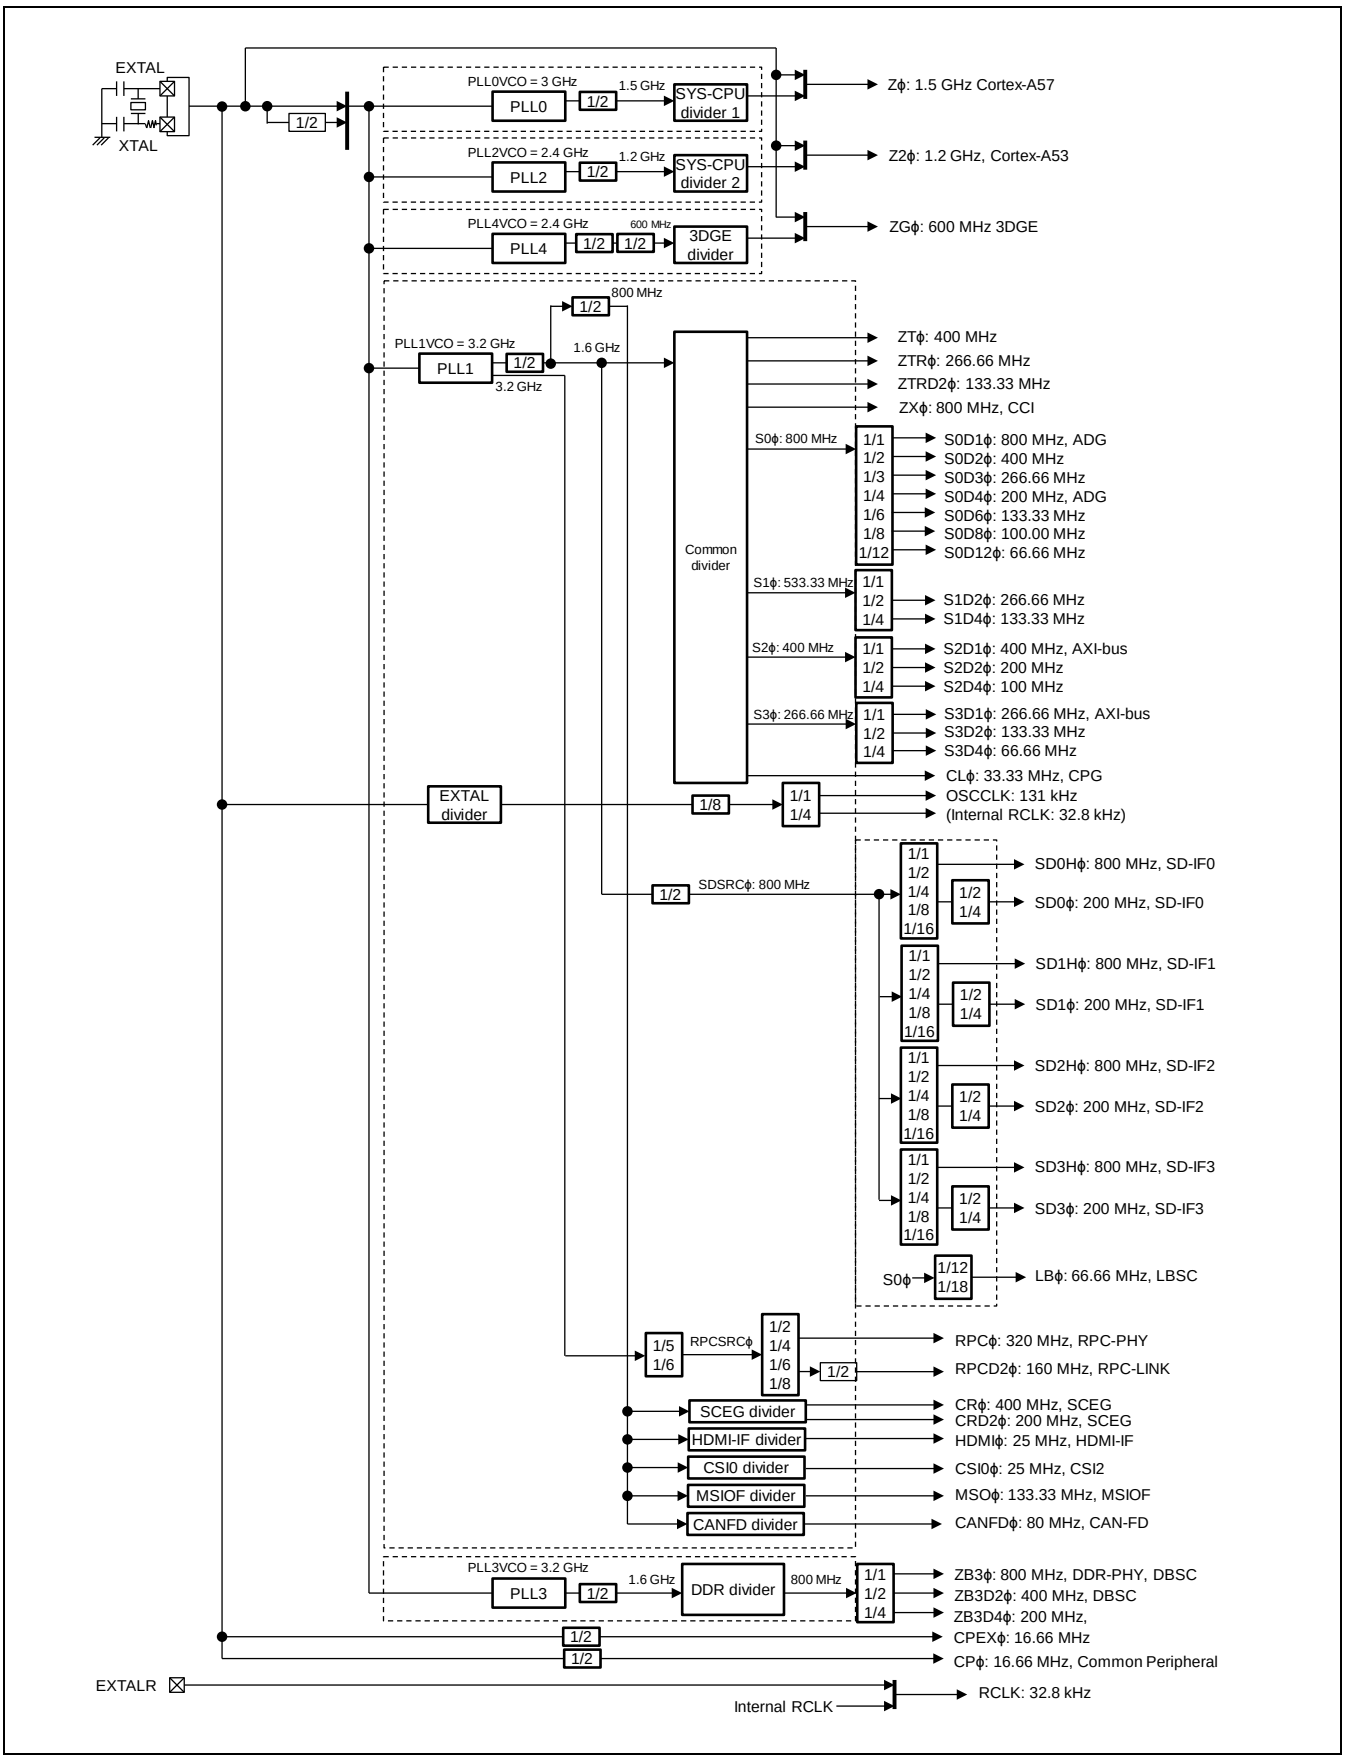

Figure 11.2 Block Diagram of CPG (RZ/G2M V1.3, RZ/G2M V3.0)

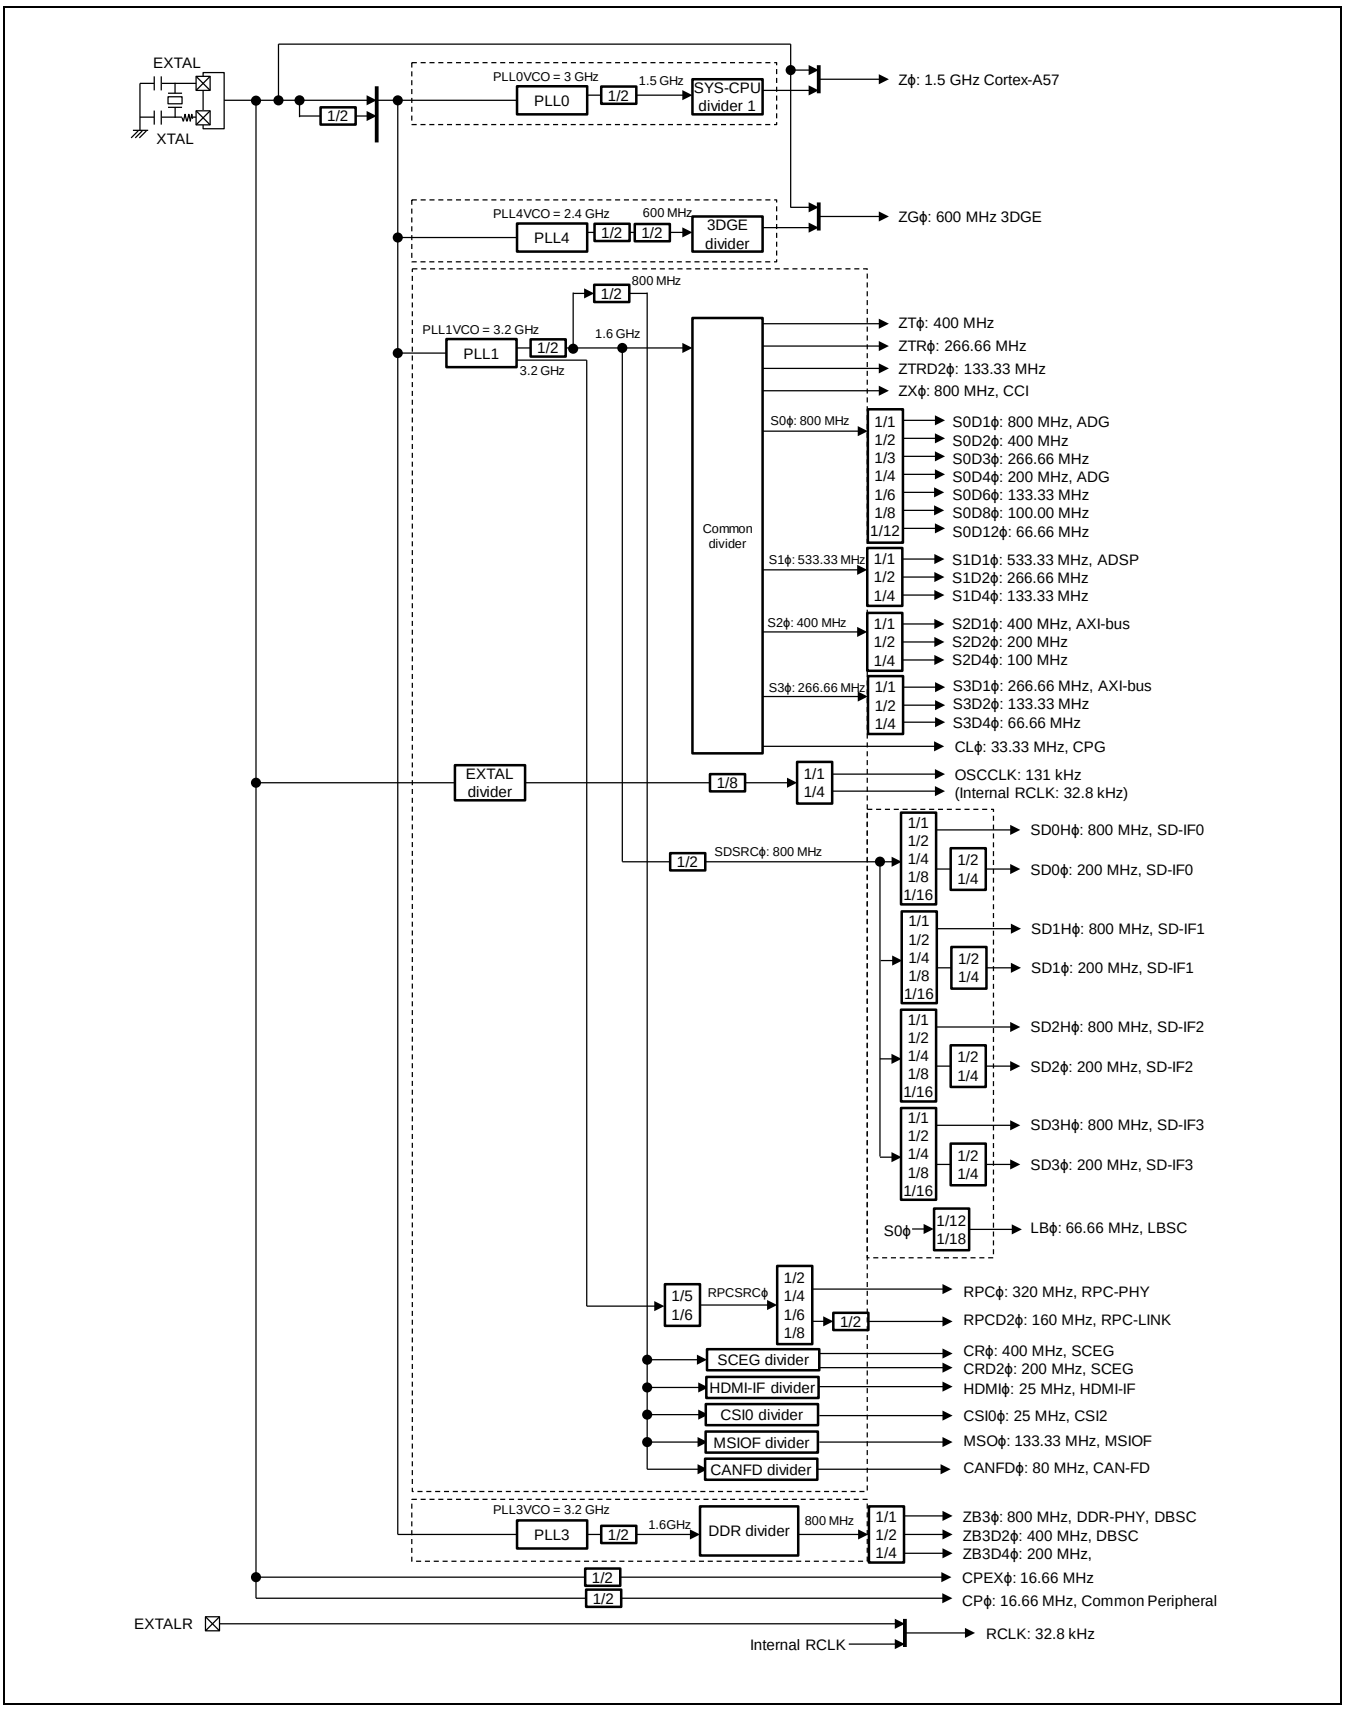

Figure 11.3 Block Diagram of CPG (RZ/G2N)

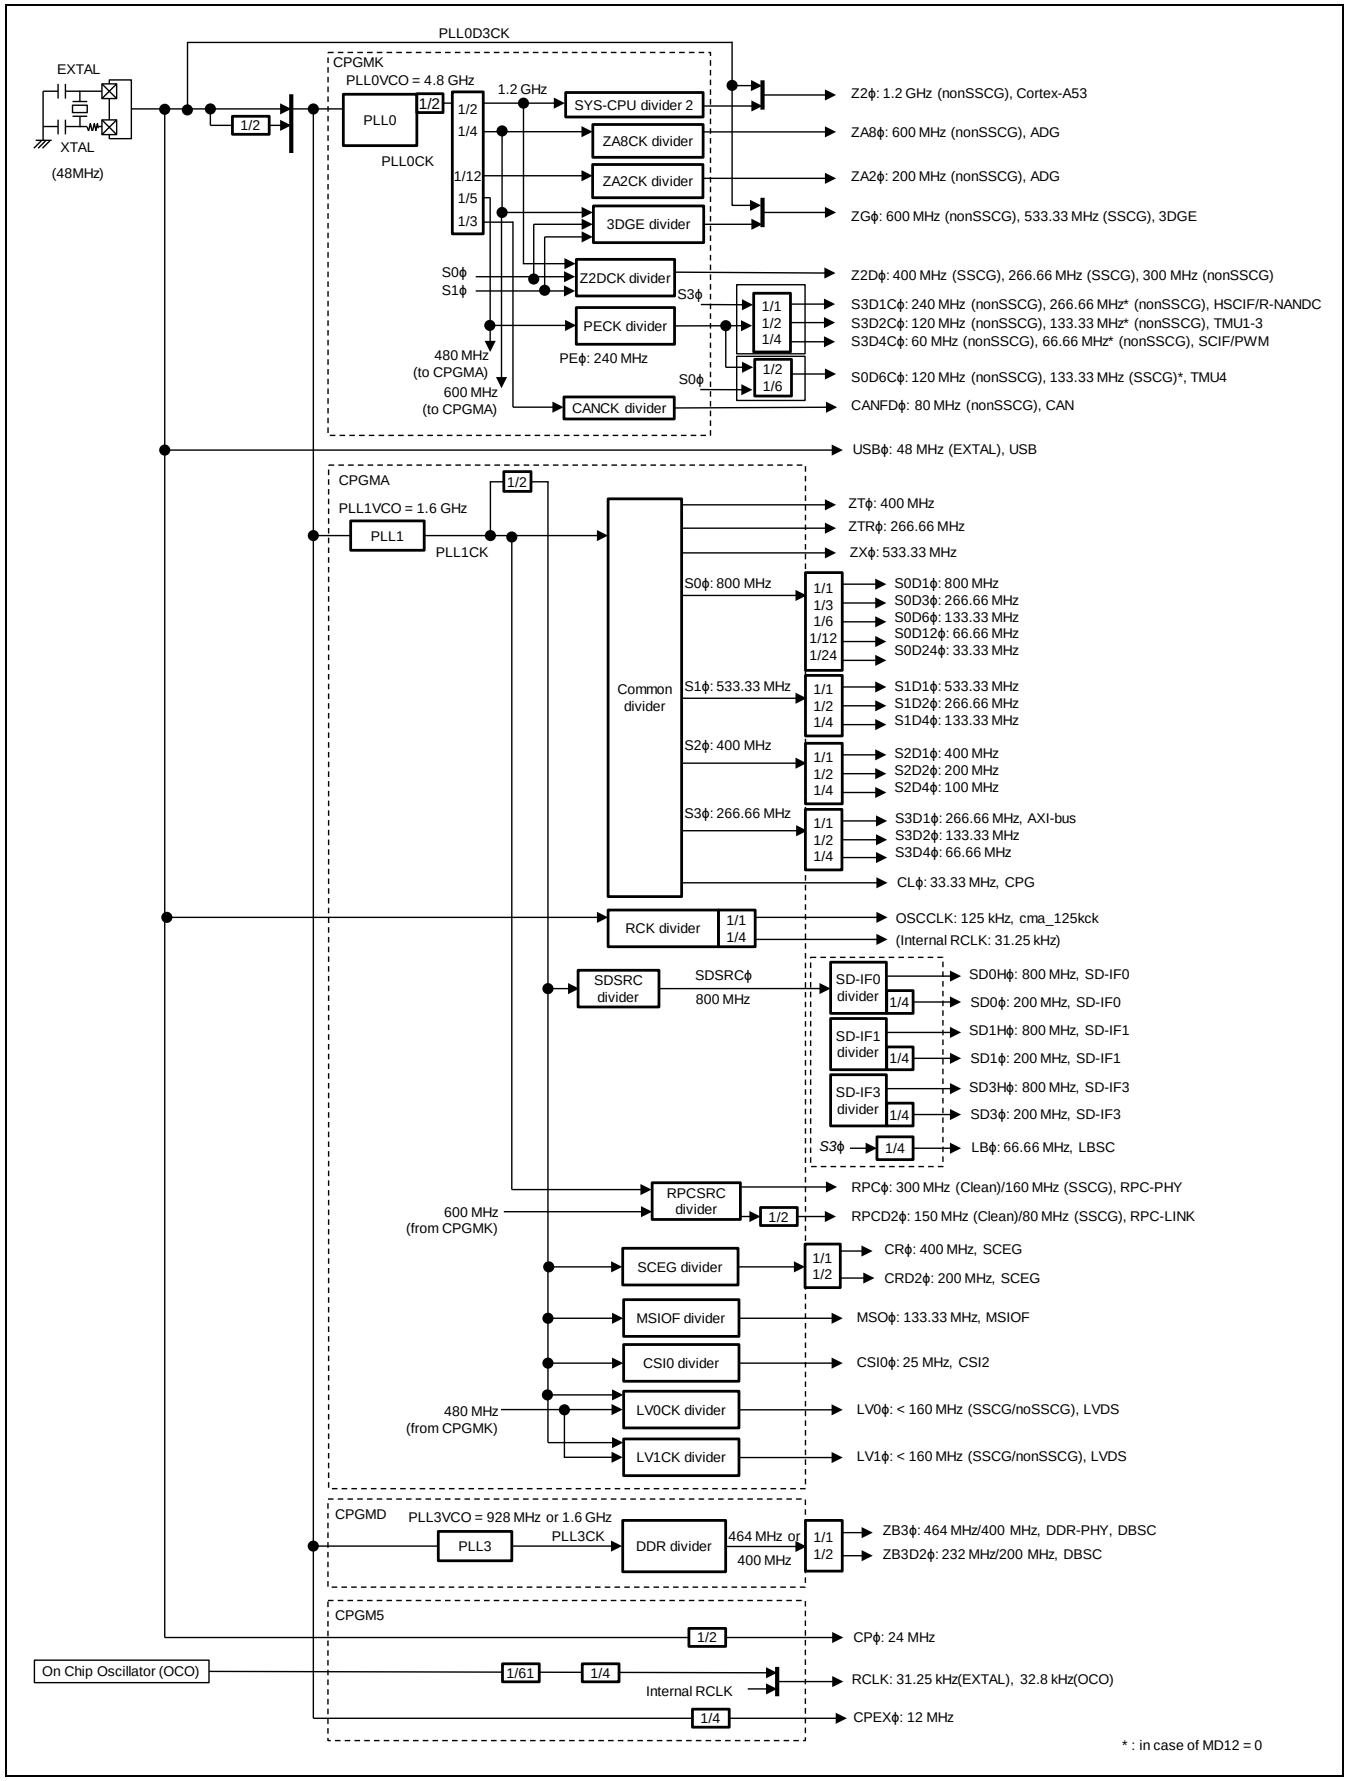

Figure 11.4 Block Diagram of CPG (RZ/G2E)

Followings are the functions of each block of CPG.

(1) PLL circuit 0 (PLL0)

PLL circuit 0 multiplies EXTAL or EXTAL/2 clock. The multiplication ratio is set by the PLL0CR.

(2) PLL circuit 1 (PLL1)

PLL circuit 1 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio shown in Table 11.2 to 11.5.

[RZ/G2E] SSCG (Spread Spectrum Clock Generator) support.

(3) PLL Circuit 2 (PLL2) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]

PLL circuit 2 multiplies the input clock from EXTAL (EXTAL or EXTAL/2). The multiplication ratio is set by the PLL2CR.

(4) PLL Circuit 3 (PLL3)

PLL circuit 3 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio shown in Table 11.2 to 11.5.

(5) PLL Circuit 4 (PLL4) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

PLL circuit 4 multiplies the input clock from EXTAL (EXTAL or EXTAL/2) by the multiplication ratio shown in Table 11.2 to 11.5.

(6) SYS-CPU clock divider 1

The SYS-CPU clock divider 1 divides PLL0 output clock. This divider generates the AP-System core clocks (Zϕ). The division ratio is set by the frequency control register C (FRQCRC).

(7) SYS-CPU clock divider 2

The SYS-CPU clock divider 2 divides PLLn output clock. This divider generates the AP-System core clocks (Z2ϕ).

n = 2 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0], n = 0 [RZ/G2E].

(8) 3DGE clock divider

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

The 3DGE clock divider divides PLL4 output clock by 2. This divider generates the system 3DGE clock (ZGϕ).

[RZ/G2E]

The 3DGE clock divider divides PLL0 output clock by 2. This divider generates the system 3DGE clock (ZGϕ). The division ratio is set by the frequency control register B (FRQCRB).

(9) Common clock divider

The common clock divider divides PLL1 output clock. This divider generates various system clocks. The division ratio is set by the frequency control register B (FRQCRB).

(10) DDR clock divider

The DDR clock divider divides PLL3 output clock, and generates DDR-PHY clock and DBSC clock.

(11) Dedicated dividers

The each dedicated divider generates special clock for the related modules.

(12) On Chip Oscillator (OCO) [RZ/G2E]On Chip Oscillator (OCO) [RZ/G2E]

By controlling RCKCR register, the clock generated from On Chip Oscillator (OCO) is output as RCLK.

11.1.3 External Pins

Table 11.1 lists the CPG pin configuration.

SD1ϕ	SD-IF1 divider	Variable	200 MHz	50 MHz	SD-IF1 clock
SD2Hϕ	SD-IF2 divider	Variable	800 MHz	Stopped	SD-IF2 clock
SD2ϕ	SD-IF2 divider	Variable	200 MHz	50 MHz	SD-IF2 clock
SD3Hϕ	SD-IF3 divider	Variable	800 MHz	Stopped	SD-IF3 clock
SD3ϕ	SD-IF3 divider	Variable	200 MHz	50 MHz	SD-IF3 clock
RPCϕ	RPC divider	Variable	320 MHz	*2	RPC-IF clock
RPCD2ϕ	RPC divider	Variable	160 MHz	*2	RPC-IF clock
MSOϕ	MSO divider	Variable	133.33 MHz	12.5 MHz	MSIOF clock
CANFDϕ	CANFD divider	Variable	80 MHz	12.5 MHz	CANFD clock
HDMIϕ	HDMI-IF divider	Variable	25 MHz	Stopped	HDMI-IF clock
CSI0ϕ	CSI0 divider	Variable	25 MHz	Stopped	CSI2 clock
CPϕ	EXTAL	Fixed	16.66 MHz	*3	Common peripheral clock, EXTAL × 1/2
CPEXϕ	EXTAL	Fixed	16.66 MHz	*3	EXTAL × 1/2
RCLK	Common divider / EXTALR	Fixed	32.89 kHz	*6	
OSCCLK	Common divider	Fixed	131.57 kHz	*7	

Notes:
1. The frequency of LBϕ depends on the value of MD18.
2. The frequency of RPCϕ depends on the value of MD4, MD3, MD2 and MD1.
   When MD4 = H or L, MD3 = L, MD2 = H, MD1 = L, RPCϕ = 320 MHz, RPCD2ϕ = 160MHz.
   When MD4 = H or L, MD3 = L, MD2 = H, MD1 = H, RPCϕ = 160 MHz, RPCD2ϕ = 80MHz.
   In the other cases of MD4, MD3, MD2 and MD1 setting, RPCϕ = 80 MHz, RPCD2ϕ = 40MHz.
3. The frequency of CPϕ is equal to EXTAL × 1/2. For example, when the frequency of EXTAL is equal to 20 MHz, the frequency of CPCLK is equal to 10 MHz.
4. The initial frequency of ZB3ϕ and ZB3D2ϕ depends on the setting of MD19 and MD17. The values shown in the above table corresponds to the case of MD19 = L and MD17 = L.
5. These clocks are oscillated in the debug mode. Otherwise, they are stopped.
6. The initial value depends on MD14, MD13 and MD28.
   When MD28 = H, RCLK = EXTALR.
   When MD28 = L, MD14 = L and MD13 = H, RCLK = 32.89 (kHz)
   In the other setting, RCLK = 32.55 (kHz)
7. The initial value depends on MD14, MD13.
   When MD14 = L and MD13 = H, OSCCLK = 131.57 (kHz).
   In the other setting, OSCCLK = 130.20 (kHz)
8. Divider setting for listed clock in Table 11.2 must not be over than maximum clock frequency of each clocks.

			EXTAL divider		Internal RCLK		OSCCLK	
MD14	MD13	EXTAL (MHz)	Fixed division ratio	Frequency (MHz)	Fixed division ratio	Frequency (kHz)	Fixed division ratio	Frequency (kHz)
0	0	16.66	× 1/16	1.04	× 1/32	32.55	× 1/8	130.20
0	1	20.00	× 1/19	1.05	× 1/32	32.89	× 1/8	131.57
1	0	25.00	× 1/24	1.04	× 1/32	32.55	× 1/8	130.20
1	1	33.33	× 1/32	1.04	× 1/32	32.55	× 1/8	130.20

Table 11.3 List of Clocks [RZ/G2M V1.3, RZ/G2M V3.0]

		Frequency			
Name	**Clock Source**	**Dividing ratio**	**Maximum**	**Initial**	**Clock Domain, Function**
Zϕ	SYS-CPU divider 1	Variable	1.5 GHz	1.5 GHz	System CPU (Cortex-A57) clock
Z2ϕ	SYS-CPU divider 2	Variable	1200 MHz	1200 MHz	System CPU (Cortex-A53) clock
ZGϕ	3DGE divider	Variable	600 MHz	600 MHz	3DGE clock
ZTRϕ	Common divider	Variable	266.66 MHz	266.66 MHz *5	Trace interface clock
ZTRD2ϕ	Common divider	Variable	133.33 MHz	133.33 MHz *5	System trace interface clock
ZTϕ	Common divider	Variable	400 MHz	400 MHz *5	Internal trace clock
ZXϕ	Common divider	Fixed	800 MHz	800 MHz	Cache coherent interconnect clock
S0ϕ	Common divider	Fixed	800 MHz	800 MHz	Clock source of S0D1ϕ, S0D2ϕ, S0D3ϕ, S0D4ϕ, S0D6ϕ, S0D8ϕ, and S0D12ϕ
S1ϕ	Common divider	Fixed	533.33 MHz	533.33 MHz	Clock source of S1D2ϕ, and S1D4ϕ
S2ϕ	Common divider	Fixed	400 MHz	400 MHz	Clock source of S2D1ϕ, S2D2ϕ, and S2D4ϕ
S3ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	Clock source of S3D1ϕ, S3D2ϕ, and S3D4ϕ
S0D1ϕ	Common divider	Fixed	800 MHz	800 MHz	ADG
S0D2ϕ	Common divider	Fixed	400 MHz	400 MHz	
S0D3ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	
S0D4ϕ	Common divider	Fixed	200 MHz	200 MHz	ADG
S0D6ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	
S0D8ϕ	Common divider	Fixed	100 MHz	100 MHz	
S0D12ϕ	Common divider	Fixed	66.66 MHz	66.66 MHz	
S1D2ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	
S1D4ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	
S2D1ϕ	Common divider	Fixed	400.00 MHz	400.00 MHz	AXI-bus
S2D2ϕ	Common divider	Fixed	200.00 MHz	200.00 MHz	
S2D4ϕ	Common divider	Fixed	100.00 MHz	100.00 MHz	
S3D1ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	AXI-bus
S3D2ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	
S3D4ϕ	Common divider	Fixed	66.66 MHz	66.66 MHz	
LBϕ	Common divider	Fixed	66.66 MHz	*1	LBSC CLKOUT
CLϕ	Common divider	Fixed	33.33 MHz	33.33 MHz	CPG
ZB3ϕ	DDR divider	Variable	800 MHz	800 MHz *4	DBSC clock
ZB3D2ϕ	DDR divider	Variable	400 MHz	400 MHz *4	DBSC clock
ZB3D4ϕ	DDR divider	Variable	200 MHz	200 MHz *4	DBSC clock
CRϕ	SCEG divider	Fixed	400 MHz	400 MHz	SCEG clock
CRD2ϕ	SCEG divider	Fixed	200 MHz	200 MHz	SCEG clock

Name	Clock Source	Frequency			Clock Domain, Function
		Dividing ratio	Maximum	Initial	
SDSRCϕ	SDSRC divider	Fixed	800 MHz	800 MHz	Source clock of SDnHϕ and SDnϕ (n = 0 to 3)
SD0Hϕ	SD-IF0 divider	Variable	800 MHz	Stopped	SD-IF0 clock
SD0ϕ	SD-IF0 divider	Variable	200 MHz	50 MHz	SD-IF0 clock
SD1Hϕ	SD-IF1 divider	Variable	800 MHz	Stopped	SD-IF1 clock
SD1ϕ	SD-IF1 divider	Variable	200 MHz	50 MHz	SD-IF1 clock
SD2Hϕ	SD-IF2 divider	Variable	800 MHz	Stopped	SD-IF2 clock
SD2ϕ	SD-IF2 divider	Variable	200 MHz	50 MHz	SD-IF2 clock
SD3Hϕ	SD-IF3 divider	Variable	800 MHz	Stopped	SD-IF3 clock
SD3ϕ	SD-IF3 divider	Variable	200 MHz	50 MHz	SD-IF3 clock
RPCϕ	RPC divider	Variable	320 MHz	*2	RPC-IF clock
RPCD2ϕ	RPC divider	Variable	160 MHz	*2	RPC-IF clock
MSOϕ	MSO divider	Variable	133.33 MHz	12.5 MHz	MSIOF clock
CANFDϕ	CANFD divider	Variable	80 MHz	12.5 MHz	CANFD clock
HDMIϕ	HDMI-IF divider	Variable	25 MHz	Stopped	HDMI-IF clock
CSI0ϕ	CSI0 divider	Variable	25 MHz	Stopped	CSI2 clock
CPϕ	EXTAL	Fixed	16.66 MHz	*3	Common peripheral clock, EXTAL × 1/2
CPEXϕ	EXTAL	Fixed	16.66 MHz	*3	EXTAL × 1/2
RCLK	Common divider / EXTALR	Fixed	32.89 kHz	*6	
OSCCLK	Common divider	Fixed	131.57 kHz	*7	

Notes: 1. The frequency of LBϕ depends on the value of MD18.

2. The frequency of RPCϕ depends on the value of MD4, MD3, MD2 and MD1.
When MD4 = L, MD3 = L, MD2 = L, MD1 = H, RPCϕ = 80 MHz, RPCD2ϕ = 40MHz.
When MD4 = H or L, MD3 = L, MD2 = H, MD1 = L, RPCϕ = 320 MHz, RPCD2ϕ = 160MHz.
When MD4 = H or L, MD3 = L, MD2 = H, MD1 = H, RPCϕ = 160 MHz, RPCD2ϕ = 80MHz.
When MD4 = L, MD3 = H, MD2 = L, MD1 = L, RPCϕ = 80 MHz, RPCD2ϕ = 40MHz.
In the other cases of MD4, MD3, MD2 and MD1 setting, RPCϕ and RPCD2ϕ are stopped.

3. The frequency of CPϕ is equal to EXTAL × 1/2. For example, when the frequency of EXTAL is equal to 20 MHz, the frequency of CPCLK is equal to 10 MHz.
4. The initial frequency of ZB3ϕ and ZB3D2ϕ depends on the setting of MD19 and MD17. The values shown in the above table corresponds to the case of MD19 = L and MD17 = L.
5. These clocks are oscillated in the debug mode. Otherwise, they are stopped.
6. The initial value depends on MD14, MD13 and MD28.
   When MD28 = H, RCLK = EXTALR.
   When MD28 = L, MD14 = L and MD13 = H, RCLK = 32.89 (kHz)
   In the other setting, RCLK = 32.55 (kHz)
7. The initial value depends on MD14, MD13.
   When MD14 = L and MD13 = H, OSCCLK = 131.57 (kHz).
   In the other setting, OSCCLK = 130.20 (kHz)
8. Divider setting for listed clock in Table 11.3 must not be over than maximum clock frequency of each clocks.

			EXTAL divider		Internal RCLK		OSCCLK	
MD14	MD13	EXTAL (MHz)	Fixed division ratio	Frequency (MHz)	Fixed division ratio	Frequency (kHz)	Fixed division ratio	Frequency (kHz)
0	0	16.66	× 1/16	1.04	× 1/32	32.55	× 1/8	130.20
0	1	20.00	× 1/19	1.05	× 1/32	32.89	× 1/8	131.57
1	0	25.00	× 1/24	1.04	× 1/32	32.55	× 1/8	130.20
1	1	33.33	× 1/32	1.04	× 1/32	32.55	× 1/8	130.20

Table 11.4 List of Clocks [RZ/G2N]

		Frequency			
Name	**Clock Source**	**Dividing ratio**	**Maximum**	**Initial**	**Clock Domain, Function**
Zϕ	SYS-CPU divider 1	Variable	1.5 GHz	1.5 GHz	System CPU (Cortex-A57) clock
ZGϕ	3DGE divider	Variable	600 MHz	600 MHz	3DGE clock
ZTRϕ	Common divider	Variable	266.66 MHz	266.66 MHz *5	Trace interface clock
ZTRD2ϕ	Common divider	Variable	133.33 MHz	133.33 MHz *5	System trace interface clock
ZTϕ	Common divider	Variable	400 MHz	400 MHz *5	Internal trace clock
ZXϕ	Common divider	Fixed	800 MHz	800 MHz	Cache coherent interconnect clock
S0ϕ	Common divider	Fixed	800 MHz	800 MHz	Clock source of S0D1ϕ, S0D2ϕ, S0D3ϕ, S0D4ϕ, S0D6ϕ, S0D8ϕ and S0D12ϕ
S1ϕ	Common divider	Fixed	533.33 MHz	533.33 MHz	Clock source of S1D2ϕ, and S1D4ϕ
S2ϕ	Common divider	Fixed	400 MHz	400 MHz	Clock source of S2D1ϕ, S2D2ϕ, and S2D4ϕ
S3ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	Clock source of S3D1ϕ, S3D2ϕ, and S3D4ϕ
S0D1ϕ	Common divider	Fixed	800 MHz	800 MHz	ADG
S0D2ϕ	Common divider	Fixed	400 MHz	400 MHz	
S0D3ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	
S0D4ϕ	Common divider	Fixed	200 MHz	200 MHz	ADG
S0D6ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	
S0D8ϕ	Common divider	Fixed	100 MHz	100 MHz	
S0D12ϕ	Common divider	Fixed	66.66 MHz	66.66 MHz	
S1D2ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	
S1D4ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	
S2D1ϕ	Common divider	Fixed	400.00 MHz	400.00 MHz	AXI-bus
S2D2ϕ	Common divider	Fixed	200.00 MHz	200.00 MHz	
S2D4ϕ	Common divider	Fixed	100.00 MHz	100.00 MHz	
S3D1ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	AXI-bus
S3D2ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	
S3D4ϕ	Common divider	Fixed	66.66 MHz	66.66 MHz	
LBϕ	Common divider	Fixed	66.66 MHz	*1	LBSC CLKOUT
CLϕ	Common divider	Fixed	33.33 MHz	33.33 MHz	CPG
ZB3ϕ	DDR divider	Variable	800 MHz	800 MHz *4	DBSC clock
ZB3D2ϕ	DDR divider	Variable	400 MHz	400 MHz *4	DBSC clock
ZB3D4ϕ	DDR divider	Variable	200 MHz	200 MHz *4	DBSC clock
CRϕ	SCEG divider	Fixed	400 MHz	400 MHz	SCEG clock
CRD2ϕ	SCEG divider	Fixed	200 MHz	200 MHz	SCEG clock
SDSRCϕ	SDSRC divider	Fixed	800 MHz	800 MHz	Source clock of SDnHϕ and SDnϕ (n = 0 to 3)
SD0Hϕ	SD-IF0 divider	Variable	800 MHz	Stopped	SD-IF0 clock
SD0ϕ	SD-IF0 divider	Variable	200 MHz	50 MHz	SD-IF0 clock

Name	Clock Source	Frequency			Clock Domain, Function
		Dividing ratio	Maximum	Initial	
SD1Hϕ	SD-IF1 divider	Variable	800 MHz	Stopped	SD-IF1 clock
SD1ϕ	SD-IF1 divider	Variable	200 MHz	50 MHz	SD-IF1 clock
SD2Hϕ	SD-IF2 divider	Variable	800 MHz	Stopped	SD-IF2 clock
SD2ϕ	SD-IF2 divider	Variable	200 MHz	50 MHz	SD-IF2 clock
SD3Hϕ	SD-IF3 divider	Variable	800 MHz	Stopped	SD-IF3 clock
SD3ϕ	SD-IF3 divider	Variable	200 MHz	50 MHz	SD-IF3 clock
RPCϕ	RPC divider	Variable	320 MHz	*2	RPC-IF clock
RPCD2ϕ	RPC divider	Variable	160 MHz	*2	RPC-IF clock
MSOϕ	MSO divider	Variable	133.33 MHz	12.5 MHz	MSIOF clock
CANFDϕ	CANFD divider	Variable	80 MHz	12.5 MHz	CANFD clock
HDMIϕ	HDMI-IF divider	Variable	25 MHz	Stopped	HDMI-IF clock
CSI0ϕ	CSI0 divider	Variable	25 MHz	Stopped	CSI2 clock
CPϕ	EXTAL	Fixed	16.66 MHz	*3	Common peripheral clock, EXTAL × 1/2
CPEXϕ	EXTAL	Fixed	16.66 MHz	*3	EXTAL × 1/2
RCLK	Common divider / EXTALR	Fixed	32.89 kHz	*6	
OSCCLK	Common divider	Fixed	131.57 kHz	*7	

Notes: 1. The frequency of LBϕ depends on the value of MD18.
2. The frequency of RPCϕ depends on the value of MD4, MD3, MD2 and MD1.
When MD4 = H or L, MD3 = L, MD2 = H, MD1 = L, RPCϕ = 320 MHz, RPCD2ϕ = 160MHz.
When MD4 = H or L, MD3 = L, MD2 = H, MD1 = H, RPCϕ = 160 MHz, RPCD2ϕ = 80MHz.
In the other cases of MD4, MD3, MD2 and MD1 setting, RPCϕ = 80 MHz, RPCD2ϕ = 40MHz.
3. The frequency of CPϕ is equal to EXTAL × 1/2. For example, when the frequency of EXTAL is equal to 20 MHz, the frequency of CPCLK is equal to 10 MHz.
4. The initial frequency of ZB3ϕ and ZB3D2ϕ depends on the setting of MD19 and MD17. The values shown in the above table corresponds to the case of MD19 = L and MD17 = L.
5. These clocks are oscillated in the debug mode. Otherwise, they are stopped.
6. The initial value depends on MD14, MD13 and MD28.
When MD28 = H, RCLK = EXTALR.
When MD28 = L, MD14 = L and MD13 = H, RCLK = 32.89 (kHz)In the other setting, RCLK = 32.55 (kHz)
7. The initial value depends on MD14, MD13.
When MD14 = L and MD13 = H, OSCCLK = 131.57 (kHz).
In the other setting, OSCCLK = 130.20 (kHz)
8. Divider setting for listed clock in Table 11.4 must not be over than maximum clock frequency of each clocks.

MD14	MD13	EXTAL (MHz)	EXTAL divider		Internal RCLK		OSCCLK	
			Fixed division ratio	Frequency (MHz)	Fixed division ratio	Frequency (kHz)	Fixed division ratio	Frequency (kHz)
0	0	16.66	× 1/16	1.04	× 1/32	32.55	× 1/8	130.20
0	1	20.00	× 1/19	1.05	× 1/32	32.89	× 1/8	131.57
1	0	25.00	× 1/24	1.04	× 1/32	32.55	× 1/8	130.20
1	1	33.33	× 1/32	1.04	× 1/32	32.55	× 1/8	130.20

Table 11.5 List of Clocks [RZ/G2E]

Name	Clock Source	Frequency			nonSSCG/ SSCG	Clock Domain, Function
		Dividing ratio	Frequency	Initial		
Z2ϕ	SYS-CPU divider 2	Variable	1200 MHz	1200 MHz	nonSSCG	System CPU (Cortex-A53) clock
ZGϕ	3DGE divider	Variable	600 MHz	600 MHz	nonSSCG/ SSCG	3DGE clock
ZTRϕ	Common divider	Variable	266.66 MHz	266.66 MHz *1	SSCG	Trace interface clock
ZTϕ	Common divider	Variable	400 MHz	400 MHz *1	SSCG	Internal trace clock
ZXϕ	Common divider	Fixed	533.33 MHz	533.33 MHz	SSCG	Cache coherent interconnect clock
S0ϕ	Common divider	Fixed	800 MHz	800 MHz	SSCG	
S1ϕ	Common divider	Fixed	533.33 MHz	533.33 MHz	SSCG	Clock source of S1D1ϕ, S1D2ϕ, S1D4ϕ
S2ϕ	Common divider	Fixed	400 MHz	400 MHz	SSCG	Clock source of S2D1ϕ, S2D2ϕ, S2D4ϕ
S3ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	SSCG	Clock source of S3D1ϕ, S3D2ϕ, S3D4ϕ
S0D1ϕ	Common divider	Fixed	800 MHz	800 MHz	SSCG	
S0D3ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	SSCG	
S0D6ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	SSCG	
S0D12ϕ	Common divider	Fixed	66.66 MHz	66.66 MHz	SSCG	
S0D24ϕ	Common divider	Fixed	33.33 MHz	33.33 MHz	SSCG	
S1D1ϕ	Common divider	Fixed	533.33 MHz	533.33 MHz	SSCG	
S1D2ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	SSCG	
S1D4ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	SSCG	
S2D1ϕ	Common divider	Fixed	400.00 MHz	400.00 MHz	SSCG	
S2D2ϕ	Common divider	Fixed	200.00 MHz	200.00 MHz	SSCG	
S2D4ϕ	Common divider	Fixed	100.00 MHz	100.00 MHz	SSCG	
S3D1ϕ	Common divider	Fixed	266.66 MHz	266.66 MHz	SSCG	AXI-bus
S3D2ϕ	Common divider	Fixed	133.33 MHz	133.33 MHz	SSCG	
S3D4ϕ	Common divider	Fixed	66.66 MHz	66.66 MHz	SSCG	
S0D6Cϕ	Common divider/ PECK divider	Variable	133.33MHz/ 120MHz	120MHz*2	nonSSCG	
S3D1Cϕ	Common divider/ PECK divider	Variable	266.66MHz/ 240MHz	240MHz*2	nonSSCG	
S3D2Cϕ	Common divider/ PECK divider	Variable	133.33MHz/ 120MHz	120MHz*2	nonSSCG	
S3D4Cϕ	Common divider/ PECK divider	Variable	66.66MHz/ 60MHz	60MHz*2	nonSSCG	
LBϕ	Common divider	Fixed	66.66 MHz	66.66 MHz*1	SSCG	LBSC, CLKOUT
CLϕ	Common divider	Fixed	33.33 MHz	33.33 MHz	SSCG	CPG
ZB3ϕ	DDR divider	Variable	464MHz/ 400MHz	400 MHz *3	nonSSCG	DBSC clock
ZB3D2ϕ	DDR divider	Variable	232MHz/ 200MHz	200 MHz *3	nonSSCG	DBSC clock

Name	Clock Source	Frequency			nonSSCG/ SSCG	Clock Domain, Function
		Dividing ratio	Frequency	Initial		
CRϕ	SCEG divider	Fixed	400 MHz	400 MHz	SSCG	SCEG clock
CRD2ϕ	SCEG divider	Fixed	200 MHz	200 MHz	SSCG	SCEG clock
SDSRCϕ	SDSRC divider	Fixed	800 MHz	800 MHz	SSCG	Source clock of SDnHϕ and SDnϕ (n = 0, 1, 3)
SD0Hϕ	SD-IF0 divider	Variable	800 MHz	Stopped	SSCG	SD-IF0
SD0ϕ	SD-IF0 divider	Variable	200 MHz	50 MHz	SSCG	SD-IF0
SD1Hϕ	SD-IF1 divider	Variable	800 MHz	Stopped	SSCG	SD-IF1
SD1ϕ	SD-IF1 divider	Variable	200 MHz	50 MHz	SSCG	SD-IF1
SD3Hϕ	SD-IF3 divider	Variable	800 MHz	Stopped	SSCG	SD-IF3
SD3ϕ	SD-IF3 divider	Variable	200 MHz	50 MHz	SSCG	SD-IF3
RPCϕ	RPC divider	Variable	300 MHz/ 160MHz	*4	nonSSCG/ SSCG	RPC-IF clock
RPCD2ϕ	RPC divider	Variable	150 MHz/ 80 MHz	*4	nonSSCG/ SSCG	RPC-IF clock
ZA2ϕ	ZA2CK divider	Fixed	200MHz	200MHz	nonSSCG	ADG clock
ZA8ϕ	ZA8CK divider	Fixed	600MHz	600MHz	nonSSCG	ADG clock
Z2Dϕ	Z2DCK divider	Variable	400MHz-266.66MHz	400MHz	nonSSCG/ SSCG	
CANFDϕ	CANCK divider	Variable	80MHz	12.5MHz	nonSSCG	CANFD clock
MSOϕ	MSIOF divider	Variable	133.33MHz	12.5MHz	SSCG	MSIOF clock
CSI0ϕ	CSI0 divider	Variable	25 MHz	Stopped	SSCG	CSI2 clock
RCLKϕ	RCK divider / OCO	Variable	32.8kHz/ 31.25kHz	31.25kHz	—	
OSCϕ	OSC divider	Fixed	125kHz	125kHz	—	
LV0ϕ	LV0CK divider	Variable	160MHz-0.2MHz	0.39MHz	nonSSCG/ SSCG	LVDS clock
LV1ϕ	LV1CK divider	Variable	160MHz-0.2MHz	0.39MHz	nonSSCG/ SSCG	LVDS clock
CPϕ	EXTAL	Fixed	24MHz	24MHz	—	
CPEXϕ	EXTAL	Fixed	12MHz	12MHz	—	EXTAL × 1/4

Notes: 1. These clocks are oscillated in the debug mode. Otherwise, they are stopped.
2. When MD12 = L, source clock of S3DnCϕ is S3ϕ, and source clock of S1D4Cϕ is S1ϕ. When MD12 = H, source clock of S3DnCϕ, S1D4Cϕ is PEϕ.
3. The initial frequency of ZB3ϕ and ZB3D2ϕ depends on the setting of MD19. The values shown in the above table corresponds to the case of MD19 = L.
4. The frequency of RPCϕ depends on the value of MD4, MD3 MD2 and MD1.
When MD4 = L, MD3 = L, MD2 = L, MD1 = H, RPCϕ = 80 MHz, RPCD2ϕ = 40MHz.
When MD4 = H or L, MD3 = L, MD2 = H, MD1 = L, RPCϕ = 300 MHz, RPCD2ϕ = 150MHz.
When MD4 = H or L, MD3 = L, MD2 = H, MD1 = H, RPCϕ = 160 MHz, RPCD2ϕ = 80MHz.
When MD4 = L, MD3 = H, MD2 = L, MD1 = L, RPCϕ = 80 MHz, RPCD2ϕ = 40MHz.
In the other cases of MD4, MD3 MD2 and MD1 setting RPCϕ = 75 MHz, RPCD2ϕ = 37.5MHz.
5. Divider setting for listed clock in Table 11.5 must not be over than maximum clock frequency of each clocks.

11.1.5 Clock Operating Modes

Table 11.6 MD9 Settings

MD9	EXTAL/XTAL Pin Settings
0	Inputs an external clock to the EXTAL pin.
1	Connects the crystal resonator to the EXTAL and XTAL pins.

Table 11.7 PLL Initial Multiplication Ratio [RZ/G2H]

MD14	MD13	MD19	MD17	EXTAL Input Frequency (MHz)	Divider Setting of EXTAL Input	PLLn reference clock (n = 0 to 4) (MHz)	PLL Multiplication Ratio				
							PLL0*1	PLL1*2	PLL2*3	PLL3*4	PLL4*5
0	0	0	0	16.66	× 1	16.66	× 180	× 192	× 144	× 192	× 144
0	0	0	1	16.66	× 1	16.66	× 180	× 192	× 144	× 128	× 144

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

Note: *Initial value is different for each product. For detail, refer to Register Description.

Table 11.15 Register States in Each Operating Mode

Register	Power-On Reset
All Registers	Initialized

11.2 Register Description

Legend for Register Description

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only.

W: Write-only. The read value is undefined.

11.2.1 CPG Write Protect Control Register (CPGWPCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

CPGWPR is a 32-bit readable/writable register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Code value (H'A5A5)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WPE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

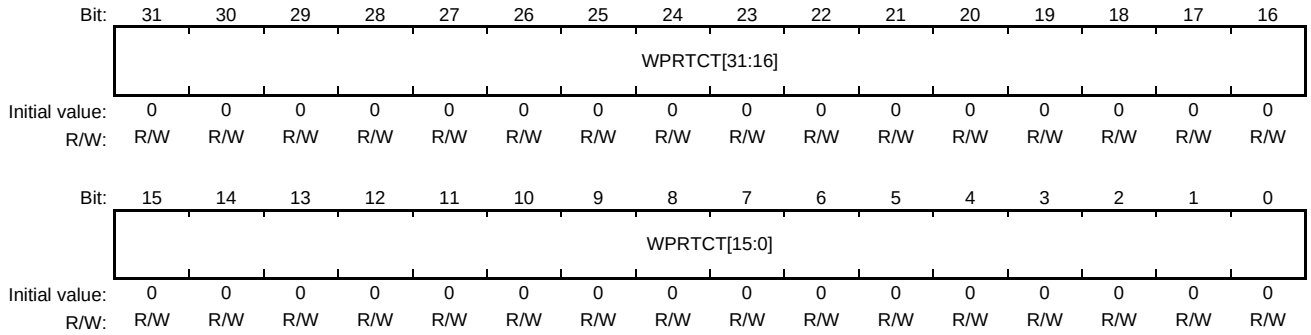
Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Code value (H'A5A5) When read, returns 0.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	WPE	B'1	R/W	Write protect enable 0: Disable the write protect 1: Enable the write protect

Refer to section 11.4.1 Write protection function for CPG registers.

11.2.2 CPG Write Protect Register (CPGWPR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

CPGWPR is a 32-bit readable/writable register. CPGWPR enables/disables writing to all registers in CPG except for CPGWPCR.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	WPRTCT [31:0]	All 0	R/W	Writing a value to CPG registers is enabled by writing the inverse of the value to this register.

11.2.3 Frequency Control Register B (FRQCRB)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

FRQCRB is a 32-bit readable/writable register. This register specifies the frequency division ratios of GPU Clock(ZGϕ). Debug Trace port clock (ZTRϕ), Debug Trace bus clock (ZTϕ), and Debug clock (ZTRD2ϕ).

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

19 to 16	ZTFC[3:0]	B'0010	R/W	Debug Trace bus Clock (ZTϕ) Frequency Division Ratio B'0010: × 1/4 B'0011: × 1/6 B'0100: × 1/8 B'0101: × 1/12 B'0110: × 1/16 B'0111: × 1/18 B'1000: × 1/24 Other values: Setting prohibited Note: ZTϕ is supplied only in debugging mode.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] Reserved These bits are always read as 0. The write value should always be 0.
	—	B’0001	R	[RZ/G2E] Reserved These bits are always read as 0001. The write value should always be 0001.
11	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
9	—	B’1	R	Reserved This bit is always read as 1. The write value should always be 1.
8	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
7	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	—	B’1	R	Reserved This bit is always read as 1. The write value should always be 1.
4	—	B’1	R	Reserved This bit is always read as 1. The write value should always be 1.
3 to 0	ZTRD2FC[3:0]	B’0101	R/W	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] Debug Clock (ZTRD2ϕ) Frequency Division Ratio B’0101: × 1/12 B’0110: × 1/16 B’0111: × 1/18 B’1000: × 1/24 Other values: Setting prohibited Note: ZTRD2ϕ is supplied only in debugging mode.
	—	B’0101	R	[RZ/G2E] Reserved These bits are always read as B’0101. The write value should always be B’0101.

11.2.4 Frequency Control Register C (FRQCRC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

When the values of ZTRϕ, ZTϕ or ZTRD2ϕ are not changed, FRQCRB.KICK bit needs setting to 1 again after FRQCRB.ZTRFC, FRQCRB.ZTFC, or FRQCRB.ZTRD2FC are stored.

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]

FRQCRC is a 32-bit readable/writable register. This register specifies the frequency division ratios of the System CPU (Cortex-A57) clock (Zϕ), System CPU (Cortex-A53) clock (Z2ϕ).

[RZ/G2N]

FRQCRC is a 32-bit readable/writable register. This register specifies the frequency division ratios of the System CPU (Cortex-A57) clock (Zϕ).

[RZ/G2E]

FRQCRC is a 32-bit readable/writable register. This register specifies the frequency division ratios of the System CPU (Cortex-A53) clock (Z2ϕ).

R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	REF DIV	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	—*2	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	STC[6:0]	*1	R/W	PLL Circuit 4 Multiplication Ratio*3 PLL circuit 4 performs multiplication with a ratio of (setting + 1) × 2 The frequency has the following relationship. (PLL4VCO) = (PLL2 reference clock) × (setting+1) × 2 (3DGE divider input) = PLL4VCO × 1/2 (fixed divider) ZGϕ = (3DGE divider input) × 1/2 (fixed divider) B’010_1111: × (48 × 2) = ×96 (Ex: 25 MHz × 96 = 2400 MHz) … B’011_1011: × (60 × 2) = ×120 (Ex: 20 MHz × 120 = 2400 MHz) … B’100_0111: × (72 × 2) = ×144 (Ex: 16.66 MHz × 144 = 2400 MHz) For example, ZGϕ = 600 MHz with EXTAL=16.66 MHz, STC[6:0] = B’100_0111. PLL4VCO = 16.66 MHz × (72 × 2) = 2400 MHz. (3DGE divider input) = 2400 MHz × 1/2 = 1200 MHz. ZGϕ = 1200 MHz × 1/2 = 600 MHz. Set PLL4VCO at 2400 MHz.
23 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	REFDIV	*2	R/W	PLL4 reference clock division ratio 0: x 1/1 1: x 1/2 Don't change from initial value.
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Notes: 1. Initial value of STC[6:0] is determined by MD14 and MD13 as shown in the Table 11.7 to 11.10 .
2. When MD14 = 1 and MD13 = 1, the initial value is 1. When the other mode setting, the initial value is 0.
3. Actual multiplication ratio of PLL4 VCO to the reference clock of PLL4 is (setting + 1) × 2. The factor "2" is derived from the fixed divider in the PLL feedback loop. The input clock to the 3DGE divider is generated by dividing PLL4 VCO by 2. That is why the input clock frequency to the 3DGE divider is expressed as (STC[6:0] + 1) × (reference clock of PLL4).

11.2.10 SD-IFn Clock Frequency Control Register (SDnCKCR, n = 0 to 3 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N], n = 0, 1, 3 [RZ/G2E])

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

SDnCKCR is a 32-bit readable/writable register. This register controls SDnH clock (SDnHϕ) and SDHIn clock (SDnϕ) frequency. This register should be set before SD-IFn module is operated. Do not access SD-IFn module during changing the clock frequency of SDnHϕ and SDnϕ or stopping these clocks.

Note: * H'2F when MD13 = 0, H'12 when MD13 = 1

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	CKSEL	B'0	R/W	Select clock source of RCLK 0: internal RCLK 1: OCO
14 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	LOCK	B'0	R/W	CKSEL lock enable. This bit can update only once. 0: Can write to CKSEL, CKSTP and DIV[5:0] and can write 1 to LOCK bit. 1: Can not write to this register and can not write 0 to LOCK bit.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CKSTP	B'0	R/W	Clock Stop of RCLK. 0: Supplies RCLK 1: Stops RCLK
7 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	DIV[5:0]	—*	R/W	Division Ratio These bits set the frequency division ratio of RCLK. Source clock is divided by the division ratio of 1 / (setting + 1) B'10_1111: 1 / 48 Others: setting prohibied

Note: * When MD13 = 0, initial value is H'2F. When MD13 = 1, initial value is H'12.
When MD13 = 1, write H'2F immediately to DIV[5:0] after boot. The following is procedure of writing to DIV[5:0].

(1) Procedure of writing to DIV[5:0]

1. Stop RCLK by setting CKSTP to 1.
2. Wait 3 cycles by RCLK source.
3. Write H'2F to DIV[5:0] and 0 to CKSTP.

11.2.17 LV0 Clock Control Register (LV0CKCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
—	—	—	√

LV0CKCR is a 32-bit readable/writable register. Prohibit clock frequency setting over 160MHz.

	—	—	—	—	—	—	—	—	—	—	—	—	ZB3FC[3:0]			
Initial value:																
	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	—	*1	R/W	Reserved Read value is depended on MD19*1. The write value should always be the same as read value.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	ZB3FC[3:0]	*1	R/W	DBSC clock (ZB3ϕ) Frequency Division Ratio B'0000: ×1/2 B'0010: ×1/4 B'0011: ×1/6 Other values: Setting prohibited

Note: 1 When MD19 = 0, initial value is B'0000. When MD19 = 1, initial value is B'0010.

11.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

11.3.1 Changing Frequency

The clock frequencies controlled by the frequency control registers can be changed either by changing the multiplication ratio of PLL circuits n (n = 0, 2, 3, 4) * or by changing the division ratio of the dividers. They are controlled by software through the frequency control registers. The methods are described below.
(*RZ/G2N does not support PLL circuit 2. RZ/G2E do not support PLL circuit 2 and 4.)

(1) Changing Multiplication Ratio of PLL circuit 0, 2, 3, 4 *

Changing the multiplication ratio of PLL circuit n (n = 0, 2, 3, 4) * can be done by modifying the STC [6:0] bits in PLLnCR (n = 0, 2, 3, 4)*. The PLL oscillation settling time is internally detected automatically. If the oscillation of PLL circuits is settled, 1 can be read through PLLnST bit of PLLECR.
(* RZ/G2N do not support PLL circuit 2. RZ/G2E do not support PLL circuit 2 and 4.)

(2) Changing Division Ratio

Changing the frequency of Zϕ*, Z2ϕ*, ZGϕ*, ZTϕ, ZTRϕ, and ZTRD2ϕ* can be done by modifying each set of bits for setting the division ratio in FRQCRB and FRQCRC. After setting new ratio, write 1 to the KICK bit in FRQCRB to start the division ratio change. Before changing the division ratio, the KICK bit must be checked for 0. After 1 is written to the KICK bit in FRQCRB, 0 can be read when the change of new division ratio is completed. While the setting is being changed with the KICK bit being 1, do not modify FRQCRB and FRQCRC. When the KICK bit is read as 1, do not write 0 into the KICK bit.
(*RZ/G2N does not support Z2ϕ. RZ/G2E does not support Zϕ and ZTRD2ϕ.)

11.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

11.4.1 Write protect function for CPG registers

(1) Protected registers

All registers in CPG (registers described in the section 11 CPG, 12 CPG_MSTPRST, and 13 CPG_APMU) except for CPGWPR can be protected from unexpected write operation when CPGWPCR.WPE = 1. When CPGWPCR.WPE = 1, CPG registers can't be written without using CPGWPR before the write access to the target register.

(2) How to write to CPG registers when CPGWPCR.WPE = 1

When CPGWPCR.WPE = 1, writing to CPRWPR is required before writing to the target register. The sample procedure is shown below (the case in which you want to write H'AAAA_5555 to the target register).

1. Write H'5555_AAAA (= inverted value of H'AAAA_5555) to CPGWPR
2. Write H'AAAA_5555 to the target register
   Then, the target register is written by H'AAAA_5555.
   When you skip the first step above, you can't write H'AAAA_5555 to the target register.

(3) How to clear CPGWPCR.WPE

When CPGWPCR.WPE = 1, the bit can be cleared by the following procedure.

0. CPGWPCR.WPE is 1
1. Write H'5A5A_FFFF to CPGWPR
2. Write H'A5A5_0000 to CPGWPCR
3. CPGWPCR.WPE becomes 0

When CPGWPCR.WPE = 0, the write protect function is disabled. Registers can be written directly without using CPGWPR.

11.4.2 Notes on Board Designing

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

(1) Bypass Capacitors

Insert laminated ceramic capacitors as bypass capacitors for each V_{SS}/V_{CC} pair. Mount the bypass capacitor near the power supply pins of the LSI. Use components with a frequency characteristic suitable for the operating frequency of the LSI, as well as a suitable capacitance value.

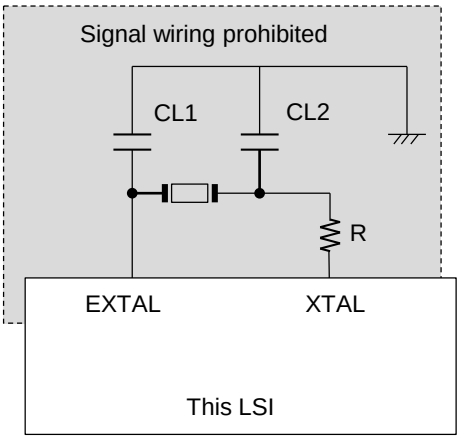
(2) Notes on Using a PLL Oscillation Circuit

Keep the wiring from the PLL V_{DD} and V_{SS} connection pattern to the power supply pins short, and make the pattern width large, to minimize the inductance component.

The analog power supply system of the PLL circuits is sensitive to noise. Therefore system malfunction may occur by the intervention with another power supply. Do not supply the analog power supply with the same resource as the digital power supply of V_{DD} and $V_{CC}Q$.

(3) When Using an External Crystal Resonator

Place the crystal resonator, capacitors CL1 and CL2, and damping resistor R as close to the XTAL, and EXTAL pins as possible. To minimize induction and thus obtain oscillation at the correct frequency, the capacitors to be attached to the resonator must be grounded to the same ground. Do not bring wiring patterns close to these components.



Note:
The values of CL1 ,CL2 and R should be determined
after consultation with crystal resonator manufacturers.
To suppress to overshoot or undershoot, the damping resistor
R should be attached.

Figure 11.5 Note on Using a Crystal Resonator

(4) When Supplying External Clock from EXTAL Pin

Leave the XTAL pin open.

12. Module Standby, Software Reset

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

12.1 Overview

The CPG functions related to module control are explained in this section. Under software control, the CPG is capable of turning the supply of clock signals to individual modules on or off and of resetting individual modules.

12.1.1 Features

- Module standby
  Clock supply to specified modules is stopped by setting the module stop control register bits.
  Four registers (MSTPSR, RMSTPCR, SMSTPCR and SCMSTPCR) for one module, and supply of the clock signal to a module is stopped when all these register bits are set to ‘stop’.
- Software Reset
  Initialize the specified module by setting the software reset register bit.
  Secure Module Stop Control function.
  Secure Software Reset Access Enable Control function.
  Secure Access protection function.

12.1.2 External Pins

There is no input/output pin related with this function.

12.1.3 Register Configuration

Table 12.1 lists of the CPG registers for module standby and software reset. Table 12.2 lists the register states in response to a reset.

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed. Values read from addresses other than those listed above are undefined.

Table 12.2 Register States in Response to a Reset

Register	Power-On Reset/WDT Reset
All Registers	Initialized

12.2 Register Description

Legend for Register Description

Initial value : Register value after a reset

— : Undefined value

R/W : Readable/writable. The written value can be read.

R : Read-only.

W : Write-only. The read value is undefined.

12.2.1 Module Stop Status Register (MSTPSRn (n = 1 to 10))

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

MSTPSRn is a 32-bit readable register that indicates whether the on-chip modules are in the module standby state.

Setting a bit in this register to 1 stops supply of the clock signal to the corresponding module and the setting a bit to 0 enables clock supply to the corresponding module.

Bit assignment and initial values are shown. The tables from 12.3 to 12.12 show the assignment of modules to bits.

12.2.1.1 Module Stop Status Register 1 (MSTPSR1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	1	1	1	0	0	0	0	0	0	0	0	1	0	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: * [RZ/G2H, RZ/G2N, RZ/G2E]
Initial value is 0.
[RZ/G2M V1.3, RZ/G2M V3.0]
The initial value of bit 17 depends on the mode pins MD4, MD3 , MD2 and MD1.
When (MD4, MD3 , MD2, MD1) = 0001/0010/0011/0100/1010/1011, initial value is 0 , other cases, initial value is 1.

0: Supply of the clock signal to the corresponding module is enabled.
1: Supply of the clock signal to the corresponding module is stopped.

1	—	—	—	—
0	—	—	—	—

Notes: "—" indicates the bit is reserved. Set the read value.

1. When the MSTPST1017 bit is set to 1, supply of the clock signal to the circuits assigned to bits MSTPST1031 to MSTPST1018 is stopped simultaneously without writing 1 to these bits. When supply of the clock signal to any of the circuits assigned to bits MSTPST1031 to MSTPST1018 is to be enabled, clear the MSTPST1017 bit.
2. When the MSTPST1005 bit is set to 1, supply of the clock signal to the SSI0 to SSI9 modules is stopped simultaneously without setting bits MSTPST1015 to MSTPST1006 to 1. When supply of the clock signal to any of the SSI0 to SSI9 modules is to be enabled, clear the MSTPST1005 bit.

12.2.2 Module Stop Control Register (RMSTPCRn/SMSTPCRn (n = 1 to 10))

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

RMSTPCRn and SMSTPCRn are 32-bit readable/writable registers which control supply of the clock signal to the modules assigned to the corresponding bits. RMSTPCRn and SMSTPCRn registers are for the AP realtime CPU core and the AP system CPU core.

When all of the control bits in RMSTPCRn,SMSTPCRn and SCMSTPCRn are set to 1 (halt), input of the clock signal to the module is halted (the module is on standby). When a corresponding control bit of RMSTPCRn, SMSTPCRn or SCMSTPCRn is 0, the clock signal is supplied.

Whether the module is stopped or not can be checked through a corresponding bit in MSTPSRn register.

Setting a bit in this register to 1 request that the module be placed on standby and setting a bit to 0 request that the module operate.

The reserved bits should be set to the values read from the bits. Positions, names and initial values of each bit are shown below. The tables from 12.13 to 12.22 show the assignment of modules to bits.

12.2.2.1 Realtime Module Stop Control Register 1 (RMSTPCR1)/System Module Stop Control Register 1 (SMSTPCR1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSTP131	MSTP130	—	MSTP128	—	—	MSTP125	MSTP124	MSTP123	MSTP122	MSTP121	—	MSTP119	MSTP118	—	—
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W*	R/W*	R	R/W*	R/W*	R	R/W	R/W	R/W	R/W	R/W	R	R/W*	R/W*	R	R

0: Enables supply of the clock signal to the corresponding module.

1: Stops supply of the clock signal to the corresponding module.

Notes: 1. [RZ/G2H, RZ/G2N, RZ/G2E]
Initial value is 0.
[RZ/G2M V1.3, RZ/G2M V3.0]
The initial value of bit 17 depends on the mode pins MD4, MD3, MD2 and MD1.
When (MD4, MD3, MD2, MD1) =0001/0010/0011/0100/1010/1011, initial value is 0
, other cases, initial value is 1.

2. Writing to a bit is only possible if the product actually has the corresponding module.

2	—	—	—	—
1	—	—	—	—
0	—	—	—	—

Notes: "—" indicates the bit is reserved. Set the read value.

1. When the MSTP1017 bit is set to 1, supply of the clock signal to the circuits assigned to bits MSTP1031 to MSTP1018 is stopped simultaneously without writing 1 to these bits. When supply of the clock signal to any of the circuits assigned to bits MSTP1031 to MSTP1018 is to be enabled, clear the MSTP1017 bit.
2. When the MSTP1005 bit is set to 1, supply of the clock signal to the SSI0 to SSI9 modules is stopped simultaneously without setting bits MSTP1015 to MSTP1006 to 1. When supply of the clock signal to any of the SSI0 to SSI9 modules is to be enabled, clear the MSTP1005 bit.

12.2.3 Software Reset Register (SRCRn (n = 1 to 10))

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Each SRCRn is a 32-bit readable/writable register. Each bit is assigned to a module in the chip. Writing 1 to the bit resets the corresponding module. Writing 1 to a given the bit of the software reset clearing register (SRSTCLRn (n = 0 to 11)) clears the corresponding bit of SRCRn and releases the reset. SRCRn and SRSTCLRn does not need read-modify-write sequence. Write 1 to only target module bit of SRCRn or SRSTCLRn. It takes maximum 1 cycle by RCLK to complete software reset after setting 1 to target bit of SRCRn. When release software reset, it is necessary to wait more than 1 cycle by RCLK before setting 1 to target bit of SRSTCLRn. If applying a software reset to a module connected to the AXI, wait the completion of any data transfer.

Bit assignment and initial values are shown in the tables from 12.28 to 12.32.

Note: "—" indicates the bit is reserved. Set the read value.

Note: * When the SRT1005 bit is set to 1, the bit of the SRT1015 to SRT1006 is simultaneously set without setting SRT1015 to SRT1006. When any of the SRT1015 to SRT1006 is cleared, SRT1005 bit is cleared.

12.2.4 Software Reset Clearing Register n (SRSTCLRn (n = 0 to 11))

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Each SRSTCLRn is a 32-bit writable register. Each bit is assigned to a module in this chip. Writing 1 to the bit clears the corresponding bit of SRCRn and releases the reset. Write 0 to the reserved bits.

Bit assignment of SRSTCLRn is same with one of SRCRn.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SCEnm (n = 0 to 11) (m = 31 to 00)	All 0	R/W	Access protection to SRCRn and SRSTCLRn (n = 0 to 11) in the viewpoint of the secure mode 0: Not check access to SRCRn bit m and SRSTCLRn bit m (m = 31 to 0) in the viewpoint of secure mode. All write access to these bits are valid. 1: Check access to SRCRn bit m and SRSTCLRn bit m (m = 31 to 0) are accessed in the secure mode or not. Write access to SRCRnm and SRSTCLRnm is valid only in the secure mode. Write access to SRCRnm and SRSTCLRnm is invalid in the non-secure mode.

Assignment of modules to bits m in SCSRSTECRn is same with one of SRCRn and SRSTCLRn.

The validity of write access to SRCRn[m] and SRSTCLRn[m] is judged by the flowchart shown in Figure 12.1.

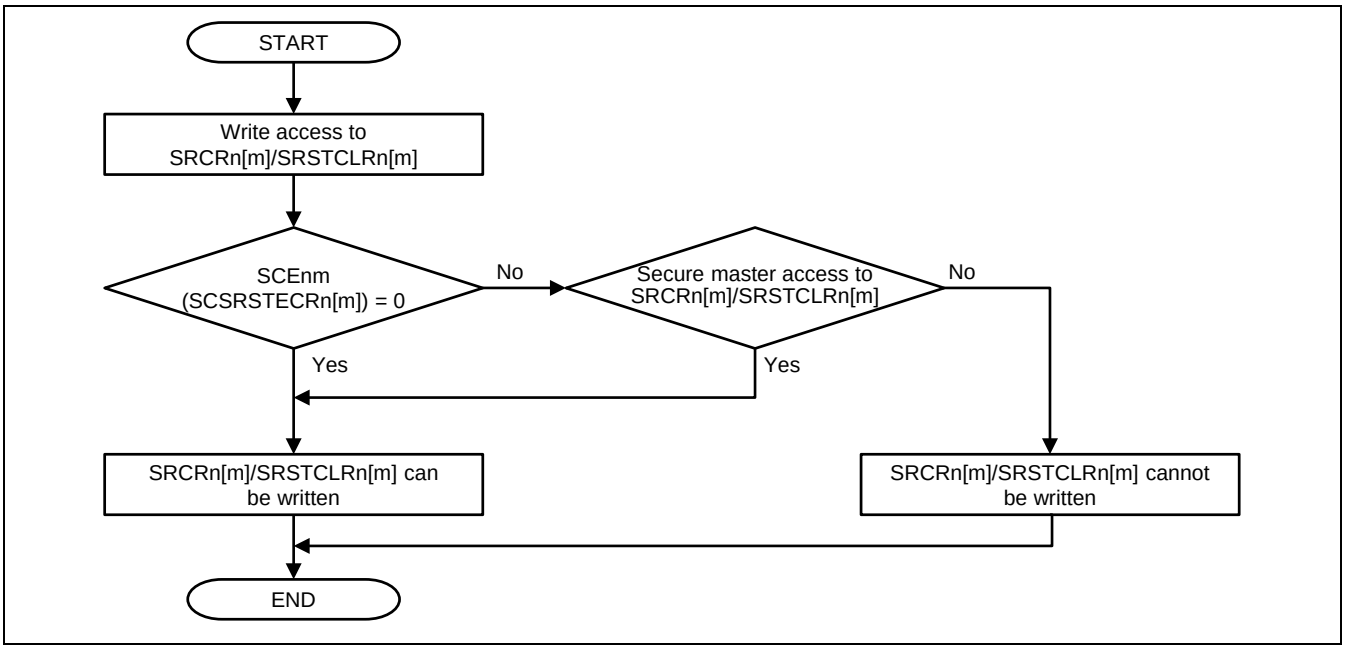

Figure 12.1 The validity check of write access to SRCRn and SRSTCLRn

13. Advanced Power Management Unit for AP-System Core (APMU)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

13.1 Overview

The AP-system core power management unit (APMU) is a module to control power supply and clock supply to the AP-system core.

13.1.1 Features

This module includes the following function

- Controls power supply to each CPU core and L2 cache area.

The APMU includes the following submodule:

- Power supply control unit (PCCU) which controls the power supply to each CPU core and L2 cache area.

13.1.2 External Pins

There are no external pins related with this function.

13.1.3 Register Configuration

Table 13.1 lists the registers of the APMU. All registers listed in this table are cleared by the reset.

Table 13.1 Register Configurations

Notes: The register address map "H'E615_4xxx" is to share the same address between registers for Cortex-A57 and registers for Cortex-A53.

1. When the address "H'E615_4xxx" is accessed by Cortex-A53, registers for Cortex-A53 (CA53XXX) are accessed.
2. When the address "H'E615_4xxx" is accessed by Cortex-A57, registers for Cortex-A57 (CA57XXX) are accessed.

13.1.4 Connected Module

Table 13.2 Connected Modules

Module name	Connected module name	Function of connected module
CPG	AP-System Core	Cortex-A53/Cortex-A57 power status control [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]
		Cortex-A53 power status control [RZ/G2E]
		Cortex-A57 power status control [RZ/G2N]
	SYSC	Cooperate with SYSC for power status control of AP-System Core

13.2 Register Description

13.2.1 Cortex-A53/Cortex-A57 CPU*n* Power Status Control Register (CA53CPU*n*CR, CA57CPU*n*CR (*n* = 0 to 3))

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: Each RZ/G Series 2nd Generation product provides these registers as shown in Table 13.1.

Cortex-A53/Cortex-A57 CPU*n* power status control registers are 32-bit readable/writable registers of PCCU. These registers define the operation of related CPU when the CPU*n* core issues WFI instruction. Write these registers while the power of related CPU is ON.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CPUPWR[1:0]	B'00	R/W	CPUn PWR Bit Defines the power supply of corresponding CPUn when the CPUn issues WFI instruction. B'00: Sleep mode B'11: CoreStandby mode (power shut off of CPU core, L1$) Other than above: Setting prohibited These bits are automatically cleared to B'00 when the PCCU completes CoreStandby instruction after B'11 is written to these bits.

13.2.2 Cortex-A53/Cortex-A57 Common Power Control Register (CA53CPUCMCR, CA57CPUCMCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: Each RZ/G Series 2nd Generation product provides these registers as shown in Table 13.1.

Cortex-A53/Cortex-A57 common power control registers are 32-bit readable/writable registers. These registers define power supply control of CPU peripheral (SCU and L2 cache controller) of AP-system core (Cortex-A53) and CPU peripheral (SCU and L2 cache controller) of AP-system core (Cortex-A57). The CMPWR bits of this register define the operation when all CPU cores are in the CoreStandby state.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CMPWR[1:0]	B'00	R/W	CPU Common Power Control Bit Defines the power supply when all of the CPUs in the cluster are in CoreStandby mode (power shut off). B'00: Normal mode, CPU peripheral (SCU and L2 cache controller) ON B'01: Setting prohibited B'10: L2 shutdown mode, CPU peripheral (SCU and L2 cache controller) OFF B'11: Setting prohibited [RZ/G2M V1.3] (not RZ/G2M V3.0) Don't write anything other than B'00.

13.2.3 Cortex-A53/Cortex-A57 CPU Wake Up Control Register (CA53WUPCR, CA57WUPCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: Each RZ/G Series 2nd Generation product provides these registers as shown in Table 13.1.

Cortex-A53/Cortex-A57 CPU wake up control registers are 32-bit readable/writable registers of PCCU. These registers request power on of each CPU core. Writing 1 to the CPU*n*WUP bit wakes up the corresponding CPU*n*, and the CPU*n* starts operation from the reset vector. Each bit is automatically cleared to 0 after the wake up procedure is finished.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CA57PSTR: When (MD7, MD6) = (L, L), the initial value is B'00. In the other setting, the initial value is B'11. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

13.2.5 Cortex-A53/Cortex-A57 Debug Resource Reset Control Register (CA53DBGRCR, CA57DBGRCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: Each RZ/G Series 2nd Generation product provides these registers as shown in Table 13.1.

Cortex-A53/Cortex-A57 debug resource reset control registers are 32-bit readable/writable registers of PCCU. These registers enable the reset requests derived from power shut off to the AP-system CPU cores in the debug mode. When you write to these registers, modify only the target bits you want to change (read-modify-write). In the debug mode, bit 19 must be set to1 before the AP-system cores first resume from power shut off. In the normal mode (i.e. not debug mode), writing all 1 to bit 19 doesn't disturb normal operation. Therefore, the same code to write these registers can be applied for both debug mode and normal mode. About CA53DBGRCR and CA57DBGRCR, refer to Appendix B.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1, 0	—	Undefined	R	Reserved These bits are always read as unknown values. The write value should always be the same as read values (read-modify-write).

13.3 Operation

RZ/G2H | RZ/G2M V1.3 | RZ/G2M V3.0 | RZ/G2N | RZ/G2E

13.3.1 Power Control

The PCCU manages the CPU power supply when the CPU issues WFI instruction, and recovers from the low power state. Table 13.3 shows power status of CPU.

Table 13.3 CPU Power Mode

Power Mode	CPU#*n* Clock	CPU#*n* Power	CPU Peripheral (SCU and L2 Cache Controller) Power
Run mode	ON	ON	ON
Sleep mode	OFF	ON	ON
CoreStandby mode	OFF	OFF	ON
L2 shutdown mode	OFF	OFF	OFF

The following is method to enter each mode. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]

Sleep mode

Issue WFI instruction when the CPUPWR bits of CA53CPUnCR/CA57CPUnCR are B’00.

CoreStandby mode

Issue WFI instruction when the CPUPWR bits of CA53CPUnCR/CA57CPUnCR are B’11.

The CPUPWR bits of CA53CPUnCR/CA57CPUnCR are automatically cleared to B’00 when the PCCU completes CoreStandby operation. So the interrupt to CPUn is masked while CPUPWR bits of CA53CPUnCR/CA57CPUnCR are B’11. In the case of cancel, set B’00 to the CPUPWR bits of CA53CPUnCR/CA57CPUnCR.

L2 shutdown mode

Issue WFI instruction when all of the conditions below are met:

Other CPU cores in the same CPU cluster are in the CoreStandby mode.

The CMPWR bits of CA53CPUCMCR/CA57CPUCMCR are B’10.

The CPUPWR bits of CA53CPUnCR/CA57CPUnCR are B’11.

Run mode

Interrupt and reset of CPU recovers each CPU to the RUN mode.

The following is method to enter each mode. [RZ/G2E]

Sleep mode

Issue WFI instruction when the CPUPWR bits of CA53CPUnCR are B’00.

CoreStandby mode

Issue WFI instruction when the CPUPWR bits of CA53CPUnCR are B’11.

The CPUPWR bits of CA53CPUnCR are automatically cleared to B’00 when the PCCU completes CoreStandby operation. So the interrupt to CPUn is masked while CPUPWR bits of CA53CPUnCR are B’11. In the case of cancel, set B’00 to the CPUPWR bits of CA53CPUnCR.

L2 shutdown mode

Issue WFI instruction when all of the conditions below are met:

Other CPU cores in the same CPU cluster are in the CoreStandby mode.

The CMPWR bits of CA53CPUCMCR are B’10.

The CPUPWR bits of CA53CPUnCR are B’11.

Run mode

Interrupt and reset of CPU recovers each CPU to the RUN mode.

The following is method to enter each mode. [RZ/G2N]

Sleep mode

Issue WFI instruction when the CPUPWR bits of CA57CPUnCR are B’00.

CoreStandby mode

Issue WFI instruction when the CPUPWR bits of CA57CPUnCR are B’11.

The CPUPWR bits of CA57CPUnCR are automatically cleared to B’00 when the PCCU completes CoreStandby operation. So the interrupt to CPUn is masked while CPUPWR bits of CA57CPUnCR are B’11. In the case of cancel,set B’00 to the CPUPWR bits of CA57CPUnCR.

L2 shutdown mode

Issue WFI instruction when all of the conditions below are met:

Other CPU cores in the same CPU cluster are in the CoreStandby mode.

The CMPWR bits of CA57CPUCMCR are B’10.

The CPUPWR bits of CA57CPUnCR are B’11.

Run mode

Interrupt and reset of CPU recovers each CPU to the RUN mode.

14. System Controller (SYSC)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

14.1 Overview

The SYSC module controls the power supply to CPUs (Cortex-A57, Cortex-A53), 3D-Graphics Engine, Video Processing domain (A3VP), VC domain (Video Codec domain, including A3VC, A2VC0, and A2VC1). When those modules are not in use, shutting off power of the module lowers leakage power than just stopping clock supply.

Refer to 14.3.1 for modules in the various power domains.

14.1.1 Features

- Control power-shutoff and resume sequence of power domains.
- Support shutoff and resumption of power supply, for power domains. Refer to Table14.4 Power Domain.
- During power-shutoff status of each power domain, clock supply for the domain is stopped, reset signal is asserted, and output signals of the domain is fixed by the isolation cells.
- Shutting off sequence of power domain for Cortex-A57 CPUs (CPU0 to CPU3), Cortex-A53 CPUs (CPU0 to CPU3) is initiated by WFI instructions.
- Resuming sequence of the power domain for Cortex-A57 CPUs (CPU0 to CPU3), Cortex-A53 CPUs (CPU0 to CPU3) is controlled by interrupts to each domain, or register access to APMU module (in case of Cortex-A57 and Cortex-A53).
- Shutting off and resuming sequence of other power domains are initiated by register access in this module.

14.1.2 Block Diagram

Figure 14.1 to 14.3 shows block diagrams of the SYSC.

Connected to the internal peripheral bus (the APB bus), the SYSC operates in coordination with the CPG, the RESET module, the CPU, and the debugger; it contains a module that controls the objects of power shutoff.

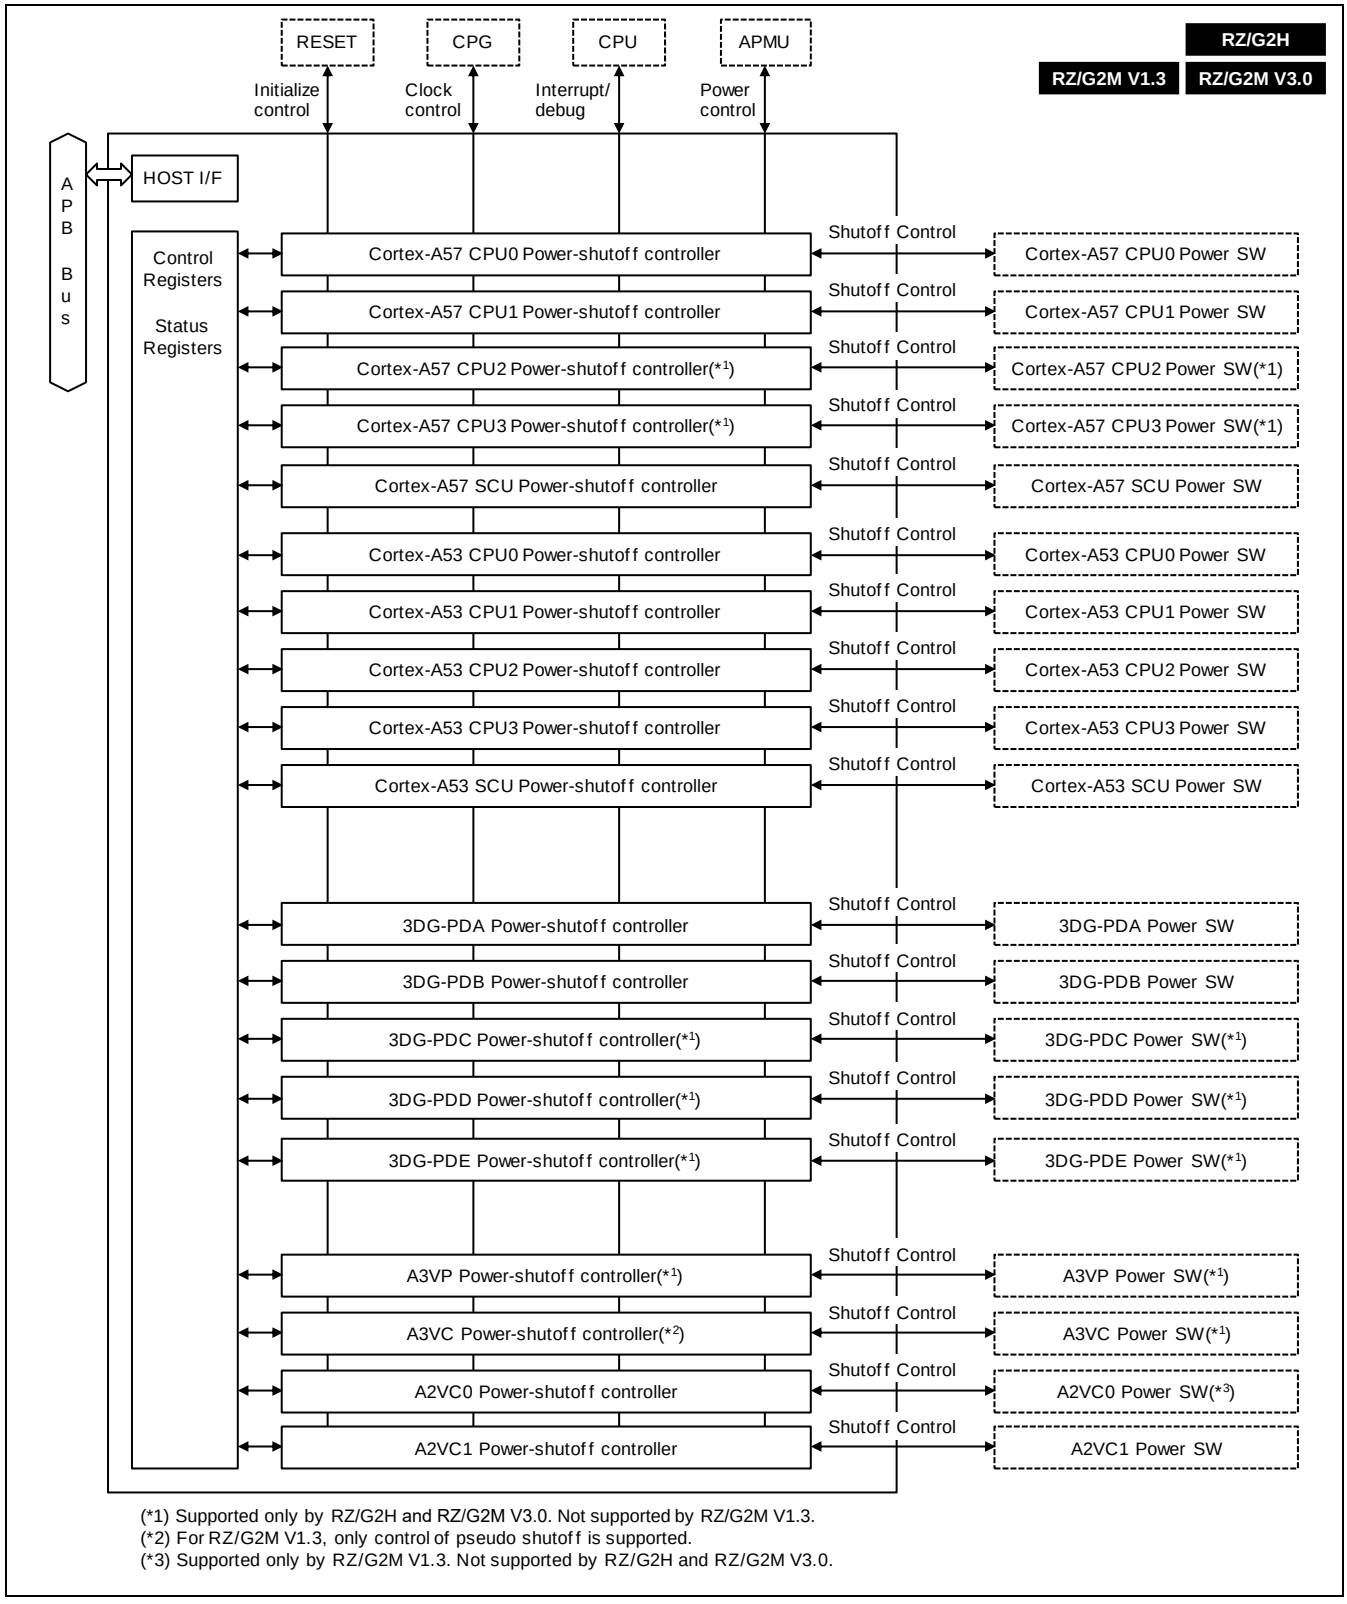

Figure 14.1 Block Diagram [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]

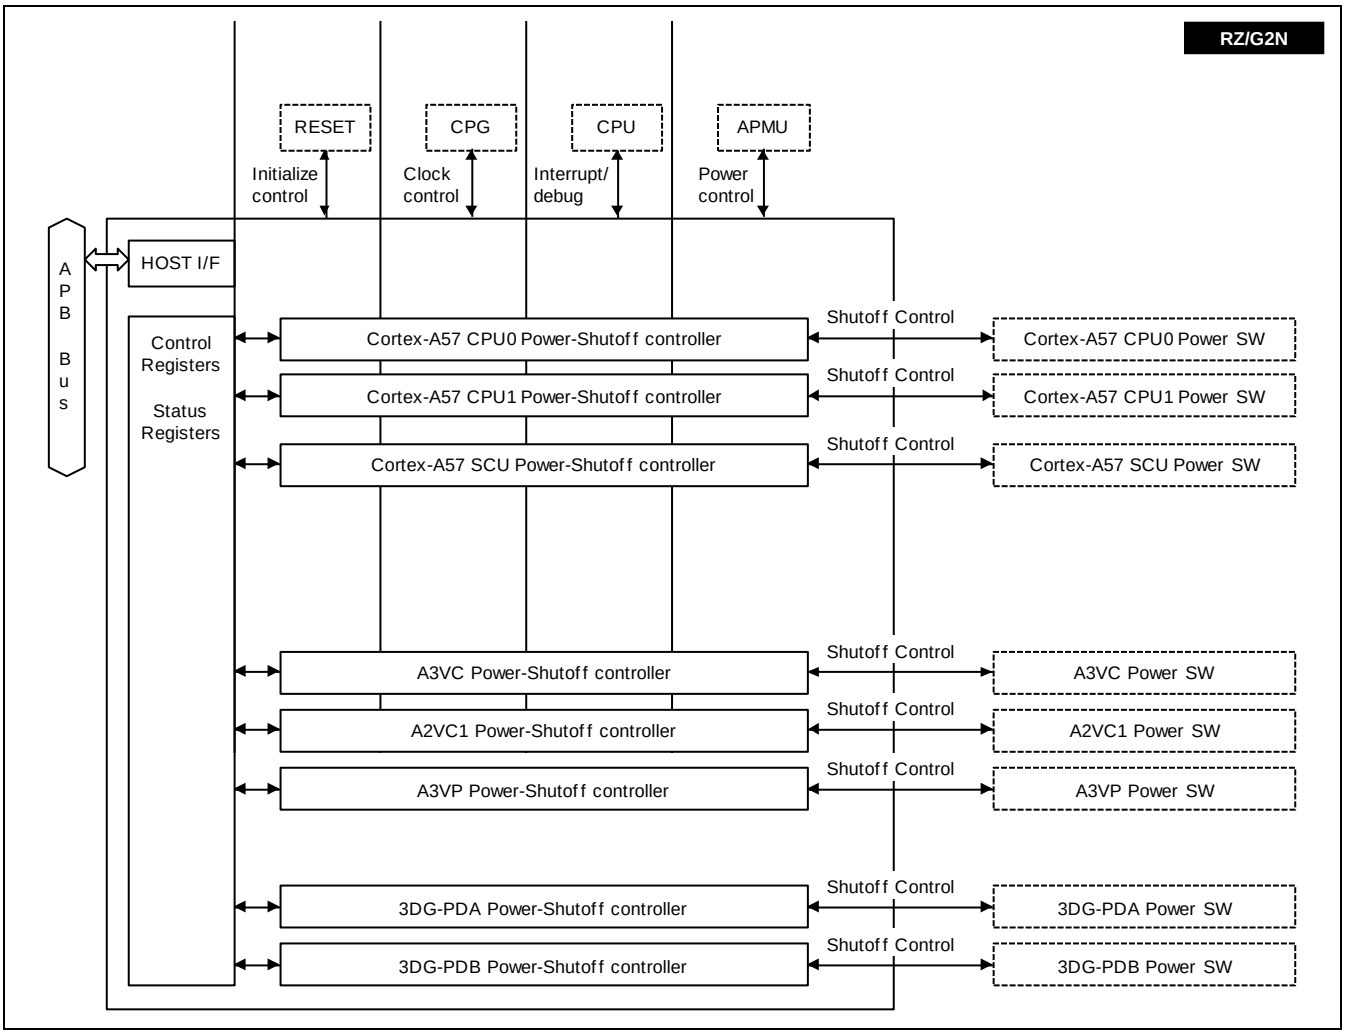

Figure 14.2 Block Diagram [RZ/G2N]

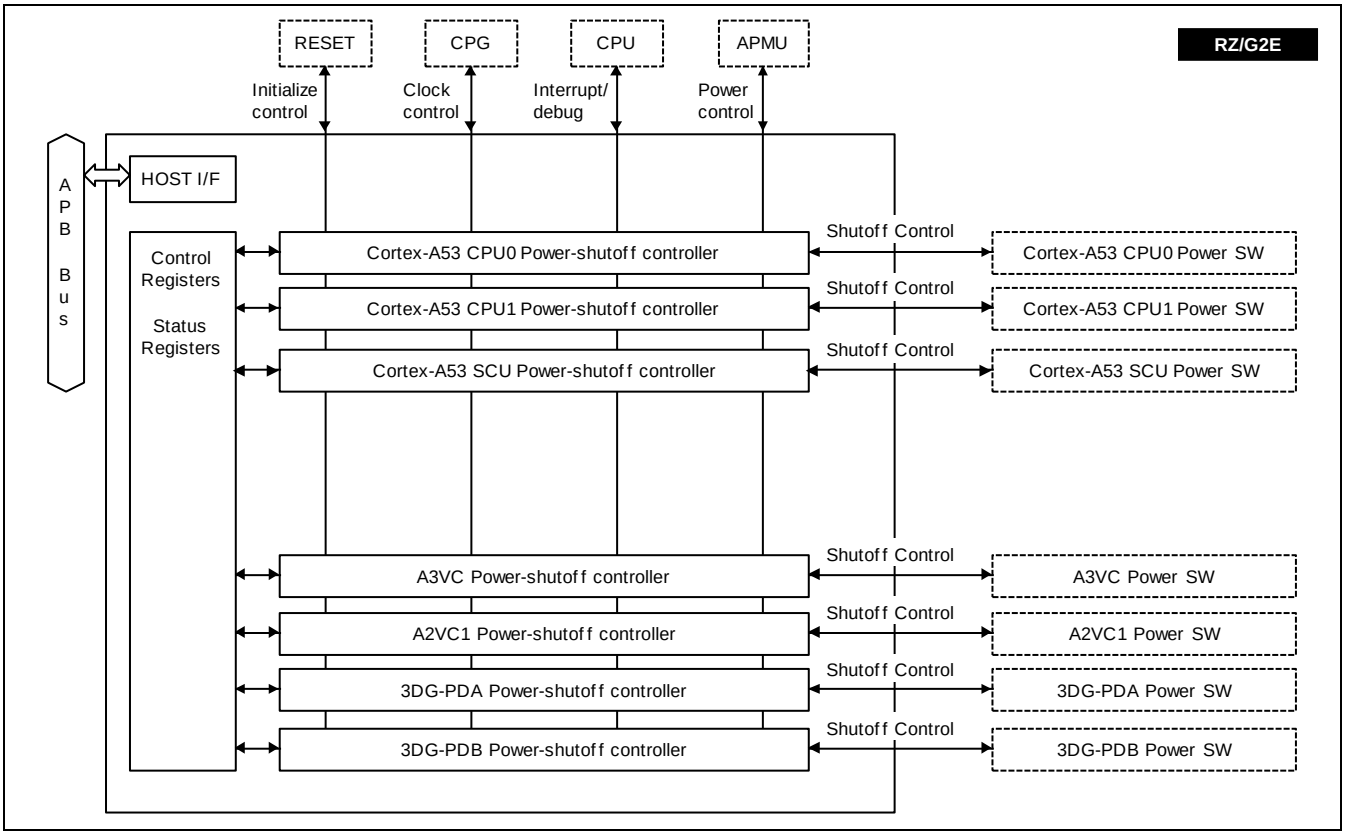

Figure 14.3 Block Diagram [RZ/G2E]

14.1.3 External Pins

The SYSC does not have external pins.

14.1.4 Register Configuration

Table 14.1 to 14.2 list the SYSC registers.

Base-address of SYSC is H'E618_0000.

Do not write to addresses other than those listed below, otherwise normal operation cannot be guaranteed. Values read from other addresses are undefined.

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be the initial value.

—/WB: Write-only. The read value is undefined.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

Note: * Initial value of this register depends on mode pin setting. Refer to 14.3.2. Initial state of power domains for detail.

14.1.5 Connected module

Table 14.3 Connected modules

Module name	Connected module name	Function of connected module
SYSC	Clock Pulse Generator (CPG)	Provide clock to SYSC and PSO (Power Shut Off) target modules. Based on SYSC's request, clocks for PSO target module will be stopped when they are in PSO state.
	Module Standby, Software Reset	Assert reset to SYSC and PSO target module. Based on SYSC's request, reset for PSO target module will be asserted when they are in PSO state.
	Advanced Power Management Unit for AP-System Core (APMU)	Activate power resume sequence for Arm CPUs.
	AP-System Core (Cortex-A57, Cortex-A53), 3D-Graphics Engine, Video Signal Processor (VSP2), Fine Display Processor (FDP1), FCPV, FCPF, FCPCS, FCPCI, IPMMU (VC), Video Codec Processor (VCP4, H.264 version), Video Decoding Processor for inter-device video transfer (iVDP1C), and Video Codec Processor (VCP4, Full Version).	Target of PSO.
	Interrupt Controller (INTC-SYS)	Report interrupt signal.

14.2 Register Description

Explanation of abbreviation of register

Initial value: Value of the register after power-on reset

—: Undefined value

R/W: The bit or field is readable and writable.

R/WC0: The bit or field is readable and writable. Writing 0 to the bit initializes the bit. Writing 1 to the bit is ignored.

R/WC1: The bit or field is readable and writable. Writing 1 to the bit initializes the bit. Writing 0 to the bit is ignored.

R: The bit or field is readable only. When writing to the register, write 0 to it.

—/WB: The bit or field is writable. Note that values read from write-only bits are not guaranteed.

14.2.1 Common Registers and Arm CPU related registers

Common registers are used to for specifying SYSC status, and interrupts generation control. Arm CPU related registers are used for controlling shutting off/resuming of Arm CPUs by interrupts or external events.

Each RZ/G product supports their specific power-domains. Refer to “14.3.1 Power domain structure”, for supported power-domains by each product. In following registers, bits for power-domains are defined as reserved bits, if corresponding power-domain is not supported by the product, if special notice is not written. In this case, those bits are defined as reserved bits, and read value for those bits are unknown, and write value for those bits should be 0.

14.2.1.1 SYSC Status Register (SYSCSR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0.
26 to 25	A2VC1, A2VC0	B'0, B'0	R	Indicates A2VC1/0 power-processing status. This bit is set to 1 when the related bit in the interrupt enable register is 1. If the related bit in the interrupt enable register is 0, this bit is not set to 1 even when the power shutoff or power resume processing is completed. An interrupt request is issued when the related bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of A2VC1/0 is not completed. 1: Power shutoff or power resume processing of A2VC1/0 is completed. [RZ/G2H, RZ/G2M V3.0, RZ/G2N and RZ/G2E] A2VC0: Reserved This bit is always read as 0.
24 to 23	—	All 0	R	Reserved
22, 20 to 19	3DG-E 3DG-D 3DG-C	B'0, B'0, B'0	R	Indicates 3DG-C/D/E power-processing status. [3DG-C/D/E are supported by RZ/G2H.] This bit is set to 1 when the related bit in the interrupt enable register is 1. If the related bit in the interrupt enable register is 0, this bit is not set to 1 even when the power shutoff or power resume processing is completed. An interrupt request is issued when the related bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of 3DG-C/D/E is not completed. 1: Power shutoff or power resume processing of 3DG-C/D/E is completed. 3DG-C/D/E [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N and RZ/G2E] Reserved These bits are always read as 0

Bit	Bit Name	Initial Value	R/W	Description
18 to 17	3DG-B 3DG-A	All 0	R	Indicates 3DG-A/B power-processing status. This bit is set to 1 when the related bit in the interrupt enable register is 1. If the related bit in the interrupt enable register is 0, this bit is not set to 1 even when the power shutoff or power resume processing is completed. An interrupt request is issued when the related bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of 3DG-A/B is not completed. 1: Power shutoff or power resume processing of 3DG-A/B is completed.
21	CA53-SCU	B'0	R	Indicates Cortex-A53 power-processing status. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2E] This bit is set to 1 when the related bit in the interrupt enable register is 1. If the related bit in the interrupt enable register is 0, this bit is not set to 1 even when the power shutoff or power resume processing is completed. An interrupt request is issued when the related bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of Cortex-A53 SCU is not completed. 1: Power shutoff or power resume processing of Cortex-A53 SCU is completed. [RZ/G2N] Reserved This bit is always read as 0. The write value should always be 0.
16 to 15	—	All 0	R	Reserved These bits are always read as 0.
14	A3VC	B'0	R	Indicates A3VC power-processing status. This bit is set to 1 when the related bit in the interrupt enable register is 1. If the related bit in the interrupt enable register is 0, this bit is not set to 1 even when the power shutoff or power resume processing is completed. An interrupt request is issued when the related bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of A3VC is not completed. 1: Power shutoff or power resume processing of A3VC is completed.
13	—	B'0	R	Reserved This bit is always read as 0.
12	CA57-SCU	B'0	R	Indicates Cortex-A57 SCU power-processing status. [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N] This bit is set to 1 when the CA57-SCU bit in the interrupt enable register is 1 upon completion of the Cortex-A57 SCU power shutoff or power resume processing. If the CA57-SCU bit in the interrupt enable register is 0, this bit is not set to 1 even when the Cortex-A57 SCU power shutoff or power resume processing is completed. An interrupt request is issued when the CA57-SCU bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of Cortex-A57 SCU is not completed. 1: Power shutoff or power resume processing of Cortex-A57 SCU is completed.
11 to 10	—	All 0	R	Reserved These bits are always read as 0.

Bit	Bit Name	Initial Value	R/W	Description
9	A3VP	B’0	R	Indicates A3VP power-processing status. [RZ/G2H and RZ/G2N] This bit is set to 1 when the A3VP bit in the interrupt enable register is 1 upon completion of the A3VP power shutoff or power resume processing. If the A3VP bit in the interrupt enable register is 0, this bit is not set to 1 even when the A3VP power shutoff or power resume processing is completed. An interrupt request is issued when the A3VP bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of A3VP is not completed. 1: Power shutoff or power resume processing of A3VP is completed. [RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2E] Reserved This bit is always read as 0.
8 to 5	CA53-CPU[3:0]	H’0	R	Indicates Cortex-A53 CPU3-0 power-processing status. [RZ/G2H, RZ/G2M V1.3 and RZ/G2M V3.0] [RZ/G2E only for Cortex-A53 CPU[0] and Cortex-A53 CPU[1]] This bit is set to 1 when the CA53-CPU [3:0] bit in the interrupt enable register is 1 upon completion of the Cortex-A53 core CPU3-0 power shutoff or power resume processing. If the CA53-CPU[3:0] bit in the interrupt enable register is 0, this bit is not set to 1 even when power shutoff or power resume processing for the Cortex-A53 core CPU3-0 is completed. An interrupt request is issued when the CA53-CPU[3:0] bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of Cortex-A53 CPU3-0 is not completed. 1: Power shutoff or power resume processing of Cortex-A53-CPU3 0 is completed. [RZ/G2N] Reserved These bits are always read as 0. [RZ/G2E] CPU[3:2] reserved These bits are always read as 0.
4	—	B'0	R	Reserved This bit is always read as 0.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	CA57-CPU[3:0]	H'0	R	Indicates Cortex-A57 CPU3-0 power-processing status. [RZ/G2H] [RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N, only for Cortex-A57 CPU[0] and CA57-CPU[1]] This bit is set to 1 when the CA57-CPU[3:0] bit in the interrupt enable register is 1 upon completion of the Cortex-A57 core CPU3-0 power shutoff or power resume processing. If the CA57-CPU[3:0] bit in the interrupt enable register is 0, this bit is not set to 1 even when power shutoff or power resume processing for the Cortex-A57 core CPU3-0 is completed. An interrupt request is issued when the CA57-CPU[3:0] bit in the interrupt mask register is 0 and this bit is 1. 0: Power shutoff or power resume processing of Cortex-A57 CPU3-0 is not complete. 1: Power shutoff or power resume processing of Cortex-A57 CPU3-0 is complete. Note: Bits for CPU3 and CPU2 are valid for RZ/G2H. For other product, those bits are reserved. Read value for those bits are unknown. [RZ/G2E] Reserved These bits are always read as 0. [RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N] CPU[3:2] reserved These bits are always read as 0.

31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	EXTMSK0	B'1(*1)	R/W	[RZ/G2H, RZ/G2N, RZ/G2E and RZ/G2M V3.0] This bit is used for masking external power ON/OFF Cortex-A57, Cortex-A53 or 3DG requests from APMU (Refer to section 13) or 3DG in case of one other power ON/OFF is performing. When this bit is set, the external request cannot be handled until clear this bit. Please refer to 14.3.4 Power Control of non-ARM CPUs for updating routine related to this register. 0: External request is not masked. 1: External request is masked

Note: External request ON/OFF means all power ON/OFF requests which are not register setting of SYSC.

Notes: 1. supported by , RZ/G2H and RZ/G2M V3.0.

Power Control Registers for Arm CPUs

These registers control power status of Cortex-A57 and Cortex-A53 CPUs.

The “n” in the register name in this section means 0 or 6, and those numbers correspond to modules as follows:

Cortex-A57: n = 0 Supported by RZ/G2H. Only CPU1/0 are supported by RZ/G2M V1.3 and RZ/G2M V3.0.

Cortex-A53: n = 6 Supported by , RZ/G2H, RZ/G2M V1.3 and RZ/G2M V3.0. Only CPU1/0 are supported by RZ/G2E.

Each RZ/G product supports their specific power-domains. Refer to “14.3.1 Power domain structure”, for supported power-domains by each product. In following registers, bits for power-domains are defined as reserved bits, if corresponding power-domain is not supported by the product, if special notice is not written. In this case, those bits are defined as reserved bits, and read value for those bits are unknown, and write value for those bits should be 0.

14.2.1.15 Power Status Register n (PWRSRn) (n = 0/6)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CPU[3:0]	H'0	R/W	By setting those bits to perform pseudo power shutoff, power is not turn off in actual, for CPU3-0. 0: Pseudo power shut off is not performed 1: Pseudo power shut off is performed. Note: If there is no corresponding Arm CPU, these bits are reserved. Read value for these bits are unknown, and write value for these bits should be 0. Refer to Appendix A for configuration of the Arm CPUs.

14.2.2 Power Control Registers for SCU of Cortex-A53, SCU of Cortex-A57, Video Processing, and Video Codec

These registers control power shutoff/resume of following modules. The “n” in the register name in this section means 3, 4,5, 8 or, 9 and those numbers correspond to modules as follows:

Cortex-A53 SCU:	n = 3	Supported by RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2E
A3IR:	n = 4	Supported by RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0
Cortex-A57 SCU:	n = 5	Supported by RZ/G2H, RZ/G2N, RZ/G2M V1.3 and RZ/G2M V3.0
A3VP:	n = 8	Supported by RZ/G2H and RZ/G2N
A3VC:	n = 9	Supported by RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N and RZ/G2E

Each RZ/G product supports their specific power-domains. Refer to “14.3.1 Power domain structure”, for supported power-domains by each product. In following registers, bits for power-domains are defined as reserved bits, if corresponding power-domain is not supported by the product and special notice is not written. In this case, those bits are defined as reserved bits, and read value for those bits are unknown, and write value for those bits should be 0.

14.2.2.1 Power Status Register n (PWRSRn) (n = 3/4/5/8/9)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PWRDWN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	—/WB

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PWRDWN(*)	—	—/WB	Specify the start of power-shutoff sequence. Writing 1 to this bit when the POFFENB bit in the SYSC status register is 1 starts the power shutoff sequence for the module. In this case, the ERR bit in the power shutoff/resume error register n is set to 0. Writing 1 to this bit when the POFFENB bit in the SYSC status register is 0 does not start the power shutoff sequence. In this case, the ERR bit in the power shutoff/resume error register n is set to 1. 0: Does not shut off power for the module. 1: Starts the power shutoff sequence for the module. When the power shutoff sequence is started, during the execution of the power shutoff sequence the shutoff processing status is indicated in the DWNSTATE bit in the power shutoff status register n. The PWRUP bit in the power status register n is set to 0. Upon completion of the power shutoff sequence, the PWRDWN bit in the power status register n is set to 1. The pertinent bit in the interrupt status register is set to 1 if it is enabled by the setting of the interrupt status enable register. If 1 is written to this bit when the module is in the power shutoff state, such a request is ignored. In this case, too, if 1 is written when the POFFENB bit is 1, the pertinent bit in the power shutoff/resume error register is set to 0, and if 1 is written when the POFFENB bit is 0, the pertinent bit in the power shutoff/resume error register is set to 1.

14.2.2.3 Power Shutoff Status Register n (PWROFFSRn) (n = 3/4/5/8/9)

0	PSEUDO	B'0	R/W	By setting this bit to perform pseudo power shutoff, power is not turn off in actual, for this domain. 0: Pseudo power shut off is not performed 1: Pseudo power shut off is performed.

14.2.3 Power Control Registers for 3D Graphics Engine

These registers control power shutoff/resume of 3D Graphics Engine. The “n” in the register name in this section means 2, and those numbers correspond to modules as follows:

3D Graphics Engine: n = 2

3D Graphics Engine have 5 power domains inside modules (*), and they are called as 3DG-A, 3DG-B, 3DG-C, 3DG-D, and 3DG-E, respectively. Each of register for 3D Graphic Engine have bits, whose name have “-A”, “-B”, “-C”, “-D”, and “-E”, and each of them corresponds to power-domains above.

3D Graphics Engine module also have power-management function inside it. When power-management inside 3D Graphics Engine is used, do not use power-control function in this module. Power control function for 3D Graphics Engine in this module can be used only when, all power domain of 3D Graphics Engine will be shut off.

Note: * The number of power-domains inside 3D Graphic engine is as follows.
RZ/G2H: 5
RZ/G2M V1.3 and RZ/G2M V3.0: 2
RZ/G2N: 2 (power-domains A and B)
RZ/G2E: 2 (power-domains A and B)
The register bits which are not supported by each product are reserved. Read value for those bits are unknown, and write value for those bits should be 0.

14.2.3.1 Power Status Register n (PWRSRn) (n = 2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

14.2.4 Power Control Registers for Video Codec

These registers control power shutoff/resume of Video Codec. The “n” in the register name in this section means 10, and those numbers correspond to modules as follows:

A2VC0 and A2VC1: n = 10 Supported by RZ/G2M V1.3

A2VC1: n = 10 Supported by RZ/G2H, RZ/G2M V3.0, RZ/G2N and RZ/G2E

14.2.4.1 Power Status Register n (PWRSRn) (n = 10)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	PSEUD1	B’0	R/W	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N] By setting those bits to perform pseudo power shutoff, power is not turn off in actual, for this domain. 0: Pseudo power shut off is not performed 1: Pseudo power shut off is performed.
0	PSEUD0	B’0	R/W	[RZ/G2M V1.3 and RZ/G2M V3.0] By setting those bits to perform pseudo power shutoff, power is not turn off in actual, for this domain. 0: Pseudo power shut off is not performed 1: Pseudo power shut off is performed. [RZ/G2H and RZ/G2N] Reserved These bits are always read as 0. The write value should always be 0.

14.3 Operation

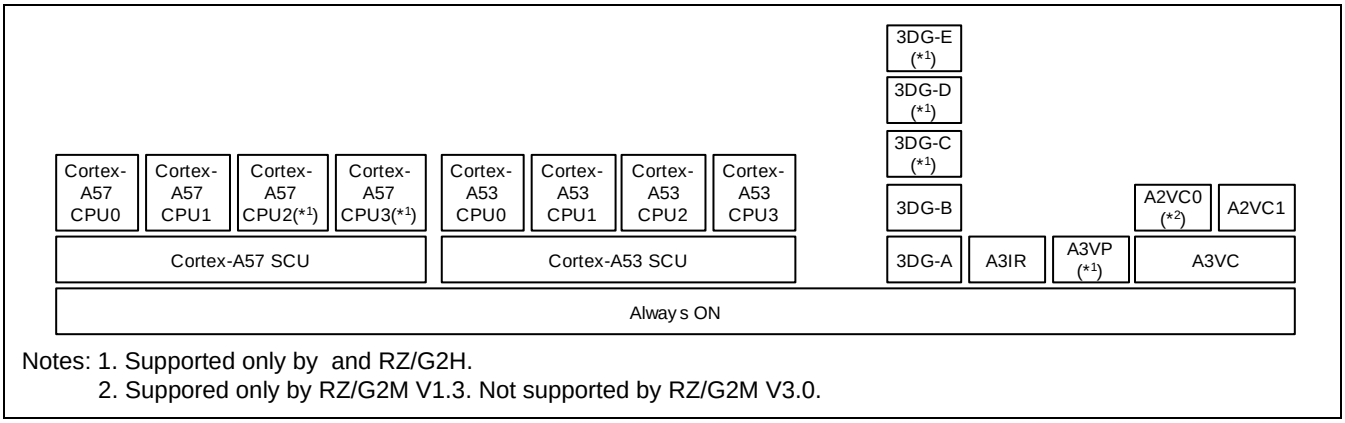
RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

14.3.1 Power domain structure

Figure 14.4 to 14.6 shows power domain structure, and Table 14.4 shows detail of each domain. When one of those power domain is shutoff state, all power domains which are written above the domain in Figure 14.4 to 14.6 must be also shutoff state. For example, when Cortex-A57 SCU is shutoff state, all of Cortex-A57 CPU0 to CPU3 must be shutoff state also.

There are some products which have pseudo power shutoff domain.
(RZ/G2M V1.3 A3VC, RZ/G2E A3VC and A2VC1.)

The modules included in each power domain are listed in Table 14.4.



Notes: 1. Supported only by and RZ/G2H.
2. Suppored only by RZ/G2M V1.3. Not supported by RZ/G2M V3.0.

Figure 14.4 Power domain structure (RZ/G2H/RZ/G2M V1.3, RZ/G2M V3.0)

14.3.3 Power Control of Arm CPUs

The AP system cores (Cortex-A53 and Cortex-A57) can be powered off by executing the WFI instruction. Similarly, power of Arm CPUs can be resumed either by controlling the APMU (Advanced Power Management Unit) registers or by an IRQ or FIQ interrupt.

For detail of power control by APMU registers, see section 13, Advanced Power Management Unit for AP-System Core (APMU).

(1) Power Control by WFI Instruction and Interrupts

The power shutdown by the WFI instruction is performed only when Cortex-A57/ Cortex-A53 CPUn power status control register (CA57CPUnCR, CA53CPUnCR) are in the core standby mode. In case of other setting, power shutdown sequence is not activated by the WFI instruction. See section 13, Advanced Power Management Unit for AP-System Core (APMU).

Power can be resumed by an IRQ or FIQ interrupt on the Arm core. After resuming power of Cortex-A57, Cortex-A53, CPUs by IRQ/FIQ, read the value of SYSCEERSR, SYSCEERSR 2, and SYSCEERSR3 registers. Without reading those registers after power-resuming, the shutdown sequence of related CPUs will not start.

14.3.4 Power Control of non Arm CPU modules

Power control on modules other than the Arm CPUs can be performed by SYSC registers. Following figure describes power control reference flowchart.

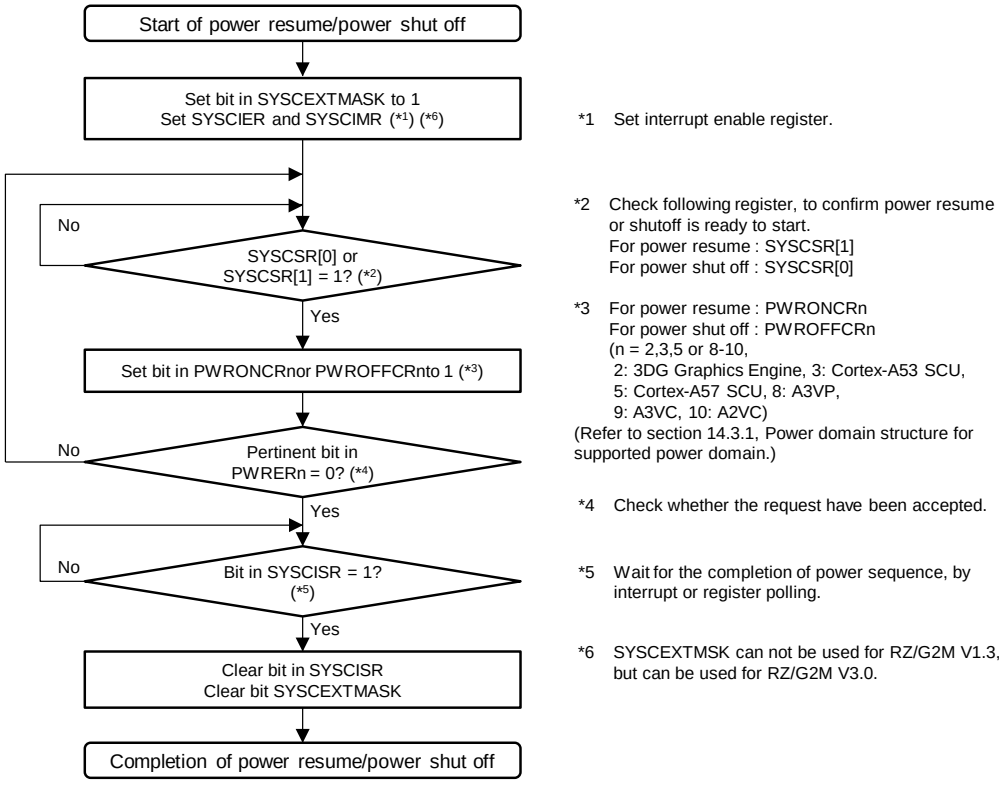

Figure 14.7 Power Resume/Shutoff Flowchart for non Arm CPU domain by SYSC Registers

14.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

1. Only one power domain is allowed to set for power shut off or power resume. Setting for more than 1 power domain at the same time is prohibited. Therefore, setting for power shut off or power resume of 3D Graphics Engine, A2VC0/1, multiple bits cannot be set but single bit must be set in turn, one by one. The order of setting those bits must follow Power domain structure (refer to 14.3.1 Power domain structure)
2. For a module for which power is shut off, register settings and memory contents are not retained. Required information should be saved before power is shut off.
3 It takes several hundreds of microseconds to shutting off and resuming power domain. Because actual time required for shutting off and resuming depends on the status of on-board power line, shutoff/resume time is not guaranteed by electrical specification.
4. Before shutting off one (or more) of the power domain of A3IR,A3VC and, A3VP, set all modules to the Module Standby state for which belong to the power domain. Refer to Figure 14.8.

   Note: Power domains for each product;

   [RZ/G2H] A3IR, A3VC, A3VP

   [RZ/G2M V1.3, RZ/G2M V3.0] A3IR, A3VC,

   [RZ/G2N] A3VC, A3VP

   [RZ/G2E] A3VC

   For the module standby capability of each module, refer to section 12, Module Standby, Software Reset.

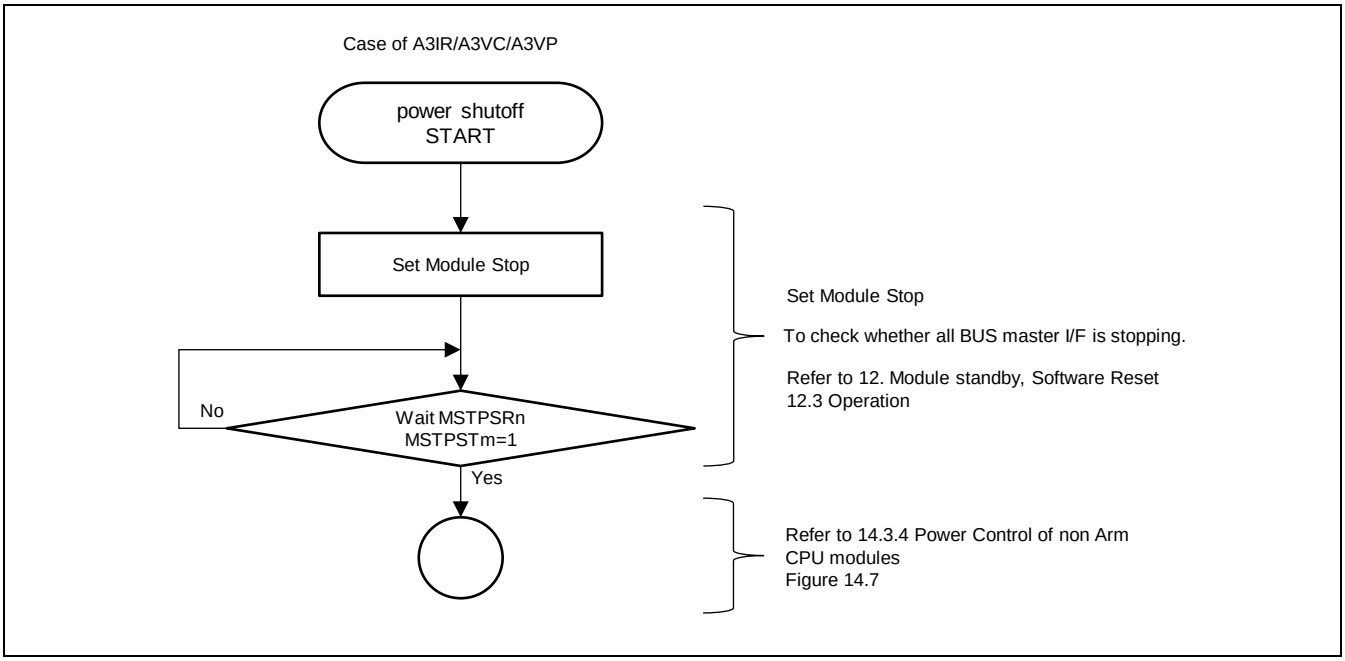

Figure 14.8 Set Module Standby for A3IR/A3VC/A3VP

6. [RZ/G2M V1.3] (not RZ/G2M V3.0) During power domains shut off or power resume sequence by SYSC register, do not use L2 shutdown mode by CMPWR on CA53CPUCMCR or CA57CPUCMCR in APMU.

15. Thermal Sensor/Chip Internal Voltage Monitor (THS/CIVM)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

15.1 Overview

This LSI provides a thermal sensor module that measures the temperature (Tj) inside the LSI. The thermal sensor module also includes a chip internal voltage monitoring module that measures the supply voltage inside the LSI.

15.1.1 Features

(1) Each of the thermal sensors measures temperature Tj with an accuracy of ± 5 °C over the range of temperatures from -40°C to 115°C.
(2) RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N provide three thermal sensor modules (THS1/CIVM1, THS2/CIVM2 and THS3/CIVM3). provide two thermal sensor modules (THS1/CIVM1 and THS2/CIVM2).
(3) This module can generate interrupts when the detected temperature Tj within the LSI rises above or falls below a specified temperature.
(4) Each of the chip internal voltage monitors in the thermal sensor module measures supply voltage inside the LSI with an accuracy of ± 60mV.
(5) RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N can monitor VDD_DVFS supply voltage. RZ/G2N can monitor VDD supply voltage.

15.1.2 Block Diagram

A block diagram of the thermal sensor modules is shown in Figure 15.1 (for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N). The thermal sensor module consists of the thermal sensors (THS), chip internal voltage monitors (CIVM) and the thermal sensor controller (TSC). THS measures Tj temperature, and CIVM measures a voltage. TSC controls THS and CIVM.

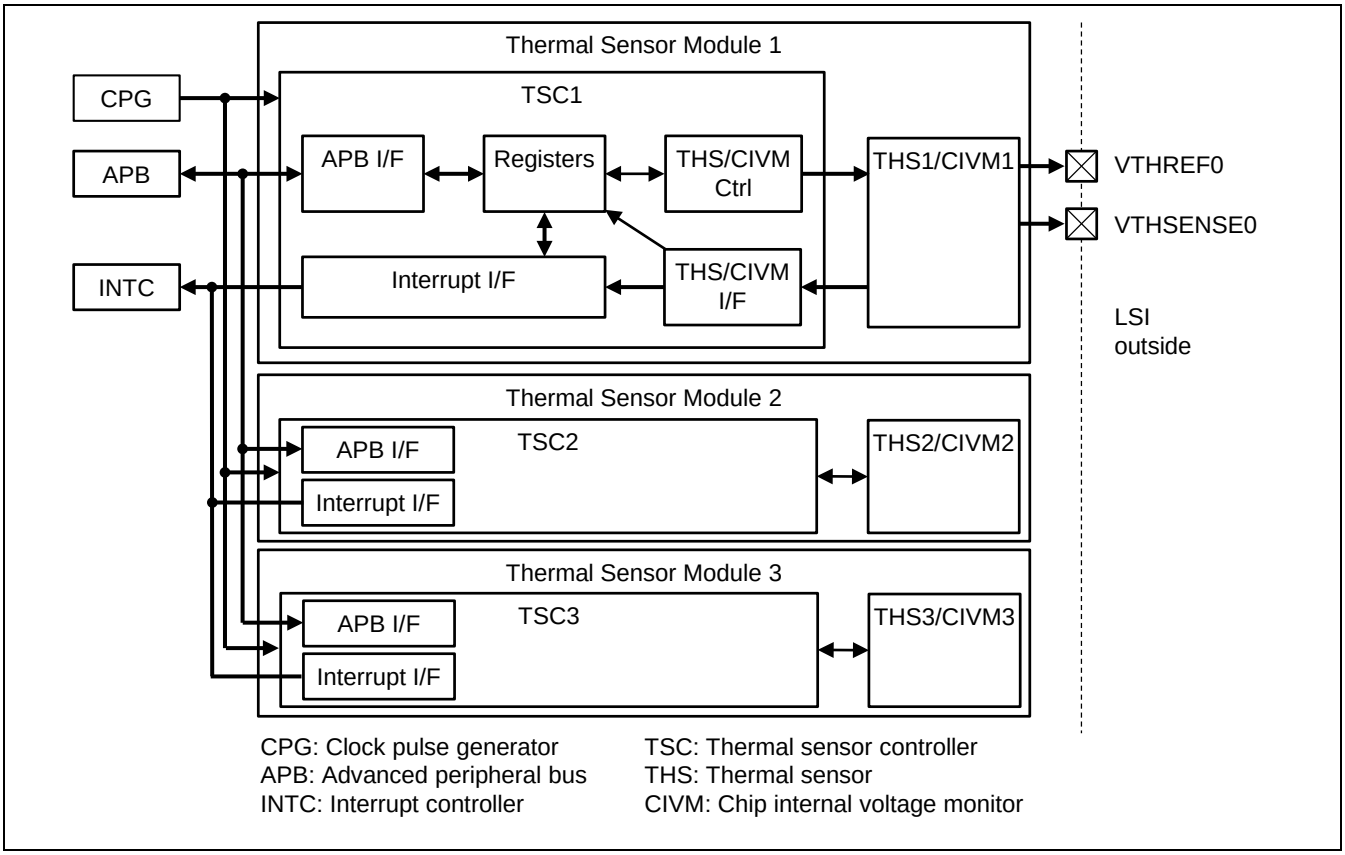

Figure 15.1 Block Diagram of Thermal Sensor Modules (for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N)

15.1.3 External Pins

Table 15.1 is a list of external pins. For the processing of these pins, refer to 15.4 Usage Note.

Table 15.1 Pin Configuration

			Second Generation RZ/G Series Products			
Pin Name	**I/O**	**Function**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
VTHSENSE0	Analog I/O	Outputs a voltage that 0 to 0.9V.	√	√	√	—
VTHREF0	Analog I/O	Outputs a voltage that 0 to 1.3V.	√	√	√	—

15.1.4 Register Configuration

Table 15.2 is a list of registers. The base addresses for the registers of each of the thermal sensor controller are as follows; H'E619_8000 for TSC1, H'E61A_0000 for TSC2, and H'E61A_8000 for TSC3. Any address other than those listed in the table must not be written to. Otherwise, correct operation is not guaranteed.

Notes: 1. several bits are read-only bits.
2. several bits can be written 0 only.

15.1.5 Connected Module

Table 15.3 is a list of the modules that are connected to this module.

Table 15.3 Connected Modules

Module Name	Connected Module Name	Connected Module Function
THS/CIVM	APB	Control to register access
	CPG	Output clock
	INTC	Control to interrupts
	Module standby	Control to stop clock
	Software reset	Execute software reset

15.2 Register Description

[Legend for register description]

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R:	Read-only. The write value should always be 0.
R/WC0:	Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
W:	Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.
__/W:	Write-only. The read value is undefined.

15.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

Note: For the RZ/G2M V3.0, following calculation example of the RZ/G2M V1.3 is reference only and values in each equation item will be changed significantly.

15.3.1 The Initial Sequence of Thermal Sensor/Chip Internal Voltage Monitor

Figure 15.2 shows the operation flow for thermal sensor and chip internal voltage monitor.

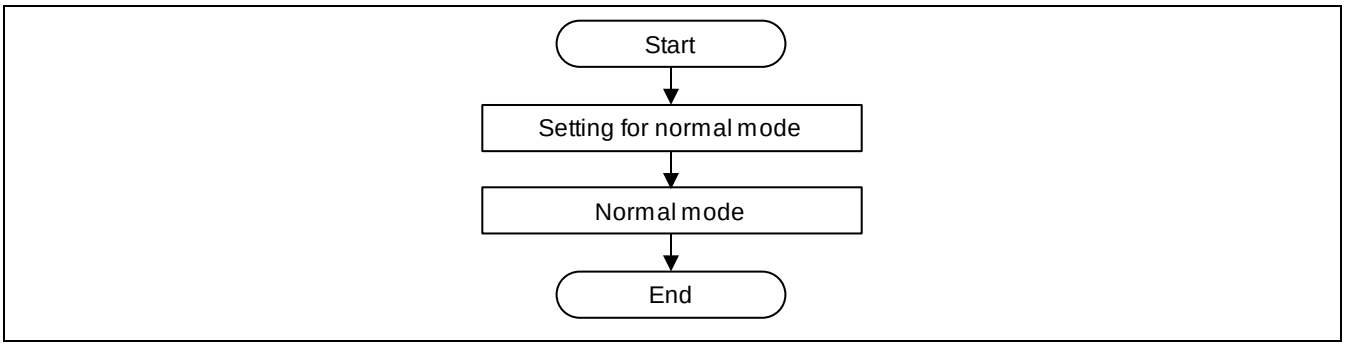

Figure 15.2 The Operation Flow for Thermal Sensor and Chip Internal Voltage Monitor

15.3.1.1 Setting of Normal Mode

Figure 15.3 shows initial sequence for normal mode of thermal sensor and chip internal voltage monitor. IRQTEMP1 to 3[11:0] calculate by using below.

First, calculate Tj_T. It is

- RZ/G2M V1.3

$$\mathrm{Tj\_T} = \frac{(\mathrm{PTAT2[11:0]} - \mathrm{PTAT3[11:0]}) \times 157}{(\mathrm{PTAT1[11:0]} - \mathrm{PTAT3[11:0]})} - 41 \approx 20 \text{ to } 40\ [^{\circ}\mathrm{C}]$$

- Except for RZ/G2M V1.3

$$\mathrm{Tj\_T} = \frac{(\mathrm{PTAT2[11:0]} - \mathrm{PTAT3[11:0]}) \times 167}{(\mathrm{PTAT1[11:0]} - \mathrm{PTAT3[11:0]})} - 41 \approx 20 \text{ to } 40\ [^{\circ}\mathrm{C}]$$

Next, calculate IRQTEMP1 to 3[11:0]. If setting temperature, STEMP, is less than Tj_T,

- RZ/G2M V1.3

$$\mathrm{IRQTEMP1\ to\ 3[11:0]} = \mathrm{THCODE3[11:0]} - \frac{(\mathrm{STEMP}+41)(\mathrm{PTAT3[11:0]} - \mathrm{PTAT1[11:0]})(\mathrm{THCODE3[11:0]} - \mathrm{THCODE2[11:0]})}{157 \times (\mathrm{PTAT3[11:0]} - \mathrm{PTAT2[11:0]})}.$$

- Except for RZ/G2M V1.3

$$\mathrm{IRQTEMP1\ to\ 3[11:0]} = \mathrm{THCODE3[11:0]} - \frac{(\mathrm{STEMP}+41)(\mathrm{PTAT3[11:0]} - \mathrm{PTAT1[11:0]})(\mathrm{THCODE3[11:0]} - \mathrm{THCODE2[11:0]})}{167 \times (\mathrm{PTAT3[11:0]} - \mathrm{PTAT2[11:0]})}.$$

If setting temperature, STEMP, is more than Tj_T,

- RZ/G2M V1.3

$$\mathrm{IRQTEMP1\ to\ 3[11:0]} = \mathrm{THCODE1[11:0]} - \frac{(\mathrm{STEMP}-116)(\mathrm{PTAT1[11:0]} - \mathrm{PTAT3[11:0]})(\mathrm{THCODE2[11:0]} - \mathrm{THCODE1[11:0]})}{157 \times (\mathrm{PTAT1[11:0]} - \mathrm{PTAT2[11:0]})}.$$

- Except for RZ/G2M V1.3

$$\mathrm{IRQTEMP1\ to\ 3[11:0]} = \mathrm{THCODE1[11:0]} - \frac{(\mathrm{STEMP}-126)(\mathrm{PTAT1[11:0]} - \mathrm{PTAT3[11:0]})(\mathrm{THCODE2[11:0]} - \mathrm{THCODE1[11:0]})}{167 \times (\mathrm{PTAT1[11:0]} - \mathrm{PTAT2[11:0]})}.$$

The following is an example of RZ/G2M V1.3.

When THCODE1[11:0] = 3397, THCODE2[11:0] = 2800, THCODE3[11:0] = 2221, PTAT1[11:0] = 2631, PTAT2[11:0] = 1509, PTAT3[11:0] = 435 and STEMP = 110[℃], calculate IRQTEMP1[11:0],

Tj_T is

$\mathrm{Tj\_T} = \frac{(1509-435)\times 157}{(2631-435)} - 41 \approx 35.8\ [℃].$

IRQTEMP1[11: 0] are

$\mathrm{IRQTEMP1}[11:0] = 3397 - \frac{(110-116)(2631-435)(2800-3397)}{157\times(2631-1509)} \approx 3352,$

because the setting temperature, STEMP (110[℃]), is more than Tj_T.

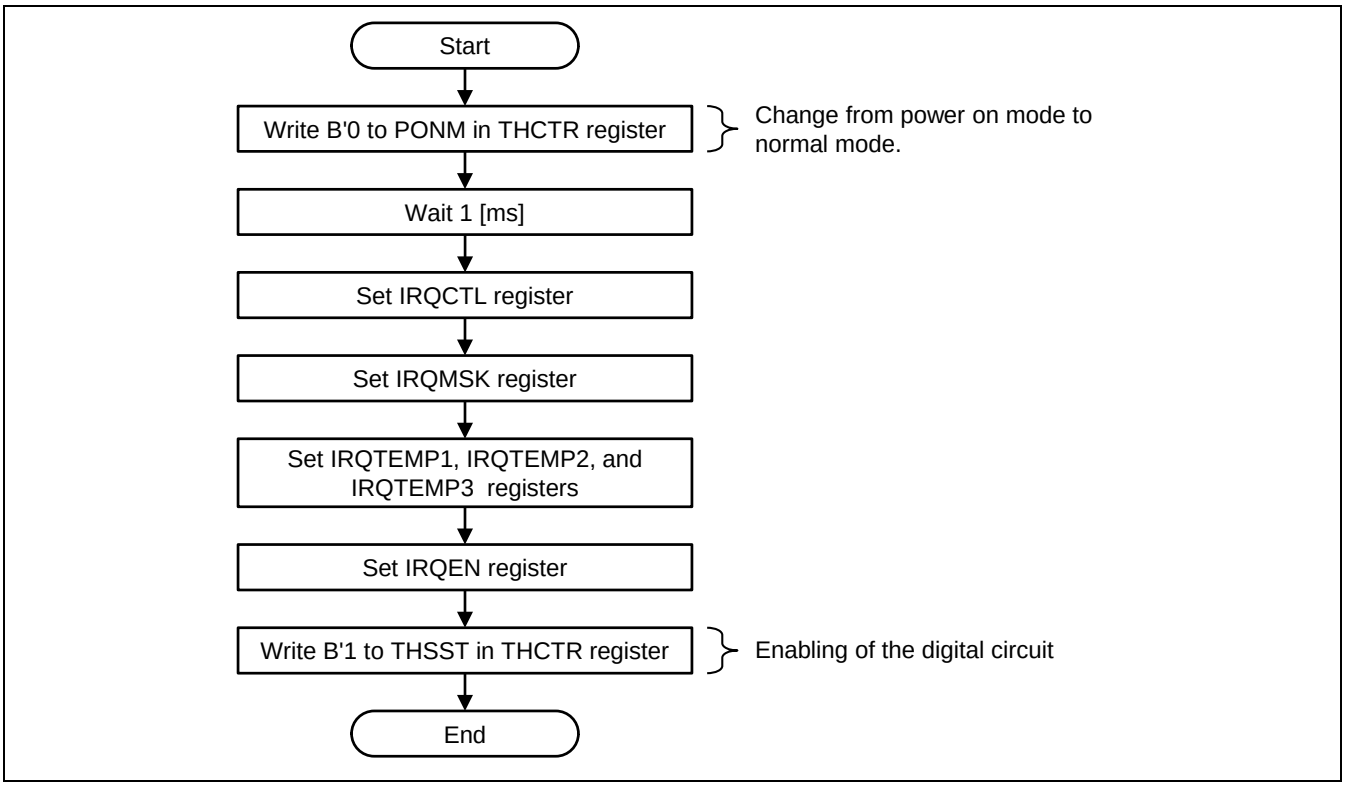

Figure 15.3 Initial Sequence for Normal Mode of Thermal Sensor and Chip Voltage Monitor

15.3.1.2 Normal Mode

Normal mode of thermal sensor module outputs the digital codes of temperature and voltage which are measured by thermal sensor module at a constant period. The conversion method from these codes to temperature and voltage are shown below.

(1) The conversion method from TEMP_CODE[11:0] to temperature

When TEMP_CODE[11:0] <THCODE2[11:0]

- RZ/G2M V1.3

$$\text{Temperature}[℃] = \frac{157\times(\text{PTAT3}[11:0]-\text{PTAT2}[11:0])(\text{THCODE3}[11:0]-\text{TEMP\_CODE}[11:0])}{(\text{PTAT3}[11:0]-\text{PTAT1}[11:0])(\text{THCODE3}[11:0]-\text{THCODE2}[11:0])} - 41$$

- Except for RZ/G2M V1.3

$$\text{Temperature}[℃] = \frac{167\times(\text{PTAT3}[11:0]-\text{PTAT2}[11:0])(\text{THCODE3}[11:0]-\text{TEMP\_CODE}[11:0])}{(\text{PTAT3}[11:0]-\text{PTAT1}[11:0])(\text{THCODE3}[11:0]-\text{THCODE2}[11:0])} - 41$$

When TEMP_CODE[11:0] ≥THCODE2[11:0]

- RZ/G2M V1.3

$$\text{Temperature}[℃] = \frac{157\times(\text{PTAT1}[11:0]-\text{PTAT2}[11:0])(\text{THCODE1}[11:0]-\text{TEMP\_CODE}[11:0])}{(\text{PTAT1}[11:0]-\text{PTAT3}[11:0])(\text{THCODE2}[11:0]-\text{THCODE1}[11:0])} + 116$$

- Except for RZ/G2M V1.3

$$\text{Temperature}[℃] = \frac{167\times(\text{PTAT1}[11:0]-\text{PTAT2}[11:0])(\text{THCODE1}[11:0]-\text{TEMP\_CODE}[11:0])}{(\text{PTAT1}[11:0]-\text{PTAT3}[11:0])(\text{THCODE2}[11:0]-\text{THCODE1}[11:0])} + 126$$

The followings are examples of RZ/G2M V1.3

First example, when THCODE1[11:0] = 3397, THCODE2[11:0] = 2800, THCODE3[11:0] = 2221, PTAT1[11:0] = 2631, PTAT2[11:0] = 1509, PTAT3[11:0] = 435 and TEMP_CODE[11:0] = 2680, the temperature, Temperature[℃], is

$$\text{Temperature}[℃] = \frac{157\times(435-1509)(2221-2680)}{(435-2631)(2221-2800)} - 41 \approx 19.9[℃]$$

because TEMP_CODE[11:0]=2680 < THCODE2[11:0]=2800.

Second example, THCODE1 to 3[11:0] and PTAT1 to 3[11:0] are same with the first example. when TEMP_CODE[11:0] = 3350, the temperature, Temperature[℃], is

$$\text{Temperature}[℃] = \frac{157\times(2631-1509)(3397-3350)}{(2631-435)(2800-3397)} + 116 \approx 109.7[℃]$$

because TEMP_CODE[11:0] = 3350 ≥ THCODE2[11:0] = 2800.

(2) The conversion method from VOLT_CODE[9:0] to voltage

VOLT_CODE[9:0] can convert to voltage[mV] by the following formula.

- RZ/G2M V1.3 (VDD_DVFS)

$$\text{Voltage}[mV] = \frac{(360)\times(\text{THCODE3}[11:0]-4\times\text{VOLT\_CODE}[9:0])}{(\text{THCODE3}[11:0]-\text{THCODE1}[11:0])} + 630 + \text{Temperature}[℃]\times 0.25$$

- RZ/G2H (VDD_DVFS),RZ/G2N(VDD_DVFS, VDD)

$$\text{Voltage}[mV] = \frac{(390)\times(\text{THCODE3}[11:0]-4\times\text{VOLT\_CODE}[9:0])}{(\text{THCODE3}[11:0]-\text{THCODE1}[11:0])} + 630 + \text{Temperature}[℃]\times 0.1$$

The following is an example of RZ/G2M V1.3

When THCODE1[11:0] = 3397, THCODE3[11:0] = 2221, VOLT_CODE[9:0] = 867 and Temperature[℃] = 19.9[℃], Voltage[mV] is

$$\text{Voltage}[mV] = \frac{(360)\times(2221-4\times867)}{(2221-3397)} + 630 + 19.9\times 0.25 \approx 1017[mV]$$

15.3.2 Interrupt

The block diagrams of interrupt are shown in Figure 15.4(for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N). The interrupts for thermal sensor module have three (Thermal Sensor ch0, Thermal Sensor ch1 and Thermal Sensor ch2). These interrupts receive from TSC1, TSC2 and TSC3. The interrupts for TSC1, TSC2 and TSC3 can detect to exceed (TEMP1, TEMP2 and TEMP3) or to fall below (TEMPD1, TEMPD2 and TEMPD3), and the interrupt signal of its module is set to 1 by is detected each of TEMP or TEMPD.
For instance, if TEMP2 of TSC2 is detected, THS2_IRQ2 is set to 1 and Thermal sensor.ch1 is set to 1.

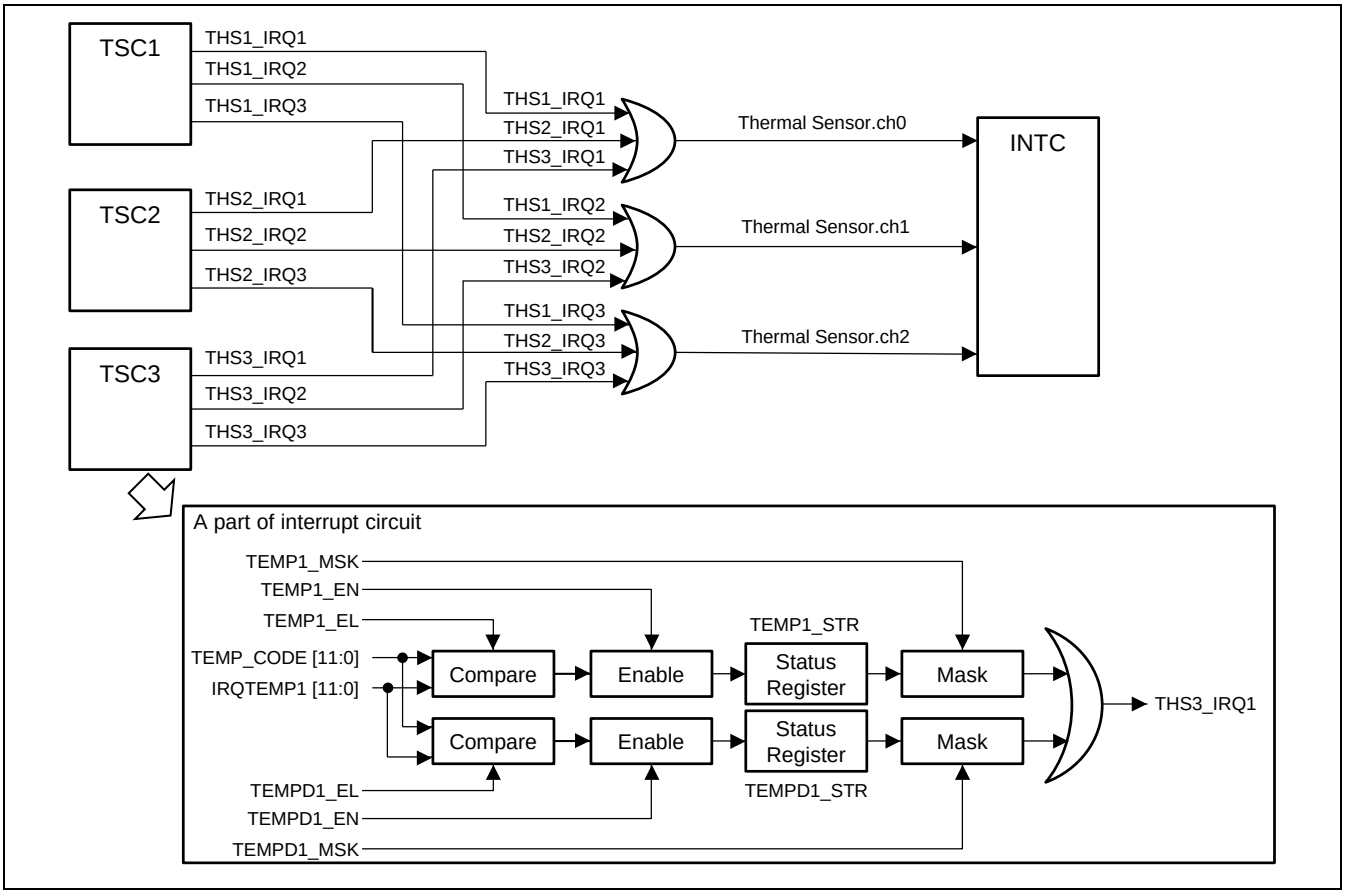

Figure 15.4 Block Diagram of Interrupt (for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 and RZ/G2N)

15.3.3 Standby Mode

This module supports module standby mode. Standby mode of TSC1, TSC2 and TSC3 are controlled together. Figure 15.5 shows module standby sequence. In the restart method, clear Module Standby register, execute a software reset and initialize in Figure 15.3. Refer to 12. Module Standby, Software Reset for the detail of setting method.

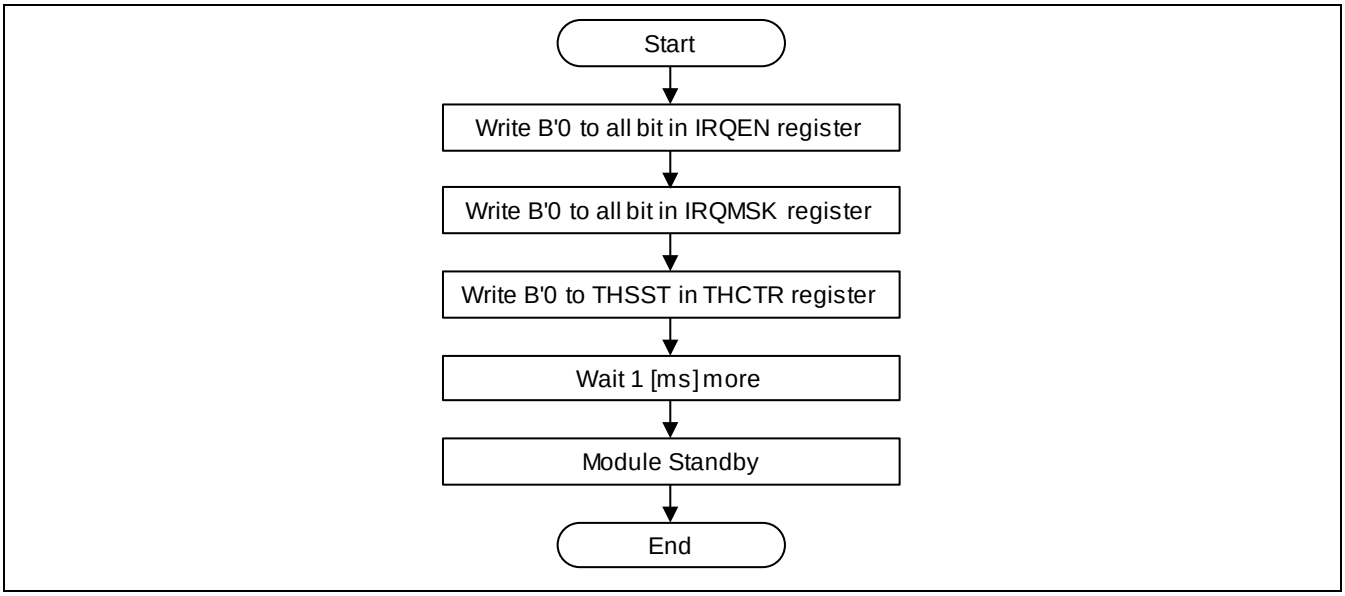

Figure 15.5 Module standby Sequence for Thermal Sensor and Chip Internal Voltage Monitor

15.3.4 Software Reset

This module supports software reset. Software reset of TSC1, TSC2 and TSC3 are controlled together. Refer to 12. Module Standby, Software Reset for the detail of setting method. Figure 15.6 shows software reset sequence. Several registers are not cleared by software reset. Table 15.4 shows behavior of register by software reset.

15.4 Usage Note

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

(1) When THEN of THCTR register set from 1 to 0, control register after 100 us.
(2) Leave external LSI pins (VTHSENSE0 and VTHREF0) open.
(3) Use digital code (TEMP register and VOLT register) when measuring Tj and chip internal voltage.
(4) When Tj exceeds 115°C, correct operation and device characteristics of this module are not guaranteed.

16. Thermal Sensor (THS)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N **RZ/G2E**

16.1 Overview

This LSI provides a thermal sensor module that measures the temperature (Tj) inside the LSI. The thermal sensor module also includes a chip internal voltage monitoring module that measures the supply voltage (VDD) inside the LSI.

16.1.1 Features

(1) The analog voltage of thermal sensor for RZ/G2E measures temperature Tj with an accuracy of ±5°C over the range from -40°C to 115°C.The digital value of thermal sensor for RZ/G2E measures temperature Tj with an accuracy of ±7.75°C over the range from -40°C to 90°C and of ±7.5°C over the range from 90°C to 115°C.

(2) Provides reference to temperature Tj as measured from outside the chip with the use of external LSI pins (VTHREF and VTHSENSE) for RZ/G2E.

(3) This module can generate interrupts when the detected temperature Tj within the LSI rises above or falls below several specified temperatures.

16.1.2 Block Diagram

A block diagram of the thermal sensor module for each product is shown in Figure 16.1 (for RZ/G2E). The thermal sensor module consists of the thermal sensors (THS), which are analog circuits for measuring temperature and voltage, respectively, and the thermal sensor controller (TSC), which control the analog circuits.

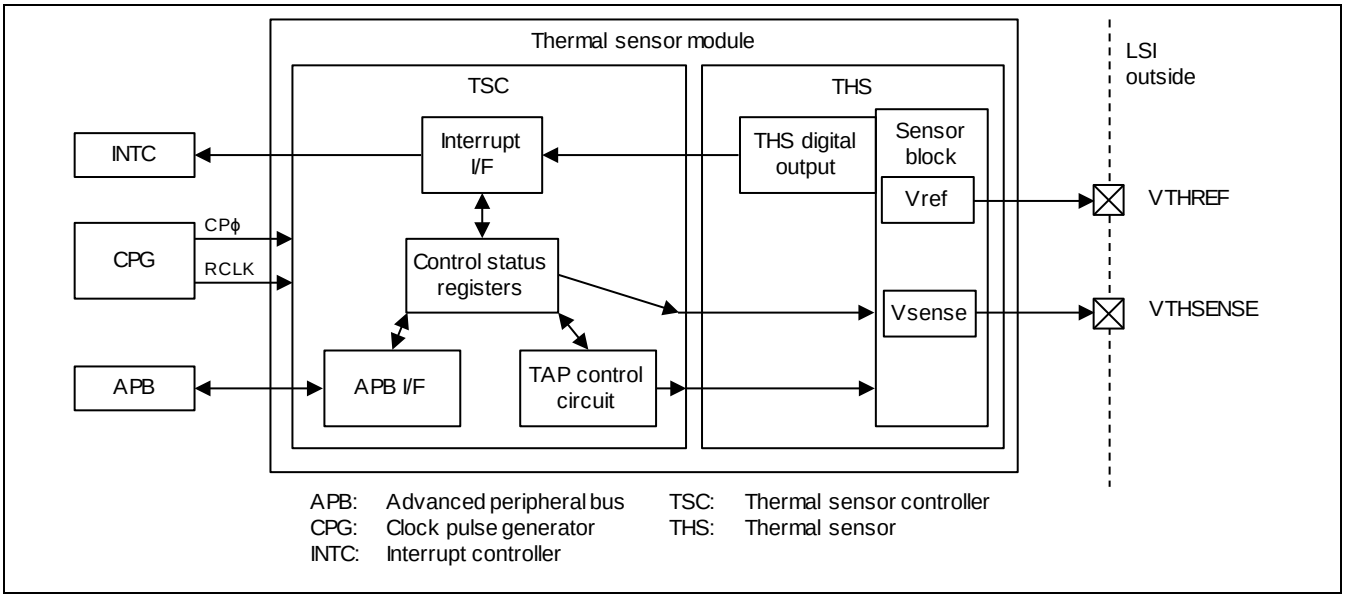

Figure 16.1 Block Diagram of Thermal Sensor Module (RZ/G2E)

The TSC module outputs two kinds of signal to the THS module, that is, signals from control registers and from the TAP control circuit. The signals from control registers are used to control the analog circuits.

The TAP control circuit automatically adjusts the measurement range required in measuring the temperature and voltage, and outputs the results to the THS module.

The THS module outputs two kinds of signal to the TSC module, that is, digital signals from the THS module, which indicate the digital values representing the temperature and voltage, respectively. These values read from the corresponding registers can be used to generate interrupts due to comparison with the specified temperatures or voltages as well as to detect the temperature and voltage within the LSI.

16.1.3 External Pins

Table 16.1 is a list of external pins.

Table 16.1 Pin Configuration

16.1.5 Connected Module

Table 16.3 is a list of the modules that are connected to this module.

Table 16.3 Connected Modules

Module Name	Connected Module Name	Connected Module Function
THS	APB	Control to register access
	CPG	Output clock
	INTC	Control to interrupts
	Module standby	Control to stop clock
	Software reset	Execute software reset

16.2 Register Description

[Legend for register description]

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R: Read-only. The write value should always be 0.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
W: Write-only. Reading this bit is prohibited. When the bit is reserved, the write value should always be 0.
_/W: Write-only. The read value is undefined.

16.2.1 Interrupt Status Register (STR)

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	These bits are fixed to 0.
29 to 24	—	H'25	R/W	The write value should always be H'25.
23, 22	—	All 0	R	These bits are fixed to 0.
21 to 16	CTEMP2[5:0]	All 0	R/W	Indicates the temperature that causes an INTDT2 interrupt. When interrupt temperature is lower than 60°C, Specify the value calculated by "((interrupt temperature) + 72) / 5.5." When interrupt temperature is equal to or higher than 60°C, Specify the value calculated by "((interrupt temperature) + 60) / 5." The INTDT2 interrupt is generated when the CPCTL bit in THSCR is 1 and the following condition is satisfied: CTEMP2[5:0] ≥ CTEMP[5:0] (when POSNEG[2] is 1) or CTEMP2[5:0] < CTEMP[5:0] (when POSNEG[2] is 0). Here CTEMP[5:0] is the current chip temperature indicated with bits 5 to 0 in THSSR.
15, 14	—	All 0	R	These bits are fixed to 0.
13 to 8	CTEMP1[5:0]	All 0	R/W	Indicates the temperature that causes an INTDT1 interrupt. When interrupt temperature is lower than 60°C, Specify the value calculated by "((interrupt temperature) + 72) / 5.5." When interrupt temperature is equal to or higher than 60°C, Specify the value calculated by "((interrupt temperature) + 60) / 5." The INTDT1 interrupt is generated when the CPCTL bit in THSCR is 1 and the following condition is satisfied: CTEMP1[5:0] ≥ CTEMP[5:0] (when POSNEG[1] is 1) or CTEMP1[5:0] < CTEMP[5:0] (when POSNEG[1] is 0). Here CTEMP[5:0] is the current chip temperature indicated with bits 5 to 0 in THSSR.
7, 6	—	All 0	R	These bits are fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	CTEMP0[5:0]	All 0	R/W	Indicates the temperature that causes an INTDT0 interrupt. When interrupt temperature is lower than 60°C, Specify the value calculated by “((interrupt temperature) + 72) / 5.5.” When interrupt temperature is equal to or higher than 60°C, Specify the value calculated by “((interrupt temperature) + 60) / 5.” The INTDT0 interrupt is generated when the CPCTL bit in THSCR is 1 and the following condition is satisfied: CTEMP0[5:0] ≥ CTEMP[5:0] (when POSNEG[0] is 1) or CTEMP0[5:0] < CTEMP[5:0] (when POSNEG[0] is 0). Here CTEMP[5:0] is the current chip temperature indicated with bits 5 to 0 in THSSR.

16.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N **RZ/G2E**

16.3.1 Initial Sequence of Thermal Sensor

Figure 16.2 shows initial sequence of thermal sensor.

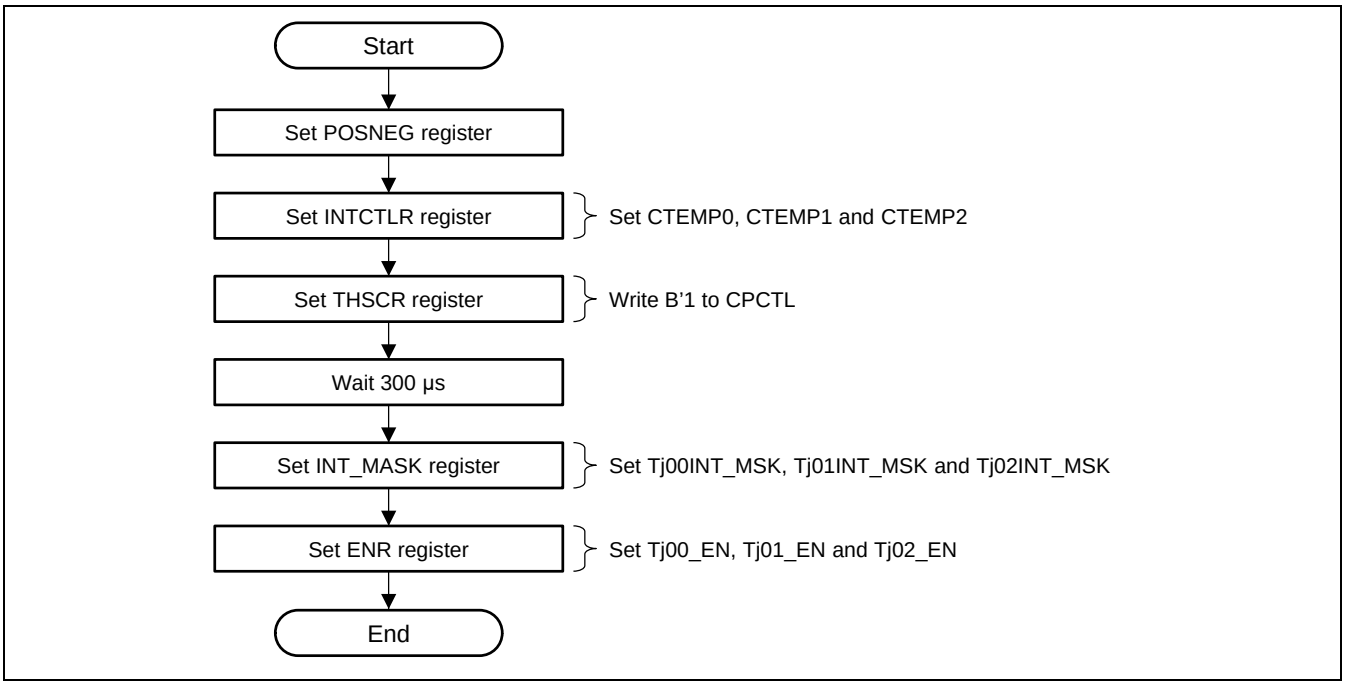

Figure 16.2 Initial Sequence of Thermal Sensor

16.3.2 Temperature Measurement Using Register (When CPCTL = 0)

Setting is prohibited.

16.3.3 Temperature Measurement Using Register (When CPCTL = 1)

When reading the temperature measurement result from a register, read the value of the CTEMP[5:0] bits in THSSR.

Do not use the value of the CTEMP[5:0] bits in THSSR immediately after a change to the offset value for the TAP control circuit because the new offset setting will not yet have been reflected in the value. When CPCTL is 1, hardware automatically updates the offset value but since software is not informed of the timing of updates, consecutively read the value of the CTEMP[5:0] bits in THSSR at an interval over 300 µs and only accept the result when the same value is read twice (since the temperature changes more gradually than the 300 µs interval, as long as a change to the offset value is not made during the interval between reading of the CTEMP[5:0] bits in THSSR, the same value will be read out.)

By setting 0 or 1 in the positive/negative logic select register (POSNEG) and specifying the temperatures that cause interrupts in the INTCTLR register, the INTDT2 to INTDT0 interrupts can be generated when the chip temperature rises above or falls below the temperatures specified in the INTCTLR register.

However, immediately after a change to the offset value for the TAP control circuit, an interrupt may be generated before completion of the temperature measurement at the changed offset value. If an interrupt is generated at such a time, read out the value of the CTEMP[5:0] bits in THSSR a second time after 300 µs, check whether or not the interrupt was valid, and if it was, proceed with interrupt processing.

16.3.4 Interrupt

Figure 16.3 shows the block diagram of interrupt. The interrupts for thermal sensor module have three (Thermal Sensor.ch0, Thermal Sensor.ch1, and Thermal Sensor.ch2.

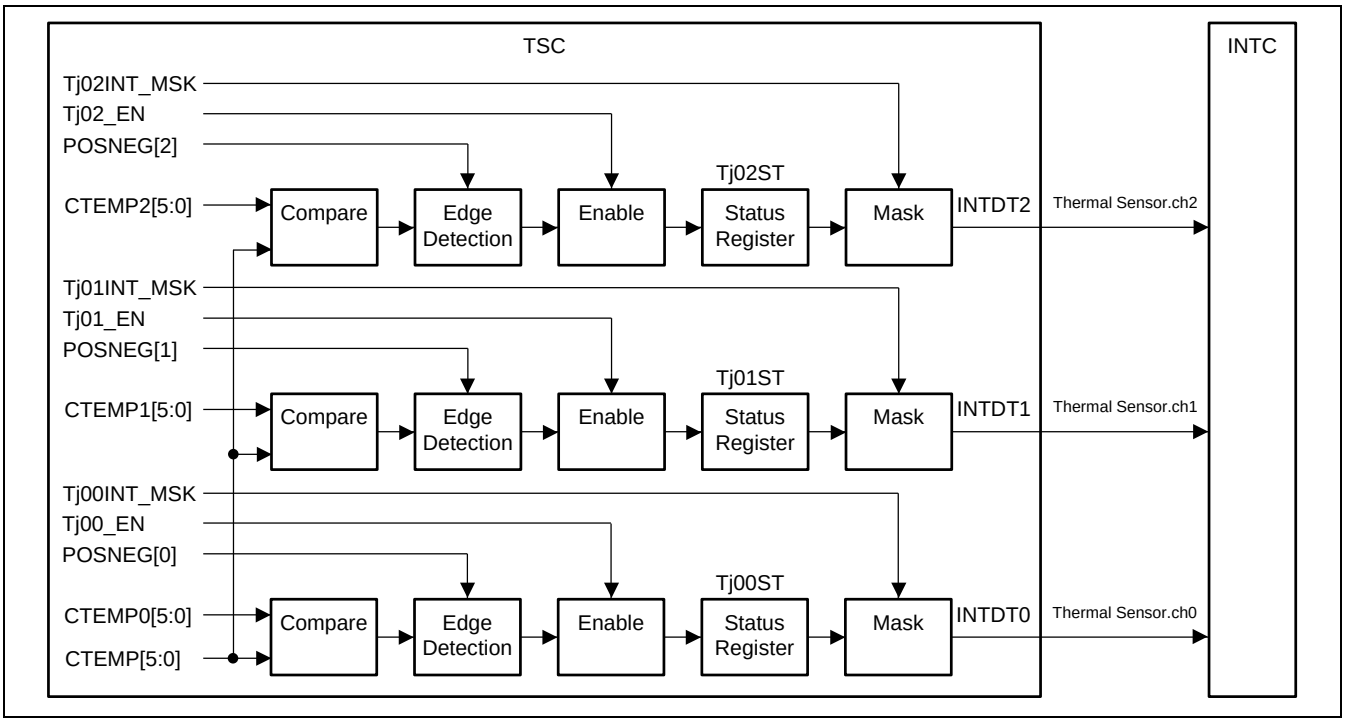

Figure 16.3 Block Diagram of Interrupt

16.3.5 Standby Mode

This module supports module standby mode. Figure 16.4 shows module standby sequence. In the restart method, clear Module Standby register, execute a software reset and initialize in Figure 16.2. Refer to 12. Module Standby, Software Reset for the detail of setting method.

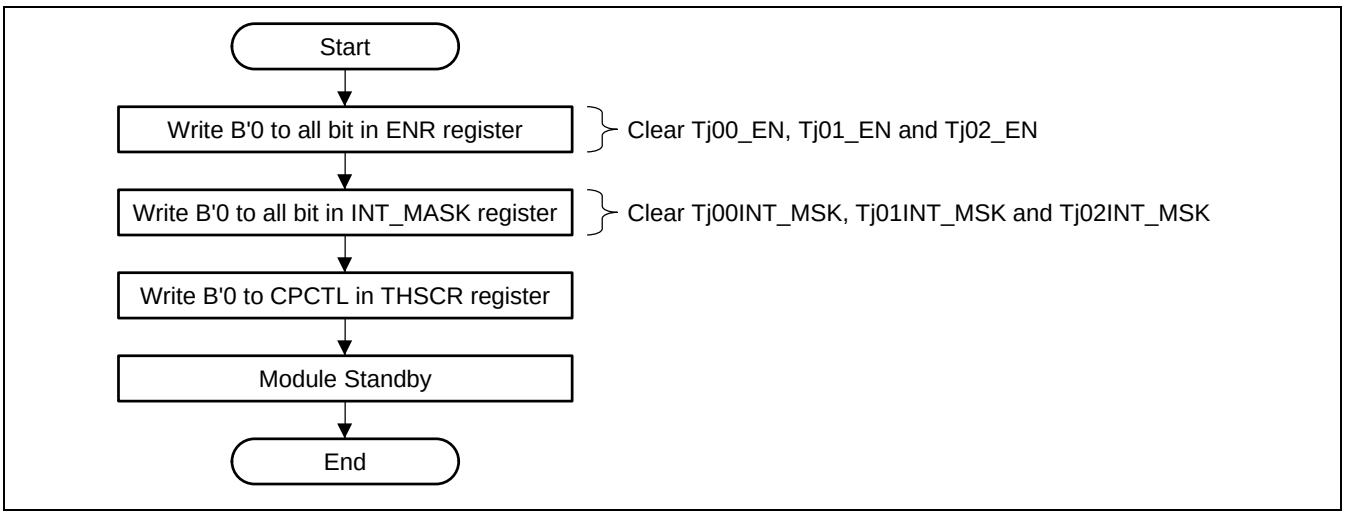

Figure 16.4 Module Standby Sequence of Thermal Sensor

16.3.6 Software Reset

This module supports software reset. Refer to 12. Module Standby, Software Reset for the detail of setting method. Figure 16.5 shows software reset sequence. Table 16.4 shows behavior of register by software reset.

16.3.9 The Temperature Measurement Using External Pins (RZ/G2E)

For temperature measurement with the external pins, connect the external circuit to the VTHSENSE and VTHREF pins and calculate the temperature based on the output voltages on these pins.

(1) External Pins Used for Temperature Measurement

In temperature measurement with the external pins, the pins shown in Table 16.7 are used.

Table 16.7 External Pins Used for Temperature Measurement

Pin Name	Output Voltage Range [V]	Maximum Allowed Input/Output Current [µA]	Tj Accuracy
VTHSENSE	360mV (min.) to 750mV (max.)	± 3	Tj accuracy of RZ/G2E is ±5°C (-40°C to 115°C). **{(VTHREF-VTHSENSE)** specification**}** (This does not include error such as device accuracy of the referenced external connection circuit). The temperature range for detection is -40°C to 115°C. When Tj is outside the range of -40°C to 115°C, the operation and accuracy cannot be guaranteed.
VTHREF	1.18 V (min.) to 1.32 V (max.)	± 3	

(2) Referenced External Connection Circuit

Figure 16.6 shows a referenced external connection circuit for the THS used for temperature measurement with the external pins.

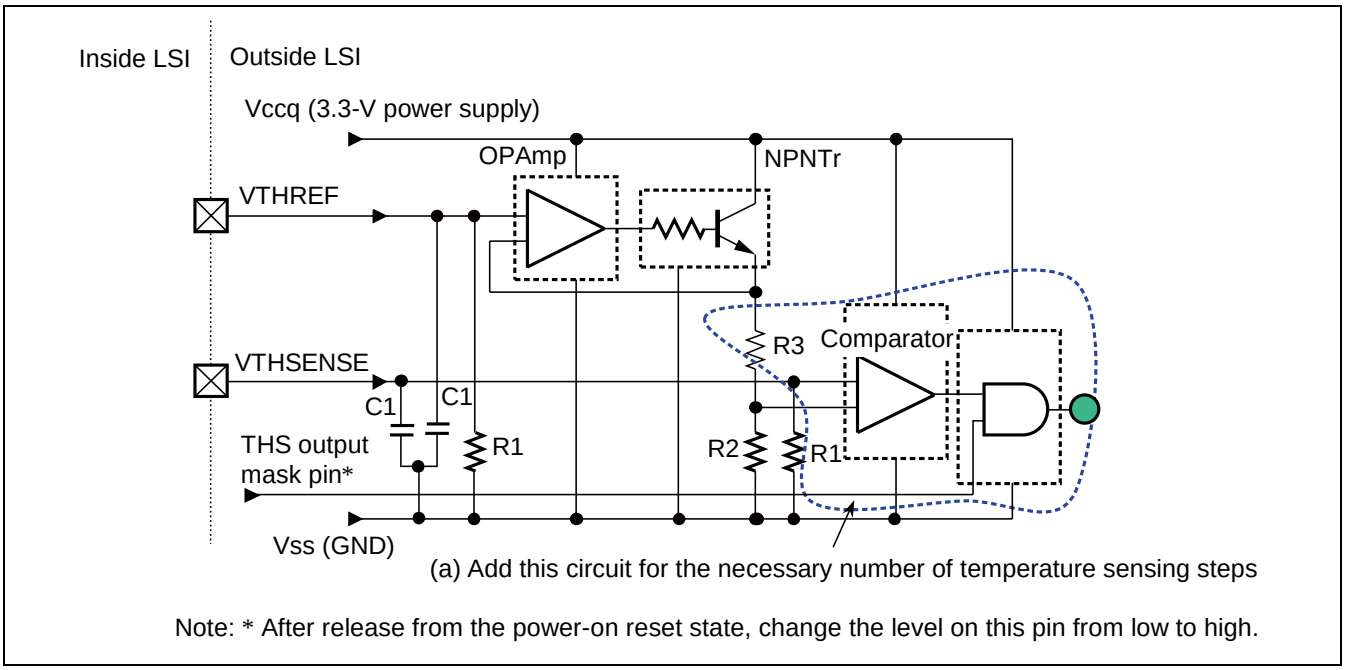

Figure 16.6 Referenced External Connection Circuit for THS

The referenced external connection circuit outputs a high level at a desired temperature. By using VTHREF, which is affected by the noise equal to the external noise that affects VTHSENSE, the external noise is canceled out, and thus the accuracy of Tj is improved.

In addition, the number of steps for digitizing a measured temperature Tj (the number of temperatures with which an actual temperature is compared) can be increased by adding the circuit part indicated with (a) in the figure.

The followings should be considered for the wiring of VTHSENSE and VTHREF.

1. For jumper wiring use a twisted pair.
2. For substrate wiring, arrange differential lines as close to each other as possible on the board.

To obtain low-to-high output at Tj = 115 °C, the constants of the circuit components are as follows:

R1 = 560 kΩ, C1 = 0.1 µF

reference value : R2 = 340Ω, R3 = 280Ω (E96) Tj@115.0°C

For R2 and R3, E96 series resistor with a tolerance of ± 0.1% is recommended. The error of this resistor will be the same value as the error produced when Tj is digitalized. A material which is little affected by the temperature is recommended for the resistor. Note that, R2 and R3 can be configured from two or more resistors.

The accuracy of R1 is not a problem since R1 is used as a pull-down resistor.

C1 is a bypass capacitor. Be sure to mount this even when the referenced external connection circuit is not to be used.

(3) Calculation Formula

Temperature Tj can be calculated from the voltages on VTHSENSE and VTHREF as follows.

Tj = (VTHREF -VTHSENSE + temperature coefficient 2) / temperature coefficient 1 [°C]

VTHSENSE, VTHREF: measured voltages [V]

Two temperature coefficients use two types.

When VTHREF-VTHSENSE value is less than 680.13mV,

Temperature coefficient 1: -1.58 [mV/ °C]

Temperature coefficient 2: -763.08 [mV].

When VTHREF-VTHSENSE value is equal to or greater than 680.13mV,

Temperature coefficient 1: -1.56 [mV/ °C]

Temperature coefficient 2: -762.03 [mV].

16.4 Usage Note

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N **RZ/G2E**

(1) When the THS is not used, THIDLE[1:0] bits in THSCR register should be set to B'11 (leave external LSI pins (VTHSENSE and VTHREF) open in RZ/G2E).

(2) The guaranteed accuracy of the outputs on the VTHSENSE and VTHREF pins is over the temperature range from -40°C to 115°C. Take measurement errors into account in designing the user system. (RZ/G2E)

Note that, when the internal registers of the TSC are used for measurement of the chip temperature, the operation of the sensor is not guaranteed outside the range of -40°C to 115°C within which operation of the logic circuit is guaranteed.

(3) When Tj exceeds 115°C, correct operation and device characteristics are not guaranteed.

Although this module provides a bit for detecting Tj = 135°C, this bit should only be used for fail-safe operation where the LSI is stopped on the verge of a thermal runaway condition (but has not yet entered that state) and the power consumption is increasing rapidly.

(4) External LSI pins (VTHSENSE and VTHREF) are intended to fail-safe. For instance, this circuit can be used as an external fail-safe circuit to stop the power supply to the LSI when thermal runaway occurs and the LSI becomes uncontrollable because of high temperature. (RZ/G2E)

17. Reset (RST)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

17.1 Overview

The reset (RST) consists of the bus interface block and registers related to reset control. Timing of the bus interface block is based on CPϕ.

17.1.1 Features

The following functions are implemented by RST.

- Register-based reset control for the Cortex-A57, Cortex-A53 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]
  Register-based reset control for the Cortex-A53 [RZ/G2E]
  Register-based reset control for the Cortex-A57 [RZ/G2N]
- Latching of the levels on mode pins when PRESET# is negated
- Mode monitoring register
- Boot address registers for the Cortex-A57, Cortex-A53, [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]
  Boot address registers for the Cortex-A53, [RZ/G2E]
  Boot address registers for the Cortex-A57, [RZ/G2N]
- WDT reset request control function.
- PRESETOUT control function.

17.2 Register Description

Legend for Register Description

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R: Read-only.

W: Write-only. The read value is undefined.

17.2.1 Mode Monitor Register (MODEMR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

MODEMR is a 32-bit read-only register, which can be accessed only in longwords.

This register is initialized only by PRESET#.

17.2.2 Cortex-A57 Reset Control Register (CA57RESCNT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

CA57RESCNT is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies whether the reset is issued to Cortex-A57 CPUn (n = 0 to 3) or not. The upper word of the write value should always be the code value H'A5A5. If the code value is read, it is always read as 0.

This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR.SPRES=1).

17.2.3 Cortex-A53 Reset Control Register (CA53RESCNT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	—	√

CA53RESCNT is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies whether the reset is issued to Cortex-A53 CPUn (n = 0 to 3) or not. The upper word of the write value should always be the code value H'5A5A. If the code value is read, it is always read as 0.

This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR.SPRES = 1).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SBAR[23:18]						—	—	—	—	—	BAREN	—	—	BTMD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0/1	0	0	00/01/10	
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR[39:18]	{H'0_0000, B'00}	R/W	System CPU (Cortex-A53) Boot Address When System CPU (Cortex-A53) accesses to the range of physical address from H'00_0000_0000 to H'00_0003_FFFF, the address bit in [39:18] is replaced by SBAR[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*2	B'0/ B'1*1	R/W	BAREN bit 0: SBAR is not valid. 1: SBAR is valid.
3, 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1, 0	BTMD[1:0]	B'00/B'01/ B'10*1	R/W	Specifies the Boot area of System CPU (Cortex-A53) During Hardware Power On Reset the initial value of these bits depends upon MD4, MD3, MD2 and MD1 pin setting. 00: SBAR[39:18] is assigned to Boot address, set SBAR[17:0] to 0. B'01: Prohibited. B'10: Boots from BootROM. B'11: Prohibited.

Notes: 1. Initial value depends upon MD4, MD3, MD2 and MD1 pin setting. Refer to the Table 17.5.

2. Do not rewrite BAREN = 1 simultaneously with SBAR and BTMD. After completing the setting of SBAR and BTMD with BAREN = 0, set only BAREN = 1.
   For example: Change SBAR[39:18] from A to B, and BTMD[1:0] = B'00
   Step 1: Write SBAR [39:18] = B, BAREN = 0, BTMD[1:0] = B'00
   Step 2: Write SBAR [39:18] = B, BAREN = 1, BTMD[1:0] = B'00

Table 17.5 Initial values of BAREN, BTMD[1:0], and boot address

17.2.7 Cortex-A53 Boot Address Register2 (CA53BAR2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	—	√

CA53BAR2 is a 32-bit readable/writable register, which can be accessed only in longwords. This register can be changed only in the secure mode.

This register specifies the boot space of the System CPU (Cortex-A53).

This register is initialized by PRESET# when WDTRSTCR.RESBAR2S = 0. This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR.SPRES = 1) when WDTRSTCR.RESBAR2S = 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SBAR2[39:24]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SBAR2[23:18]						—	—	—	—	—	BAREN	—	—	—	VLD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR2[39:18]	{H'0_0000, B'00}	R/W	System CPU (Cortex-A53) Boot Address2 When System CPU (Cortex-A53) accesses to the range of physical address from H'00_0000_0000 to H'00_0003_FFFF, the address bit in [39:18] is replaced by SBAR2[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*	B'0	R/W	BAREN bit 0: SBAR2 is not valid. 1: SBAR2 is valid.
3 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	VLD	B'0	R/W	VALID bit When 1 is set to this bit, System CPU (Cortex-A53) starts only from the address set to SBAR2. 0: System CPU (Cortex-A53) starts from the address set to SBAR. 1: System CPU (Cortex-A53) starts from the address set to SBAR2.

Note: * Do not rewrite BAREN = 1 simultaneously with SBAR2 and VLD. After completing the setting of SBAR2 and VLD with BAREN = 0, set only BAREN = 1.

For example: Change SBAR2 [39:18] from A to B, and VLD=1

Step 1: Write SBAR2[39:18] = B, BAREN = 0, VLD = 1

Step 2: Write SBAR2[39:18] = B, BAREN = 1, VLD = 1

17.2.8 Cortex-A57 Boot Address Register (CA57BAR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

CA57BAR is a 32-bit readable/writable register, which can be accessed only in longwords.

This register specifies the boot space of the System CPU (Cortex-A57).

This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR.SPRES = 1).

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR[39:18]	{H'0_0000, B'00}	R/W	System CPU (Cortex-A57) Boot Address When System CPU (Cortex-A57) accesses to the range of physical address from H'00_0000_0000 to H'00_0003_FFFF, the address bit in [39:18] is replaced by SBAR[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*2	B'0/ B'1*1	R/W	BAREN bit 0: SBAR is not valid. 1: SBAR is valid.
3, 2	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
1, 0	BTMD[1:0]	B'00/ B'01/ B'10*1	R/W	Specifies the Boot area of System CPU (Cortex-A57) During Hardware Power On Reset the initial value of these bits depends upon MD4, MD3 , MD2 and MD1 pin setting. 00: SBAR[39:18] is assigned to Boot address, set SBAR[17:0] to 0. B'01: Prohibited. B'10: Boots from BootROM. B'11: Prohibited.

Notes: 1. Initial value depends upon MD4, MD3 ,, MD2 and MD1 pin setting. Refer to the Table 17.6.

2. Do not rewrite BAREN = 1 simultaneously with SBAR and BTMD. After completing the setting of SBAR and BTMD with BAREN = 0, set only BAREN = 1.

For example: Change SBAR[39:18] from A to B, and BTMD[1:0] = B'00

Step 1: Write SBAR[39:18] = B, BAREN = 0, BTMD[1:0] = B'00

Step 2: Write SBAR[39:18] = B, BAREN = 1, BTMD[1:0] = B'00

17.2.9 Cortex-A57 Boot Address Register2 (CA57BAR2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

CA57BAR2 is a 32-bit readable/writable register, which can be accessed only in longwords. This register can be changed only in the secure mode.

This register specifies the boot space of the System CPU (Cortex-A57).

This register is initialized by PRESET# when WDTRSTCR.RESBAR2S = 0. This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR.SPRES = 1) when WDTRSTCR.RESBAR2S = 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SBAR2[39:24]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	SBAR2[39:18]	{H'0_0000, B'00}	R/W	System CPU (Cortex-A57) Boot Address2 When System CPU (Cortex-A57) accesses to the range of physical address from H'00_0000_0000 to H'00_0003_FFFF, the address bit in [39:18] is replaced by SBAR2[39:18].
9 to 5	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
4	BAREN*	B'0	R/W	BAREN bit 0: SBAR2 is not valid. 1: SBAR2 is valid.
3 to 1	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
0	VLD	B'0	R/W	VALID bit When 1 is set to this bit, System CPU (Cortex-A57) starts only from the address set to SBAR2. 0: System CPU (Cortex-A57) starts from the address set to SBAR. 1: System CPU (Cortex-A57) starts from the address set to SBAR2.

Note: * Do not rewrite BAREN = 1 simultaneously with SBAR2 and VLD. After completing the setting of SBAR2 and VLD with BAREN = 0, set only BAREN = 1.

For example: Change SBAR2[39:18] from A to B, and VLD = 1

Step 1: Write SBAR2[39:18] = B, BAREN = 0, VLD = 1

Step 2: Write SBAR2[39:18] = B, BAREN = 1, VLD = 1

17.2.10 Cortex-A57 CPUn (n = 0 to 3[RZ/G2H], n = 0 and 1[RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]) Boot Address Register for 64-bit mode H (CA57CPUnBARH)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

CA57CPUnBARH is a 32-bit readable/writable register, which can be accessed only in longwords. This register can be changed only in the secure mode.

This register specifies the boot space of the Cortex-A57 in 64-bit addressing mode.

This register is initialized by PRESET# when WDTRSTCR.RESBAR2S = 0. This register is initialized by PRESET# and Soft Power On Reset (WDT reset or SRESCR.SPRES = 1) when WDTRSTCR.RESBAR2S = 1.

Note: Each RZ/G Series 2nd Generation product provides these registers as shown in Table 17.2.

17.2.14 Standby Flag Register n (STBCHRn) (n = 0 to 7)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

STBCHRn are 32-bit readable/writable registers. STBCHR0 to 3 can be changed only in the secure mode. STBCHR4 to 7 can be changed even if in the non-secure mode (no access protection). These registers are defined purely for software purpose. Setting these registers doesn't influence the LSI operation. As these bits are initialized only by PRESET#, the programmer can use this register at their convenience.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STBn[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STBn[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	STBn[31:0]	H'0000_0000	R/W	defined purely for software purpose

17.2.15 Soft Power On Reset Control Register (SRESCR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

SRESCR is a 32bit readable/writable register. This register can be changed only in the secure mode. This register is initialized only by PRESET#. The upper word of the write value should always be the code value H'5AA5. If the code value is read, it is always read as 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Code value (H'5AA5)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPRES	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	H'0000	R/W	Code value (H'5AA5) When read, returns 0.
15	SPRES	B'0	R/W	Soft Power On Reset Soft Power On Reset is asserted. This bit is initialized on Power On Reset. 0: Ignored 1: Soft Power On Reset is asserted. Note: Soft Power On Reset is asserted when 1 is written to this bit. When Power On Reset process is completed, this bit gets cleared (The range of initialization is same with Soft Power On Reset by WDT)
14 to 0	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.

17.2.16 SYS Reset Flag Register (SRSTFR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

SRSTFR is a 32bit readable/writable register. This register can be changed only in the secure mode. Write access is performed only to clear the flag bits. Access this register from System Core (Cortex-A57 or Cortex-A53 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0], Cortex-A53 [RZ/G2E], Cortex-A57 [RZ/G2N]). This register sets the reset flags when Soft Power On Reset (Power On Reset other than PRESET#) is detected. By reading this register at the time of reboot etc., it is known that which kind of reset was detected.
This register is initialized only by PRESET#.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	RCPRES	RCSWDT	RCRWDT	RPF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R(/W)*	R(/W)*	R(/W)*	R(/W)*

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved When read, returns 0. The write value should always be 0.
3	RCPRES	B'0	R(/W)*	Soft Power On Reset Factor Bit 0: SRESCR.SPRES is not Soft Power On Reset factor. 1: SRESCR.SPRES is Soft Power On Reset factor.
2	RCSWDT	B'0	R(/W)*	Soft Power On Reset Factor Bit 0: System-WDT is not Soft Power On Reset factor. 1: System-WDT is Soft Power On Reset factor.
1	RCRWDT	B'0	R(/W)*	Soft Power On Reset Factor Bit 0: RWDT is not Soft Power On Reset factor. 1: RWDT is Soft Power On Reset factor.
0	RPF	B'0	R(/W)*	Soft Power On Reset detection bit 0: Soft Power On Reset is not detected. 1: Soft Power On Reset is detected.

Note: * Write 0 to clear the flags.

17.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

17.3.1 Power-On Reset by PRESET# Pin

For the power-on oscillation settling time (tOSC), see section 73, Electrical Characteristics.

After the state on the PRESET# pin input is changed from a low level to high level, the internal reset state continues until the flash ROM reset time (longer than 50 µs), the flash ROM holding time (longer than 5 µs) and the reset holding time elapse.

(1) Sequence for Turning on the Power

When the power is turned on, ensure that a low level is input to the PRESET# pin. A low level input is also needed on the TRST# pin.

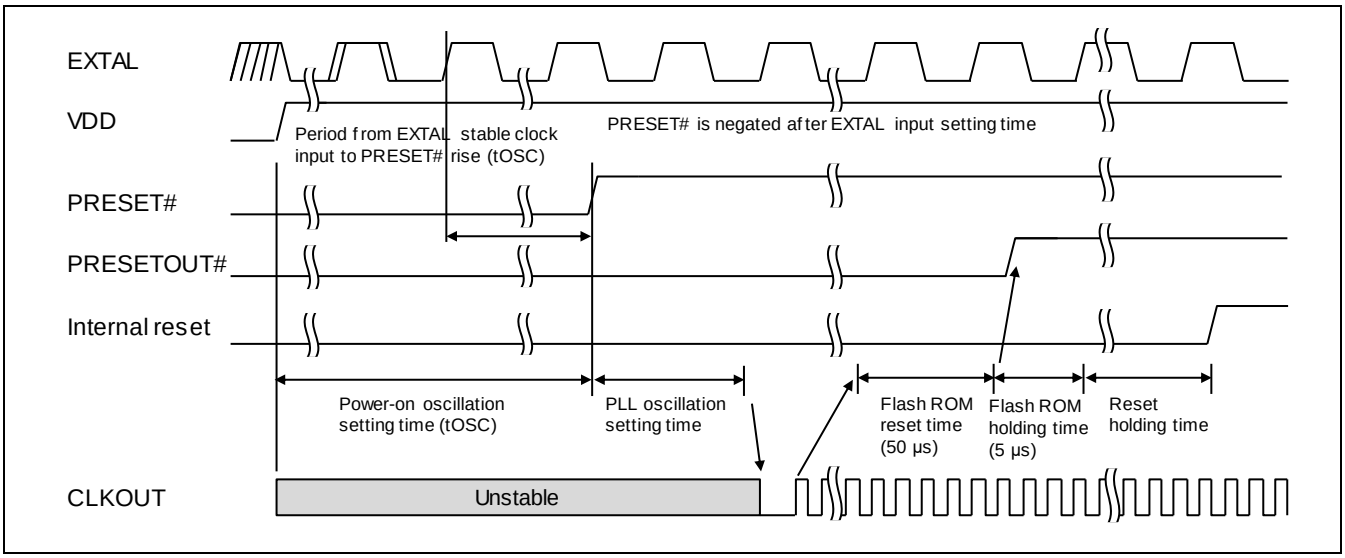

Figure 17.4 Free-Running Mode (MD0 = L)

17.3.2 WDT reset

- WDT resets can be issued by the RWDT and System WDT modules.
- WDTRSTCR controls the permission or prohibition of WDT resets.
- The reset (RST) module is not initialized by a WDT reset.

18. Interrupt Controller (INTC)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

18.1 Overview

This module handles system domain interrupt events.

18.1.1 Features

- INTC-AP handles system domain interrupt events, refer to section 19

18.1.2 Block Diagram

Figure 18.1 shows block diagram of connection between INTC and related modules. INTC module consists of synchronization.

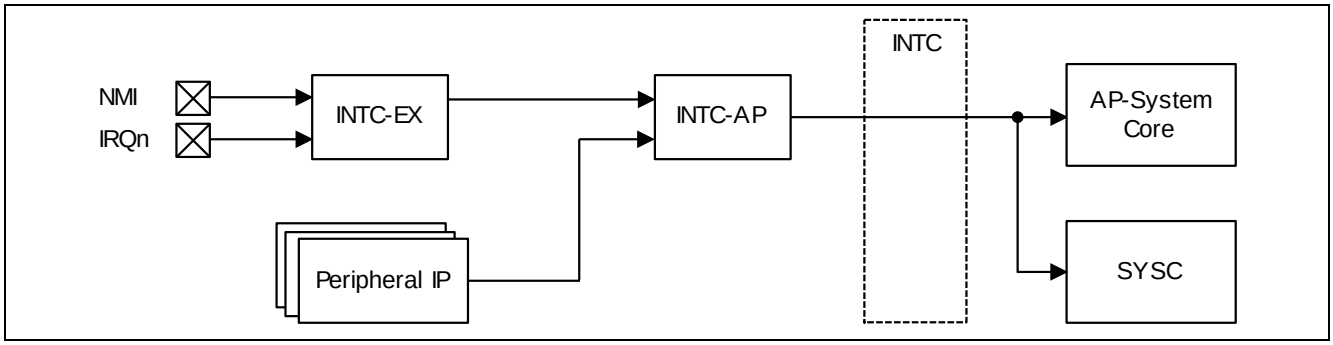

Figure 18.1 Block diagram of connection between INTC and related modules

18.1.3 External Pins

Refer to section 20.

18.1.4 Connected Module

Table 18.1 Connected Module

Module name	Connected module name	Function of connected module
INTC	AP-System Core	Application CPU core block
	INTC-EX	Provide interrupt from external device
	SYSC	Control the power supply to CPUs

19. Interrupt Controller (INTC-AP)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

19.1 Overview

This module handles system domain interrupt events. This module is integrated Arm CoreLink GIC-400(r0p0) which is compliant Arm GICv2.

19.1.1 Features

- Interrupt controller for AP-System core
- 32 programmable priority levels
- Arm-IRQ interrupt generation
- INTC-AP handles peripheral interrupt

19.1.2 Block Diagram

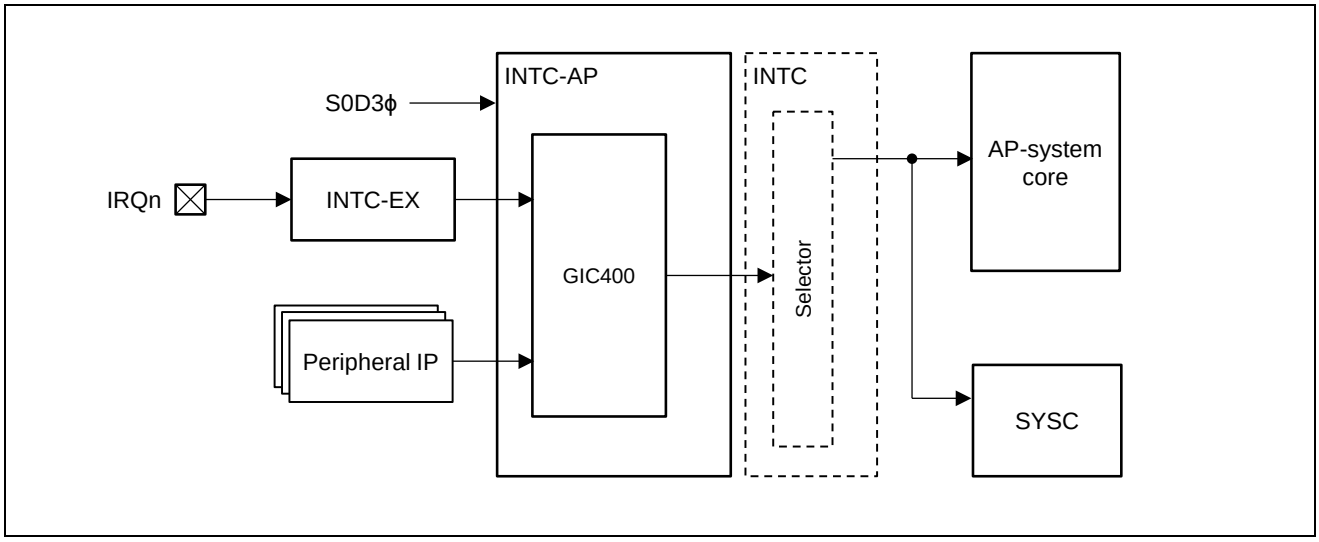

Figure 19.1 Block diagram of INTC-AP

19.1.3 External Pins

Refer to section 20.

19.1.4 Register Configuration

Refer to Arm Cortex-A57/Cortex-A53 Technical Reference Manual and Arm CoreLink GIC-400(r0p0) Generic Interrupt Controller Technical Reference Manual.

19.1.5 Connected Module

Table 19.1 Connected Module

Module name	Connected module name	Function of connected module
INTC-AP	AP-System Core	Application CPU core block
	INTC-EX	Provide interrupt from external device
	SYSC	Control the power supply to CPUs

19.2 Register Description

This section describes the registers of INTC-AP. If you want more detail information, refer to Arm Cortex-A57/Cortex-A53 Technical Reference Manual and Arm CoreLink GIC-400(r0p0) Generic Interrupt Controller Technical Reference Manual.

Table 19.2 Register Description

		Second Generation RZ/G Series Products			
GIC-400(r0p0) functional block	**Address range**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
INTC-AP Distributor	H'F101_0000 – H'F101_0FFF	√	√	√	√
INTC-AP CPU Interfaces	H'F102_0000 – H'F102_0FFF*1 H'F103_0000 – H'F103_0FFF*2	√	√	√	√
INTC-AP Virtual Interface control block, for the processor that is performing the access	H'F104_0000 – H'F104_0FFF	√	√	√	√
INTC-AP Virtual interface control block, for the processor selected by address bits[11:9]	H'F105_0000 – H'F105_01FF Alias for Processor 0 H'F105_0200 – H'F105_03FF Alias for Processor 1 … H'F105_0E00 – H'F105_0FFF Alias for Processor 7	√	√	√	√
INTC-AP Virtual CPU interfaces	H'F106_0000 – H'F106_0FFF H'F107_0000 – H'F107\0FFF	√	√	√	√

Notes: CPU Interface register base address is H'F102 0000.
1. Offset H'0000 to H'0FFF are assigned.
2. Offset H'1000 to H'1FFF are assigned.

19.3 Operation

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

INTC-AP is based on Arm Generic Interrupt Controller. For more information, see Arm Generic Interrupt Controller Architecture Specification and section 7, AP-System Core.

19.3.1 INTC-AP Register Configuration and Function Description

480 SPI interrupts are integrated into Interrupt ID [511:32].

The INTC-AP supports 8 CPU cores which are mapped as shown below.

Table 19.3 Port mapping for INTC-AP

	RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
CPU0 interface	AP-System core (Cortex-A57) CPU0	AP-System core (Cortex-A57) CPU0	AP-System core (Cortex-A57) CPU0	AP-System core (Cortex-A53) CPU0
CPU1 interface	AP-System core (Cortex-A57) CPU1	AP-System core (Cortex-A57) CPU1	AP-System core (Cortex-A57) CPU1	AP-System core (Cortex-A53) CPU1
CPU2 interface	AP-System core (Cortex-A57) CPU2	Reserved	Reserved	Reserved
CPU3 interface	AP-System core (Cortex-A57) CPU3	Reserved	Reserved	Reserved
CPU4 interface	AP-System core (Cortex-A53) CPU0	AP-System core (Cortex-A53) CPU0	Reserved	Reserved
CPU5 interface	AP-System core (Cortex-A53) CPU1	AP-System core (Cortex-A53) CPU1	Reserved	Reserved
CPU6 interface	AP-System core (Cortex-A53) CPU2	AP-System core (Cortex-A53) CPU2	Reserved	Reserved
CPU7 interface	AP-System core (Cortex-A53) CPU3	AP-System core (Cortex-A53) CPU3	Reserved	Reserved

For more information of these registers, see Arm Cortex-A57/Cortex-A53 Technical Reference Manual and Arm CoreLink GIC-400(r0p0) Generic Interrupt Controller Technical Reference Manual.

19.3.2 Interrupts Mapping

Table 19.4 shows the AP-system core interrupt controller (INTC-AP) interrupt mapping.

Note: SGI is Software Generated Interrupt, PPI is Private Peripheral Interrupt and SPI is Shared Peripheral Interrupt. All SPI interrupts should be level-sensitive configuration. If you want more detail information, refer to Arm Cortex-A57/Cortex-A53 Technical Reference Manual and Arm CoreLink GIC-400(r0p0) Generic Interrupt Controller Technical Reference Manual.

20. Interrupt Controller (INTC-EX)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

20.1 Overview

The INTC-EX is a common sub-module of interrupt controllers. This sub-module provides interrupt from external device and inter-domain communication.

20.1.1 Features

- Common module to handle the external NMI/IRQ inputs
- Edge-triggered on rising, falling or both
- Level-sensitive on high or low values
- IRQ signal debouncing, noise reduction and chattering

20.1.2 Block Diagram

Figure 20.1 and Figure 20.2 are block diagrams of INTC-EX.

The event detector block detects external IRQn, and supports noise reduction and edge detection.

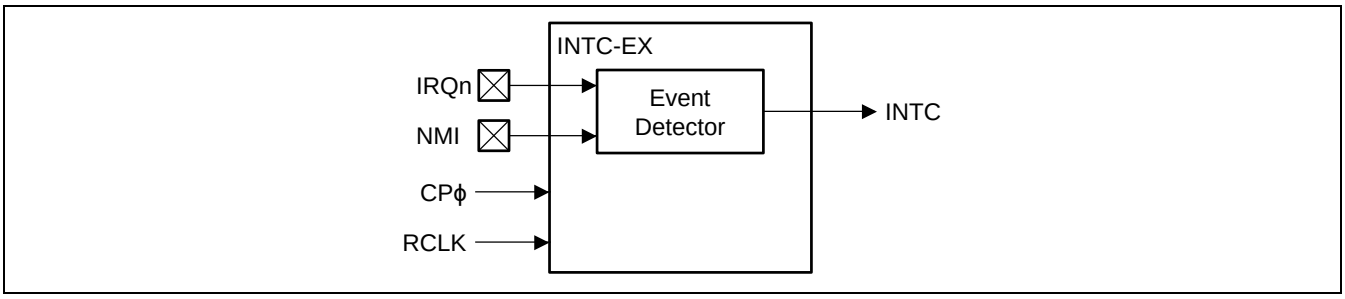

Figure 20.1 INTC-EX Block Diagram

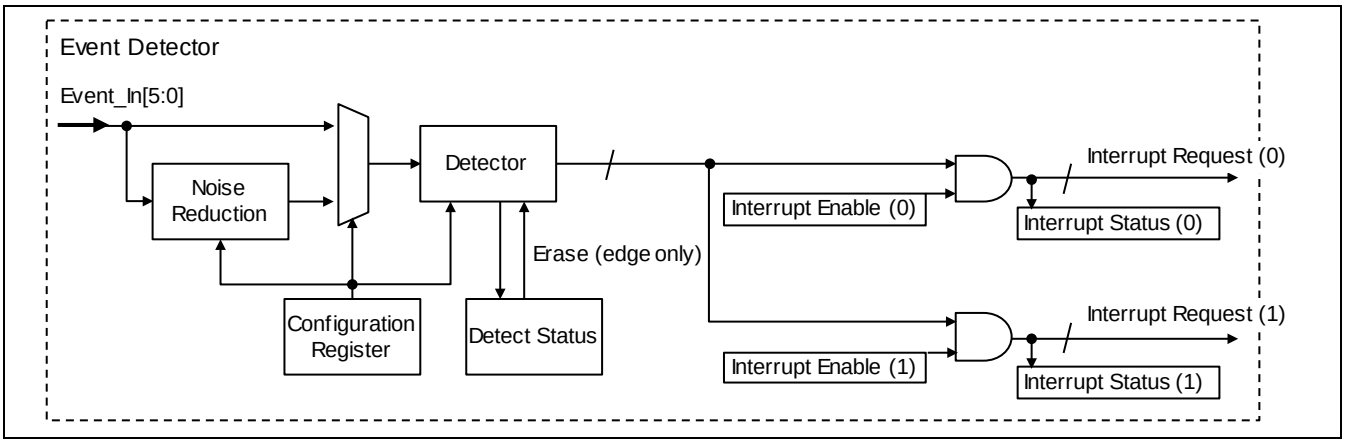

Figure 20.2 INTC-EX Event Detector

20.1.3 External Pins

Table 20.1 shows the INTC-EX pin configuration.

Table 20.1 Pin Configuration

				Second Generation RZ/G Series Products			
Pin Name	**Function**	**I/O**	**Description**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
IRQn (n = 0 to 5)	External interrupt input pins	Input	Input of IRQn interrupt request signals from external device. All IRQ signals are always active.	√	√	√	√
NMI	External non maskable Interrupt input pins	Input	Input of NMI interrupt request signal from external device.	√	√	√	√

20.1.4 Register Configuration

Table 20.2 shows the base address of each block and Table 20.3 to Table 20.5 show register configuration.

Table 20.2 INTC-EX Base Address

Module Name	Base Address
INTC-EX	H'E61C_0000
INTC-EX event detector block	H'E61C_0000
NMI event detector block	H'E61C_0400
NMI mask lock block	H'E61C_0A00

20.1.5 Connected Module

Table 20.6 Connected modules

Module name	Connected module name	Function of connected module
INTC-EX	INTC-AP	Interrupt controller for AP-System Core

20.2 Register Description

20.2.1 Interrupt Request Status Register0 (INTREQ_STS0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register shows interrupt request status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	INTREQ					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	INTREQ[5:0]	H'00	R	Interrupt Status 0: Interrupt not generation 1: Interrupt generation

20.2.2 Interrupt Enable Status Register0 (INTEN_STS0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register shows interrupt enable status and clear interrupt enable.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	INTEN					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	INTEN[5:0]	H'00	R/WC1	Interrupt Enable Read 0: Interrupt generation is disabled Read 1: Interrupt generation is enabled Write 0: No functional effect Write 1: Interrupt enable clear

20.2.3 Interrupt Enable Set Register0 (INTEN_SET0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register set interrupt enable.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	INTENS					
Initial value:	0	0	0	0	0	0	0	0	0	0	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	INTENS[5:0]	—	W	Interrupt Enable Set Write 0: No functional effect Write 1: Interrupt enable set

20.2.4 IRQn Detect Status Register (DETECT_STATUS)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register shows IRQn event detection status and provides the function to clear edge-triggered event. The status bit is cleared by writing 1 to the corresponding bit in edge-triggered mode. Writing 0 to this register bits does not affect to the register value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	IRQnDET					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	IRQnDET [5:0]	H'00	R/WC1	IRQn Event Detection Status Edge-triggered mode: Read 0: No interrupt request occurred Read 1: Interrupt request occurred Write 0: No functional effect Write 1: Cleared detection. Level-sensitive mode: Read 0: No interrupt request occurred. Read 1: Interrupt request occurred Write 0: No functional effect. Write 1: No functional effect.

Note: n = 5

20.2.5 IRQn Signal Level Monitor Register (MONITOR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register provides external signal monitor.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	IRQnMON					
Initial value:	0	0	0	0	0	0	0	0	0	0	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	IRQnMON [5:0]	—	R	IRQn External Signal Level Monitor This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: IRQn is low level 1: IRQn is high level

Note: n = 5

20.2.6 IRQn High Level Detect Status Register (HLVL_STS)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	IRQnHSTS					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	IRQnHSTS[5:0]	H'00	R	IRQn High Level Interrupt Status 0: IRQn high level interrupt request not occurred 1: IRQn high level interrupt request occurred

Note: n = 5

20.2.7 IRQn Low Level Detect Status Register (LLVL_STS)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31	CHTEN	B'0	R/W	Chattering Reduction Enable 0: Chattering reduction disabled 1: Chattering reduction enabled
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	STS1	B’00	R/W	IRQn Scan Timing These bits provide chattering reduction timing. B’00: 1 ms B’01: 2 ms B’10: 4 ms B’11: 8 ms
21 to 16	STS2	H’00	R/W	IRQn Chattering Reduction Period The chattering reduction period is defined by STS1 × STS2. H'00: No reduction H'01 to H'3F: STS1 × STS2 Notes: 1. These bits should not be set to H'00 when chattering reduction enable. 2. Check chattering reduction is disabled completely with corresponding bit of chattering reduction status register (CHTEN_STS) when this bit change.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	SS	H'00	R/W	Sense Selection B'00_0000: Disable event detection B'00_0001: Enable low level sensitive B'00_0010: Enable high level sensitive B'00_0100: Enable synchronous falling edge triggered B'00_1000: Enable synchronous rising edge triggered B'00_1100: Enable synchronous both edge triggered B'01_0000: Enable asynchronous falling edge triggered B'10_0000: Enable asynchronous rising edge triggered B'11_0000: Enable asynchronous both edge triggered Others : setting prohibit Note: The Asynchronous edge triggered can use only as follow conditions. + Chattering reduction not use. The synchronous edge triggered can use always.

20.2.14 NMI Request Status Register 0 (NMIREQ_STS0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register shows external NMI request status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

20.2.17 NMI Detect Status Register (DETECT_STATUS_NMI)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register shows NMIn event detection status and provides the function to clear edge-triggered event. The status bit is cleared by writing 1 to the corresponding bit in edge-triggered mode. Writing 0 to this register bits does not affect to the register value.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

20.2.18 NMI Signal Level Monitor Register (MONITOR_NMI)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register provides external signal monitor.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	NMI7 MON	NMI6 MON	NMI5 MON	NMI4 MON	NMI3 MON	NMI2 MON	NMI1 MON	NMI0 MON
Initial value:	0	0	0	0	0	0	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	NMI7MON	—	R	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0] NMI7 External Signal Level Monitor for CPU7 interface (INTC-AP) This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: NMI7 is low level 1: NMI7 is high level
				[RZ/G2N, RZ/G2E] Reserved These bits are always read as 0. The write value should always be 0.
6	NMI6MON	—	R	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0] NMI6 External Signal Level Monitor for CPU6 interface (INTC-AP) This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: NMI6 is low level 1: NMI6 is high level
				[RZ/G2N, RZ/G2E] Reserved These bits are always read as 0. The write value should always be 0.
5	NMI5MON	—	R	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0] NMI5 External Signal Level Monitor for CPU5 interface (INTC-AP) This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: NMI5 is low level 1: NMI5 is high level

Bit	Bit Name	Initial Value	R/W	Description
				[RZ/G2N, RZ/G2E] Reserved These bits are always read as 0. The write value should always be 0.
4	NMI4MON	—	R	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0] NMI4 External Signal Level Monitor for CPU4 interface (INTC-AP) This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: NMI4 is low level 1: NMI4 is high level
				[RZ/G2N, RZ/G2E] Reserved These bits are always read as 0. The write value should always be 0.
3	NMI3MON	—	R	[RZ/G2H] NMI3 External Signal Level Monitor for CPU3 interface (INTC-AP) This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: NMI3 is low level 1: NMI3 is high level
				[RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E] Reserved These bits are always read as 0. The write value should always be 0.
2	NMI2MON	—	R	[RZ/G2H] NMI2 External Signal Level Monitor for CPU2 interface (INTC-AP) This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: NMI2 is low level 1: NMI2 is high level
				[RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E] Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	NMI1MON	—	R	NMI1 External Signal Level Monitor for CPU1 interface (INTC-AP) This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: NMI1 is low level 1: NMI1 is high level
0	NMI0MON	—	R	NMI0 External Signal Level Monitor for CPU0 interface (INTC-AP) This function show input value when signal is enabled by corresponding configuration register SS bits. So, initial value depends on input value. 0: NMI0 is low level 1: NMI0 is high level

20.2.19 NMI High Level Detect Status Register (HLVL_STS_NMI)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register provides interrupt detail detect status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CHTEN	B’0	R	Chattering Reduction Enable Status 0: Chattering reduction disabled 1: Chattering reduction enabled

Note: After you set CHTEN.DEB_SET_NMI bit, this bit shows its status.
However, 3 cycles @ RCLK (32 kHz) is necessary to reflect the set value.

20.2.26 NMI Debounce Setting Register (DEB_SET_NMI)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register provides chattering reduction setting.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CHTEN	—	—	—	—	—	—	—	STS1		STS2					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CHTEN	B’0	R/W	Chattering Reduction Enable 0: Chattering reduction disabled 1: Chattering reduction enabled
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23, 22	STS1	B’00	R/W	NMI Scan Timing These bits provide chattering reduction timing. B’00: 1 ms B’01: 2 ms B’10: 4 ms B’11: 8 ms
21 to 16	STS2	H’00	R/W	NMI Chattering Reduction Period The chattering reduction period is defined by STS1 × STS2. H'00: No reduction H'01 to H'3F: STS1 × STS2 Note 1. These bits should not be set H'00 when chattering reduction enable. 2. Check chattering reduction is disabled completely with bit of chattering reduction status register (CHTEN_STS) when this bit change.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The writing value should always be 0.

20.2.27 NMI Configuration n Register (CONFIGn_NMI)

Note: n = 0 CPU0 interface (INTC-AP)
n = 1 CPU1 interface (INTC-AP)
n = 2 CPU2 interface (INTC-AP)
n = 3 CPU3 interface (INTC-AP)
n = 4 CPU4 interface (INTC-AP)
n = 5 CPU5 interface (INTC-AP)
n = 6 CPU6 interface (INTC-AP)
n = 7 CPU7 interface (INTC-AP)
For the CPUn interface, see section 19.INTC-AP Register Configuration and Function Description.

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register provides detection mode and noise reduction setting.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

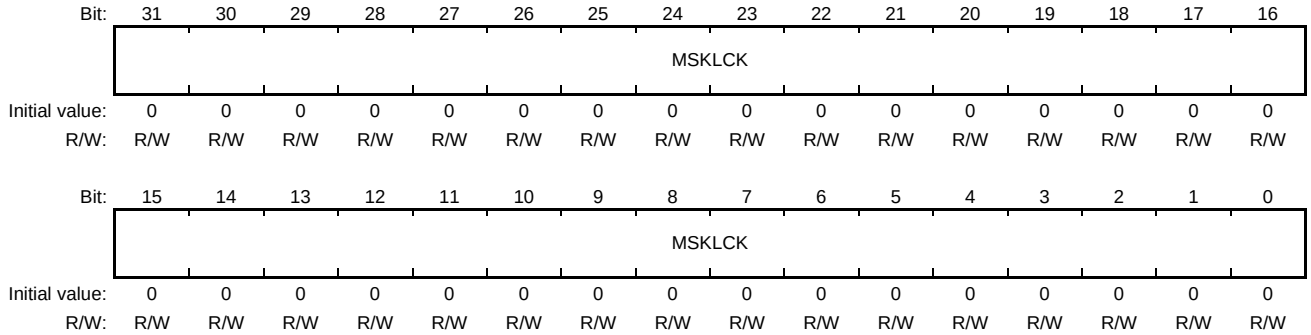
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SS					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SS	H'00	R/W	Sense Selection B'00_0000: Disable event detection B'00_0001: Enable low level sensitive B'00_0010: Enable high level sensitive B'00_0100: Enable synchronous falling edge triggered B'00_1000: Enable synchronous rising edge triggered B'00_1100: Enable synchronous both edge triggered B'01_0000: Enable asynchronous falling edge triggered B'10_0000: Enable asynchronous rising edge triggered B'11_0000: Enable asynchronous both edge triggered Others: setting prohibit Note: The Asynchronous edge triggered can be used only following conditions. - Chattering reduction not be used. - Only low level sensitive can be used for Arm.

20.2.28 NMI Mask Lock Set Register (NMI_LCK)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register provides NMI mask locking feature. When set the same value as NMI_LCKCODE, then NMI cannot be masked by software (always accept NMI interrupt).

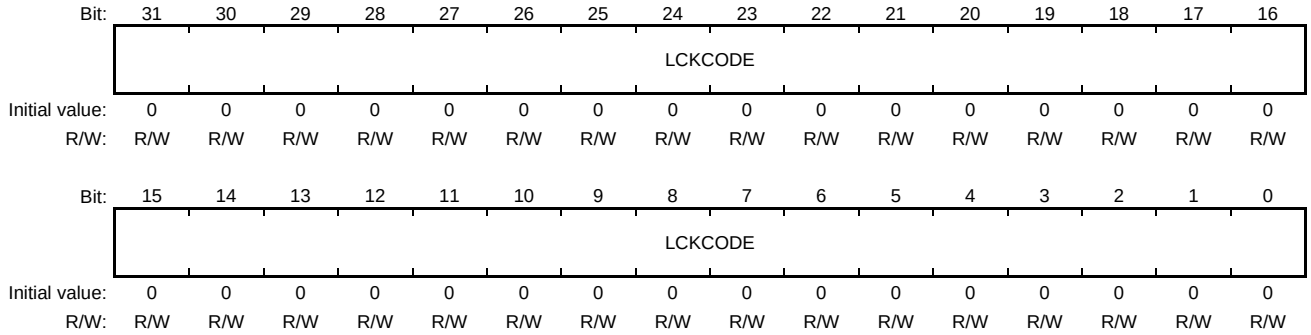


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MSKLCK	All 0	R/W	Lock code setting

20.2.29 NMI Lock Code Register (NMI_LCKCODE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register sets the value for lock code of NMI mask.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LCKCODE	H'0000_0000	R/W	NMI mask lock code setting

20.2.30 NMI Debug Control Enable Register (NMI_DBG)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register enables the debug feature for NMI mask lock.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved
0	DBGEN	B'0	R/W	Enable debug for NMI mask lock feature

20.2.31 NMI Debug Code Register (NMI_DBGCODE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

This register sets value for debug code of NMI mask lock. When set the following value, then unlock this mask feature.

DBGCODE[31:0] = ~(NMI_LCKCODE.LCKCODE[31:0] (bit reversed))

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DBGCODE															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DBGCODE															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DBGCODE	H'0000_0000	R/W	NMI mask lock debug code setting

20.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

20.3.1 NMI Mask Lock Feature

NMI can be masked by setting NMI Mask Lock Set Register. If you set the lock code to NMI lock code register and set the same lock code to NMI lock set register, then NMI cannot be masked by software (locked NMI mask). If you want to unlock NMI mask, you need to set DBGEN bit of NMI debug control register and set the unlock code to the NMI debug code register.

20.3.2 Procedure of NMI Mask Lock

- Lock feature

1. Write the lock code to NMI lock code register
   ex) Write32 (INTC-EX_BASE + H'0A04), H'00A_CCE55
2. Write the lock code to NMI mask lock set register
   ex) Write32 (INTC-EX_BASE + H'0A00), H'00AC_CE55
3. Write access to NMI lock code register and NMI mask lock set register
   — Check whether these registers cannot be updated

- Unlock feature

1. Set enable bit to NMI debug control register
   ex) Write32 (INTC-EX_BASE + H'0A08), H'0000_0001
2. Write unlock code to NMI debug code register
   ex) Write32 (INTC-EX_BASE + H'0A0C), H'558C_CAFF
3. Write access to NMI lock code register and NMI mask lock register
   — Check whether these registers can be updated

21. AXI-bus

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

21.1 Overview

AXI-bus is the On-Chip interconnect bus based on the AMBA® Advanced extensible Interface (AXI) Protocol Specification. AXI-bus has the hierarchical structure and there are the following domains.

- 3DGE (3D-Graphic) domain AXI
- VP (Video Processor) domain AXI (RZ/G2H, RZ/G2N, RZ/G2E)
- VC (Video Codec) domain AXI
- VIO (Video IO) domain AXI
- Peripheral (PeriE/PeriW) domain AXI
- Audio domain AXI
- HC (High Communication) domain AXI
- CPU domain AXI
- Main Memory domain AXI
- Slave Access Bus

21.1.1 Features

- Bus protocol: AXI3 with QoS Control
- Frequency: 266MHz/400MHz/533MHz
- Bus width: 64bits/128bits/256bits/512bits
- Quality-of-Service (QoS)
- Cache snoop function for CPU (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0)
- Provide flexible SDRAM address mapping. Linear mapping allocates a continuous address space to every single memory controller. Split mapping provides an interleaved address space to four memory controllers at 4KB granularity.
- Decompression of visual near lossless compressed image
- Access protection for secure regions
- Low Power function

21.1.2 Block Diagram

Figure 21.1 to Figure 21.4 are block diagrams of the AXI-bus.

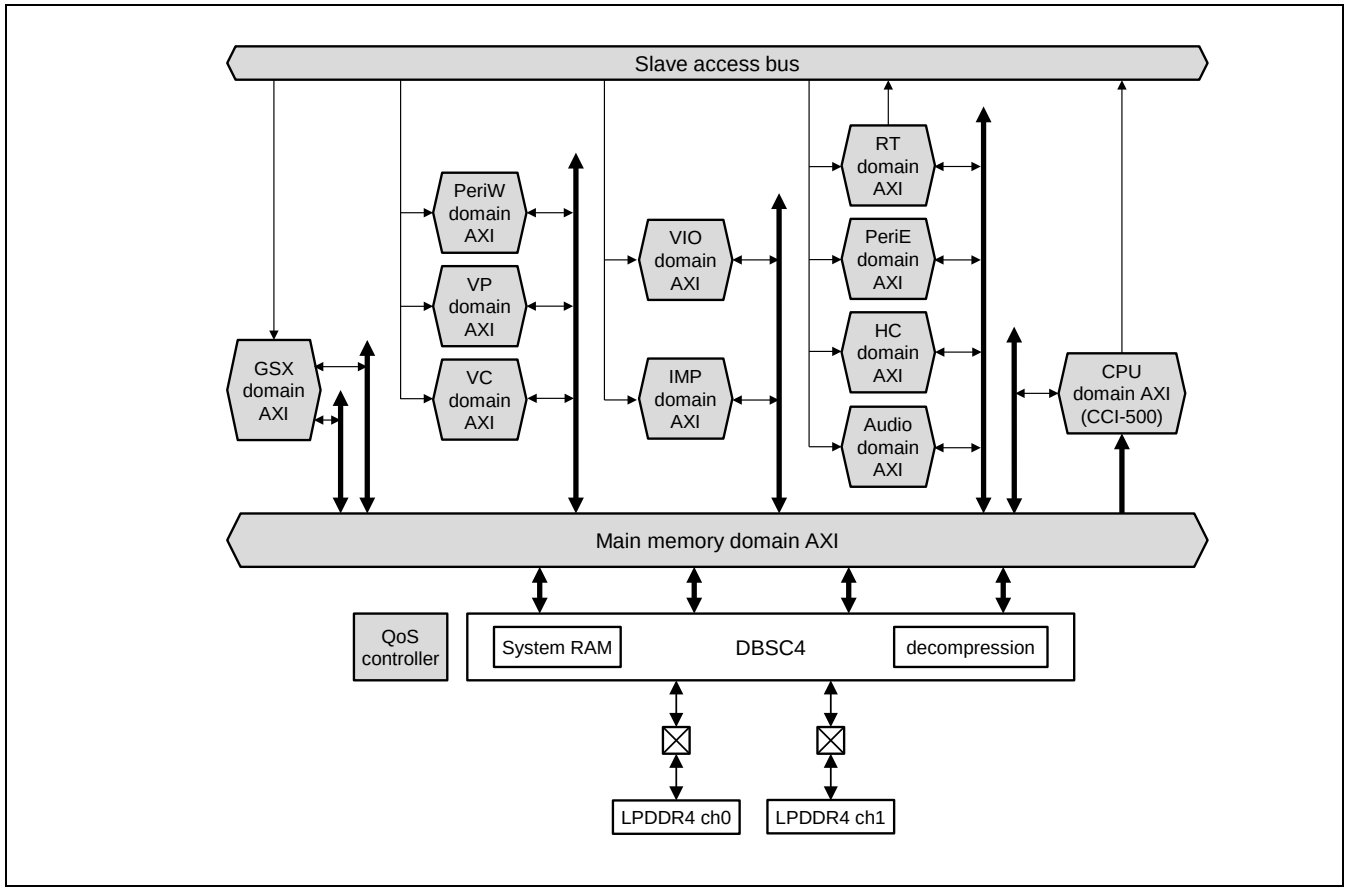


Figure 21.1 Block diagram of AXI-bus [RZ/G2H]

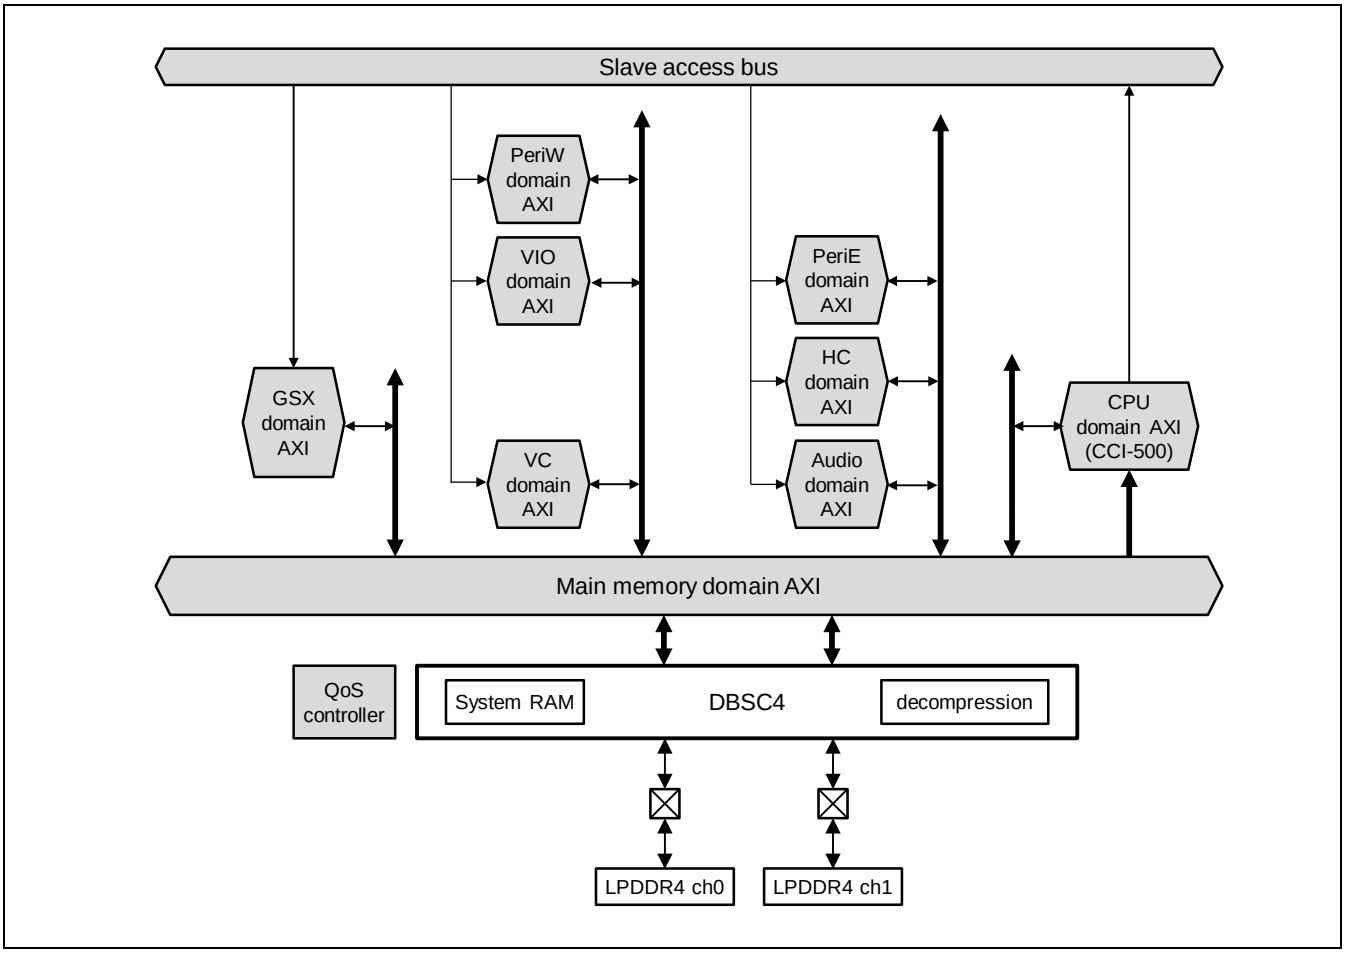

Figure 21.2 Block diagram of AXI-bus [RZ/G2M V1.3, RZ/G2M V3.0]

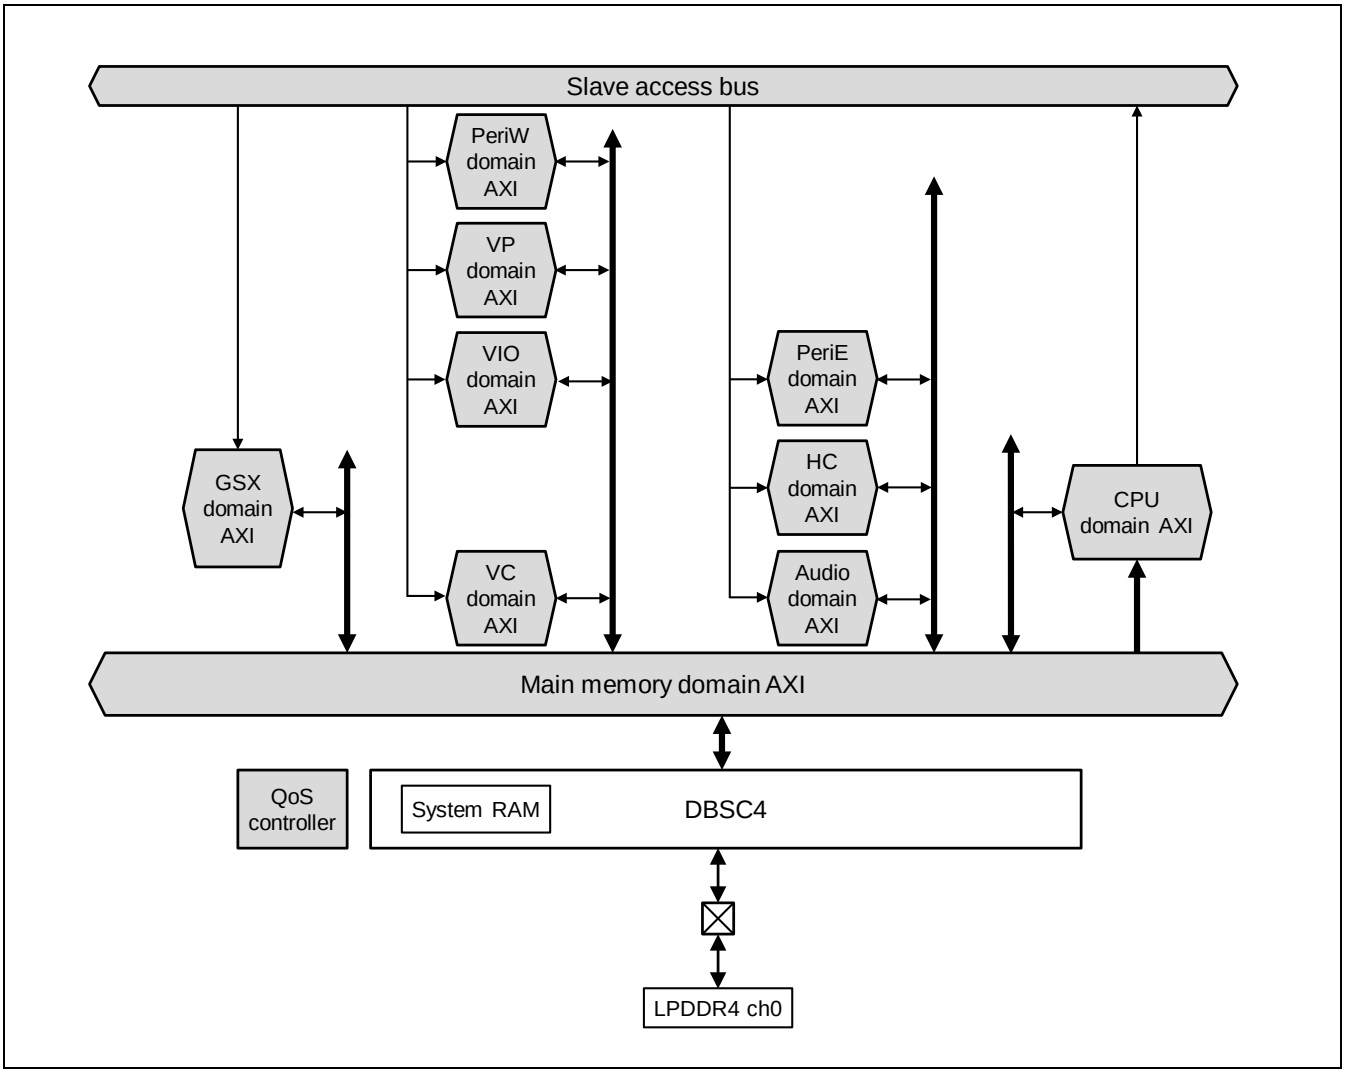

Figure 21.3 Block diagram of AXI-bus [RZ/G2N]

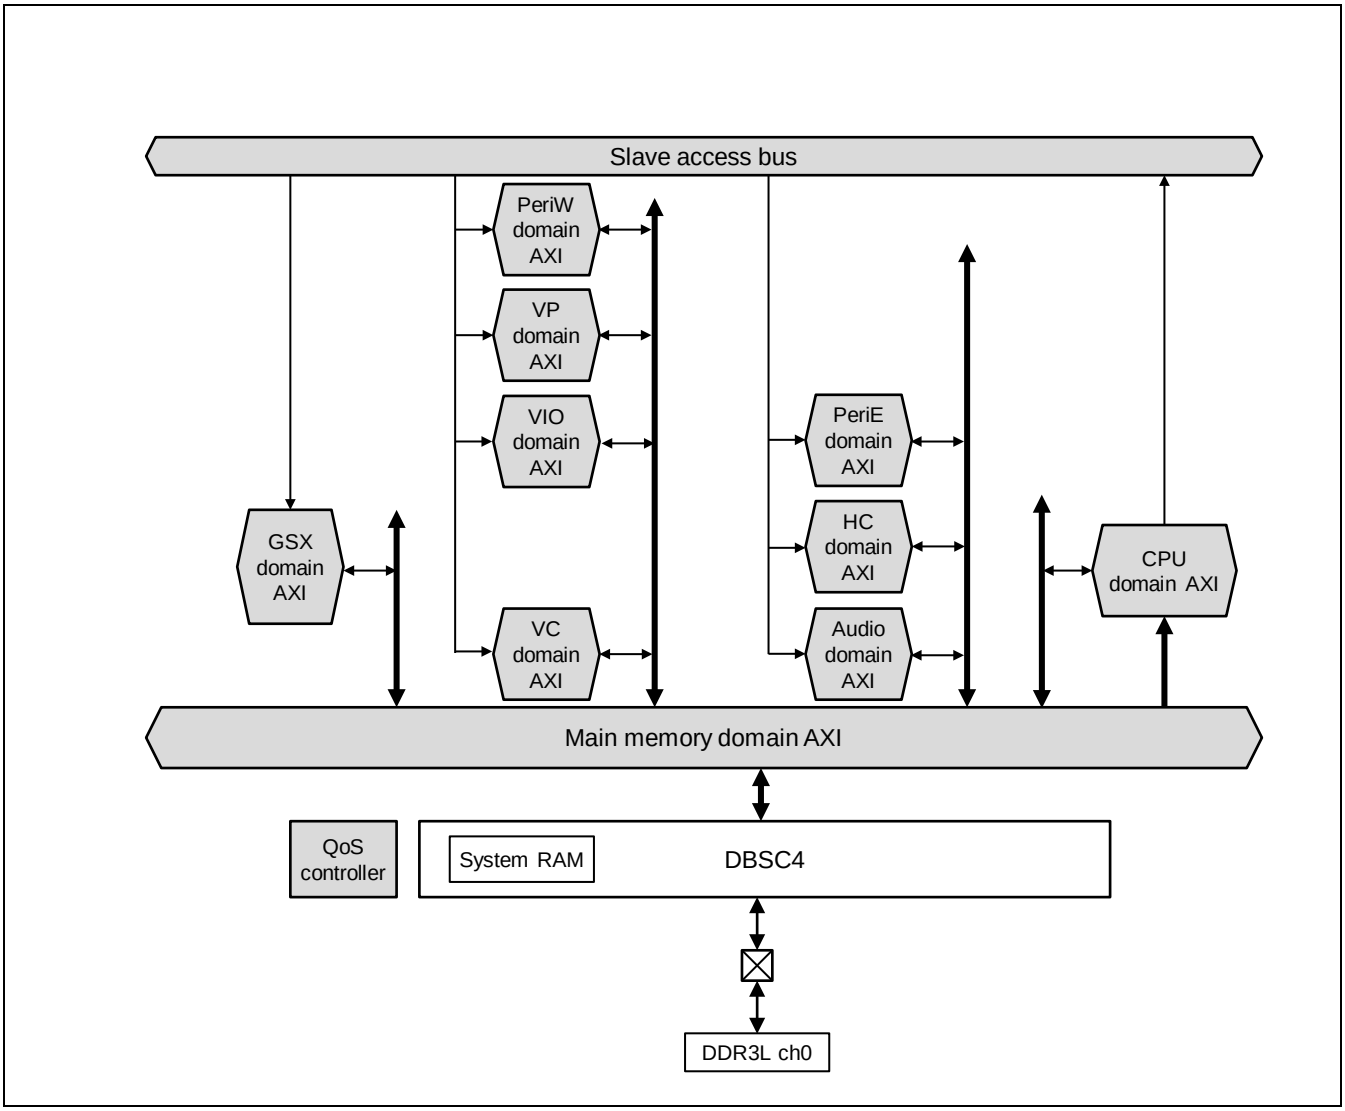

Figure 21.4 Block diagram of AXI-bus [RZ/G2E]

21.1.3 External Pins

No external pins are supported.

21.2 Register Description

21.2.1 Address Split Control Register0 (ADSPLCR0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	—	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADRMODE	—	—	—	—	—	—	—	SPLITSEL[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	AREA[4:0]					—	—	—	SWP[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	ADRMODE	B’0	R/W	Select address mapping mode 0: default mode(Gen2) 1: Gen1 mode Set 0 on this bit.
30 to 24	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SPLITSEL	H’00	R/W	Specify the areas in 4ch split mode translated through SWP. Each bit of SPLITSEL represents the number of area (0-7) Set below value on these bits: H’00
15 to 13	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	AREA	H’00	R/W	Indicate the address bit which divides DBSC address space into 8 areas. Set below value on these bits: RZ/G2H: H'1C RZ/G2M V1.3: H’00 RZ/G2M V3.0: H’00
7 to 5	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	SWP	H’00	R/W	Indicate the address bit to interleave DBSCs in 4ch split mode. Set below value on these bits: RZ/G2H: H’00 RZ/G2M V1.3: H’00 RZ/G2M V3.0: H’00

21.2.2 Address Split Control Register1 (ADSPLCR1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	—	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SPLITSEL[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	AREA[4:0]					—	—	—	SWP[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SPLITSEL	H'00	R/W	Specify the areas in 2ch split mode translated through SWP. Each bit of SPLITSEL represents the number of area (0-7) Set H'FF on these bits.
15 to 13	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	AREA	H'00	R/W	Indicate the address bit which divides DBSC address space into 8 areas. Set H'1C on these bits.
7 to 5	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	SWP	H'00	R/W	Indicate the address bit to interleave DBSCs in 2ch split mode. Set H'0C on these bits.

21.2.3 Address Split Control Register2 (ADSPLCR2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	refsslot	H'3	R/W	refsslot Setting. Set 0x3 on these bits. A value other than above must not be set to these bits. These bits are used when refresh_mode bit of QOSCTRL_STATQC is 0.
23 to 20	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	slotsslot	H'7	R/W	slotsslot Setting. Set 0x5 on these bits. A value other than above must not be set to these bits.
15 to 9	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	sslotclk	H'0FA	R/W	sslotclk Setting. Set below values depending on DDR refresh interval period. 1.89 usec refresh interval: H'07D 3.78 usec refresh interval: H'0FB [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] H'0AE [RZ/G2E] 7.80 usec refresh interval: H'15D [RZ/G2E]

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.19 QOSCTRL REF ARS Register (QOSCTRL_REF_ARS)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: There are unsupported products depending on its refresh interval period;
1.89 usec: RZ/G2E is not supported.
7.80 usec: RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N are not supported.
In this case, arbstopcycle field value is always read as 0 and the write value should always be 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	arbstopcycle								
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	arbstopcycle	H'064	R/W	arbstopcycle Setting. Set below values depending on DDR refresh interval period. 1.89 usec refresh interval: H'078 3.78 usec refresh interval: H'0F6 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 3.90 usec: refresh interval: H'102 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] H'0A9 [RZ/G2E] 7.80 usec: refresh interval: H'158 [RZ/G2E]
15 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.20 QOSCTRL REF ENBL Register (QOSCTRL_REF_ENBL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	refssloten															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	refssloten	H'0000	R/W	refssloten Setting. Set H'0000 on these bits. These bits are used when refresh_mode bit of QOSCTRL_STATQC is 1. A value other than above must not be set to these bits.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.21 QOSCTRL STATQC Register (QOSCTRL_STATQC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	refresh_mode	—	—	—	—	—	—	—	statqen
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
8	refresh_mode	B'0	R/W	refresh_mode setting. Set 0x0 on this bit. This bit must be set with statqen bit.
7 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	statqen	B'0	R/W	QOS control Enable 0: Disable 1: Enable.

21.2.22 QOSCTRL MEMBANK Register (QOSCTRL_MEMBANK)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	exe_membank	—	—	—	—	—	—	—	membank
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
8	exe_membank	B'0	R/W	Current using bank of QOSBW Status. 0: using QOSBW_FIX_QOS_BANK0 and QOSBW_BE_QOS_BANK0 1: using QOSBW_FIX_QOS_BANK1 and QOSBW_BE_QOS_BANK1
7 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	membank	B'0	R/W	Bank of QOSBW_FIX_QOS_BANK0, QOSBW_FIX_QOS_BANK1, QOSBW_BE_QOS_BANK0 and QOSBW_BE_QOS_BANK1 registers to control QOS Setting.* 0: use QOSBW_FIX_QOS_BANK0 and QOSBW_BE_QOS_BANK0 1: use QOSBW_FIX_QOS_BANK1 and QOSBW_BE_QOS_BANK1

Notes: * Bit [8](exe_membank) specifies "Current Bank" of QOSBW_FIX QOS_BANK and QOSBW_BE_QOS_BANK. Shifting QOSBW_FIX QOS_BANK and QOSBW_BE_QOS_BANK, write opposite value of read value of Bit [8](exe_membank) to Bit [0](membank). Subsequently, set equivalent QOSBW_FIX QOS_BANK and QOSBW_BE_QOS_BANK.
(ex. Bit [8] = 1'b0; write 1'b1 to Bit [0] and set QOSBW_FIX QOS_BANK1 and QOSBW_BE_QOS_BANK1, vice versa.)
Do not write any value other than mentioned above.
This register can be written regardless of statqen bit value of QOSCTRL_STATQC register.

21.2.23 QOSCTRL RAS Register (QOSCTRL_RAS)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	EnumInit							
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	EnumInit	H’20	R/W	EnumInit Setting. Set below value on each product: RZ/G2H: H’44 RZ/G2M V1.3, RZ/G2M V3.0: H’44 RZ/G2N: H'28 RZ/G2E: H'20 Notice: Above value for , RZ/G2H and RZ/G2M V1.3 and RZ/G2M V3.0 are based on below condition. - Number of DRAM CH: RZ/G2H: 32bits × 2CH RZ/G2M V1.3, RZ/G2M V3.0: 32bits × 2CH - Split Mapping: All area is set as split mapping. For other configuration case, please contact Renesas.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.24 QOSCTRL DANT Register (QOSCTRL_DANT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	DAccNodeThreshold2						
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

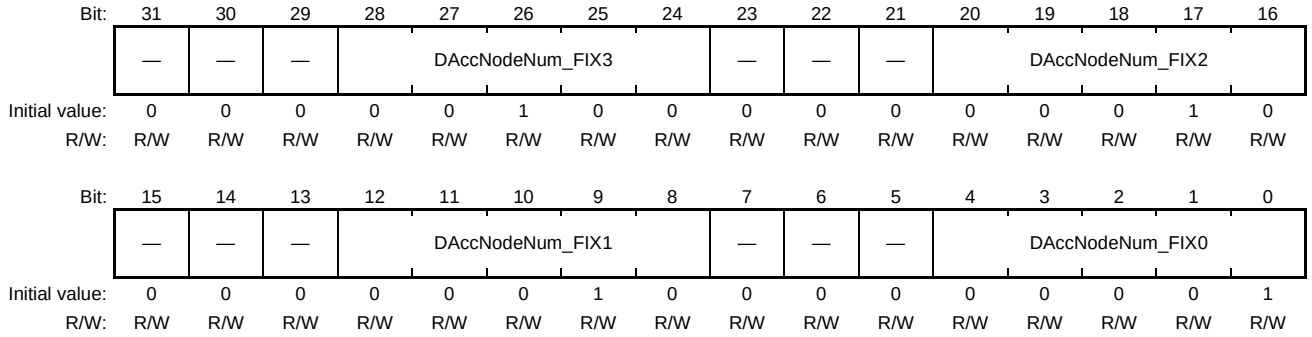
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DAccNodeThreshold1							—	DAccNodeThreshold0						
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
22 to 16	DAccNodeThreshold2	H’20	R/W	DAccNodeThreshold2 Setting. Set below value on these bits: RZ/G2H, RZ/G2M Ver1.3, RZ/G2M Ver.3.0: H’20 Others: H’10 A value other than above must not be set to these bits.
15	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
14 to 8	DAccNodeThreshold1	H’10	R/W	DAccNodeThreshold1 Setting. Set below value on these bits. RZ/G2H, RZ/G2M Ver1.3, RZ/G2M Ver.3.0: H’10 Others: H’08 A value other than above must not be set to these bits.
7	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	DAccNodeThreshold0	H’08	R/W	DAccNodeThreshold0 Setting. Set below value on these bits. RZ/G2H, RZ/G2M Ver1.3, RZ/G2M Ver.3.0: H’0A Others: H’04 A value other than above must not be set to these bits.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.25 QOSCTRL DANN LOW Register (QOSCTRL_DANN_LOW)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
28 to 24	DAccNodeNum_FIX3	H'04	R/W	DAccNodeNum_FIX3 Setting. Set H'02 on these bits. These bits setting range is 0, 1, 2, 4, 8 or 16.
23 to 21	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	DAccNodeNum_FIX2	H'02	R/W	DAccNodeNum_FIX2 Setting. Set H'02 on these bits. These bits setting range is 0, 1, 2, 4, 8 or 16.
15 to 13	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	DAccNodeNum_FIX1	H'02	R/W	DAccNodeNum_FIX1 Setting. Set H'02 on these bits. These bits setting range is 0, 1, 2, 4, 8 or 16.
7 to 5	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	DAccNodeNum_FIX0	H'01	R/W	DAccNodeNum_FIX0 Setting. Set H'01 on these bits. These bits setting range is 0, 1, 2, 4, 8 or 16.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.26 QOSCTRL DANN HIGH Register (QOSCTRL_DANN_HIGH)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	DAccNodeNum_BE3					—	—	—	DAccNodeNum_BE2				
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DAccNodeNum_BE1					—	—	—	DAccNodeNum_BE0				
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
28 to 24	DAccNodeNum_BE3	H’04	R/W	DAccNodeNum_BE3 Setting. Set H'04 on these bits. These bits setting range is 0, 1, 2, 3, 4, 5, 8, 9 or 16.
23 to 21	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	DAccNodeNum_BE2	H’02	R/W	DAccNodeNum_BE2 Setting. Set below value on these bits: Other than RZ/G2N: H’04 RZ/G2N: H'02 These bits setting range is 0, 1, 2, 3, 4, 5, 8, 9 or 16.
15 to 13	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	DAccNodeNum_BE1	H’02	R/W	DAccNodeNum_BE1 Setting. Set below value on these bits: RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E: H'2 RZ/G2N: H'00 These bits setting range is 0, 1, 2, 3, 4, 5, 8, 9 or 16.
7 to 5	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	DAccNodeNum_BE0	H’01	R/W	DAccNodeNum_BE0 Setting. Set H'00 on these bits. These bits setting range is 0, 1, 2, 3, 4, 5, 8, 9 or 16.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.27 QOSCTRL EMS LOW Register (QOSCTRL_EMS_LOW)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	emaxschedule7			—	emaxschedule6			—	emaxschedule5			—	emaxschedule4		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	emaxschedule3			—	emaxschedule2			—	emaxschedule1			—	emaxschedule0		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
30 to 28	emaxschedule7	B’000	R/W	emaxschedule7 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
27	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	emaxschedule6	B’000	R/W	emaxschedule6 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
23	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
22 to 20	emaxschedule5	B’000	R/W	emaxschedule5 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
19	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	emaxschedule4	B’000	R/W	emaxschedule4 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
15	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	emaxschedule3	B’000	R/W	emaxschedule3 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
11	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	emaxschedule2	B’000	R/W	emaxschedule2 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
7	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
6 to 4	emaxschedule1	B’000	R/W	emaxschedule1 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
3	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	emaxschedule0	B’000	R/W	emaxschedule0 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.28 QOSCTRL EMS HIGH Register (QOSCTRL_EMS_HIGH)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	emaxschedule15			—	emaxschedule14			—	emaxschedule13			—	emaxschedule12

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	emaxschedule11			—	emaxschedule10			—	emaxschedule9			—	emaxschedule8		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
30 to 28	emaxschedule15	B’000	R/W	emaxschedule15 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
27	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	emaxschedule14	B’000	R/W	emaxschedule14 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
23	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
22 to 20	emaxschedule13	B’000	R/W	emaxschedule13 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
19	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	emaxschedule12	B’000	R/W	emaxschedule12 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
15	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	emaxschedule11	B’000	R/W	emaxschedule11 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
11	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	emaxschedule10	B’000	R/W	emaxschedule10 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.

Bit	Bit Name	Initial Value	R/W	Description
7	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
6 to 4	emaxschedule9	B’000	R/W	emaxschedule9 Setting. Set B’000 on these bits. The range of these bits is B’000 to B’100.
3	—	B'0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	emaxschedule8	B’000	R/W	emaxschedule8 Setting. Set B’000 on these bits The range of these bits is B’000 to B’100.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

[RZ/G2H]

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	early_return_ mode	B’0	R/W	early_return_mode Setting. Set 0 on this bit.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

[RZ/G2M V3.0, RZ/G2N, RZ/G2E]

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	early_return_ mode	B’00	R/W	early_return_mode Setting. Set below value on these bits: RZ/G2N: B’01 Others: B'00

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.30 QOSCTRL RACNT0 Register (QOSCTRL_RACNT0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	gpu_ticket mode		—	—	—	—	be_ticket_mask _cycle		ticket_mask cycle	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	swapin inform disable	beticket mask disable
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	gpu_ticket_mode	B'00	R/W	[RZ/G2M V1.3, RZ/G2M V3.0] gpu_ticket_mode Setting. Set B'10 on these bits. A value other than above must not be set to these bits. [Other Product] Reserved These bits are always read as 0. The write value should always be 0.
23 to 20	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
19, 18	be_ticket_mask_cycle	B'00	R/W	[RZ/G2N, RZ/G2E] be_ticket_mask_cycle Setting. Set B'00 on these bits. A value other than above must not be set to these bits. [Other Product] Reserved These bits are always read as 0. The write value should always be 0.
17, 16	ticket_mask_cycle	B'00	R/W	ticket_mask_cycle Setting. Set B'01 on these bits. A value other than above must not be set to these bits.
15 to 2	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
1	swapin_inform_disable	B'0	R/W	swapin_inform_disable Setting. Set 1 on this bit. A value other than above must not be set to this bit.

Bit	Bit Name	Initial Value	R/W	Description
0	beticket_mask_disable	B'0	R/W	beticket_mask_disable Setting. Set B'1 on this bit. A value other than above must not be set to this bit.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.31 QOSCTRL INSFC Register (QOSCTRL_INSFC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	insfclear_sslot															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	insfclear_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	insfclear_sslot	H'0000	R/W	insfclear_sslot Setting. Set H'0633 on these bits. A value other than above must not be set to these bits.
15 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	insfclear_en	B'0	R/W	insfclear_en Enable. Set 1 on this bit. A value other than above must not be set to this bit.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.32 QOSCTRL RAEN Register (QOSCTRL_RAEN)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RAlloc Enable
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	RAllocEnable	B'0	R/W	RAllocEnable Enable. This bit must be set 1 before QOSCTRL_STATQC setting..

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.33 QOSCTRL STATGEN0 Register (QOSCTRL_STATGEN0)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	—	√	—	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	gpu ticket mode
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	gpu_ticket_mode	B’0	R/W	gpu_ticket_mode Setting Set 1 on this bit. A value other than above must not be set to this bit.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.34 QOSWT WTEN Register (QOSWT_WTEN)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

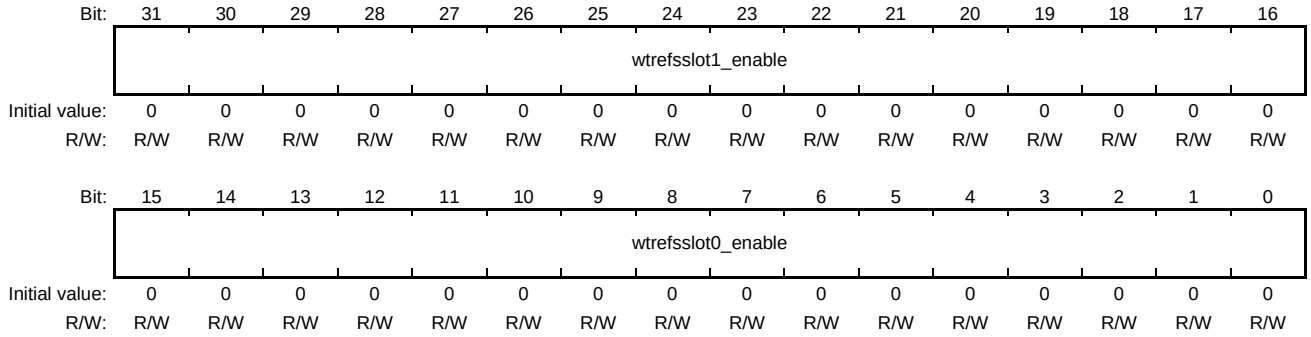
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	wtbank_en
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	wtbank_en	B'0	R/W	wtbank_en Enable. Using the Write DQ training, set this bit "1" after setting PMSTREN bit of DBDFIPMSTRCNF "1", and WTMODE of DBDFIPMSTRCNF "B'01". 0: Disable 1: Enable

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.35 QOSWT WTREF Register (QOSWT_WTREF)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

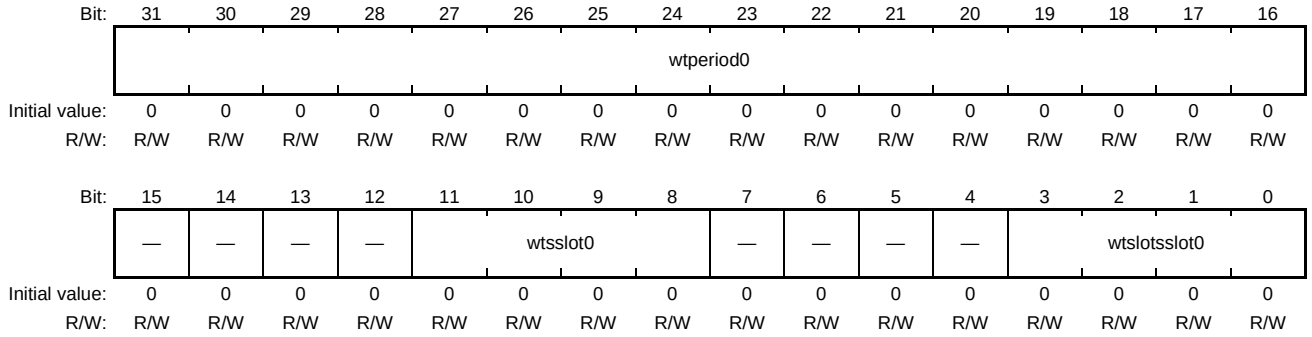


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	wtrefsslot1_enable	H'0000	R/W	wtrefsslot1_enable Setting. Set below value on these bits: RZ/G2E: H'0000 Others: H'0001 A value other than above must not be set to these bits.
15 to 0	wtrefsslot0_enable	H'0000	R/W	wtrefsslot0_enable Setting. Set below value on these bits: RZ/G2E: H'0000 Others: H'0001 A value other than above must not be set to these bits.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.36 QOSWT WTSET0 Register (QOSWT_WTSET0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

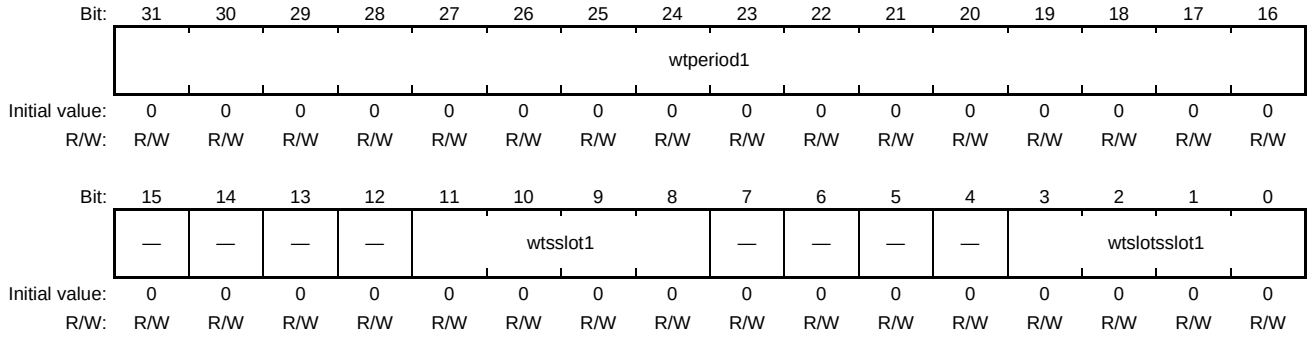


Bit	Bit Name	Initial Value	R/W	Description
31 to 16	wtperiod0	H'0000	R/W	wtperiod0 Setting. Set below value on these bits: RZ/G2E: H'0000 Others: 1.89 usec refresh interval: H'2955 3.78 usec refresh interval: H'14AA A value other than above must not be set to these bits.
15 to 12	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	wtsslot0	H'0	R/W	wtsslot0 Setting. Set below value on these bits: RZ/G2E: H'0 Others: H'4 A value other than above must not be set to these bits.
7 to 4	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	wtslotsslot0	H'0	R/W	wtslotsslot0 Setting. Set below value on these bits: RZ/G2E: H'0 Others: H'B A value other than above must not be set to these bits.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.37 QOSWT WTSET1 Register (QOSWT_WTSET1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	wtperiod1	H'0000	R/W	wtperiod1 Setting. Set below value on these bits: RZ/G2E: H'0000 Others: 1.89 usec refresh interval: H'2955 3.78 usec refresh interval: H'14AA A value other than above must not be set to these bits.
15 to 12	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	wtsslot1	H'0	R/W	wtsslot1 Setting. Set below value on these bits: RZ/G2E: H'0 Others: H'4 A value other than above must not be set to these bits.
7 to 4	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	wtslotsslot1	H'0	R/W	wtslotsslot1 Setting. Set below value on these bits: RZ/G2E: H'0 Others: H'B A value other than above must not be set to these bits.

Note: This register must be written during statqen bit of QOSCTRL_STATQC register is 0.

21.2.38 QOSBW FIX QOS BANK0 Register n (QOSBW_FIX_QOS_BANK0)

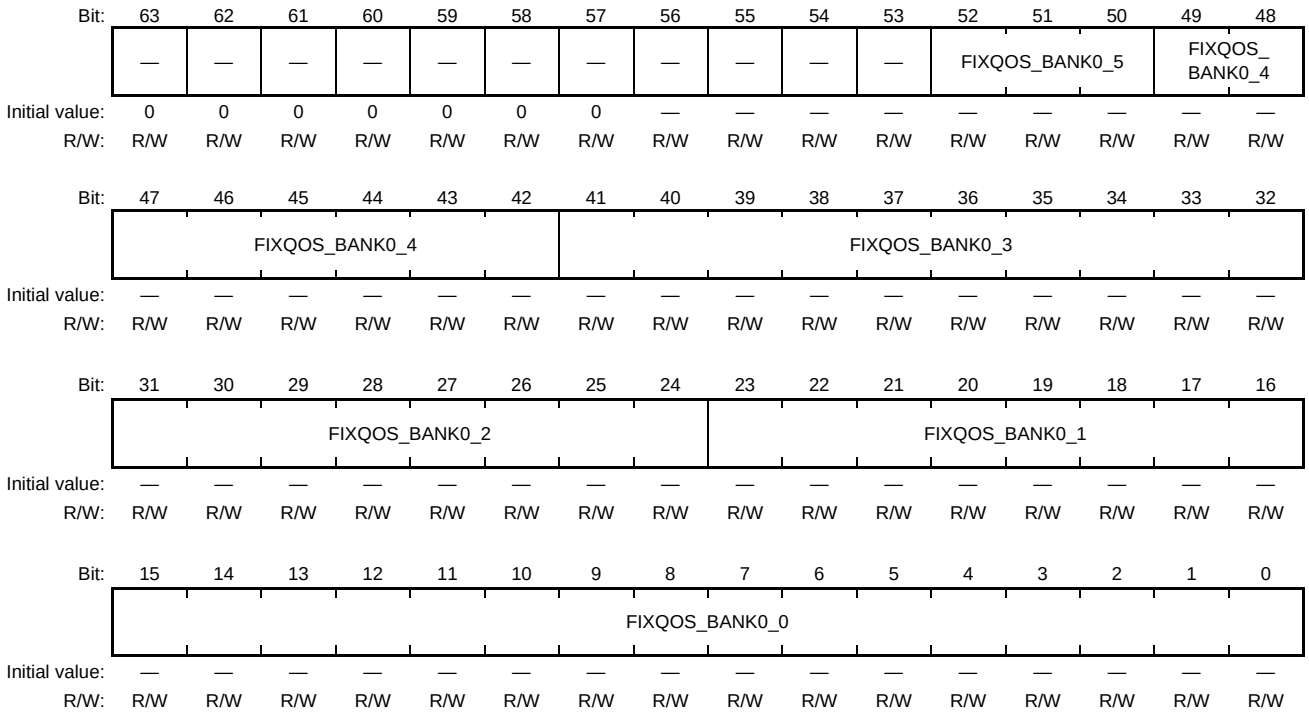
RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

[RZ/G2H] n: 0 to 365, Address range: H'E67E_0000 to H'E67E_0B68

[RZ/G2M V1.3, RZ/G2M V3.0] n: 0 to 362, Address range: H'E67E_0000 to H'E67E_0B50

[RZ/G2N] n: 0 to 370, Address range: H'E67E_0000 to H'E67E_0B90

[RZ/G2E] n: 0 to 255, Address range: H'E67E_0000 to H'E67E_07F8



Bit	Bit Name	Initial Value	R/W	Description
63 to 57	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
56 to 53	—	—	R/W	Reserved The write value should always be 0.
52 to 50	FIXQOS_BANK0_5	—	R/W	FIXQOS_BANK0_5 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits. Setting value must be 0, 3, 4 or 5.
49 to 42	FIXQOS_BANK0_4	—	R/W	FIXQOS_BANK0_4 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.
41 to 32	FIXQOS_BANK0_3	—	R/W	FIXQOS_BANK0_3 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	FIXQOS_BANK0_2	—	R/W	FIXQOS_BANK0_2 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.
23 to 16	FIXQOS_BANK0_1	—	R/W	FIXQOS_BANK0_1 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.
15 to 0	FIXQOS_BANK0_0	—	R/W	FIXQOS_BANK0_0 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.

Notes: This register must be accessed by 8byte access.
This register must be written during statqen bit of QOSCTRL_STATQC register is 0 or exe_membank of QOSCTRL_MEMBANK is 1.
Refer to the Table 21.2 for setting values of QOSBW_FIX_QOS_BANK0 registers.

Table 21.2 Setting values of QOSBW_FIX_QOS_BANK0 registers (1/2)

21.2.39 QOSBW FIX QOS BANK1 Register n (QOSBW_FIX_QOS_BANK1)

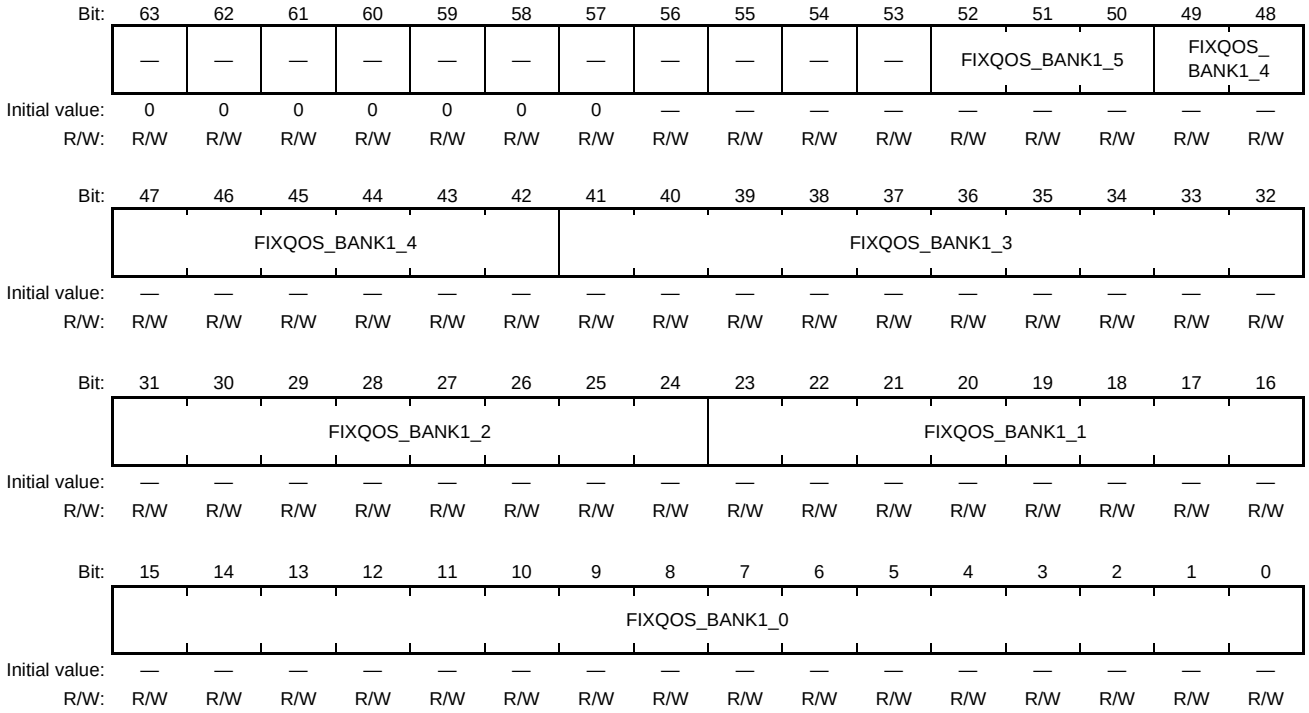
RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

[RZ/G2H] n: 0 to 365, Address range: H'E67E_1000 to H'E67E_1B68

[RZ/G2M V1.3, RZ/G2M V3.0] n: 0 to 362, Address range: H'E67E_1000 to H'E67E_1B50

[RZ/G2N] n: 0 to 370, Address range: H'E67E_1000 to H'E67E_1B90

[RZ/G2E] n: 0 to 255, Address range: H'E67E_1000 to H'E67E_17F8



Bit	Bit Name	Initial Value	R/W	Description
63 to 57	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
56 to 53	—	—	R/W	Reserved The write value should always be 0.
52 to 50	FIXQOS_BANK1_5	—	R/W	FIXQOS_BANK1_5 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits. Setting value must be 0, 3, 4 or 5.
49 to 42	FIXQOS_BANK1_4	—	R/W	FIXQOS_BANK1_4 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.
41 to 32	FIXQOS_BANK1_3	—	R/W	FIXQOS_BANK1_3 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	FIXQOS_BANK1_2	—	R/W	FIXQOS_BANK1_2 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.
23 to 16	FIXQOS_BANK1_1	—	R/W	FIXQOS_BANK1_1 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.
15 to 0	FIXQOS_BANK1_0	—	R/W	FIXQOS_BANK1_0 Setting. These bits should be a value generated by a tool released from Renesas. A value other than above must not be set to these bits.

Notes: This register must be accessed by 8byte access.
This register must be written during statqen bit of QOSCTRL_STATQC register is 0 or exe_membank of QOSCTRL_MEMBANK is 0.
Refer to the Table 21.3 for setting values of QOSBW_FIX_QOS_BANK1 registers.

RZ/G2N RZ/G2E

21.3.1 DRAM Split/Linear Address mapping

The AXI-bus provides the mixed address space interleaved address mapping (Split mapping) and no-interleaved address mapping (Linear mapping) on memory controllers through **ADSPLCRn** register. The split mapping mode enhances DRAM access efficiency and bandwidth via parallel access to memory controllers. In this mode, allocated to each DBSC channel at the specified granularity. The linear mapping mode allocate a contiguous space to each memory controller. It can be divided into 8 areas. And also, Linear or Split mapping can be chosen in each area. Figure 21.5 and Figure 21.6 shown Split/Linear Address mapping.

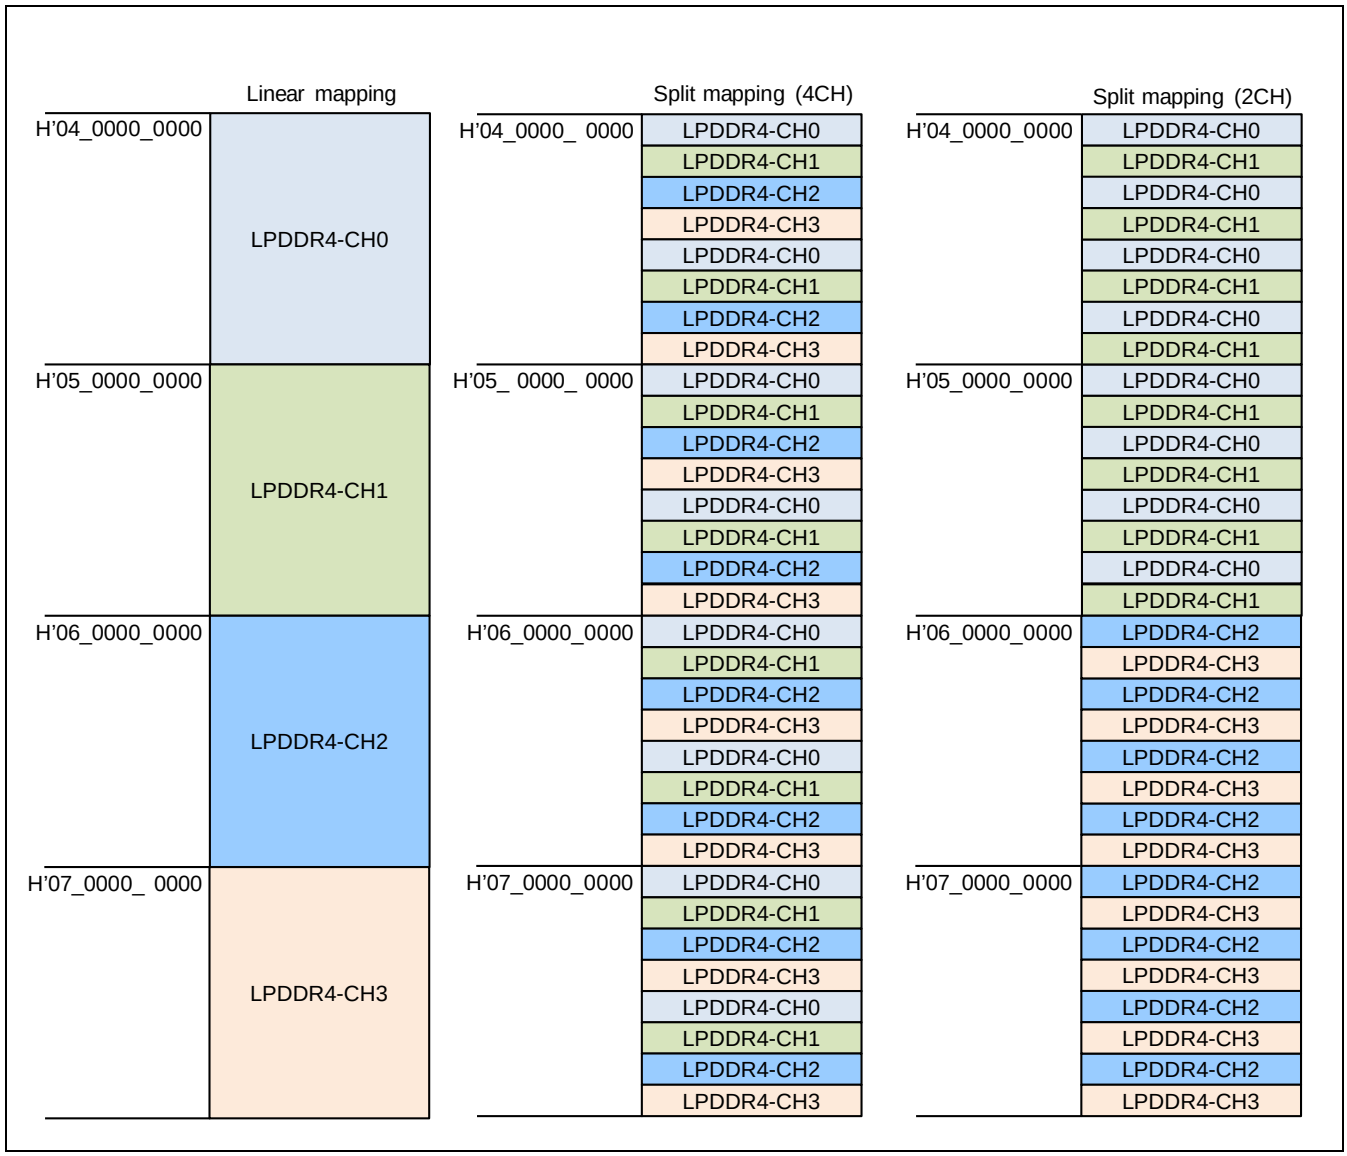

Figure 21.5 Concept of Split/Linear Address mapping [RZ/G2H]

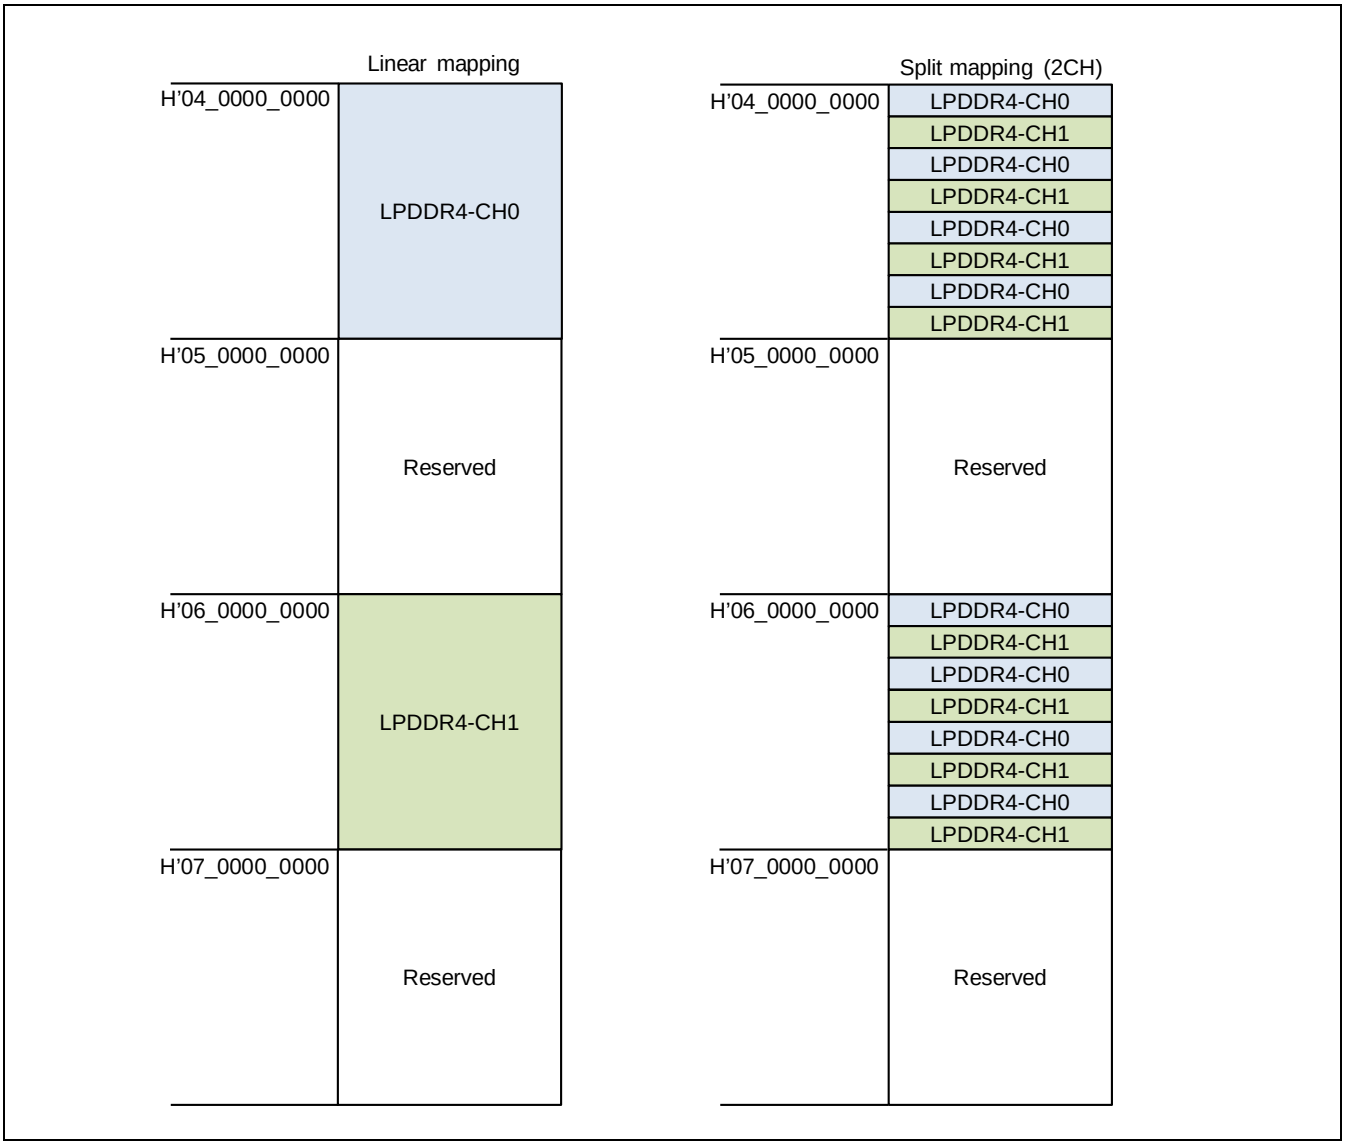

Figure 21.6 Concept of Split/Linear Address mapping [RZ/G2M V1.3, RZ/G2M V3.0]

21.3.2 Decompression of visual near lossless compressed image

AXI-bus supports decompression of visual near lossless compressed image. IPs can read compressed data by accessing to setting area through **DCMPAREACRAn/DCMPAREACRBn** or **DCMPSHDWCR** register.

21.3.3 QoS arbitration

AXI-bus has the QoS arbitration to guarantee latency and bandwidth. A concept of the time shared control which is being called time division slot allocation is introduced. The arbitration can be controlled by assigning bandwidth of each IP to time slot.

21.3.4 Access protection for secure/safety regions

21.3.4.1 Memory Protection

Main Memory domain AXI-bus has memory protected area function. This function as shown in Figure 21.7 is that DRAM or System RAM area can be divided into 16 areas and each area and each area can be set access privilege to 4 secure groups.

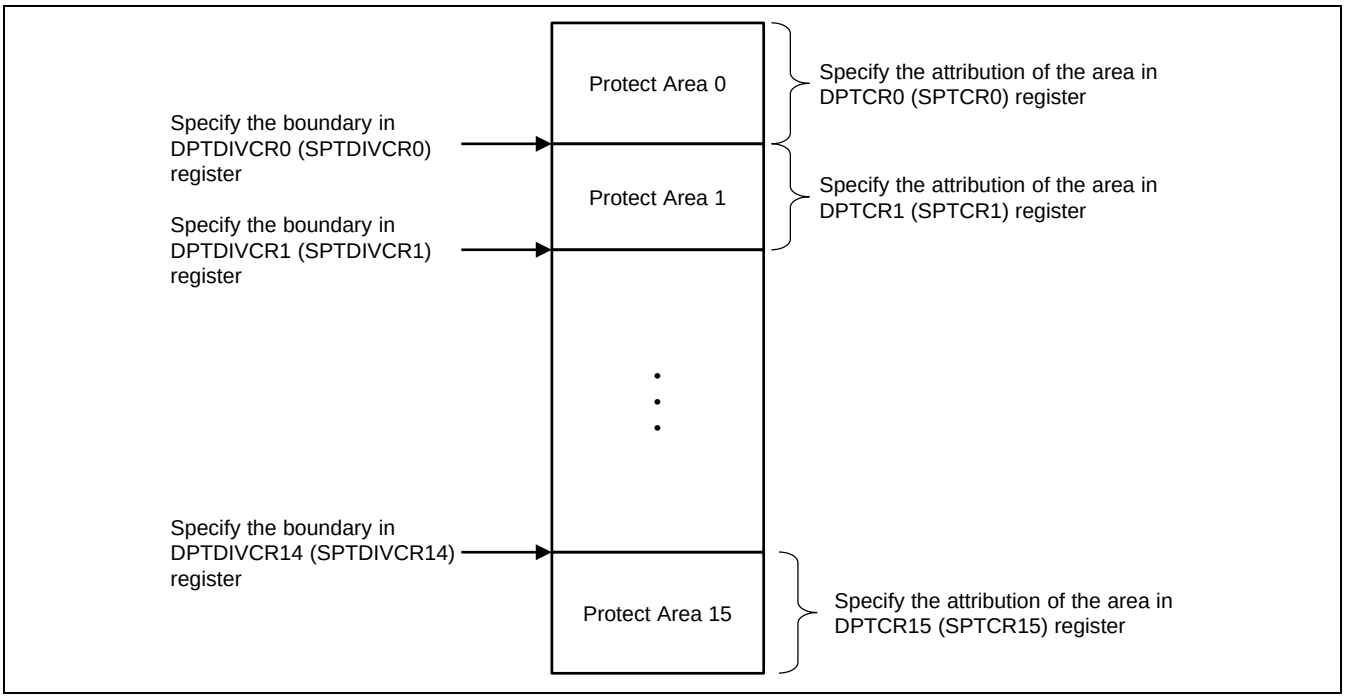

Figure 21.7 Memory Protected Area Function Concept

21.4 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

21.4.1 Change of the initial value of the register

The initial value of the following private register should be changed before using the LSI.
Write H'0000_000A to the address field H'E67F_0048 with 32-bit access.
Note: The initial value of this address field is H'0080_000A.

22. IPMMU

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

22.1 Overview

The IPMMU is a Memory Management Unit (MMU) which provides address translation and access protection functionalities to processing units and interconnect networks.

22.1.1 Features

IPMMU includes the following main features.

- MMU architecture compatible with Armv8 VMSAv8-64 and VMSAv8-32 including the Large Physical Address Extension (LPAE), the Security Extensions and the Multiprocessing Extensions. IPMMU supports eight sets of TLBs and these can be managed independently.
- PMB* address translation functionality. IPMMU supports sixteen domains.
- Caching recently used page table entries in translation look-aside buffer (TLB)
- Performance monitoring for Armv8 VMSAv8-64 and VMSAv8-32 LPAE
- DVM messages are not supported.

For more information about Armv8 VMSA, see Arm Architecture Reference Manual Armv8, for Armv8-A architecture profile.

In VMSAv8-64, supported memory translation granule size is 4KB and 64KB. 16KB granule size is not supported in IPMMU. And 8bit ASID size is only supported. (not support 16bit size)

In VMSAv8-32, 40bit IPA can be handled by IPMMU.

Note: * PMB (Privileged space Mapping Buffer) is the register specified address translation mechanism. It supports up to sixteen translation tables and four types of tables (16 MB, 64 MB, 128 MB and 521 MB) can be set.

22.1.2 Block Diagram

Figure 22.1 shows the IPMMU block diagram. When a master (a processing unit or an interconnect) issues a transaction, a micro-TLB connected to the master sends a virtual address to the IPMMU cache which is connected to the same bus domain. If the virtual address is not cached in the IPMMU cache, the IPMMU performs a page table walk to the main IPMMU which is located at the main memory bus domain through an interconnect and returns a physical address to the micro-TLB.

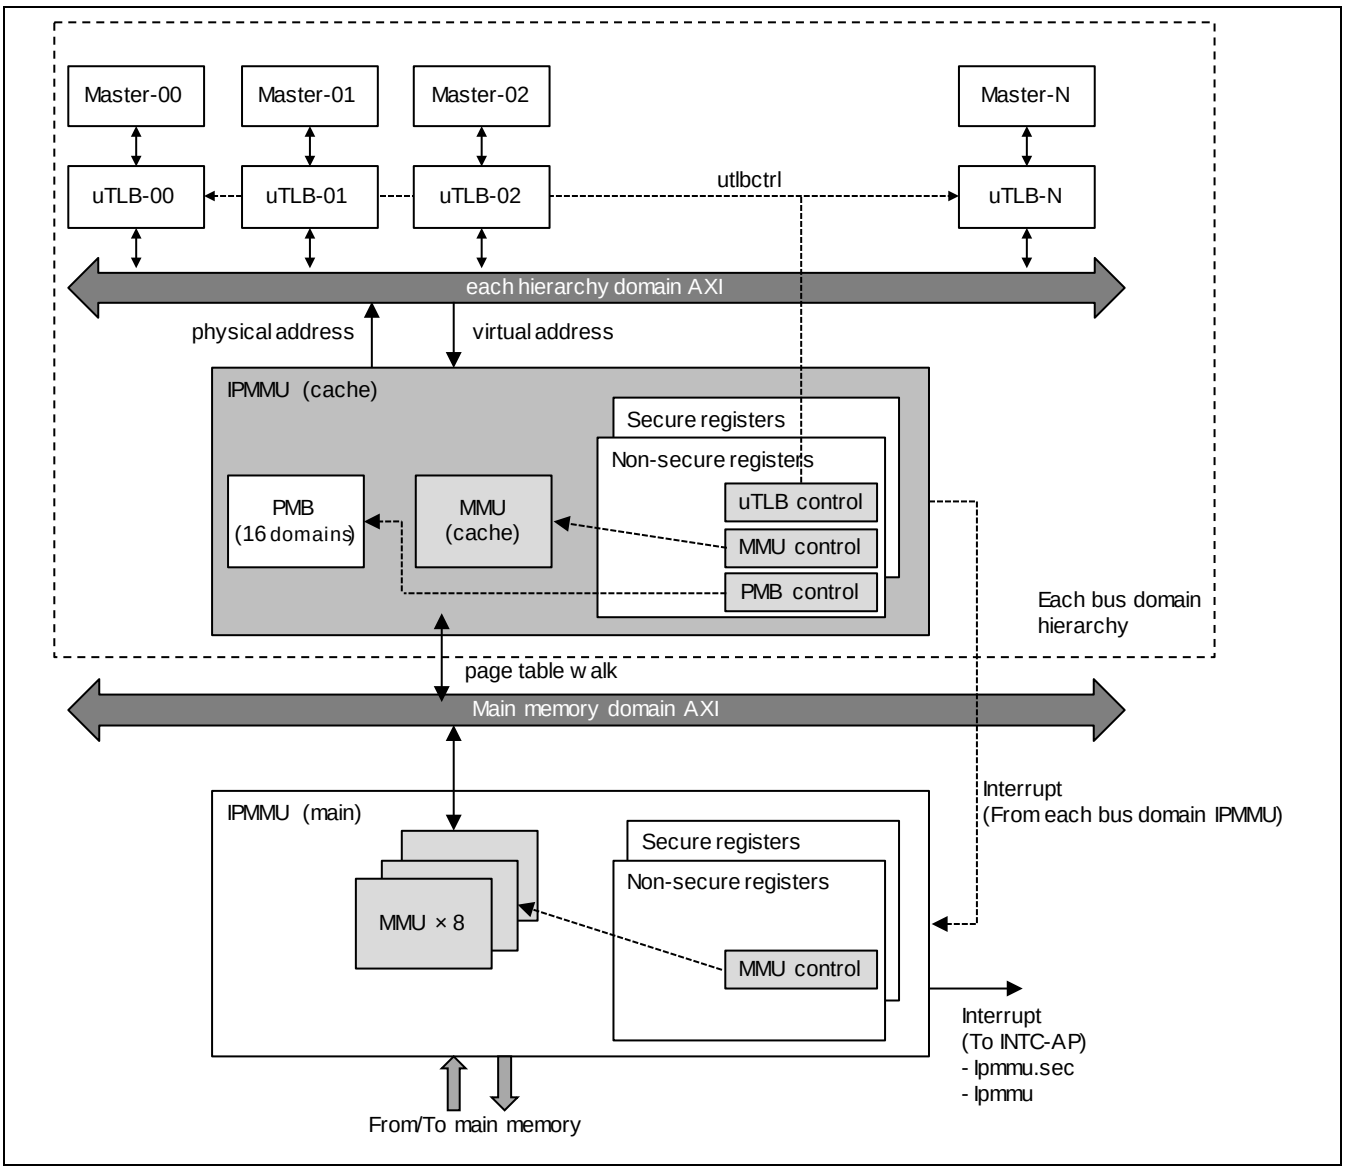

Figure 22.1 IPMMU System Integration

22.1.3 External Pins

There are no external pins in this module.

22.1.4 Register Configuration

Table 22.1 shows the register address map of IPMMU. These registers are 32-bit access registers. When modifying reserved bits or read-only bits, write 0 to the bits.

Table 22.1 Register Configurations

Address alias of Non-secure registers *2	—	R/W	H'0800 to H'0FFC	H'0000_0000	32	√	√	√	√	√

Notes: 1. These registers are composed of the registers banked for security. This provides a separate secure and non-secure copies of the registers.
2. Non-secure registers (H'0800 to H'0FFC) can be accessed through this address space in Secure mode. In Non-secure mode, this address space is always read as 0.
3. These registers can be accessed by secure mode only.
4. IMPFMCTR, IMPFMTOTAL, IMPFMHIT, IMPFMMISS are not supported in IPMMU-cache of RZ/G2M V1.3, RZ/G2M V3.0.

Table 22.2 shows the each IPMMU base address and the power domain which belong to. This table also shows which IPMMU is supported to each RZ/G product. Basically, each IPMMU is connected to the each BUS modules. But the number of IPMMU is different between each RZ/G product. Except the IPMMU in Always-On domain, power-up sequence is required before initialization of IPMMU. About the power domain and the procedure for power-up sequence of the corresponding power domain, see the specification of SYSC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	VA64*	B'0	R/W	AArch64 support 1: VMSAv8-64 mode 0: VMSAv8-32 mode This register can be set IPMMU-MM only
28 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	TRE*	B'0	R/W	TEX Remap Enable This field is used when EAE is 0. 0: TEX remap disabled. 1: TEX remap enabled. This register can be set IPMMU-MM only
16	AFE*	B'0	R/W	Access Flag Enable 0: Behave as if AF bit is always set to 1. 1: Enable software management of the Access Flag. This register can be set IPMMU-MM only
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 4	RTSEL[2:0]*	B'000	R/W	Retranslation Table Select When TREN is 1, RTSEL indicates the table number to retranslate. This register can be set IPMMU-MM only
3	TREN*	B'0	R/W	MMU Retranslation Enable 0: Output PA as a physical address. 1: Output PA as an intermediate physical address to retranslate through 40-bit TLB. This register can be set IPMMU-MM only

Bit	Bit Name	Initial Value	R/W	Description
2	INTEN	B'0	R/W	Interrupt Enable 0: Don't assert an interrupt when an error occurs. 1: Assert an interrupt when an error occurs.
1	FLUSH	B'0	R/W	TLB Invalidate This bit is automatically cleared to 0. So read value is always 0. 1: Invalidate all TLB entries instantaneously.
0	MMUEN	B'0	R/W	MMU Enable. If 0 is set, IPMMU and micro-TLBs which are belong to this IPMMU are disabled. 0: MMU disabled 1: MMU enabled

Note: * These fields are implemented in IPMMU-MM only

22.2.2 MMU Translation Table Base Control Register n (IMTTBCRn)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

Note: n = 0 to 7

This register controls the attribute of TLB managed by each MMU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
25, 24	IRGN1[1:0] *4	B’00	R/W	Inner Cache ability attributes for the memory associated with the translation table walks using TTBR1n. B’00: Normal memory, Inner Non-cacheable B’01: Normal memory, Inner Write-Back Write-Allocate Cacheable B’10: Normal memory, Inner Write-Through Cacheable B’11: Normal memory, Inner Write-Back no Write-Allocate Cacheable
23	PGSZ	B’0	R/W	[VMSAv8-32, EAE = 0] 2nd level Page Size Select 1: Support large page size (64KB page) 0: Support small page size (4KB page) [VMSAv8-64] 3rd level Page Size Select 1: 64KB page granule 0: 4KB page granule (default)
22	SCSZ	B'0	R/W	[VMSAv8-32, EAE = 0] 1st level page size select 1: Support super section size (16MB) 0: Support section size (1MB)
21 to 16	TSZ1[5:0]*3	B’00_0000	R/W	[VMSAv8-64] - TSZ1[5:0] is used for the size offset of the TTBR0n addressed region, encoded as a 6-bit unsigned number, giving the size of the region as 2^(64-TSZ1). [VMSAv8-32, stage 1 translation]: - TSZ1[5:3] is reserved. This bit is always read as 0. The write value should always be 0. - TSZ1[2:0] is used for the size offset of the TTBR0n addressed region, encoded as a 3-bit unsigned number, giving the size of the region as 2^(32-TSZ1). [VMSAv8-32, stage 2 translation]: - TSZ1[5:0] is reserved. This bit is always read as 0. The write value should always be 0.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	SH0[1:0] *4	B’00	R/W	Share ability attributes for the memory associated with the translation table walks using TTBR0n. B’00: Non-shareable B’01: Reserved B’10: Outer shareable B’11: Inner shareable
11, 10	ORGN0[1:0] *4	B’00	R/W	Outer Cache ability attributes for the memory associated with the translation table walks using TTBR0n. B’00: Normal memory, Outer Non-cacheable B’01: Normal memory, Outer Write-Back Write-Allocate Cacheable B’10: Normal memory, Outer Write-Through Cacheable B’11: Normal memory, Outer Write-Back no Write-Allocate Cacheable

Bit	Bit Name	Initial Value	R/W	Description
9, 8	IRGN0[1:0] *4	B’00	R/W	Inner Cache ability attributes for the memory associated with the translation table walks using TTBR0n. B’00: Normal memory, Inner Non-cacheable B’01: Normal memory, Inner Write-Back Write-Allocate Cacheable B’10: Normal memory, Inner Write-Through Cacheable B’11: Normal memory, Inner Write-Back no Write-Allocate Cacheable
7, 6	SL[1:0]*2	B’00	R/W	Starting level for translation table walks. [VMSAv8-32] SL[1]: 1: Start at first level 0: Start at second level. [VMSAv8-64, PGSZ = 0] SL[1:0] B’00: Start at second level B’01: Start at first level [VMSAv8-64, PGSZ = 1] SL[1:0] B’00: Start at third level B’01: Start at second level
5 to 0	TSZ0[5:0]	B’00_0000	R/W	[VMSAv8-64]. - TSZ0[5:0] is used for the size offset of the TTBR0n addressed region, encoded as a 6-bit unsigned number, giving the size of the region as 2^(64-TSZ0). [VMSAv8-32, stage 1 translation]: - TSZ0[5:3] is reserved. This bit is always read as 0. The write value should always be 0. - TSZ0[2:0] is used for the size offset of the TTBR0n addressed region, encoded as a 3-bit unsigned number, giving the size of the region as 2^(32-TSZ0). [VMSAv8-32, stage 2 translation]: - TSZ0[5:4] is reserved. This bit is always read as 0. The write value should always be 0. - TSZ0[3:0] is used for the size offset of the TTBR0n addressed region, encoded as a 4-bit signed number, giving the size of the region as 2^(32-TSZ0).

Notes: 1. Even if IMCTRn.VA64 bit is set, this field need to be set in case of using long descriptor format.
2. About Start Level, refer to “22.5.3.4 Start Level for Page Table Walk”.
3. If TSZ1 = 24 is set, all page table walk request will be issued via TTBR1.This setting is prohibited. From the hardware point of view, each IP (except ARM-CPU) can be treated the VA up to 40-bit. In case that TSZ0 and TSZ1 are set to "24" at the same time, IPMMU cannot recognize which TTBR is used for page table walk.
4. Changing the initial value of these fields has no effect to the system because cache snoop transaction for page table walk request is not supported in RZ/G Series, 2nd Generation. Not configuring to these fields are recommended.

22.2.3 MMU Translation Table Upper Base Register 0/1n (IMTTUBR0/1n)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

Note: n = 0 to 7

This register indicates the base address of the TLB managed by each MMU.

R/W:	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	PPN[31:24]	H'00	R/W	Physical Page Number For 16-Mbyte page, PPN[31:24] is used. For 64-Mbyte page, PPN[31:26] is used. For 128-Mbyte page, PPN[31:27] is used. For 512-Mbyte page, PPN[31:29] is used.
23 to 16	PPN[39:32]	H'00	R/W	Upper Physical Page Number
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	V	B'0	R/W	Enable this page translation.
7	SZ[1]	B'0	R/W	This bit and SZ[0] (bit 4) specify the page size. SZ[1:0] = 00: 16-Mbyte page 01: 64-Mbyte page 10: 128-Mbyte page 11: 512-Mbyte page
6, 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SZ[0]	B'0	R/W	Page Size See the description of SZ[1] (bit 7).
3	C	B'0	R/W	Cache bit When this bit is set, the request after address translation can be treated as "cacheable" request.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

22.2.13 PMB Status Register (IMPSTR)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

This register indicates the error status of the address translation by PMB.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MHIT	—	—	—	TF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MHIT	B'0	R/W	Multiple hit Indicate that multiple PMB hits occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TF	B'0	R/W	Translation Fault This bit is set to 1 when a translation fault occurred during a PMB translation.

22.2.14 PMB Error Address Register (IMPEAR)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

This register indicates the address which an address translation error occurred.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EAR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EAR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EAR[31:0]	H'0000_0000	R	The faulting virtual address is set when an address translation error occurred.

22.2.15 uTLB Control Register n (IMUCTRn)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

Note: n = 0 to 47

This register controls the behavior of each uTLB.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FIXADDEN	—	—	—	—	—	—	—	FIXADD[39:32]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TTSEL[3:0]				—	—	FLUSH	MMUEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FIXADDEN	B’0	R/W	Fix the upper 8 bits of physical address Always output the upper 8 bits of physical address as FIXADD[39:32]. This bit must be used only when IMTTBCRn.EAE is 0. 0: Disable FIXADD[39:32] 1: Enable FIXADD[39:32] IMUCTRn.FIXADD[39:32] cannot be used with stage 2 translation as part of stage 1 translation to form upper 8 bits of IPA.
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	FIXADD [39:32]	All 0	R/W	When FIXADDEN is 1, the upper 8bit of physical address is FIXADD[39:32]. This bit must be used only when IMTTBCRn.EAE is 0.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 4	TTSEL[3:0]	B’0000	R/W	Translation Table B’0000 to B’0111: MMU0 to MMU7 B’1000: PMB B’1001 to B’1111: Reserved
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	FLUSH	B’0	R/W	micro-TLB Invalidate Invalidate all entries in the micro-TLB. This bit is automatically cleared to 0. So read value is always 0. 1: Invalidate all entries instantaneously.
0	MMUEN	B’0	R/W	Address Translation Enable 0: Disable address translation 1: Enable address translation

22.2.16 uTLB ASID Register n (IMUASIDn)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

Note: n = 0 to 47

This register is used for setting ASID of each uTLB.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ASID1[7:0]								ASID0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	ASID1[7:0]	H'00	R/W	ASID1 This field indicates the ASID which the micro-TLB uses in the stage 2 translation.
7 to 0	ASID0[7:0]	H'00	R/W	ASID0 This field indicates the ASID which the micro-TLB uses in the stage 1 translation.

Note: ASID is not supported in RZ/G2. See “22.5.3.6 Treatments of ASID feature”.

22.2.17 MMU System Control Register (IMSCTLR)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

This register controls the behavior of IPMMU function.

[RZ/G2M V1.3]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31	diswprot	B’0	R/W	Read and Write protection of MMU System Control Register and MMU auxiliary Control register 1: Enable read and write access permission 0: Disable read and write access permission, read value is all 0 (default)
30	nsaccen	B’0	R/W	Non-secure access enable for MMU System Control Register and MMU auxiliary Control register 1: Enable non-secure access 0: Disable non-secure access (default)
29	dismmu	B’0	R/W	Disable IPMMU cache 1: Disable IPMMU cache 0: Enable IPMMU cache This bit can be set except IPMMU-MM
28	use_secgrp	—	R/W	Use security group to judge Secure/Non-secure access 1: Group 3 or 2 access is judged as Secure access 0: Only secure access is judged as Secure access
27 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0

22.2.18 MMU Auxiliary Control Register (IMSAUXCTLR)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

This register controls the behavior of IPMMU function. This register is supported main IPMMU (IPMMU-MM) only.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	nhint40	nmerge 40	—	—	—	—	—	—	—	nmerge 32
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	s2pte	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0
25	nhint40	B'0	R/W	Disable the "hint" field in long descriptor format 0: Enable the hint field (default) 1: Disable the hint field Hint feature is only applied for 16 adjacent translation table entries.
24	nmerge40*	B'0	R/W	Disable merge for the adjacent TLB entry in long descriptor format 0: Enable merge for the adjacent TLB entry (default) 1: Disable merge for the adjacent TLB entry
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0
16	nmerge32*	B'0	R/W	Disable merge for the adjacent TLB entry in short descriptor format 0: Enable merge for the adjacent TLB entry (default) 1: Disable merge for the adjacent TLB entry
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0
3	s2pte	B'0	R/W	Support stage 2 translation table format 0: Use stage 1 translation table format when stage 2 translation enabled (default) 1: Use stage 2 translation table format when stage 2 translation enabled
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0

Note: * In case that the successive two 4KB page has the same MMU attribute like shareability, nG, IPMMU can be merged these two pages and can be treated them as one 8KB page. This is our special setting for optimizing the page table walk. RZ/G2M V1.3 supports this function but RZ/G2M V3.0 does not.

22.2.19 MMU Interrupt Status Register (IMSSTR)

RZ/G2H	RZ/G2M V1.3	RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√	√

This register indicates the interrupt status from each IPMMU. This register can be read in non-secure mode only. In secure mode, refer to the IMSTRn.and IMPSTRn in the IPMMU where secure master is managed.

[RZ/G2H]

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

22.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

22.3.1 Address Translation Sequence in micro-TLBs

Each micro-TLB has independent entries and can translate from a virtual address to a physical address without sending translation requests to the IPMMU if the virtual address is cached in the micro-TLB.

When a translation error occurred in address translation, the micro-TLB blocks subsequent transactions until a valid page entry is registered. Set IMUCTRn.FLUSH = 1 after the entry registration.

Figure 22.2 shows the micro-TLB address translation sequence.

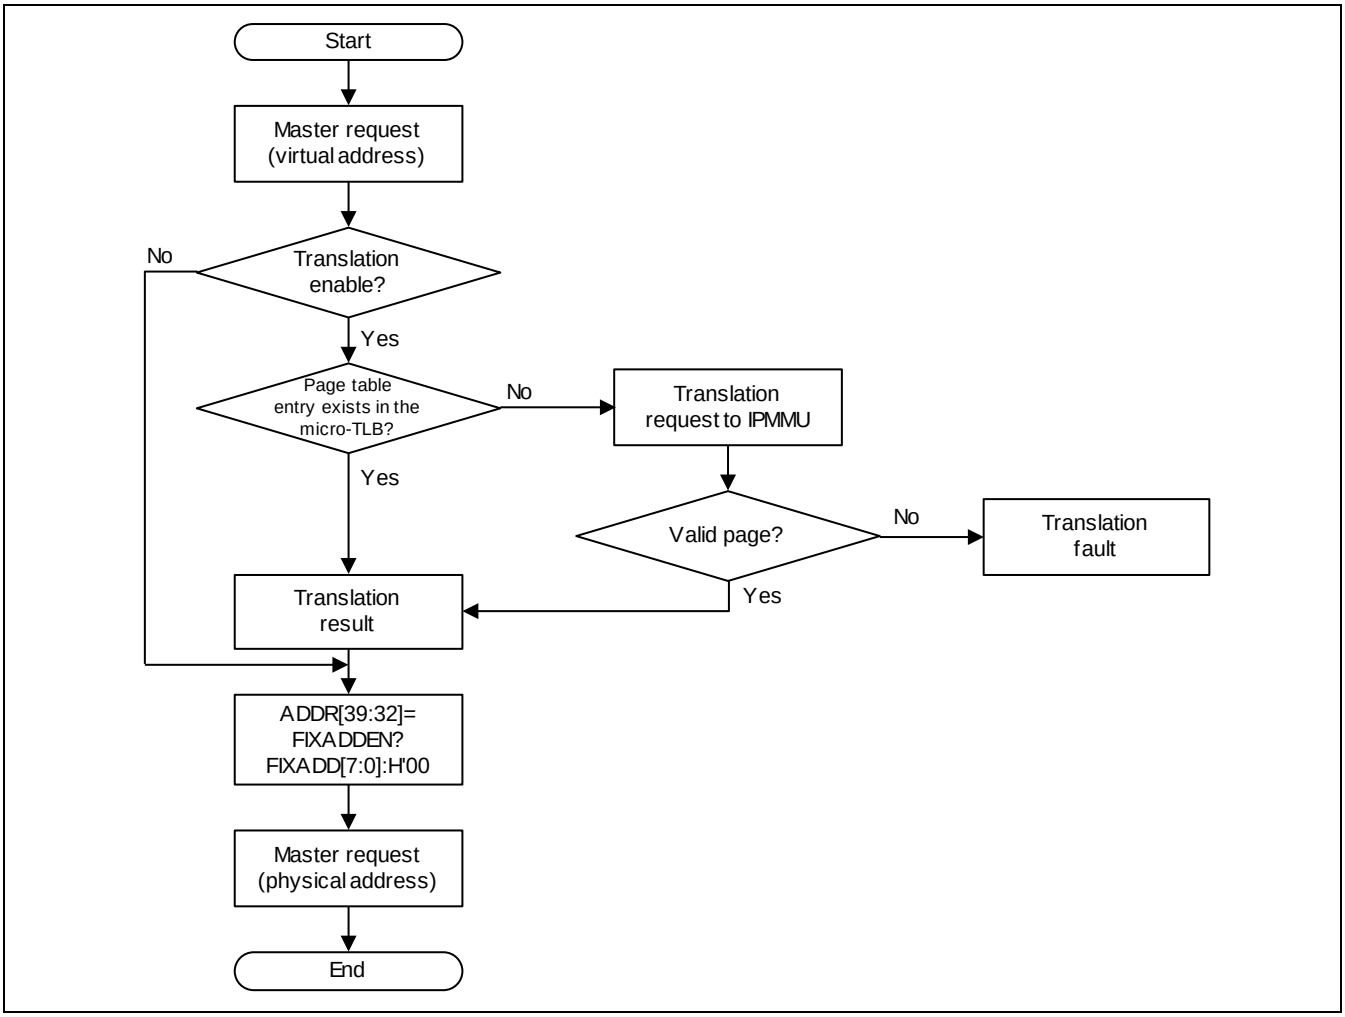

Figure 22.2 micro-TLB Address Translation Sequence

22.3.2 Address Translation Sequence in the IPMMU

(1) MMU Address Translation

The IPMMU has independent eight non-secure page tables and eight secure page tables which support two page table formats, the Short-descriptor format and the Long-descriptor format. When the IPMMU receives an address translation request from a micro-TLB, the IPMMU starts address translation sequence based on the page table specified by IMUCTRn.TTSEL. In case that the micro-TLB is enabled and MMU is selected in IMUCTRn.TTSEL, then the corresponding IMCTRn.MMUEN also need to be set. In case that IMCTRn.MMUEN is disabled, the corresponding micro-TLB must not be enabled.

Figure 22.3 shows the MMU address translation sequence.

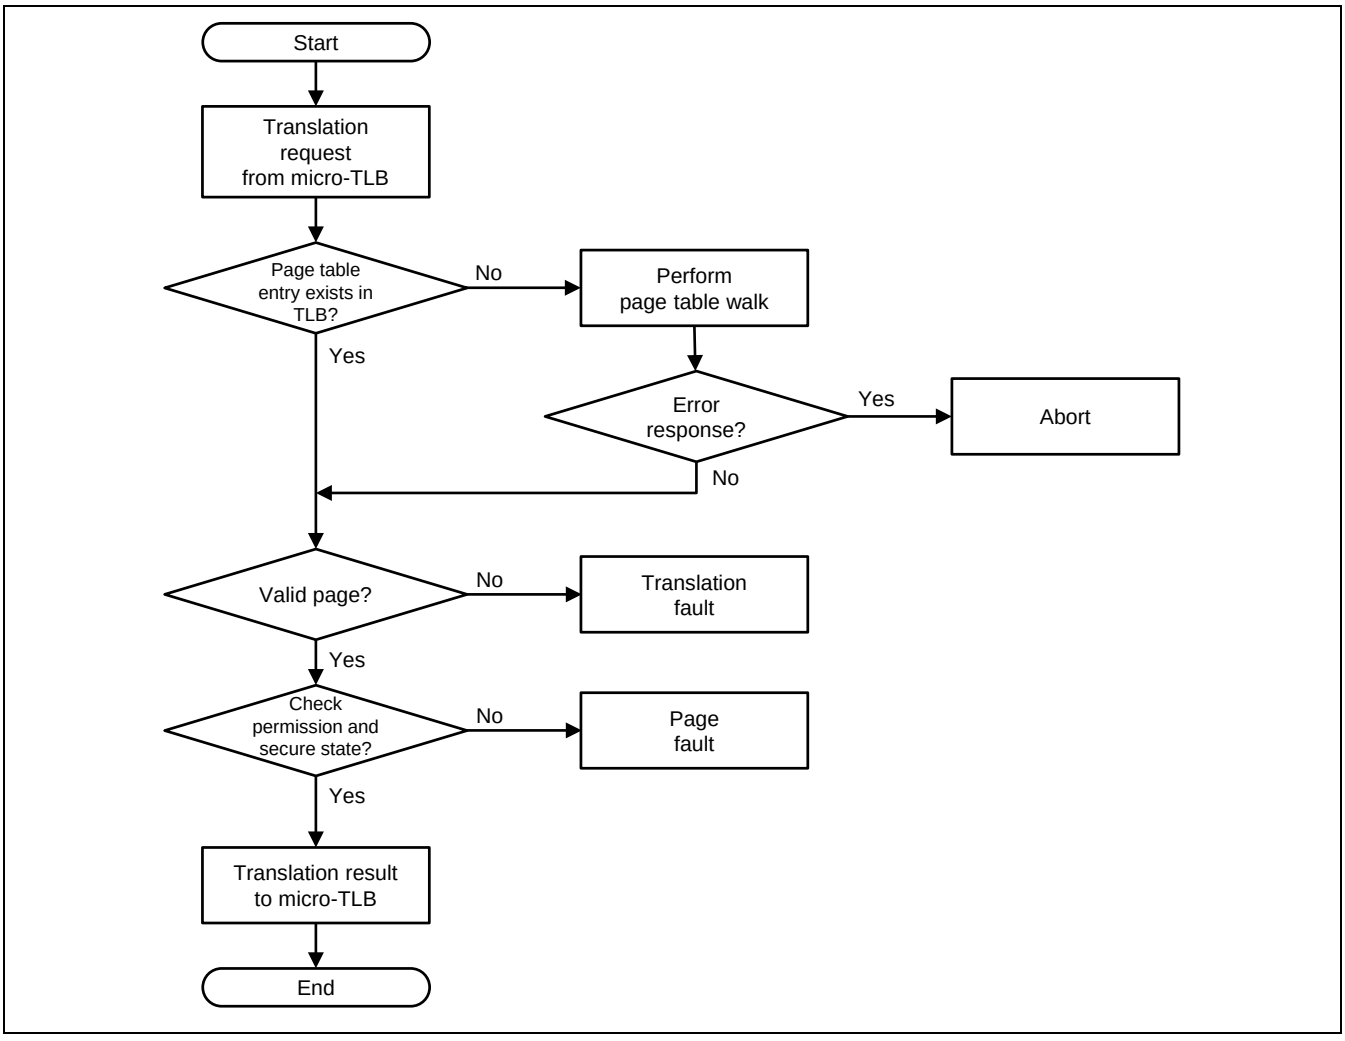

Figure 22.3 MMU Address Translation Sequence

(2) PMB Address Translation

PMB address translation is performed in two ways. When PMB address translation is chosen in IMUCTRn.TTSEL, all virtual addresses are translated by PMB. When PMB address translation is performed in a part of MMU translation (IMTTBCRn.PMB = 1), virtual addresses within H'8000_0000 to H'BFFF_FFFF are translated to physical addresses by PMB. In case that the micro-TLB is enabled and PMB is selected in IMUCTRn.TTSEL, then the corresponding IMPCTR.PMBEN also need to be set. In case that IMPCTR.PMBEN is disabled, the corresponding micro-TLB must not be enabled.

Figure 22.4 shows the PMB translation flow.

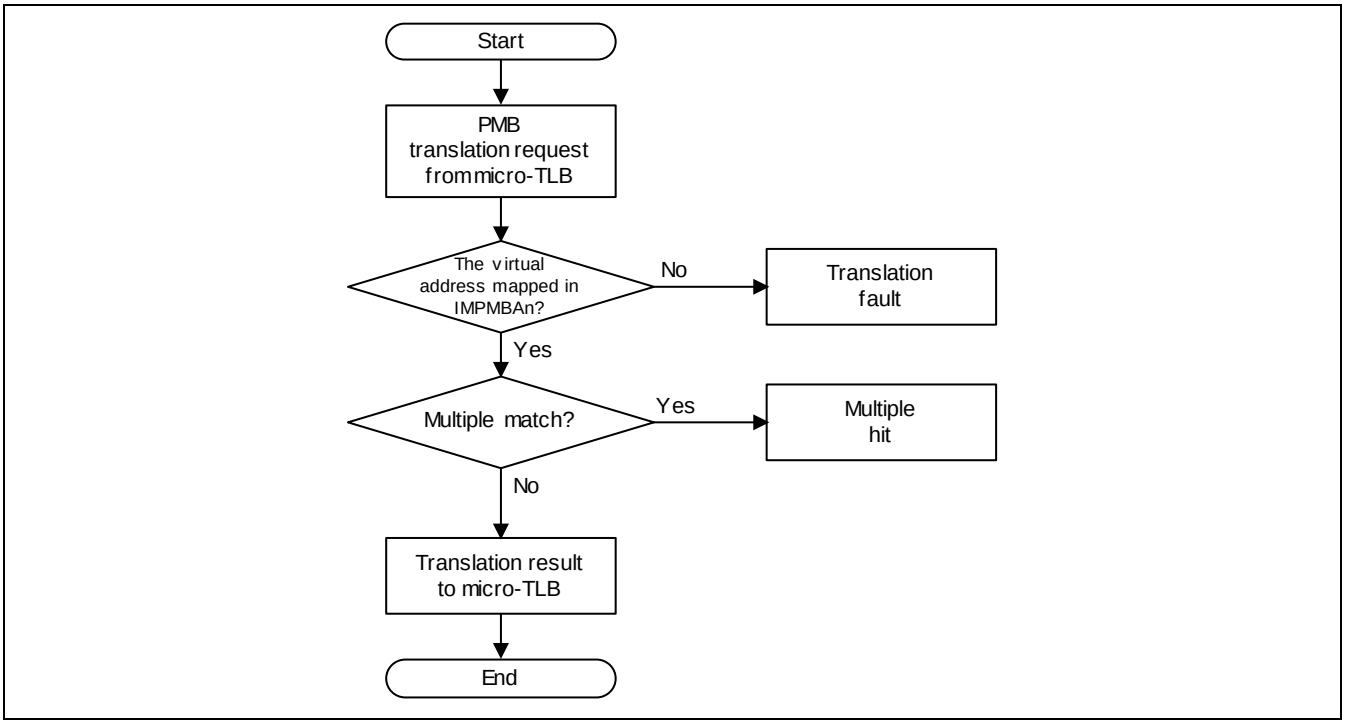

Figure 22.4 PMB Translation Flow

22.3.3 Address Space

(1) Short-descriptor

In the short-descriptor format, 32-bit virtual address space is translated to 32-bit physical address space managed by TTBR0/1. When IMTTBCRn.PMB = 1, translation address space is compatible with our previous products. In this mode, a virtual address within H'8000_0000 to H'BFFF_FFFF is translated by PMB and a virtual address within H'C000_0000 to H'FFFF_FFFF is mapped to a physical address of the same value.

Figure 22.5 shows the Short-descriptor address space.

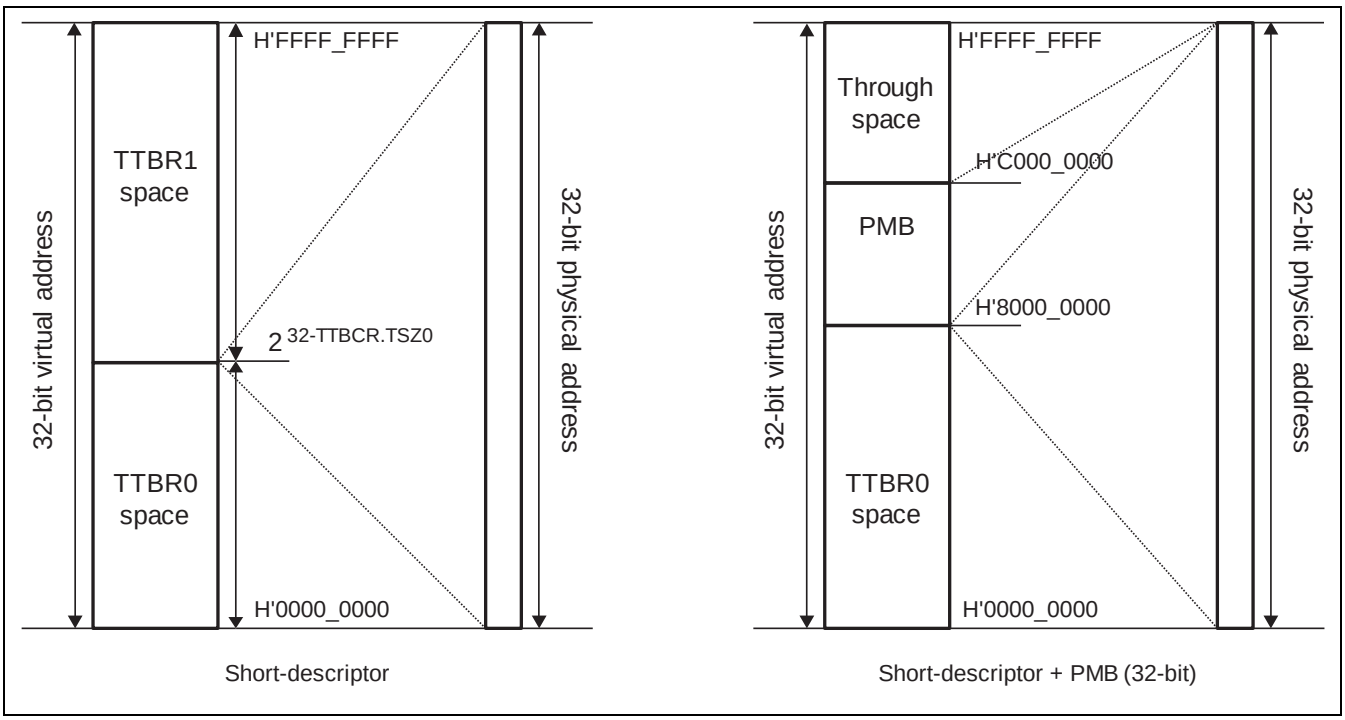

Figure 22.5 Short-descriptor Address Space

(2) Long-descriptor

In the long-descriptor format, 32-bit and 40-bit virtual address space is translated to 40-bit physical address space managed by TTBR0/1. The IPMMU supports the Secure PL1 and PL0 stage 1 translation and the Non-secure PL1 and PL0 stage 1 translation.

Figure 22.6 and Figure 22.7 shows the Long-descriptor address space for VMSAv8-32 and VMSAv8-64.

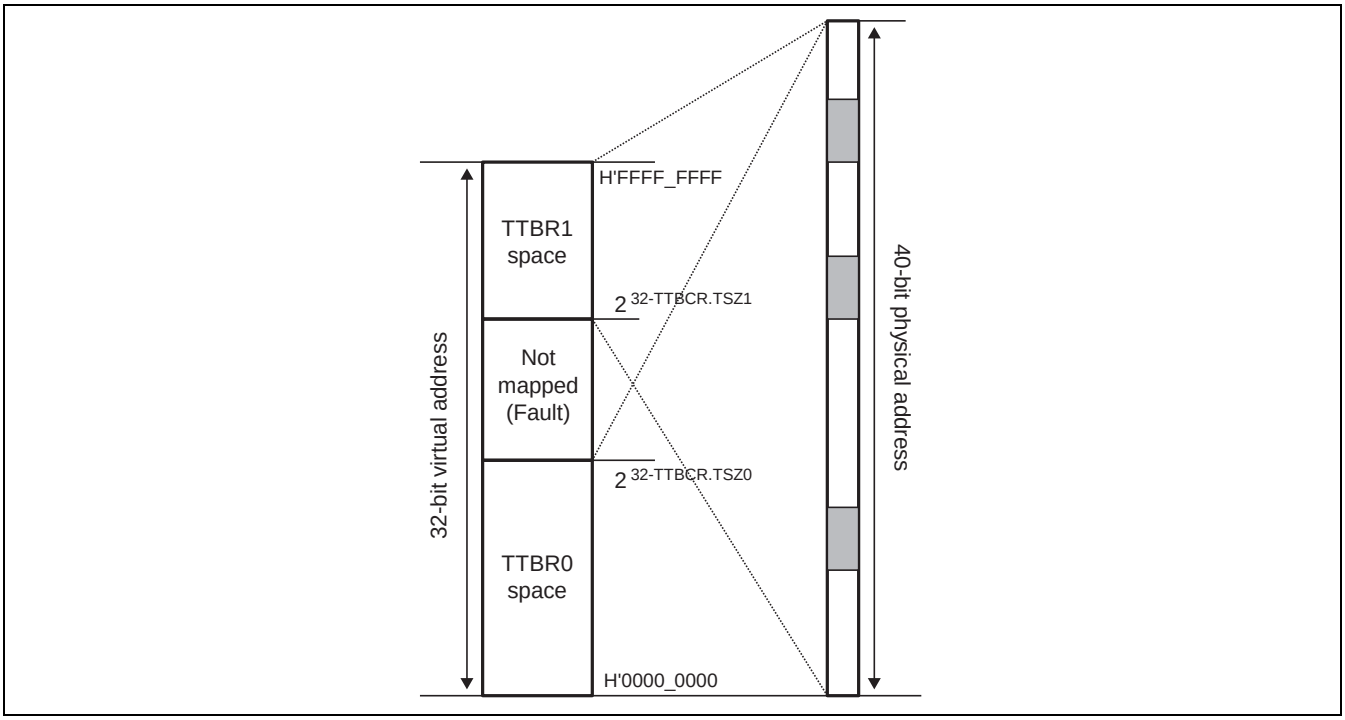

Figure 22.6 Long-descriptor Address Space (VMSAv8-32)

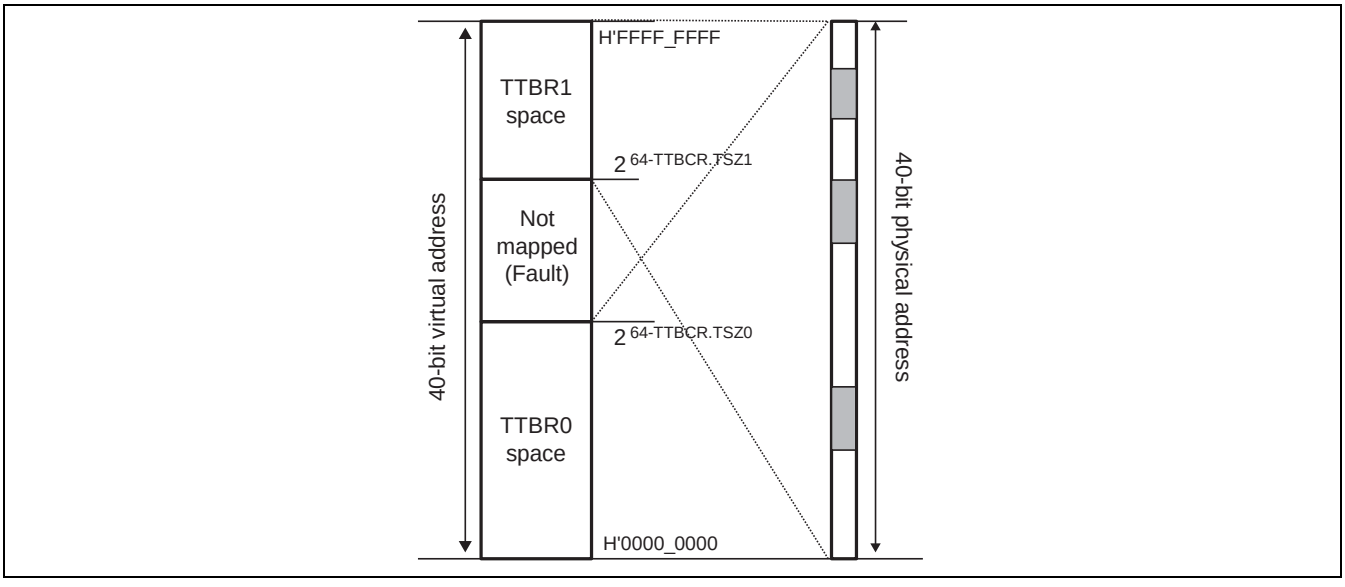

Figure 22.7 Long-descriptor Address Space (VMSAv8-64)

(3) PMB

The IPMMU supports the PMB address translation system. Figure 22.8 shows the PMB address space.

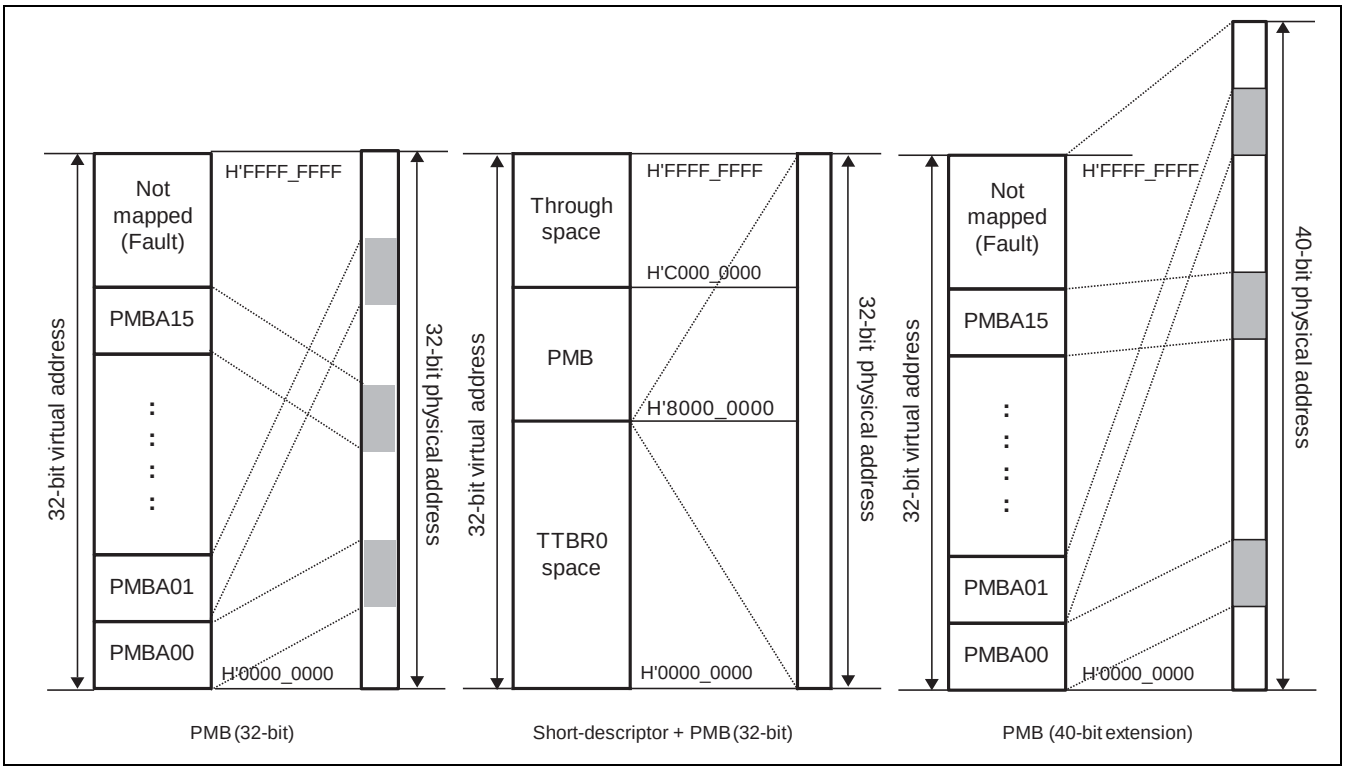

Figure 22.8 PMB Address Space

(4) Stage 2 Translation [Except RZ/G2M V1.3, RZ/G2M V3.0]

The IPMMU supports stage 2 translation. At the stage 1, 32-bit address space is translated to 32-bit or 40-bit intermediate physical address (IPA) space. At the stage 2, 32-bit or 40-bit IPA space is translated to 40-bit physical address space. In order to enable the stage 2 translation, set 1 to IMCTRn.TREN and set its stage 2 page table to IMCTRn.RTSEL. In default, IPMMU use stage 1 translation table format even if performing stage 2 translation. In default, IPMMU use stage 1 translation table format even if performing stage 2 translation. In case of using stage 2 translation table format in stage 2 translation, set 1 to IMSAUXCTLR.S2PTE. In some hypervisor system, only address translation from IPA to PA is supported by stage 2 translation. By setting 1 to IMTTBCRn.BYPEN, IPMMU doesn't perform stage 1 address translation and start stage 2 address translation.*

Note: * IMSAUXCTLR.S2PTE and IMTTBCRn.BYPEN are supported by RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N and RZ/G2E.

Figure 22.9 shows the stage 2 translation address space.

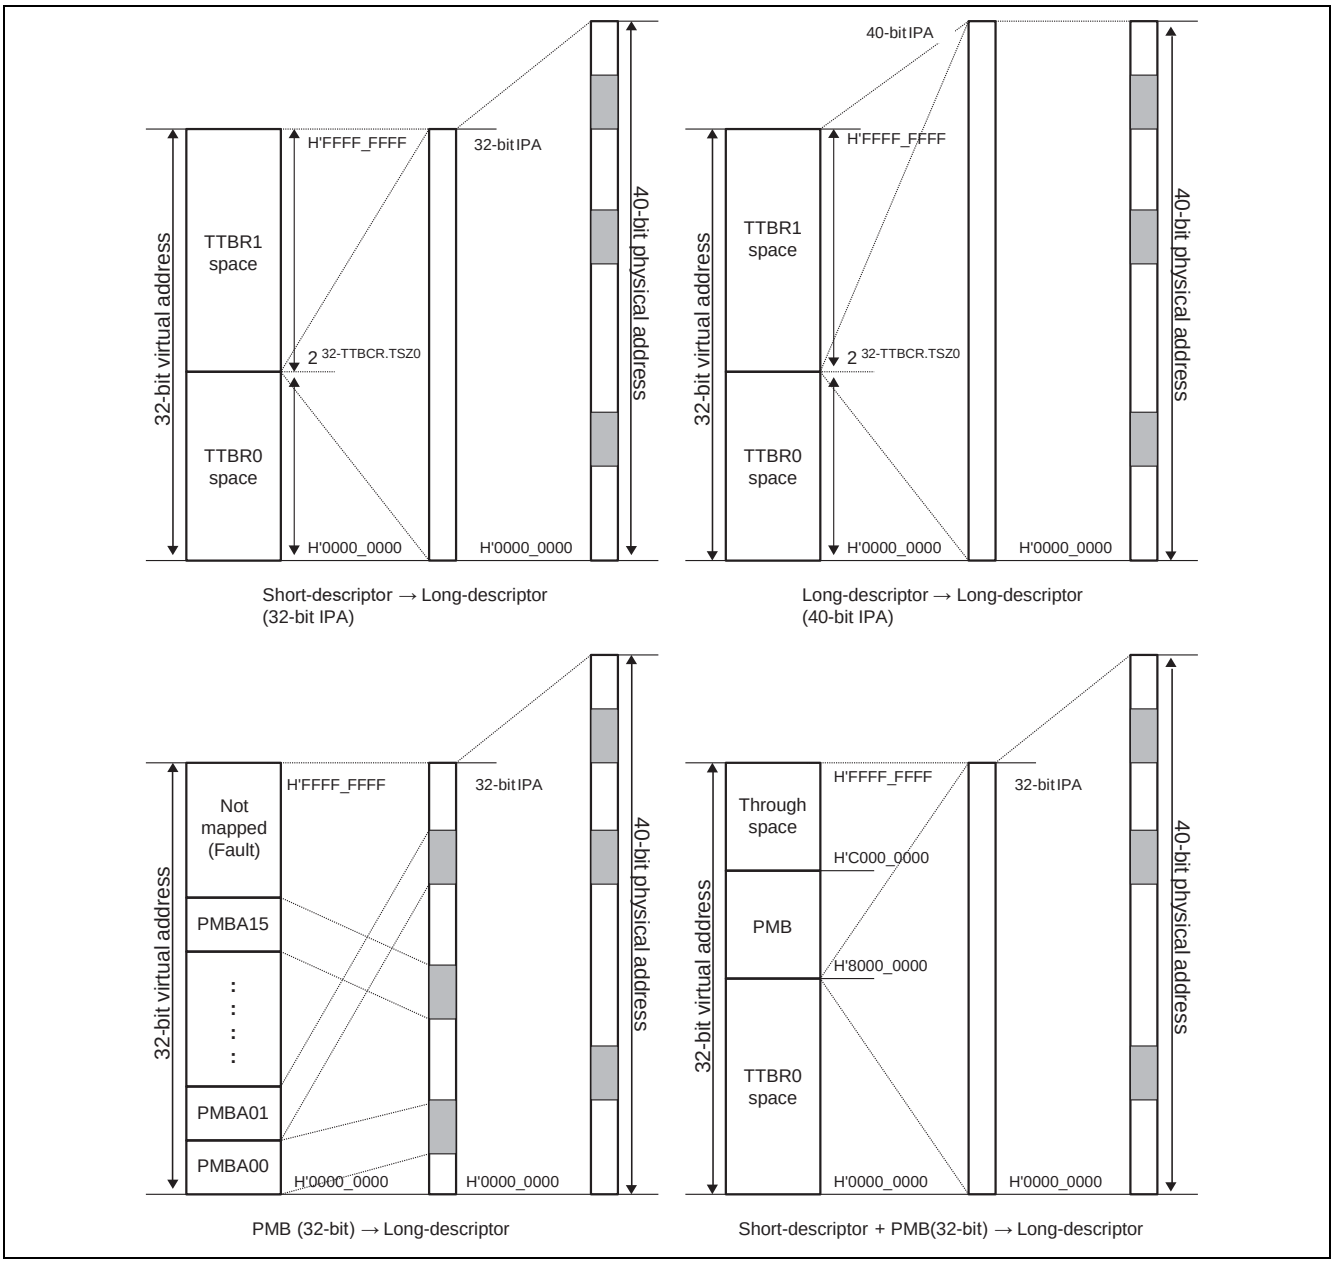

Figure 22.9 Stage 2 Translation Address Space

22.3.4 Initialization Sequence

This section describes the initialization sequence of the IPMMU.

(1) Module Stop

The IPMMU doesn't support module stop control. The IPMMU can be used whenever a master requires address translation through the IPMMU. When a master doesn't require address translation, the corresponding IMUCTRn MMUEN must be disabled.

(2) micro-TLB

Before a master access, the corresponding micro-TLB registers which includes the translation mode and ASIDs must be configured.

Figure 22.10 and Figure 22.11 shows the example of the procedure for using MMU and PMB function.

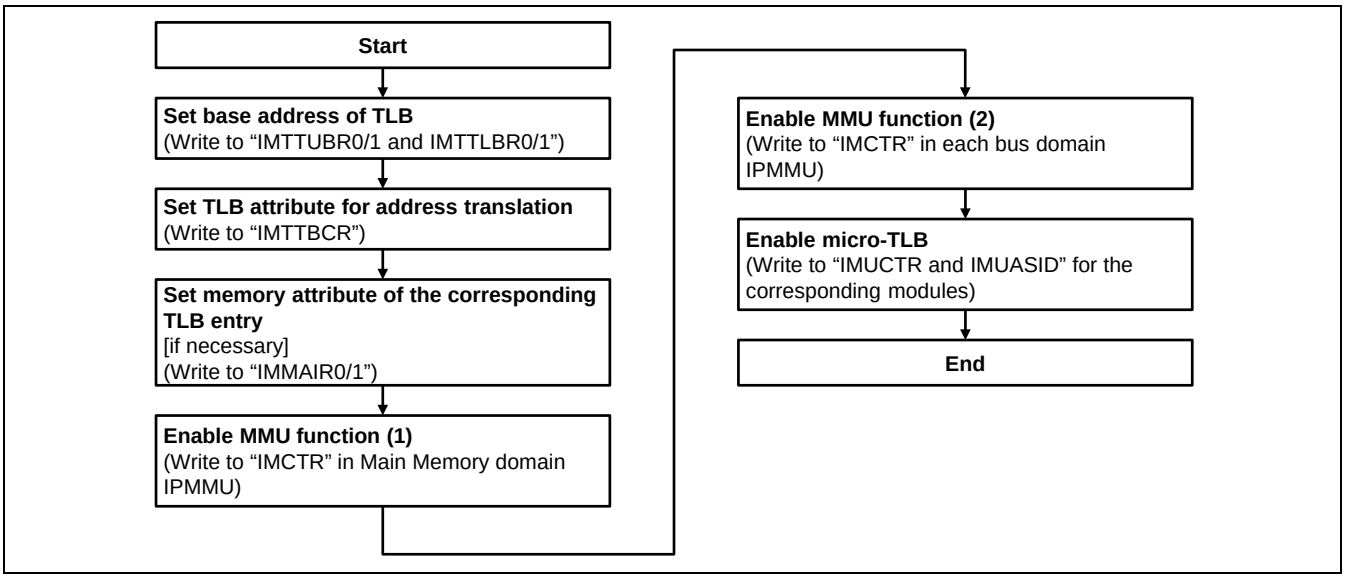

Figure 22.10 initialization sequence for using MMU function

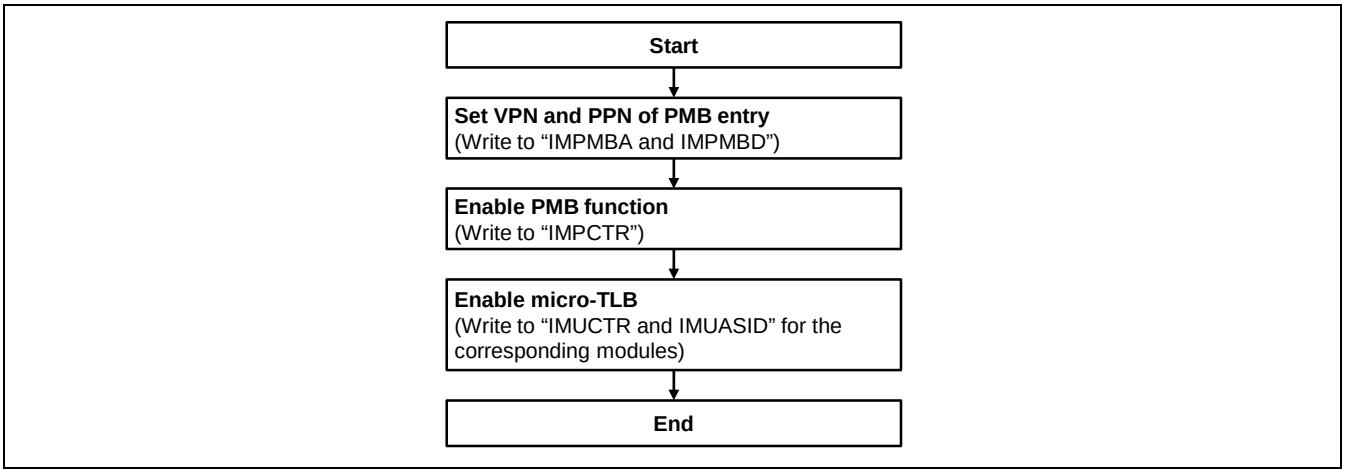

Figure 22.11 initialization sequence for using PMB function

22.3.5 TLB Maintenance

Some TLB maintenances between an IPMMU and the connected micro-TLBs are performed automatically by hardware. In case that the flush operation is performed via IMCTRn (IMCTRn FLUSH = 1), all the microTLB which is related to the same MMU tables are applied the TLB flush and clear the all TLB entry in microTLB.

Table 22.6 TLB Maintenance

Category	Software operation	TLB maintenance in IPMMU	TLB maintenance in micro-TLB
MMU Page Table	First entry registration	Not required	Not required
	Entry update	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
	Entry release	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
ASID	ASID update	Automatically invalidated	Automatically invalidated
MMU registers	MMU register values update	Invalidate the target TLB (IMCTRn.FLUSH = 1)	Automatically invalidated
PMB	PMB entry registration	Not required	Not required
	PMB entry update	Not required	Invalidate the target micro-TLB
	PMB entry release	Not required	Invalidate the target micro-TLB

IPMMU-main cannot issue the flush operation to each IPMMU-cache and microTLB. In case of replace the MMU table, the flush operation of both IPMMU-main and IPMMU-cache via IMCTRn(IMCTRn.FLUSH = 1) is required. TLB invalidation is instantaneous so software doesn't need to check IMUCTRn.FLUSH or IMCTRn.FLUSH whether TLB invalidation is completed. Figure 22.12 shows the example of the procedure for updating TLB entry

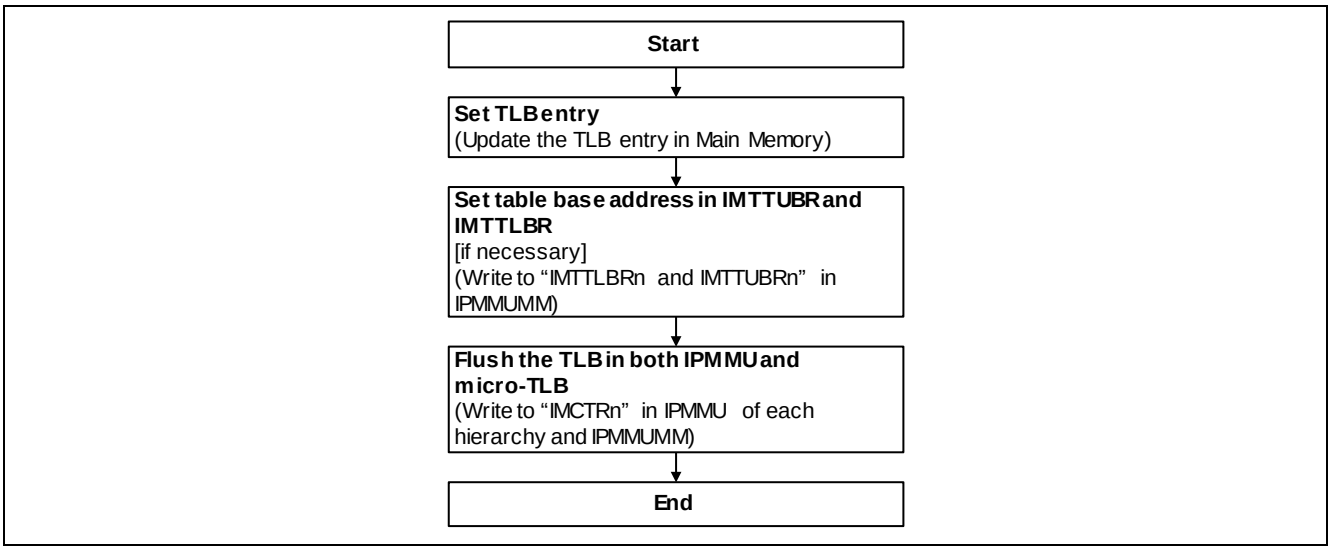

Figure 22.12 update sequence of TLB entry

22.3.6 Security Support

The IPMMU supports the security function based on Armv8 and additional extensions.

(1) Banked Registers

The IPMMU has two copies of a register at the same address. They are banked with secure and non-secure. A Non-secure access can read and write only non-secure registers and a secure access can read and write secure registers. A secure access can also read and write non-secure registers through the alias address space to non-secure registers (from H'0800 to H'0FFC).

(2) Secure-Group

Besides Secure access, IPMMUs support another secure access. The IPMMU which belongs to either secure group2 or secure group3 is treated as a secure, and performs its page table walk in secure mode. Table 22.7 shows the supported secure mode of IPMMU.

Table 22.7 Supported Secure Mode

IPMMU	Secure	Secure group control	RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

Note: √: Supported, —: Not Supported

(3) Address Translation

When a Secure/Accelerator master sends a translation request to an IPMMU through a micro-TLB, Secure MMU registers are referred to perform its page table walk. The Secure page table walk can read secure page table entries (NS = 0). In the case of a Non-secure translation request, Non-secure MMU registers are referred and the access to secure page table entries is ignored.

22.3.7 OS-ID support

IPMMU-PV0/1/2/3 and IPMMU-VC0/1 [RZ/G2H, RZ/G2M V3.0] support the OS-ID which is used for specifying the operating system. In order to use this feature, the microTLB which corresponds to the OS-ID need to be used. Table 22.8 shows the micro-TLB assignment for each OS-ID.

Table 22.8 micro-TLB assignment for OS-ID support.

OS-ID	Micro-TLB assignment
ID 0	uTLB0, uTLB8, uTLB16 and uTLB24
ID 1	uTLB1, uTLB9, uTLB17 and uTLB25
ID 2	uTLB2, uTLB10, uTLB18 and uTLB26
ID 3	uTLB3, uTLB11, uTLB19 and uTLB27
ID 4	uTLB4, uTLB12, uTLB20 and uTLB28
ID 5	uTLB5, uTLB13, uTLB21 and uTLB29
ID 6	uTLB6, uTLB14, uTLB22 and uTLB30
ID 7	uTLB7, uTLB15, uTLB23 and uTLB31

22.3.8 Error Handling

(1) IPMMU Interrupt Requests

Table 22.9 shows the error events which can cause interrupts. They are all errors which IPMMU supports. The errors are set in IMSTRn registers.

Table 22.9 IPMMU Error Events

Category	Error	Description
Long-descriptor Short-descriptor	Translation Fault	A virtual address was not mapped in the region defined by TTBR0 and TTBR1.*
		A descriptor was neither Table nor Block format
	Page Fault	AP (access permissions) / AF (access flag) bit mismatch occurred.
		NS bit mismatch occurred. Non-secure master read a Secure page table entry.
	Abort	The IPMMU got an error response from an Interconnect during a page table walk.
	Multiple Hit (MHIT)	Multiple TLB hits occurred.
PMB	Translation Fault	A virtual address was not mapped in IMPMBAn.
	Multiple Hit (MHIT)	Multiple PMB hits occurred.

Note: * This factor is only for long-descriptor.

(2) Error Handling Flow

When the micro-TLB cannot translate its virtual address because of some IPMMU errors, the micro-TLB stops to issue the following transactions. When the IPMMU detects an error, IMCTRn.FLUSH must be set after the IMSTRn register is cleared and page table entries are updated. After the TLB invalidation, the micro-TLB resumes to issue transactions.

Figure 22.13 shows the error handling flow.

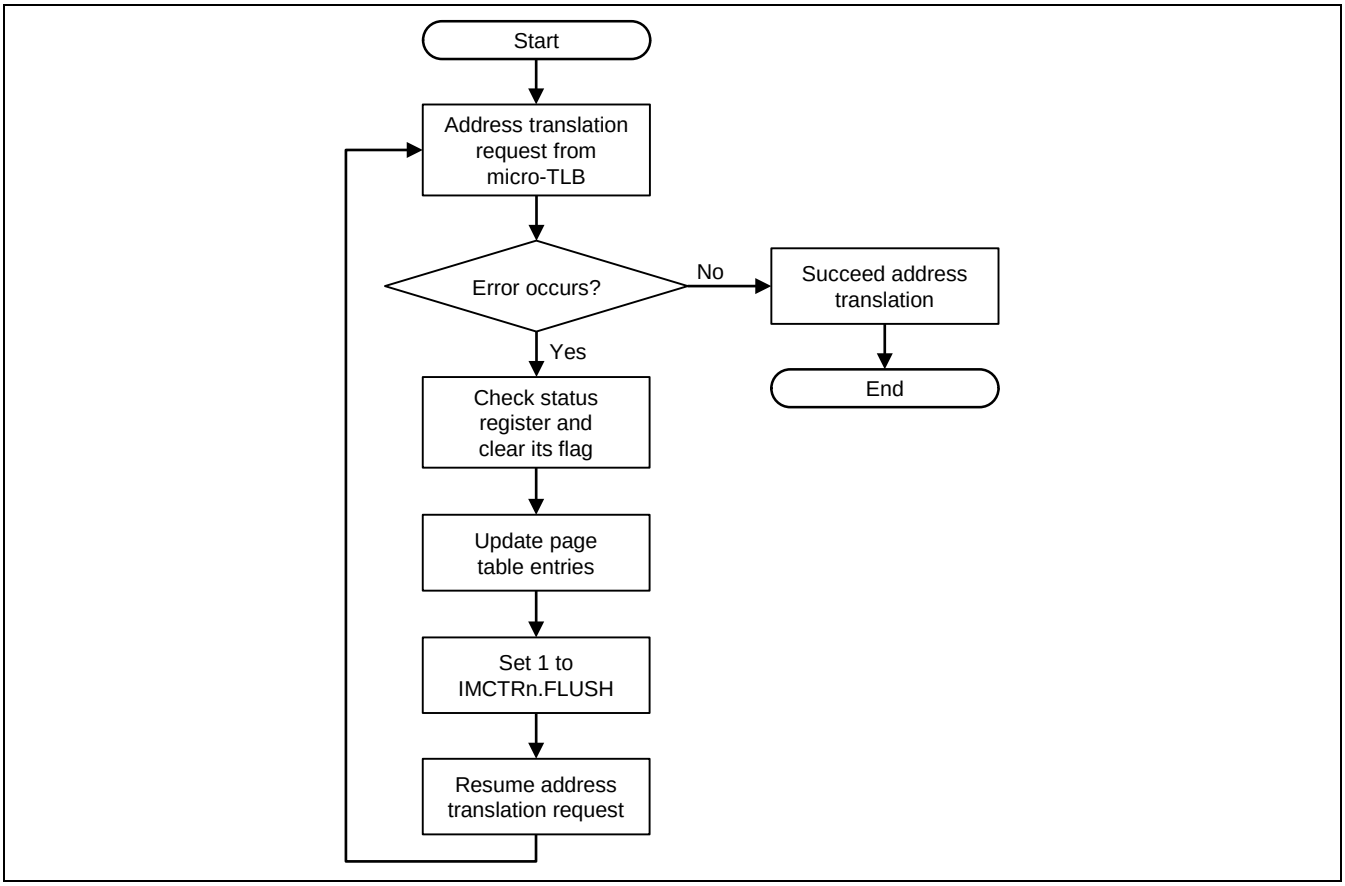

Figure 22.13 Error Handling Flow

22.3.9 Performance monitor

In order to check the number of the page hit or miss, performance monitor is helpful for this purpose. When you use performance monitor, set the IMPFMCTR.MD[1:0] bits. After that set 1 to IMPFMCTR.EN bit. After you set 1 to IMPFMCTR.EN, IMPFMTOTAL, IMPFMHIT, IMPFML3MISS and IMPFML2MISS registers start counting.

22.4 micro-TLB Assignment

The assignment of micro-TLB varies with the RZ/G series products. Refer to the following sections.

22.4.1 micro-TLB Assignment

22.5.2 IPMMU configuration

22.5.2.1 IPMMU configuration for FCPCS [RZ/G2H, RZ/G2M V3.0]

In case that the VDPB, VCPLF and iVDP1C use the address translation function of IPMMU, uTLB8 and uTLB12 of both IPMMU-VC0 and IPMMU-VC1 need to be set. Because the request from each master IP is split to the two master ports at FCPCS. Each master port is connected to the each IPMMU. (IPMMU-VC0 and IPMMU-VC1). Figure 22.14 shows the connection of FCPCS and each IPMMU. When the MMU configuration is changed, TLB flush operation is required to IPMMU-VC0 and IPMMU-VC1 as well as each uTLB of both IPMMUs.

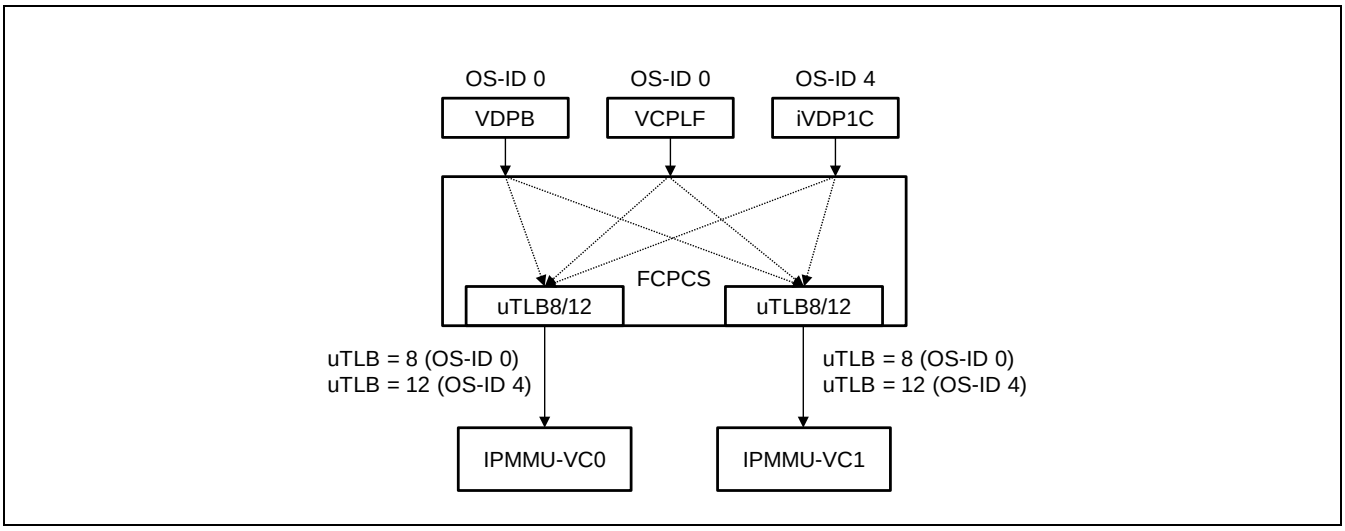

Figure 22.14 connection of FCPCS and IPMMU

For RZ/G2M V3.0, uTLB1, uTLB5, uTLB8, and uTLB12 of IPMMU-VC0 need to be set. Each mater port is connected to the IPMMU-VC0. Figure 22.15 shows the connection of FCPCS and IPMMU.

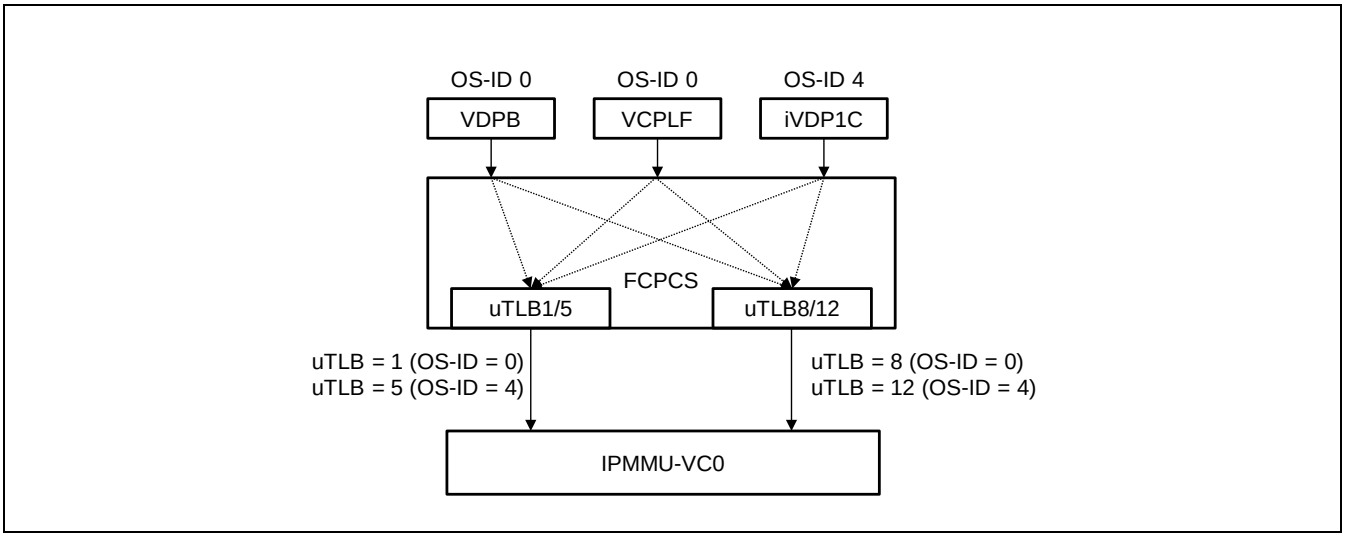

Figure 22.15 connection of FCPCS and IPMMU

22.5.2.2 IPMMU configuration for 3DG [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]

In case that the 3DG engine use the address translation function of IPMMU, uTLB corresponding to OS-ID of IPMMU-PVn (n = 0, 1, 2, 3 [RZ/G2H], n = 0, 1 [RZ/G2M V1.3, RZ/G2M V3.0]) need to be set as well. Figure 22.16 and Figure 22.17 show the connection of 3DG engine and each IPMMU. When the MMU configuration is changed, TLB flush operation is required to IPMMU-PVn as well as each uTLB of both IPMMUs.

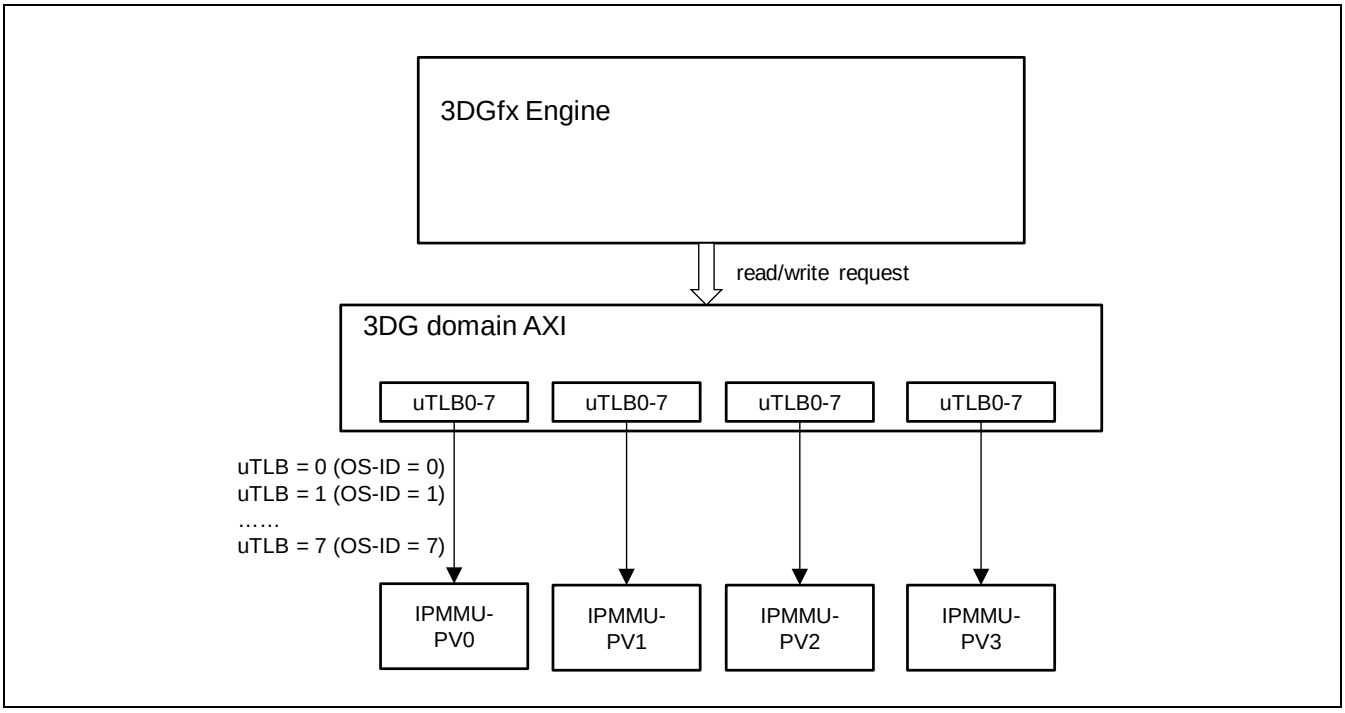

Figure 22.16 connection of 3DG engine and IPMMU (RZ/G2H)

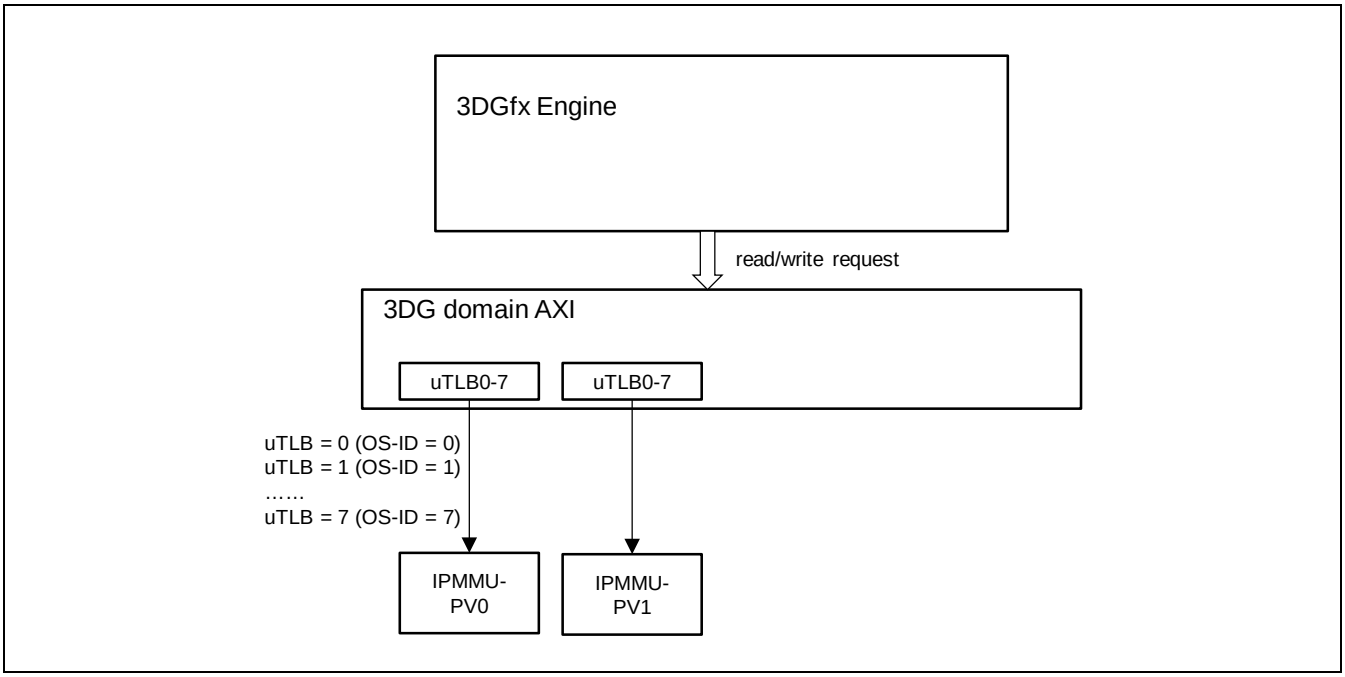

Figure 22.17 connection of 3DG engine and IPMMU (RZ/G2M V1.3, RZ/G2M V3.0)

22.5.3 Restrictions for IPMMU

22.5.3.1 Page size and Section size usage in VMSAv8-32

IPMMU cannot handle both 4KB page and 64KB page at the same MMU context in VMSAv8-32. In case of using the 64KB page, IMTTBCRn.PGSZ = 1 is required. Also 1MB section and 16MB super-section cannot be handled. In case of using 16MB section, IMTTBCRn.SCSZ = 1 is required.

22.5.3.2 4KB page usage in VMSAv8-64

Four level translation is not supported in IPMMU. In case of using 4KB page granule, we should set "0x1" to "SL" field. (start from 1st level) and use concatenated translation table. Architecturally, this table optimization is supported in stage 2 translation, but IPMMU is supported this mode in stage 1 translation as well in order to reduce the number of page table walk. In table lookup, MSB of input address (IA[39]) is used for the page table entry selection for upper or lower table.

22.5.3.3 Error Handling in VMSAv8-64

Architecturally, Address Size Fault is described in VMSAv8-64. But this fault is not able to handle in IPMMU. On the other hand, the NS bit in a Non-secure translation table descriptor need to be set in IPMMU although it is ignored in VMSAv8-64. In order to avoid “Secure Access Fault”, set “NS bit” in a Non-secure translation table descriptor.

22.5.3.4 Start Level for Page Table Walk

Start Level for page table walk need to be set under below condition. Refer to Table 22.25.

Table 22.25 Start Level for Page Table Walk

IMCTRn.VA64 = 1 IMTTBCRn.PGSZ = 0 (use 4KB page granule)		
Look Up	stage 1 Translation	stage 2 Translation
Level 0 *	No support	No Support
Level 1	base address[39:x]: Input Address[y:30] if IMTTBCRn SL[1:0] = 2'b01 x = (37 – TSZn (n = 0, 1)) [24* <=TSZn <= 33] y = x + 26 Other values go to Level 2	base address[39:x]: Input Address[y:30] if IMTTBCRn SL[1:0] = 2'b01 x = (37 – TSZn (n = 0, 1)) [24* <=TSZn <= 33] y = x + 26 Other values go to Level 2
Level 2	base address [39:x], Input Address[y:21] if IMTTBCRn SL[1:0] = 2'b00 x = (46 -TSZn (n = 0,1)) [30 <= TSZn <= 39] y = x + 17 Other values x = (46 – TSZn (n = 0, 1)) [34 <=TSZn <= 39] y = x + 17	base address[39:x]: Input Address[y:21] if IMTTBCRn.SL[1:0] = 2'b00 x = (46 – TSZn (n = 0,1)) [30 <=TSZn <= 39] y = x + 17 Other values No support
IMCTRn.VA64 = 1 IMTTBCRn.PGSZ = 1 (use 64KB page granule)		
Level 1	No Support	No Support
Level 2	base address [39:x], Input Address[y:29] if IMTTBCRn SL[1:0] = 2'b01 x = (38 – TSZn (n = 0, 1)) [24 <= TSZn <= 34] y = x + 25 Other values go to Level 3	base address [39:x], Input Address[y:29] if IMTTBCRn SL[1:0] = 2'b01 x = (38 – TSZn (n = 0, 1)) [24 <= TSZn <= 34] y = x + 25 Other values go to Level 3
Level 3	base address [39:x], Input Address [y:16] if IMTTBCRn.SL[1:0] = 2'b00 x = (51 – TSZn (n = 0, 1)) [31 <=TSZn <= 39] y = x + 12 Other values x = (51 – TSZn (n = 0, 1)) [35 <=TSZn <= 39] y = x + 12	base address [39:x], Input Address [y:16] if IMTTBCRn.SL[1:0] = 2'b00 x = (51 – TSZn (n = 0, 1)) [31 <= TSZn <= 39] y = x + 12 Other values x = (51 – TSZn (n = 0, 1)) [35 <= TSZn <= 39] y = x + 12
IMCTRn.VA64 = 0		
Level 1	base address[39:x]: Input Address[y:30] if IMTTBCRn SL[1] = 1'b1 x = (5 – TSZn (n = 0, 1)) [0 <=TSZn <= 1] y = x + 26 Other values go to Level 2	base address[39:x]: Input Address[y:30] if IMTTBCRn.SL[1] = 1'b1 x = (5 – TSZ0) [–2 <= TSZ0 <= 1] y = x + 26 Other values x = (5 – TSZ0) [–8 <= TSZ0 <= –3] y = x + 26
Level 2	base address[39:x]: Input Address[y:21] if IMTTBCRn.SL[1] = 1'b0 x = (14 – TSZn (n = 0, 1)) [2 <= TSZn <= 7] y = x + 17 Other values No support	base address[39:x]: Input Address[y:21] if IMTTBCRn.SL[1] = 1'b0 x = (14 – TSZ0) [–2 <= TSZ0 <= 7] y = x + 17 Other values No support

Note: * Not support level 0 page table walk. Refer to 22.5.3.2 4KB page usage in VMSAv8-64.

22.5.3.5 Virtual address space range

In case of using MMU, Virtual address space range cannot be configured less than or equal 128MB. In case of supporting this address range, set virtual address space range to 256MB by setting TSZ0/TSZ1 and unnecessary area is not mapped by MMU.

22.5.3.6 Treatments of ASID feature

In RZ/G2, IPMMU is not supported ASID feature. Software should not set the value except “0” in IMUASID register.

22.5.3.7 Disabling the address translation by IPMMU

Even if a master IP is disabling the address translation by IPMMU, IMUCTRn.TTSEL[2:0] needs to be set unused MMU context number. It means that only seven MMU context can be used for the address translation by IPMMU in this case.

22.5.3.8 Restriction for DMAC transfer [RZ/G2M V1.3 only]

SYS-DMAC cannot support read interleaving feature. In order to avoid this occurrence, it is required to apply the following restriction in case that SYS-DMAC need to access address space exceeding 32-bit.

1. Don’t set the transfer size exceeding 16 bytes in case of using IPMMU
2. Use 1GB page in order to avoid TLB miss.
3. Don’t use IPMMU. Use extended address function which is implemented in SYS-DMAC.

22.5.3.9 Restriction for OS-ID support [RZ/G2M V1.3 only]

In order to perform address translation for 3DG Engine by IPMMU normally, context switching by OS-ID cannot be used. It is required to set the same MMU context number to each uTLB for 3DG Engine.

22.5.3.10 Restriction for TLB location [RZ/G2M V1.3 only]

TLB for address translation by IPMMU cannot be located at System-RAM. It is required to put TLB in the main memory.

22.5.3.11 Restriction for TLB flush operation [RZ/G2M V1.3 only]

In order to perform address translation by IPMMU normally, it is limited to replace the MMU context dynamically so as not to perform TLB flush operation. Use 1GB page to avoid this occurrence.

22.5.3.12 Restriction for IPMMU cache [RZ/G2M V1.3, RZ/G2N, RZ/G2E]

In order to perform address translation by IPMMU normally, it is limited not to use IPMMU cache. In RZ/G2N and RZ/G2E, it is required to disable IPMMU cache by setting “IMSCTLR.dismmu” to 1. In RZ/G2M V1.3, IPMMU cache is always disabled by hardware. IPMMU cache cannot be used.

22.5.3.13 Restriction for PMB

In order to perform address translation by IPMMU normally, it is limited not to use PMB mode in secure mode. Use PMB mode only in non-secure mode.

22.5.3.14 Restriction for PMB with Stage 2 Translation [RZ/G2M V1.3 only]

In order to perform address translation by IPMMU normally, it is limited not to use PMB mode with Stage 2 Translation. Use MMU mode only in Stage 2 Translation.

23. Direct Memory Access Controller for System (SYS-DMAC)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

This LSI includes a direct memory access controller for system (SYS-DMAC). The SYS-DMAC can be used in place of the CPU to handle high-speed data transfer to and from an external memory, the on-chip memory, memory-mapped external devices, or on-chip peripheral modules.

23.1 Overview

23.1.1 Features

- Up to 48 channels are available.
- 1-T byte physical address space
- Transfer data length: Byte, word (2 bytes), longword (4 bytes), 8 bytes, 16 bytes, 32 bytes, and 64 bytes
- Maximum number of transfer times: 16,777,215
- Address mode: Dual address mode
- Transfer requests:

  Requests from on-chip peripheral modules or auto requests can be selected. The following modules can issue on-chip peripheral module requests.

  IIC-PMIC, TPU0, HSCIF0/1/2/3/4, MSIOF0/1/2/3, SCIF0/1/2/3/4/5, CANFD, I2C0/1/2/3/4/5/6.

  Note: The availability of these modules and channels depends on the product. Refer to Table 23.5 for available modules in each product.
- Selectable bus modes:

  Normal speed mode or slow mode can be selected for each channel.
- Either fixed priority or round-robin arbitration can be selected for use in arbitration among the transfer channels.
- Interrupt request:

  The SYS-DMAC can be set up to generate an interrupt request for the CPU upon completion of transfer under the control of one stage of the descriptor memory, at the end of the data transfer, in response to an MMU error, and in response to an address error.

- Descriptor memory function:

  Up to 128 sets of the settings for the source address register, destination address register, and transfer count register are available (if use of the descriptor memory is only enabled for one channel) for use in setting up consecutive DMA transfers (the memory can hold register values for up to 256 stages of transfer when the external memory is selected). An infinite repeat mode is also available.

Figure 23.1 shows the block diagram of the SYS-DMAC.

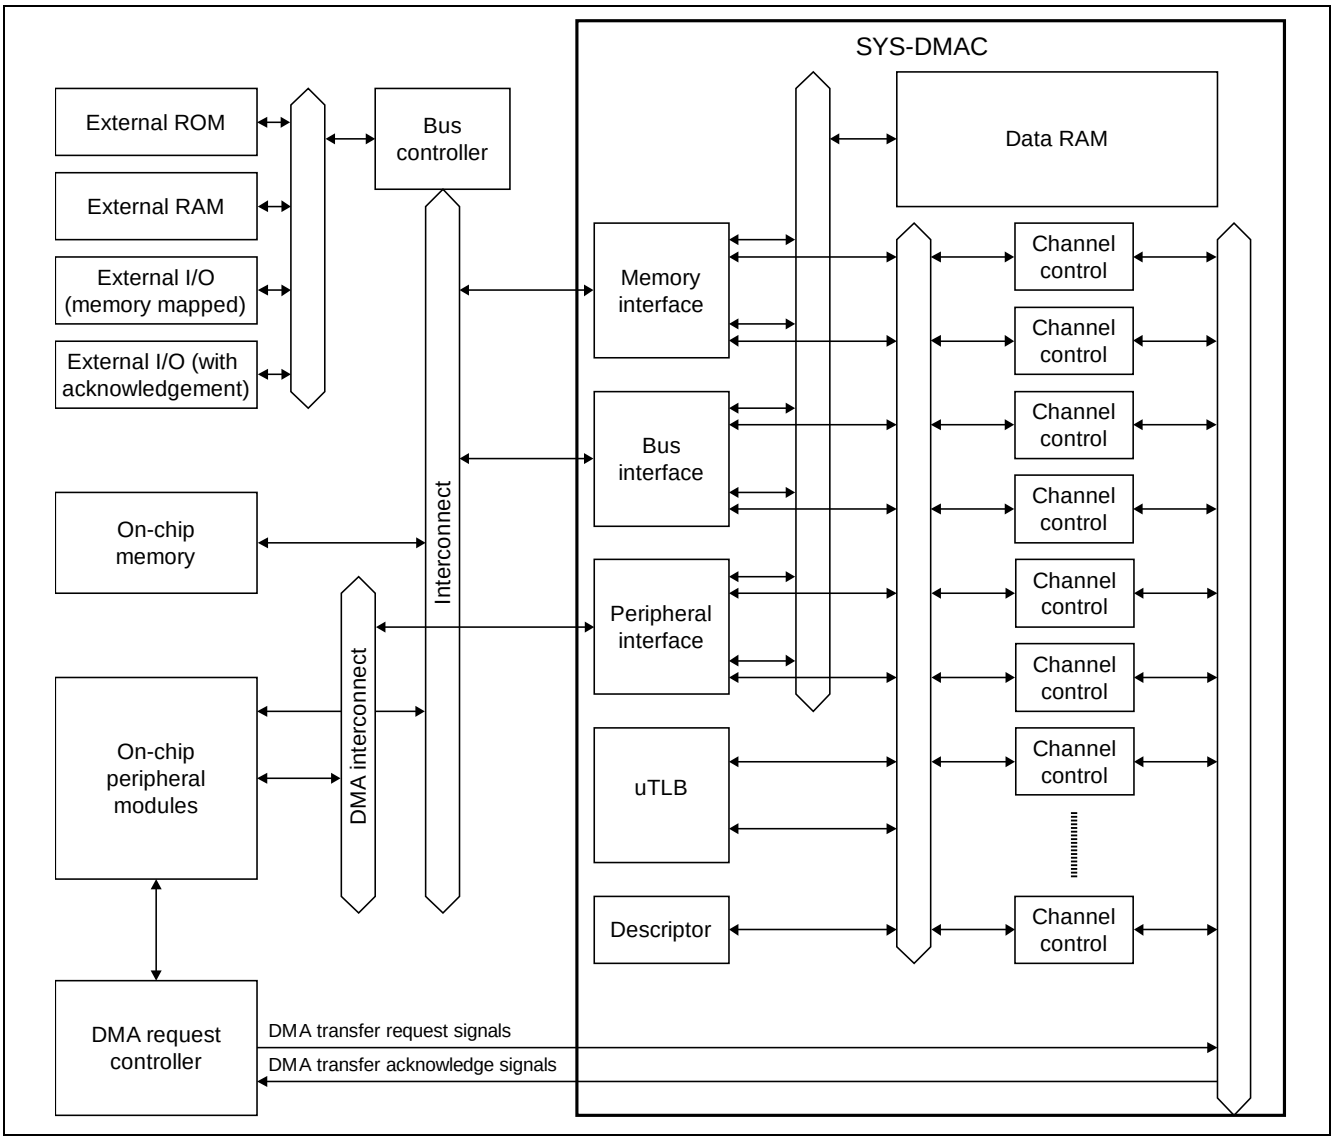

Figure 23.1 Block Diagram of the SYS-DMAC

23.1.2 External Pins

There are no external pins relevant to the SYS-DMAC.

23.1.3 Register Configuration

Table 23.1 lists the registers of the SYS-DMAC. Table 23.2 shows the register states of the SYS-DMAC in each operating mode.

Each product of the Second Generation RZ/G series has the same configuration of registers for the SYS-DMAC.

Table 23.1 Register Configuration of the SYS-DMAC

					Second Generation RZ/G Series Products

23.1.4 Connected Module

Table 23.3 shows the connected modules to SYS-DMAC. As for the feature of the connected modules, refer to the chapter of each module.

Table 23.3 Connected Modules

Module name	Connected module name	Function of connected module
SYS-DMAC	CPG	Output clocks
	Module Standby	Control to stop clocks
	Software Reset	Execute software reset
	INTC-SYS	Control to interrupt

23.2 Register Description

23.2.1 DMA Interrupt Status Register for channels 0 to 15 (DMAISTA_0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMAISTA_0 is a 32-bit readable register that indicates the states of the interrupt signals for each of the lower-numbered channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	I31	B'0	R	Interrupt State in Channel 31 0: An interrupt is not present. 1: An interrupt is present.
14	I30	B'0	R	Interrupt State in Channel 30 0: An interrupt is not present. 1: An interrupt is present.
13	I29	B'0	R	Interrupt State in Channel 29 0: An interrupt is not present. 1: An interrupt is present.
12	I28	B'0	R	Interrupt State in Channel 28 0: An interrupt is not present. 1: An interrupt is present.
11	I27	B'0	R	Interrupt State in Channel 27 0: An interrupt is not present. 1: An interrupt is present.
10	I26	B'0	R	Interrupt State in Channel 26 0: An interrupt is not present. 1: An interrupt is present.
9	I25	B'0	R	Interrupt State in Channel 25 0: An interrupt is not present. 1: An interrupt is present.
8	I24	B'0	R	Interrupt State in Channel 24 0: An interrupt is not present. 1: An interrupt is present.
7	I23	B'0	R	Interrupt State in Channel 23 0: An interrupt is not present. 1: An interrupt is present.

Bit	Bit Name	Initial Value	R/W	Descriptions
6	I22	B'0	R	Interrupt State in Channel 22 0: An interrupt is not present. 1: An interrupt is present.
5	I21	B'0	R	Interrupt State in Channel 21 0: An interrupt is not present. 1: An interrupt is present.
4	I20	B'0	R	Interrupt State in Channel 20 0: An interrupt is not present. 1: An interrupt is present.
3	I19	B'0	R	Interrupt State in Channel 19 0: An interrupt is not present. 1: An interrupt is present.
2	I18	B'0	R	Interrupt State in Channel 18 0: An interrupt is not present. 1: An interrupt is present.
1	I17	B'0	R	Interrupt State in Channel 17 0: An interrupt is not present. 1: An interrupt is present.
0	I16	B'0	R	Interrupt State in Channel 16 0: An interrupt is not present. 1: An interrupt is present.

23.2.3 DMA Interrupt Status Register for channels 32 to 47 (DMAISTA_2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMAISTA_2 is a 32-bit readable register that indicates the states of the interrupt signals for each of the higher-numbered channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	I47	B'0	R	Interrupt State in Channel 47 0: An interrupt is not present. 1: An interrupt is present.
14	I46	B'0	R	Interrupt State in Channel 46 0: An interrupt is not present. 1: An interrupt is present.
13	I45	B'0	R	Interrupt State in Channel 45 0: An interrupt is not present. 1: An interrupt is present.
12	I44	B'0	R	Interrupt State in Channel 44 0: An interrupt is not present. 1: An interrupt is present.
11	I43	B'0	R	Interrupt State in Channel 43 0: An interrupt is not present. 1: An interrupt is present.
10	I42	B'0	R	Interrupt State in Channel 42 0: An interrupt is not present. 1: An interrupt is present.
9	I41	B'0	R	Interrupt State in Channel 41 0: An interrupt is not present. 1: An interrupt is present.
8	I40	B'0	R	Interrupt State in Channel 40 0: An interrupt is not present. 1: An interrupt is present.
7	I39	B'0	R	Interrupt State in Channel 39 0: An interrupt is not present. 1: An interrupt is present.

Bit	Bit Name	Initial Value	R/W	Descriptions
6	I38	B'0	R	Interrupt State in Channel 38 0: An interrupt is not present. 1: An interrupt is present.
5	I37	B'0	R	Interrupt State in Channel 37 0: An interrupt is not present. 1: An interrupt is present.
4	I36	B'0	R	Interrupt State in Channel 36 0: An interrupt is not present. 1: An interrupt is present.
3	I35	B'0	R	Interrupt State in Channel 35 0: An interrupt is not present. 1: An interrupt is present.
2	I34	B'0	R	Interrupt State in Channel 34 0: An interrupt is not present. 1: An interrupt is present.
1	I33	B'0	R	Interrupt State in Channel 33 0: An interrupt is not present. 1: An interrupt is present.
0	I32	B'0	R	Interrupt State in Channel 32 0: An interrupt is not present. 1: An interrupt is present.

23.2.4 DMA Secure Control Register for channels 0 to 15 (DMASEC_0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMASEC_0 is a 32-bit readable/writable register that controls the security attribute of each of the lower-numbered channels. Only the initiator in the secure mode can change the setting of this register.

Only secure access is allowed to register of channels with the secure mode setting. The following registers are protected by the secure mode.

DMASAR_0, DMADAR_0, DMATCR_0, DMATSR_0, DMACHCR_0, DMATCRB_0, DMATSRB_0, DMACHCRB_0, DMARS_0, DMABUFCR_0, DMADPBASE_0, DMADPCR_0, DMAFIXSAR_0, DMAFIXDAR_0, and DMAFIXDPBASE_0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

23.2.6 DMA Secure Control Register for channels 32 to 47 (DMASEC_2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMASEC_2 is a 32-bit readable/writable register that controls the security attribute of each of the higher-numbered channels. Only the initiator in the secure mode can change the setting of this register.

Only secure access is allowed to register of channels with the secure mode setting. The following registers are protected by the secure mode.

DMASAR_2, DMADAR_2, DMATCR_2, DMATSR_2, DMACHCR_2, DMATCRB_2, DMATSRB_2, DMACHCRB_2, DMARS_2, DMABUFCR_2, DMADPBASE_2, DMADPCR_2, DMAFIXSAR_2, DMAFIXDAR_2, and DMAFIXDPBASE_2.

23.2.7 DMA Operation Register for channels 0 to 15 (DMAOR_0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMAOR_0 is a 16-bit readable/writable register that enables DMA transfer on all lower-numbered channels and specifies the method used to determine the priority levels for all lower-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]		—	—	—	—	—	AE	—	DME
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R/(W)*	R	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PR[1:0]	B'00	R/W	Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. B'00: Fixed CH0 > CH1 > ... > CH14 > CH15 B'11: Round-robin priority Other than above: Setting prohibited
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	AE	B'0	R/(W)*	Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR_0 or DMADAR_0 does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: A SYS-DMAC address error interrupt is not present. [Clearing condition] (*) Writing CAE = 0 after reading CAE = 1 1: A SYS-DMAC address error interrupt being generated during DMA transfer.
1	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Descriptions
0	DME	B'0	R/W	DMA Master Enable Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR_0 are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_0 must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR_0 for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels. 0: Disables DMA transfers on all channels 1: Enables DMA transfers on all channels

23.2.8 DMA Operation Register for channels 16 to 31 (DMAOR_1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMAOR_1 is a 16-bit readable/writable register that enables DMA transfer on all higher-numbered channels and specifies the method used to determine the priority levels for all higher-numbered DMA channels. This register also indicates address errors.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

31	SEC	B'0	R/W	Security Attribute Setting for Descriptor Memory Specifies the security attribute of the address space used for the descriptor memory. 0: Non-secure 1: Secure
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	SA[8:0]	H'000	R/W	Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	SM[8:0]	H'000	R/W	Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 23.4.

23.2.16 DMA Source Address Registers 0 to 47 (DMASAR_0 to DMASAR_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMASAR is a 32-bit readable/writable register that specifies the source address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next source address.

When the address mode is incremental, sources in memory only have byte boundaries. For details, refer to Table 23.4.

23.2.17 DMA Destination Address Registers 0 to 47 (DMADAR_0 to DMADAR_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMADAR is 32-bit readable/writable register that specify the destination address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next destination address.

When the address mode is incremental, destinations in memory only have byte boundaries. For details, refer to Table 23.4.

Table 23.4 SAR/DAR Address Restriction

Resource Selection	Address Mode	Restriction
Auto request	Incremental	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/DAR, Reception/SAR	All	Boundary corresponding to the DMA transfer size
On-chip peripheral module request Transmission/SAR, Reception/DAR	Incremental	No restriction (byte boundaries)
	Others	Boundary corresponding to the DMA transfer size

23.2.18 DMA Transfer Count Registers 0 to 47 (DMATCR_0 to DMATCR_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMATCR is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'0000_0001, 16,777,215 when the setting is H'00FF_FFFF (the maximum). During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in reading.

The eight higher-order bits of DMATCR are always read as 0, and the write value should always be 0.

23.2.19 DMA Transfer Count Registers B_0 to 47 (DMATCRB_0 to DMATCRB_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMATCRB is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'0000_0001, 16,777,215 when the setting is H'00FF_FFFF (the maximum). During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in writing.

The eight higher-order bits of DMATCRB are always read as 0, and the write value should always be 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

23.2.20 DMA Transfer Size Registers 0 to 47 (DMATSR_0 to DMATSR_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMATSR is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'0000_0001, 4,294,967295 bytes when the setting is H'FFFF_FFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'0000_0000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The SYS-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the read transfer size.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DM[1:0]		SM[1:0]		RS[3:0]				—	—	—	TS[1:0]		IE	TE	DE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/(W)*	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31	CAE	B'0	R/(W)*	Channel Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the CAE bit, write 0 to the CAE bit after reading 1 from it or clear the AE bit in DMAOR. (When the AE bit in DMAOR is cleared, CAE bit in all channels are cleared.) 0: A SYS-DMAC address error interrupt is not present. [Clearing condition] Writing CAE = 0 after reading CAE = 1 1: A SYS-DMAC address error interrupt being generated during DMA transfer.
30	CAIE	B'0	R/W	Channel Address Error Interrupt Enable Enables or disables the generation of interrupt requests for the CPU when address errors occur. When the CAIE bit is set to 1, if the CAE bit is also set, an interrupt (DEI 0 to 47) from the corresponding channel will be generated for the CPU in response to address errors. Note: An address error interrupt (DADERR) is also asserted simultaneously. See section 19, Interrupt Controller (INTC-AP) for more details. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.

Bit	Bit Name	Initial Value	R/W	Descriptions
29, 28	DPM[1:0]	B'00	R/W	Operating Mode of Descriptor Memory Enable or disable the descriptor memory and specify its operating mode. B'00: Disabled (normal use) B'01: Enabled (normal mode) B'10: Enabled (repeat mode) B'11: Enabled (read-out interrupt mode, infinite repeat mode)
27 to 25	RPT[2:0]	B'000	R/W	Descriptor Setting Update Specify the parameters to be updated from the descriptor memory. RPT[2]: Enables or disables updating of the source address register RPT[1]: Enables or disables updating of the destination address register RPT[0]: Enables or disables updating of the transfer count register 0: Disabled 1: Enabled
24, 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	DPB	B'0	R/W	Descriptor Start Specifies configuration to be loaded when transfer under control of the descriptor memory begins. This bit is cleared after the descriptor memory is read. 0: Processing starts with the values in DMASAR, DMADAR, and DMATCR. 1: Processing starts after the first set of descriptors is read out.
21, 20	TS[3:2]	B'00	R/W	DMA Transfer Size In combination with TS[1:0], these bits specify the DMA transfer size. When the transfer source or transfer destination is a register of an on-chip peripheral module for which a transfer size is specified, be sure to select the specified transfer size. For the transfer source or destination address specified by DMASAR or DMADAR, an appropriate boundary address should be set according to the transfer data size. TS[3:2] + TS[1:0] ("+" here indicates concatenation, not addition) B'0000: Transfer is in byte units. B'0001: Transfer is in word (2-byte) units. B'0010: Transfer is in longword (4-byte) units. B'0011: Transfer is in 16-byte units. B'0100: Transfer is in 32-byte units. B'0101: Transfer is in 64-byte units. B'0111: Transfer is in 8-byte units. Other than above: Setting prohibited
19	DSE	B'0	R/(W)*	Descriptor Stage End (*) When the DSIE bit is set to 1 and the descriptor memory is enabled, the DSE bit is set to 1 on completion of the DMA transfer. This bit is not set when the DPM bit is set to 0 (descriptors are disabled). To clear the DSE bit, start by reading it as 1, and then write 0 to the bit. 0: DMA transfer is still running or has been aborted. 1: Transfer under the control of one stage of the descriptor memory has been completed.

Bit	Bit Name	Initial Value	R/W	Descriptions
18	DSIE	B’0	R/W	Descriptor Stage End Interrupt Enable Specifies whether an interrupt request is generated for the CPU on completion of transfer under the control of one stage of the descriptor memory. When this bit is set to 1, an interrupt (DEI) is generated for the CPU whenever the DSE is set to 1. 0: Interrupt requests are disabled. 1: Interrupt requests are enabled.
17, 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15, 14	DM[1:0]	B’00	R/W	Destination Address Mode Specify whether the DMA destination address is incremented, fixed, or decremented. The unit of transfer (transfer size) determines the size of the increment. B’00: Destination address is fixed. B’01: Destination addresses are incremented. + 1 when transfer is in byte units. + 2 when transfer is in word units. + 4 when transfer is in longword units. + 8 when transfer is in 8-byte units. + 16 when transfer is in 16-byte units. + 32 when transfer is in 32-byte units. + 64 when transfer is in 64-byte units. B’10: Destination addresses are decremented. – 1 when transfer is in byte units. – 2 when transfer is in word units. – 4 when transfer is in longword units. Setting prohibited when transfer is in 8-, 16-, 32-, or 64-byte units. B’11: Setting Prohibited
13, 12	SM[1:0]	B’00	R/W	Source Address Mode Specify whether the DMA source address is incremented, fixed, or decremented. The unit of transfer (transfer size) determines the size of the increment. 00: Source address is fixed. B’01: Source addresses are incremented. + 1 when transfer is in byte units. + 2 when transfer is in word units. + 4 when transfer is in longword units. + 8 when transfer is in 8-byte units. + 16 when transfer is in 16-byte units. + 32 when transfer is in 32-byte units. + 64 when transfer is in 64-byte units. B’10: Source addresses are decremented. – 1 when transfer is in byte units. – 2 when transfer is in word units. – 4 when transfer is in longword units. Setting prohibited when transfer is in 8-, 16-, 32-, or 64-byte units. B’11: Setting Prohibited
11 to 8	RS[3:0]	B’0000	R/W	Resource Selection Specify the source of transfer requests. Only change the transfer request source while the DMA enable bit (DE) is set to 0. B’0100: Auto request B’1000: Source is selected by the DMA extended resource selector. Other than above: Settings prohibited

Bit	Bit Name	Initial Value	R/W	Descriptions
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	TS[1:0]	B'00	R/W	DMA Transfer Size See the description of TS[3:2] (bits 21 and 20).
2	IE	B'0	R/W	Interrupt Enable Specifies whether or not an interrupt request is generated for the CPU on completion of DMA transfer. When this bit is set to 1, an interrupt request (DEI) for the CPU is generated whenever the TE bit is set to 1. 0: Interrupt request is disabled. 1: Interrupt request is enabled.
1	TE	B'0	R/(W) *	Transfer End Flag When the descriptor memory is not in use, the TE bit is set to 1 when DMATCR becomes 0 on completion of the DMA transfer. When the descriptor memory is in use, the TE bit is set to 1 on completion of all transfers set up in the descriptor memory. The TE bit is not set to 1 in the following cases. • DMA transfer ends due to a DMA address error before DMATCR becomes 0. • DMA transfer is aborted by clearing the DE and DME bits in DMAOR. To clear the TE bit, start by reading it as 1, and then write 0 to it. When the TE bit is set to 1, transfer is not possible even if the DE bit is set to 1. 0: DMA transfer is in progress or was aborted [Clearing condition] Writing of 0 after reading of 1 1: DMA transfer ended on the specified count (TCR = 0)
0	DE	B'0	R/W	DMA Enable Enables or disables DMA transfer. In the auto request mode, a DMA transfer is started by setting the DE and DME bits in DMAOR to 1. At this time, the setting of both the AE and TE bits in DMAOR must be 0. In a peripheral module request, a DMA transfer starts if the transfer request is generated by the selected device or on-chip peripheral module after setting the DE and DME bits to 1. In this case too, the settings of both the TE and AE bits must be 0. Clearing the DE bit to 0 aborts all DMA transfer. Note: Ensure that the setting of the DE bit is actually 0 after clearing it. 0: DMA transfer is disabled. 1: DMA transfer is enabled.

Note: * Writing 0 is possible to clear the flag.

23.2.23 DMA Channel Control Register B_0 to 47 (DMACHCRB_0 to DMACHCRB_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMACHCRB is a 32-bit readable/writable register that controls the DMA transfer mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DCNT[7:0]	H'00	R/W	Number of Stages of Descriptor Memory Specify the number of stages of the descriptor memory as DCNT + 1. When the descriptor memory is enabled, a transfer end (TE) interrupt is only generated for the CPU on completion of transfer under control of the specified number of stages.
23 to 16	DPTR[7:0]	H'00	R	Descriptor Pointer This bit indicates the pointer to the next descriptor to be read. It is cleared to 0 when the last descriptor of the number of stages specified by DCNT[7:0] is read. It is also cleared to 0 when 1 is written to DRST.
15	DRST	B’0	W	Descriptor Reset Resets the descriptor pointer. Before the descriptor memory is used, the pointer must be reset by writing 1 to this bit. This bit is always read as 0.
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DTS	B’0	R/W	Total Size Transmission under Descriptor Control This bit is only effective when total size transmission is selected. 0: The TCR fields of the descriptors are used as transfer count settings. 1: The TCR fields of the descriptors are used as total size settings.
7 to 4	SLM[3:0]	B’0000	R/W	DMA Transfer Low-Speed Mode Specify the number of cycles of AXI-bus clock (266.66 MHz) for the DMA transfer. One round of DMA transfer is executed in the number of cycles of the clock specified by this bit. B’0000: Normal mode B’1000: On round in 256 cycles of the clock. B’1001: On round in 512 cycles of the clock. B’1010: On round in 1024 cycles of the clock. : B’1111: On round in 32768 cycles of the clock. Other than above: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Descriptions
3 to 0	PRI[3:0]	B'0000	R/W	Channel Request Priority Setting These bits should be written by 0.

23.2.24 DMA Buffer Control Registers 0 to 47 (DMABUFCR_0 to DMABUFCR_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMABUFCR is a 32-bit readable/writable register that controls the upper limit on buffer size in and burst unit for the SDRAM.

Use this register when the upper limit on buffering requires control.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ULB[9:0]									
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

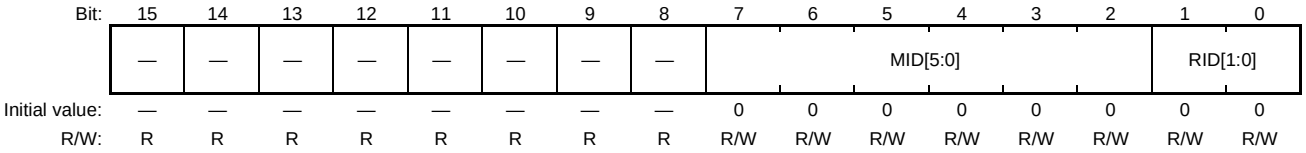
Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	MBU[8:0]	H'080	R/W	Maximum Burst Unit for SDRAM This register is only effective for SDRAM access, and everything other than that is under control of the transfer size (unit). Settings bigger than ULB are prohibited. Power-of-two settings are recommended. Maximum value is 256 (bytes).
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	ULB[9:0]	H'100	R/W	Upper Limit on Buffer Size This register controls the upper limit value for buffering. Power-of-two settings are recommended. Maximum value is 512 (bytes).

23.2.25 DMA Extended Resource Selectors 0 to 47 (DMARS_0 to DMARS_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMARS is a 16-bit readable/writable register that specifies the on-chip peripheral module to be the source of the DMA transfer request for the given channel. DMARS_0 specifies the source for channel 0, DMARS_1 specifies the source for channel 1 and so on.

When bits MID and RID are set to a value other than the values listed in Table 23.5, the operation of this LSI is not guaranteed. Transfer requests from the source selected in DMARS are only valid when the resource selection bits (RS[3:0]) in DMACHCR have been set to B'1000. Otherwise, even if DMARS has been set, requests from the corresponding transfer request source are not accepted.

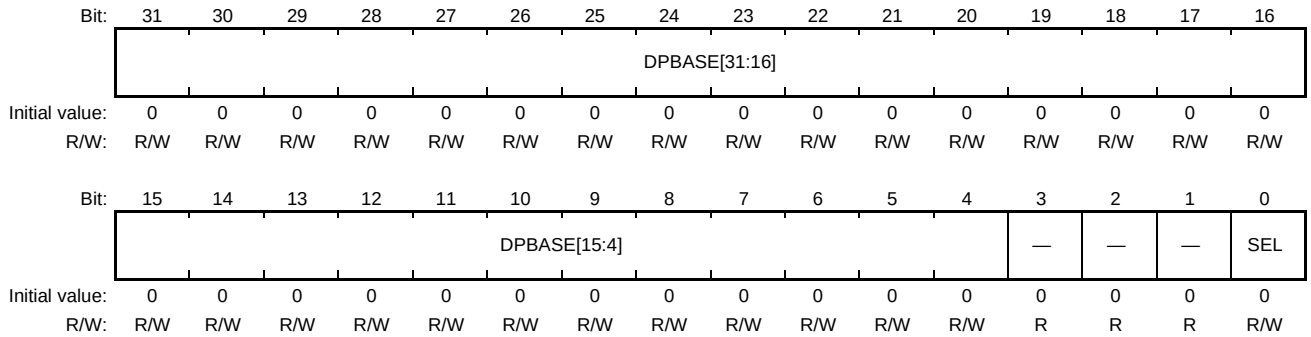


Bit	Bit Name	Initial Value	R/W	Descriptions
15 to 8	—	—	R	Reserved These bits are always read as an undefined value. The write value should always be 0.
7 to 2	MID[5:0]	B'00_0000	R/W	DMA Request Source Adoption MID[5] to MID[0] (MID) See Table 23.5.
1, 0	RID[1:0]	B'00	R/W	DMA Request Source Adoption RID[1] and RID[0] (RID) See Table 23.5.

23.2.26 DMA Descriptor Base Address Registers 0 to 47 (DMADPBASE_0 to DMADPBASE_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMADPBASE specifies the base address of the descriptor memory. The address range of the descriptor memory is specified by setting this register.



Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 4	DPBASE[31:4]	H'000_0000	R/W	Base Address of Descriptor Memory Place each stage of the descriptor memory on a 16-byte boundary. Setting example: When Built-in memory is used, [SYS-DMAC0]: H'E67_0A00 to H'E67_0A7F [SYS-DMAC1]: H'E73_0A00 to H'E73_0A7F [SYS-DMAC2]: H'E73_1A00 to H'E73_1A7F When External memory is used, Other memory area on a 16-byte boundary
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SEL	B'0	R/W	Descriptor Memory Selection Selects the memory to be used as descriptor memory. The transfer control registers can be updated at high speed by using the built-in descriptor memory. 0: Setting Prohibited. 1: Built-in memory or External memory is used.

23.2.27 DMA Descriptor Control Registers 0 to 47 (DMADPCR_0 to DMADPCR_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMADPCR is a 32-bit readable/writable register that controls the timing with which interrupts are output in read-out interrupt mode (descriptor mode 3).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DIPT[7:0]								—	—	—	—	—	—	—	—

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Descriptions
31 to 24	DIPT[7:0]	H'00	R/W	Descriptor Read-out Interrupt Pointer The number of stages for which descriptor read-out interrupts are generated in descriptor mode 3. DIPT + 1 specifies the number of descriptor stages.
23 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

23.2.28 DMA Fixed Source Address Registers 0 to 47 (DMAFIXSAR_0 to DMAFIXSAR_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMAFIXSAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit source address for a DMA transfer.

This register is not incremented by carrying when DMASAR overflows. And when uTLB function is effective, this register is invalid.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SAR[39:32]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

23.2.29 DMA Fixed Destination Address Registers 0 to 47 (DMAFIXDAR_0 to DMAFIXDAR_47)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

DMAFIXDAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit destination address for a DMA transfer.

This register is not incremented by carrying when DMADAR overflows. And when uTLB function is effective, this register is invalid.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EID[31:0]	H'0000_0000	R	First error ID when access to channel 32 to 47 was denied.

23.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request and on-chip peripheral module request. The bus mode can be selected from normal speed mode and slow speed mode).

23.3.1 DMA Transfer Requests

Most commonly, DMA transfer requests are generated by either the source or destination for transfer, but they can also be generated by on-chip peripheral modules that are neither the source nor the destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. The request mode is selected for each channel by DMARS.

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the SYS-DMAC to automatically generate a transfer request signal internally. When the DE bit in DMACHCR and the DME bit in DMAOR are set to 1 for the target channel, the transfer begins so long as the CAE bit in DMACHCR is 0.

(2) On-Chip Peripheral Module Request Mode

This mode is in case of DMACHCR.RS=1000.

In this mode, a transfer is performed at the transfer request signal of an on-chip peripheral module. The source (on-chip peripheral module) of the DMA transfer request is specified by DMARS.

When this mode is selected, if the DMA transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0), a transfer is performed upon the input of a transfer request signal.

When a transmit data empty transfer request of the peripheral is set as the transfer request, the transfer destination must be the peripheral transmit data register. Likewise, when receive data full transfer request of the peripheral is set as the transfer request, the transfer source must be the peripheral receive data register. These conditions also apply to the other on-chip peripheral modules.

The number of the receive FIFO triggers can be set as a transfer request depending on an on-chip peripheral module. Data needs to be read after the DMA transfer is ended, because data may be left in the receive FIFO when the receive FIFO trigger condition is not satisfied.

Table 23.5 Selecting On-Chip Peripheral Module Request Modes

Channels Support	DMARS MID + RID	DMA Transfer Request Source	DMA Transfer Request Signal	Source	Destination	Second Generation RZ/G Series Products

23.3.2 Channel Priority

When the SYS-DMAC receives simultaneous transfer requests on two or more channels, it transfers data according to a predetermined priority. Two modes (fixed mode and round-robin mode) are selected by the PR[1:0] bits in DMAOR.

Fixed Mode

In this mode, the priority levels among the channels remain fixed.

CH0 > CH1 > ... > CH14 > CH15, CH16 > CH17 > ... > C30 > C31, C32 > C 33 > ... > CH46 > CH47

Round-Robin Mode

In round-robin mode, each time data of one transfer unit (byte, word, longword, 8-byte, or 16-byte units) is transferred on one channel, the priority is rotated. The channel on which the transfer was just finished rotates to the bottom of the priority. The priority of round-robin mode is CH0 > CH1 > ... > CH14 > CH15, CH16 > CH17 > ... > C30 > C31, C32 > C33 > ... > CH46 > CH47 immediately after reset.

23.3.3 Slow Speed Mode

In the slow-speed mode, a single round of DMA transfer is performed every time the number of clock cycles specified by the SLM bits in DMACHCRB elapse. This mode can be selected per DMA channel. Transfer on other channels can proceed after each round of transfer for a channel in the slow-speed mode is completed.

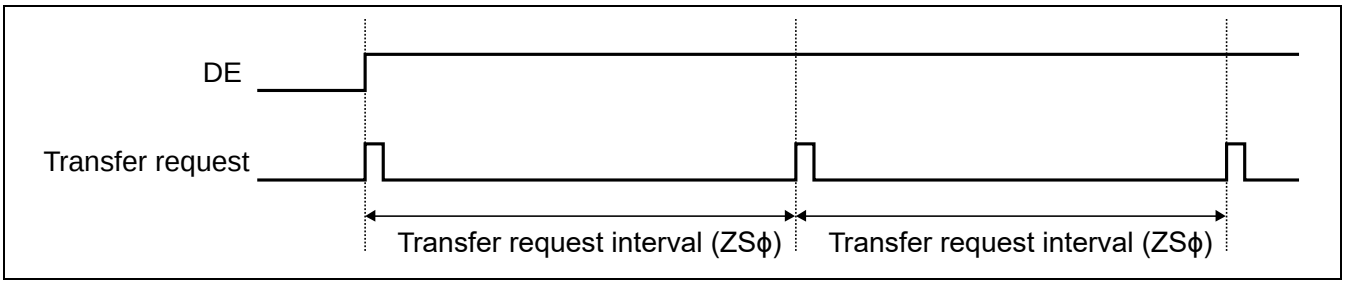

Figure 23.2 Slow Speed Mode

23.3.4 Descriptor Memory

The descriptor memory function is selected by setting the DPM[1:0] bits in DMACHCR to B'01, B'10, or B'11. When DMATCR is set to 0 and the DMA transfer is completed, the next set of settings is read, and if only a single channel is enabled, the contents defined by up to 128 stages of descriptor memory can be consecutively transferred when the built-in descriptor memory is used. External memory can also be used as the descriptor memory. In that case, the contents defined by up to 256 stages of descriptor memory can be transferred.

The following initial settings are required to use the descriptor memory.

- Set the base address of the descriptor memory for the DMA transfer in DMADPBASE.
- Set the DRST bit in DMACHCRB to reset the descriptor memory.
- Set the number of stages of the descriptor memory in the DCNT bits of DMACHCRB.

The descriptor memory is shared between all channels. Ensure that the areas of descriptor memory for use by each of the channels do not overlap.

It is necessary to arrange each stage of the descriptor memory on a 16-byte boundary.

There are two methods to activate the descriptor memory as follows.

- Specify the first DMA transfer settings in DMASAR, DMADAR, and DMATCR, and specify the subsequent settings in the descriptor memory. Then, set the DPB bit in DMACHCR to 0 to activate the descriptor memory. In this case, after completion of the transfer specified in DMASAR, DMADAR, and DMATCR, transfer continues after new settings are read from the descriptor memory. Note, however, that when the operating mode of the descriptor memory is set to the repeat mode, the values specified in DMASAR, DMADAR, and DMATCR are not read, and the transfer starts and is repeated from the head of the descriptor memory.
- Write the DMA transfer settings to the descriptor memory, and write 1 to the DPB bit in DMACHCR to activate the descriptor memory. In this case, the DMA transfer starts from the first settings in the descriptor memory.

There are three operating modes of the descriptor memory, which can be selected by setting the DPM bits in DMACHCR.

For details on these operating modes, see the descriptions of each operating mode in this section.

(1) Configuration of Descriptor Memory

Figure 23.3 shows the configuration of the built-in descriptor memory.

The capacity of the built-in descriptor memory is 16 bytes per stage × 128 stages.

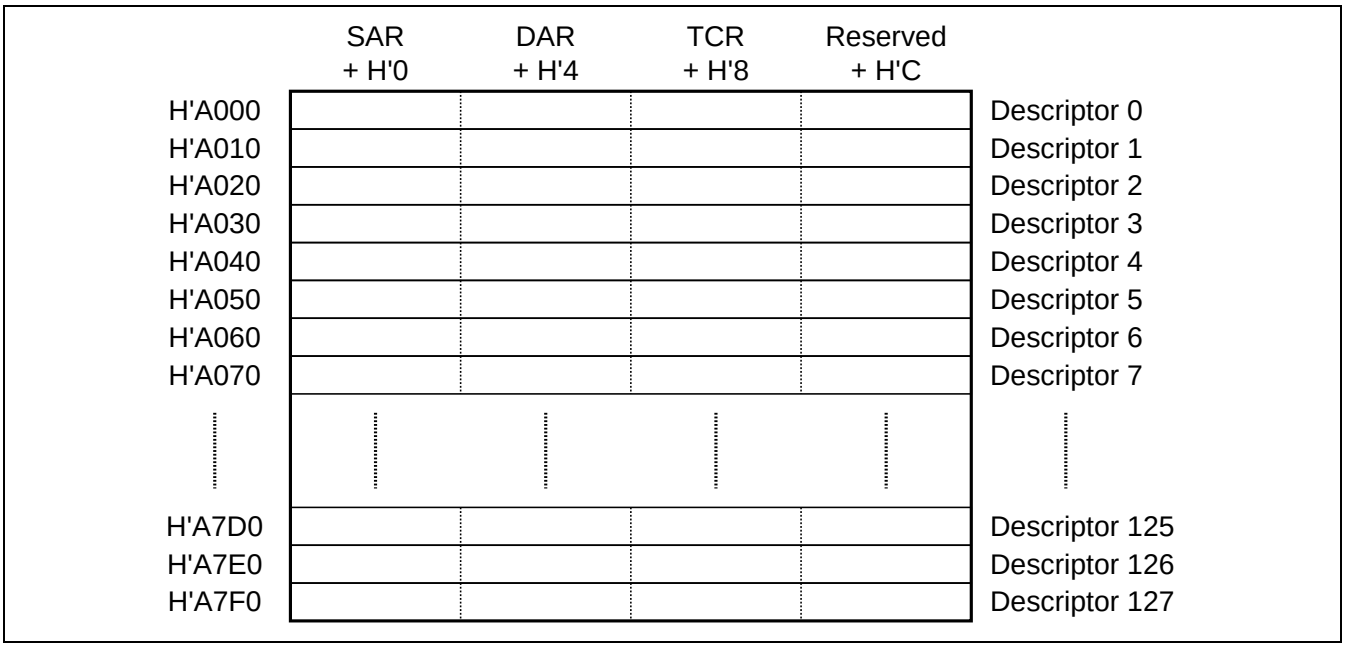

Figure 23.3 Configuration of Built-in Descriptor Memory

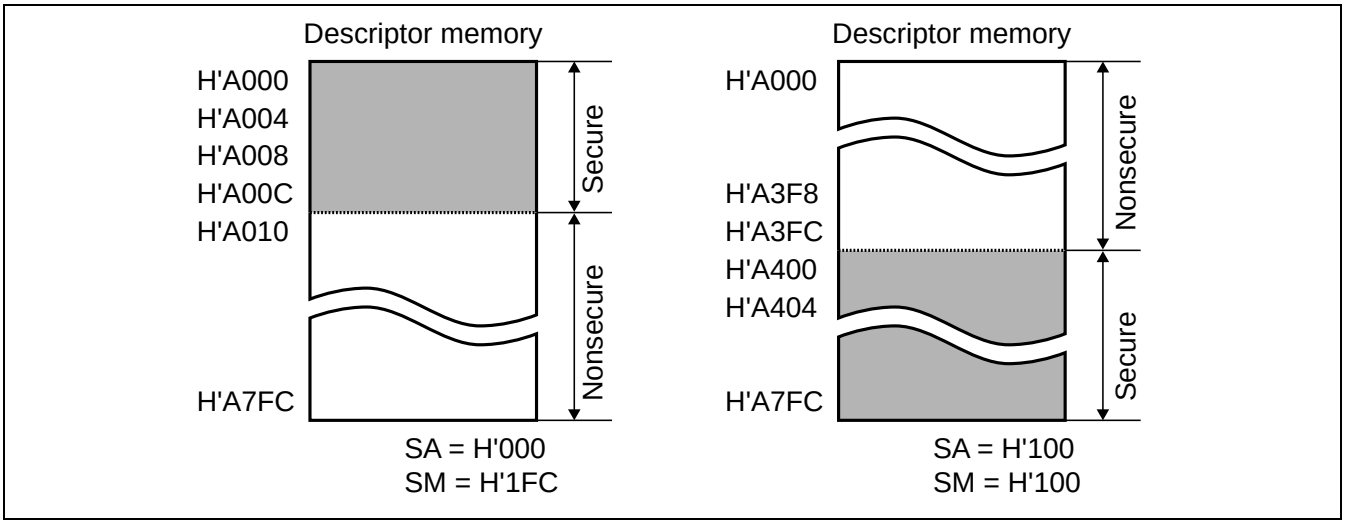

Figure 23.4 Example of DMADPSEC Setting

(2) Flow of Updating from Descriptor Memory

The RPT bits in DMACHCR can be used to specify which registers are to be updated from the descriptor memory.

The DPTR bits in DMACHCRB are incremented when updating from the descriptor memory is completed. If the DPTR value matches the DCNT value, the DPTR value is reset to 0.

This flow is automatically processed by hardware.

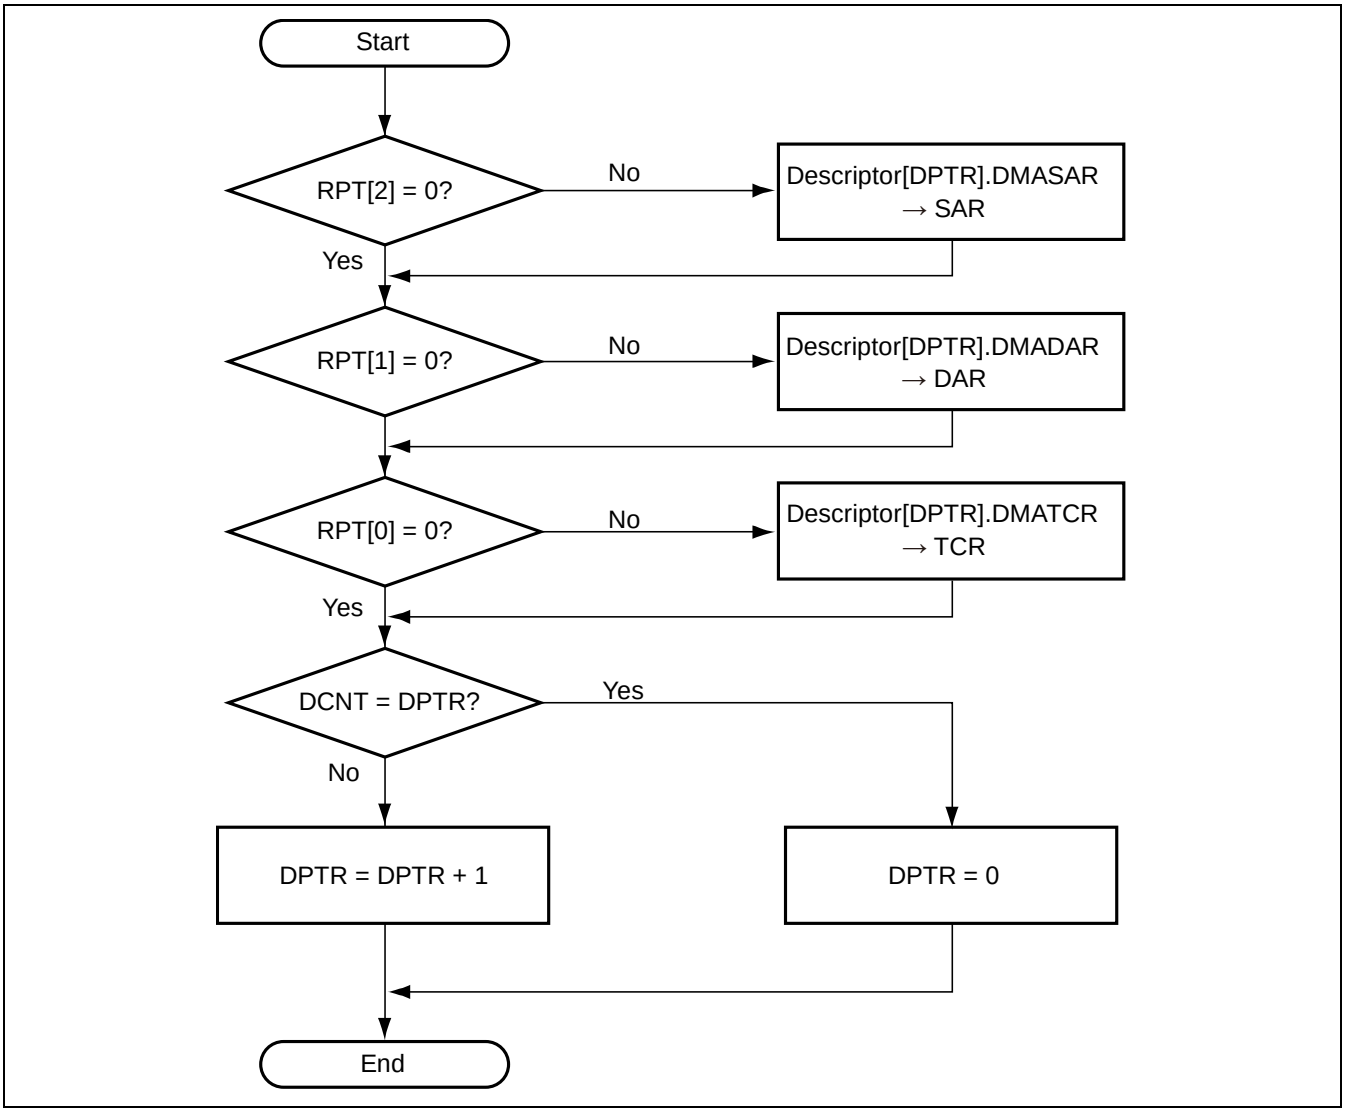

Figure 23.5 Flow of Updating from Descriptor Memory

(3) Operating Mode 1 of Descriptor Memory

Set the DPM bits in DMACHCR to B'01 to select operating mode 1 (normal mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, the DMA transfer is complete when the TE bit in DMACHCR is set to 1 after transfer under control of the number of stages of the descriptor memory specified in the DCNT bits in DMACHCRB.

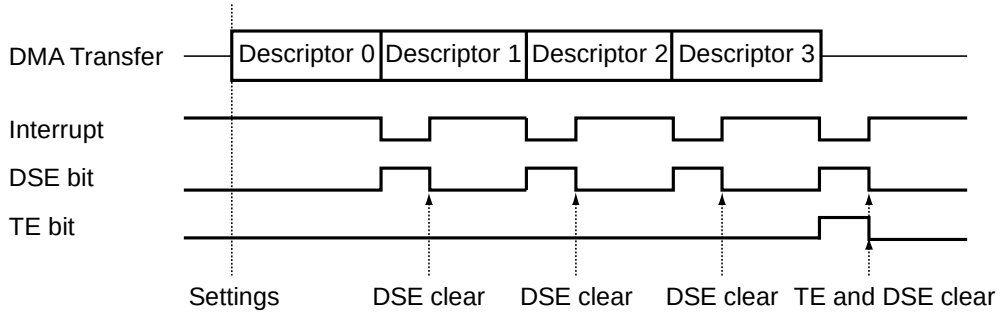
When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

Figure 23.6 is an example of transfer when operating mode 1 is selected and the TE and DSE bits are set to 1.

Figure 23.7 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 1 is selected and the TE and DSE bits are set to 1.

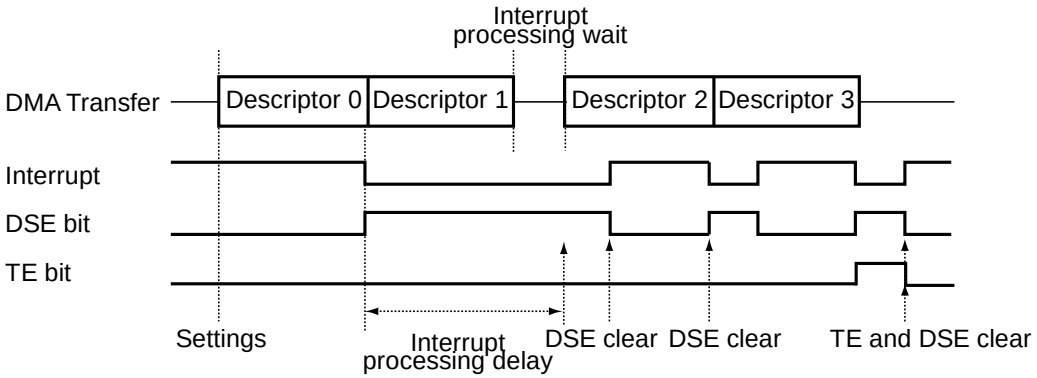
Figure 23.8 is an example of transfer when operating mode 1 is selected and the TE bit is set to 1.

In each example, there are four descriptor stages.



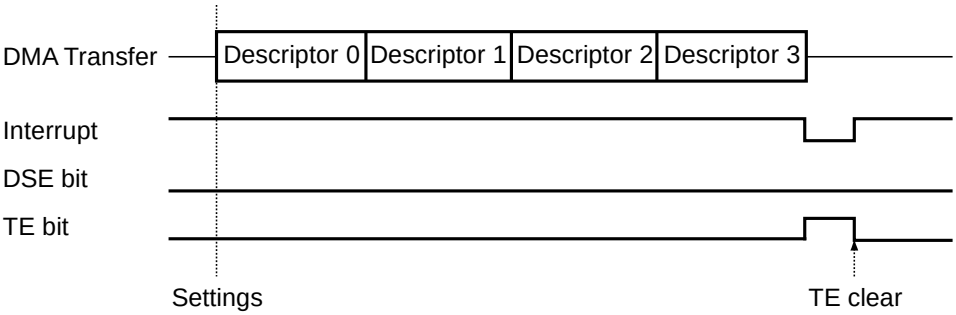
Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DPB = B'1, DSIE = B'1, IE = B'1), DMACHCRB (DRST = B'1).

Figure 23.6 Operating Mode 1 (Example 1)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DPB = B'1, DSIE = B'1, IE = B'1), DMACHCRB (DRST = B'1).

Figure 23.7 Operating Mode 1 (Example 2)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'01, DPB = B'1, DSIE = B'0, IE = B'1), DMACHCRB (DRST = B'1).

Figure 23.8 Operating Mode 1 (Example 3)

(4) Operating Mode 2 of Descriptor Memory

Set the DPM bits in DMACHCR to B'10 to select operating mode 2 (repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

When the DSIE bit in DMACHCR is set to 0, after transfer under control of all stages of the descriptor memory is complete, the TE bit in DMACHCR is set to 1 and a TE interrupt is generated. If a TE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the TE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

To end operation in mode 2, change the mode to mode 1 by using the TE interrupt processing. When the mode is changed to mode 1, the DMA transfer is completed when the next TE interrupt is generated.

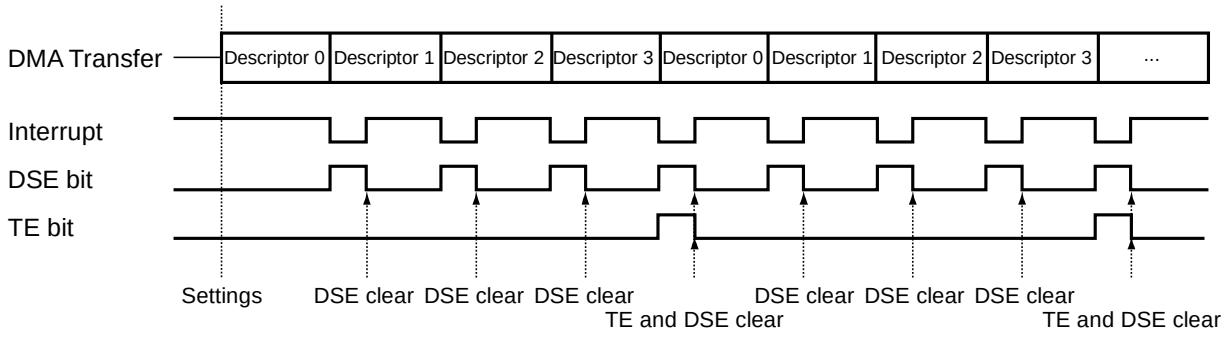
Figure 23.9 is an example of transfer when operating mode 2 is selected and the TE and DSE bits are set to 1.

Figure 23.10 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE and DSE bits are set to 1.

Figure 23.11 is an example of transfer when operating mode 2 is selected and the TE bit is set to 1.

Figure 23.12 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE is set to 1.

In each example, there are four descriptor stages.

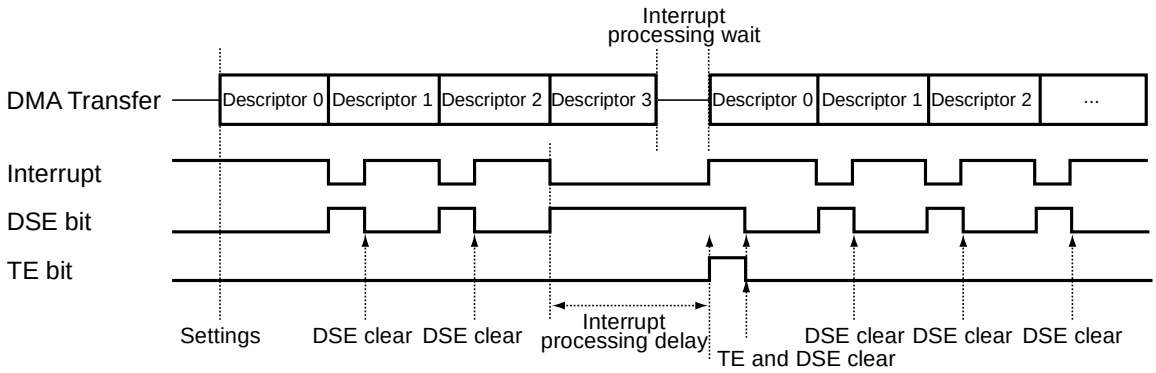


Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.

2. Set the DMACHCRB register (DCNT = 3).

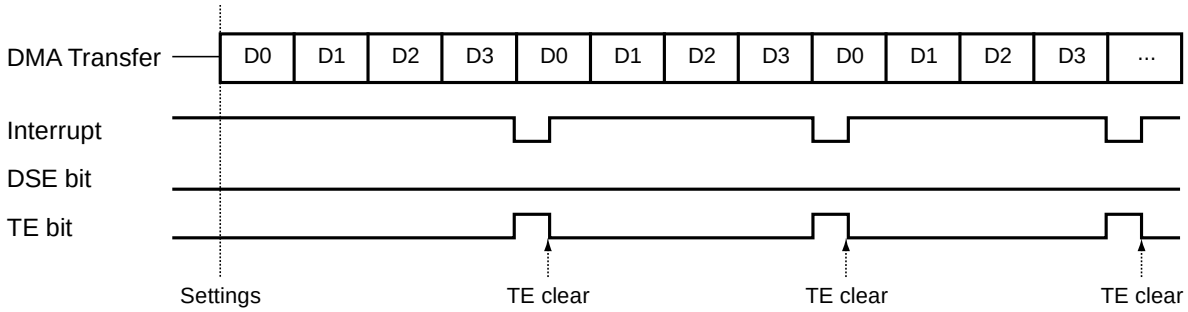
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'1, IE = B'1), DMACHCRB (DRST = B'1).

Figure 23.9 Operating Mode 2 (Example 1)



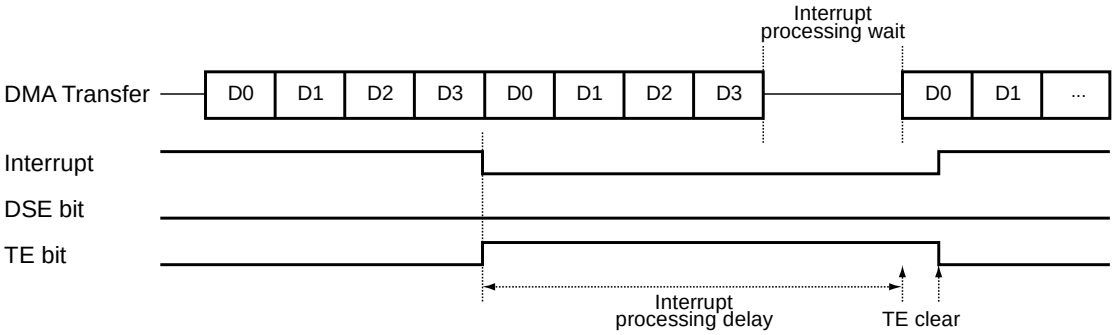
Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'1, IE = B'1), DMACHCRB (DRST = B'1).

Figure 23.10 Operating Mode 2 (Example 2)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'0, IE = B'1), DMACHCRB (DRST = B'1).

Figure 23.11 Operating Mode 2 (Example 3)



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'0, IE = B'1), DMACHCRB (DRST = B'1).

Figure 23.12 Operating Mode 2 (Example 4)

(5) Operating Mode 3 of Descriptor Memory

Set the DPM bits in DMACHCR to B'11 to select operating mode 3 (infinite repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

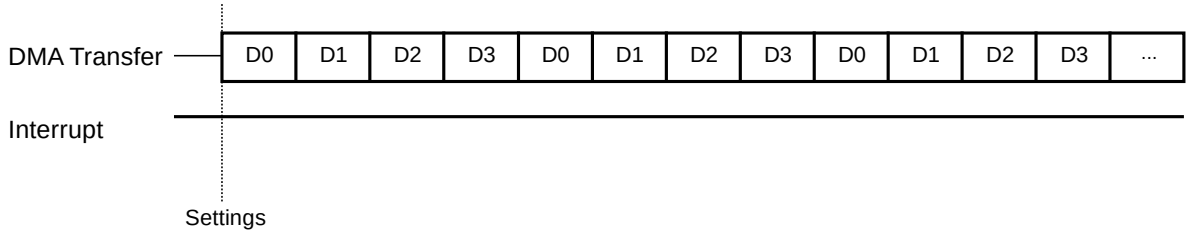
In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. Even if a first DSE interrupt has not been processed when a further DSE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of DSE interrupts that have been generated, the TE bit can be cleared by writing to it once. Similarly, even if a first TE interrupt has not been processed when a further TE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of TE interrupts that have been generated, the TE bit can be cleared by writing to it once.

Figure 23.13 is an example of transfer when infinite repeat mode is selected.

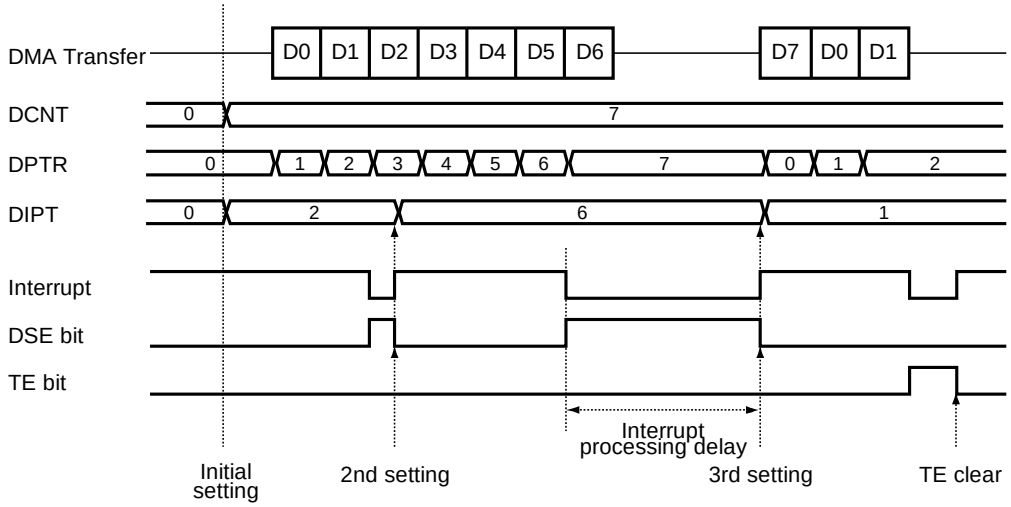
Figure 23.14 is an example of transfer when read-out interrupt mode is selected.

In each example, there are four descriptor stages.



Settings: 1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMACHCRB register (DCNT = 3).
3. Set the DMACHCR register (DPM = B'11, DPB = B'1, DSIE = B'0, IE = B'0), DMACHCRB (DRST = B'1).

Figure 23.13 Operating Mode 3 (Infinite Repeat Mode)



Initial setting:
1. Set the DMACHCRB register (DCNT = 7).
2. The descriptor has three setting (DMASAR, DMADAR, DMATCR) stages.
3. Set the DMADPCR register (DIPT = 2).
4. Set the DMACHCR register (DPM = B'11, DPB = B'1, DSIE = B'1, IE = B'0), DMACHCRB (DRST = B'1)

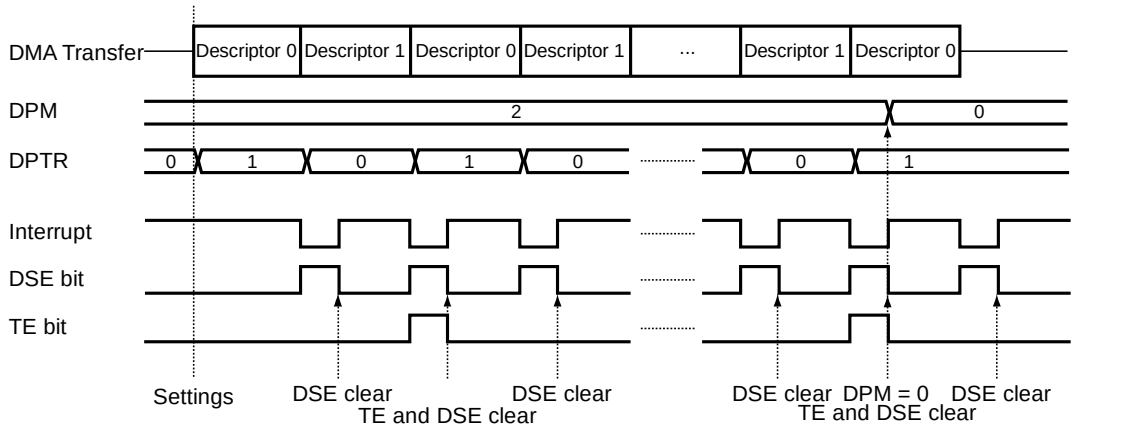
2nd setting:
1. The descriptor has four setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMADPCR register (DIPT = 6).
   (3 stages + 4 stages -1) mod 8 = 6
3. Clear DSE.

3rd setting: (Transfer end)
1. The descriptor has three setting (DMASAR, DMADAR, DMATCR) stages.
2. Set the DMADPCR register (DIPT =1).
   (3 stages + 4 stages + 3 stages -1) mod 8 = 1
3. Clear the DSE bit and set the DMACHCR register (DPM = B'11, DPB = B'0, DSIE = B'0, IE = B'1).

Figure 23.14 Operating Mode 3 (Read-Out Interrupt Mode)

(6) Using the Descriptor Memory for Double Buffering

To use the descriptor memory for double buffering, set the number of stages of descriptor memory to 2, set the buffer configuration to the descriptor memory, and activate the memory in operating mode 2. The DSE interrupt is used in double buffering. To end the use of double buffering, disable the descriptor operating mode, which stops the transfer on completion of the transfer currently in progress.



Settings: 1. The descriptor has two setting (buffer A, buffer B) stages.
2. Set the DMACHCRB register (DCNT = 1).
3. Set the DMACHCR register (DPM = B'10, DPB = B'1, DSIE = B'1, IE = B'0), DMACHCRB (DRST = B'1).

Figure 23.15 Using the Descriptor Memory for Double Buffering

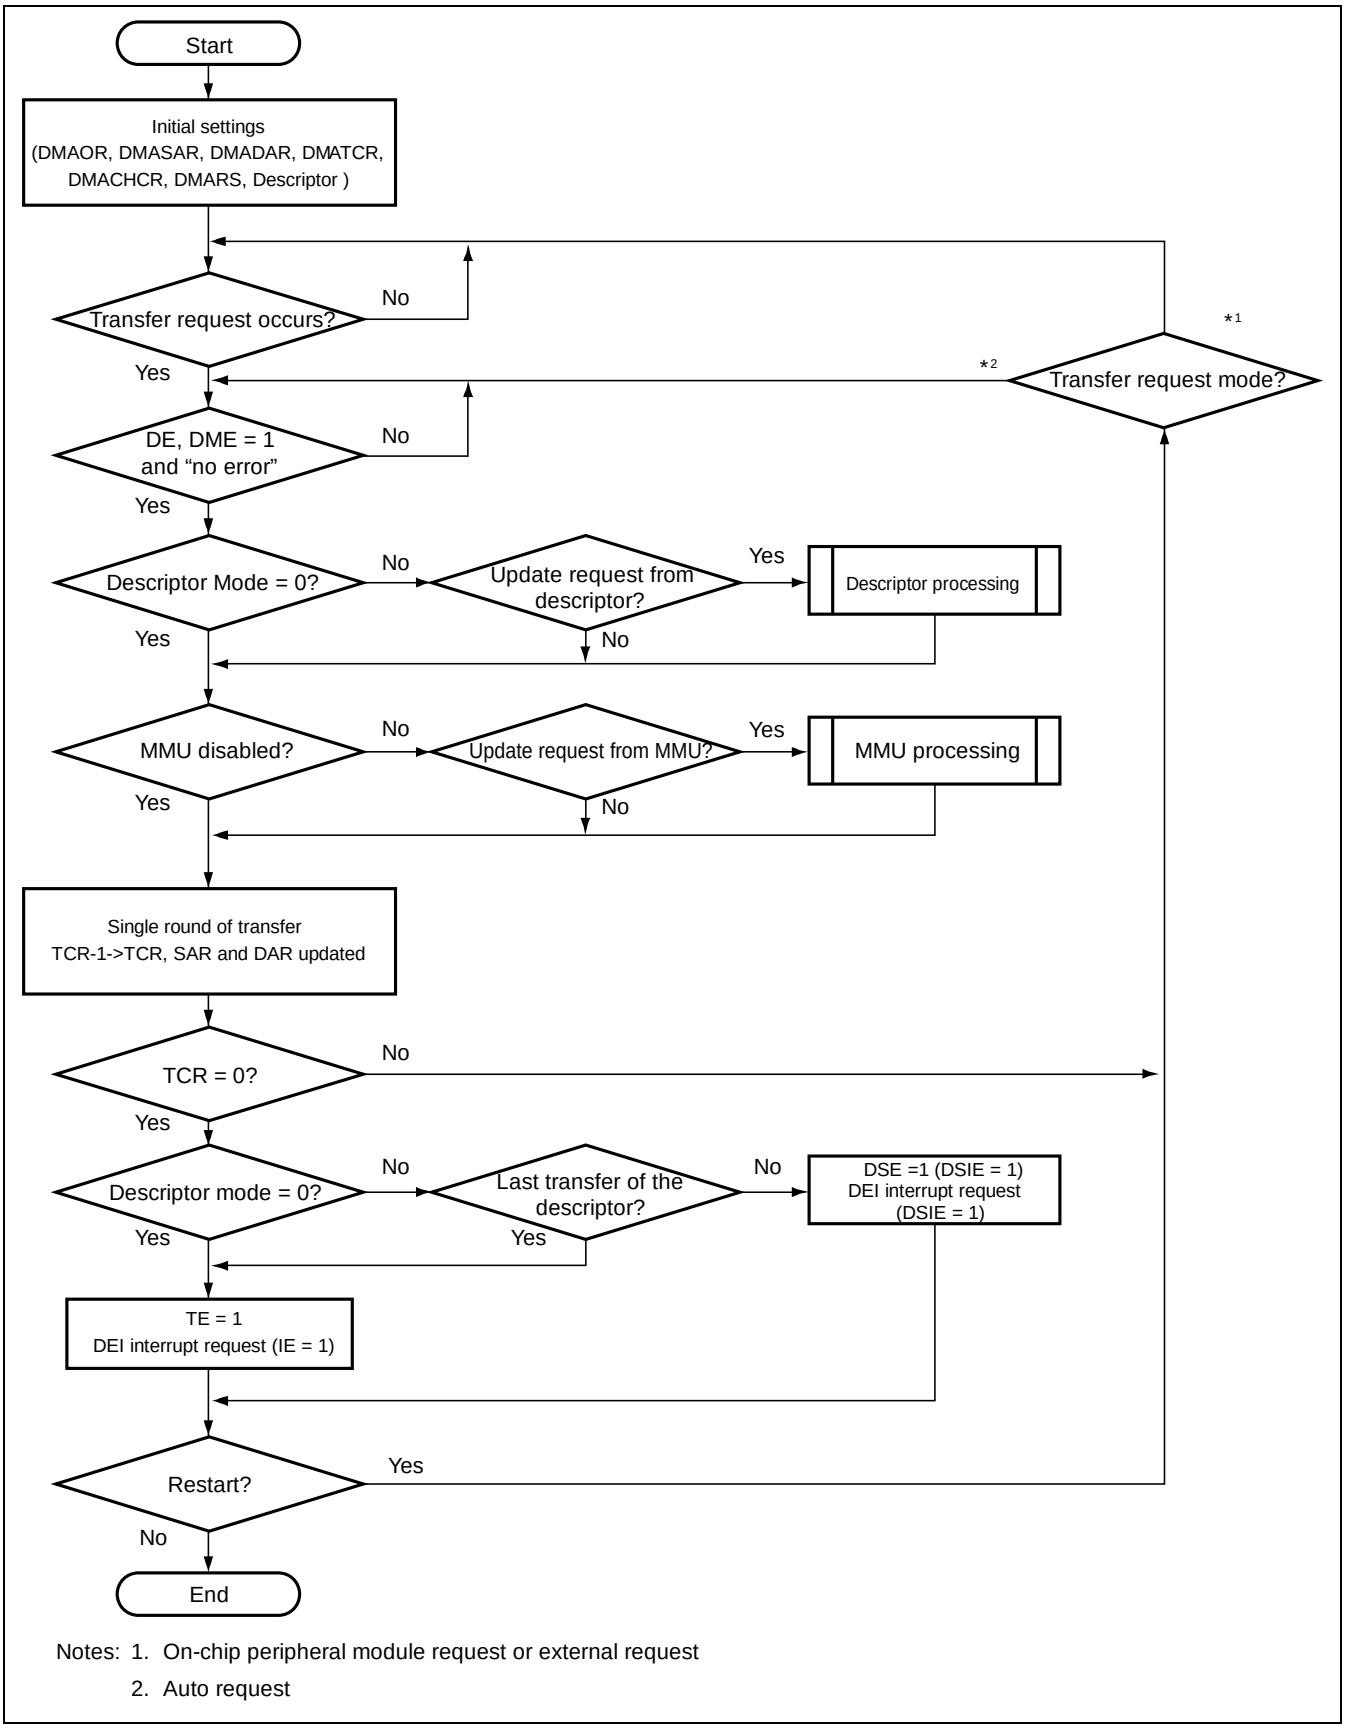
23.3.5 Transmission Flow

Set the transfer conditions as required in the following registers:

DMA source address register (DMASAR), DMA destination address register (DMADAR), DMA transfer count register (DMATCR), DMA Channel control register (DMACHCR), DMA operation register (DMAOR) and DMA extended resource selector (DMARS)

The DMAC then transmits data in the following order.

- A transfer request is generated and the controller checks whether the transfer is allowed (DE = 1, DME = 1, TE = 0, DSE = 0, CAE = 0). When a channel is in the auto request mode, the transfer starts automatically.
- The controller checks whether updating from the descriptor memory is required.
- Updating from the descriptor memory proceeds when the DPB bit in DMACHCR is set to 1 or the descriptor memory is enabled, if DMATCR is set to 0.
- For updating by using the descriptor memory, see section 23.3.4, Descriptor Memory.
- Check whether address translation by the IPMMU is required.
- Address translation by the IPMMU proceeds if the address exceeds the effective size for address translation when the DE bit in DMACHCR is enabled and updating of transfer settings from the descriptor memory is executed.
- Each time a transfer request is generated, the amount of data for a single round of transfer (specified by the TS[3:0] bits) is transmitted. The value in DMATCR is decremented by 1 every time the DMA transfer is completed.
- When the specified number of rounds of transfer are completed (the value in DMATCR is set to 0), the transfer ends normally. A TE interrupt is generated for the CPU upon the end of the transfer if the IE bit in DMACHCR is set to 1. If the descriptor memory is enabled, the processing differs with the mode of the descriptor memory. For more details, see section 23.3.4, Descriptor Memory.
- Transfer is aborted when the DMAC encounters an address error. Transfer is also aborted when the DE bit in DMACHCR or the DME bit in DMAOR is set to 0.



Notes: 1. On-chip peripheral module request or external request
2. Auto request

Figure 23.16 Transmission Flow

23.3.6 Total Size Transmission

The amount of data for total size transmission can be set in DMATSR (in bytes), and this setting is effective regardless of the size specified in the TS bits in DMACHCR. Thereby, the desired size can be transmitted in a single round of DMA transfer.

To use this function, make the settings for total size transmission in DMASAR, DMADAR, DMATSR, DMATSRB and DMACHCR.

Total size is set in the TCR (TSR) field of descriptors and 1 is set in DMACHCRB.DTS when total size transmission and descriptors are in use.

23.3.7 Rate access control

In the rate access control mode, the performance of DMA transfer will decrease depending on value of the rate access counter which is set up by CNT bits in WRADM_CONTROL register or RRADM_CONTROL register. When to be enable rate access bit which is set up to 1 by EN bit in WRADM_CONTROL register or RRADM_CONTROL register, the rate access counter starts to count. Whenever value of CNT bits matches with value of counter register, then enable control bit will be toggled after 3 clock cycles.

Period of time of a transaction in the rate access control is calculated as following:

Period of time of a transaction = (CNT + 1) * 2 + 3 (clock cycle)

23.4 Secure function

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

23.4.1 Secure function

Security of each channel of SYS-DMAC is protected by DMASEC_* register. Refer description of DMA Secure Control Register for each channel.

In case a channel is in secure mode, when Non-secure CPU access to that channel, the access must be denied, then DMAC do these actions:

(1) Issue error status and store into DMASES_* register.

(2) Log error ID of the first access into DMAEMID_* register.

(3) Log error address of the first access into DMASEA_* register.

23.5 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

Pay attention to the following notes when using the SYS-DMAC.

(1) DMA Transfer for Peripheral Modules

When executing DMA transfer for an on-chip peripheral module, set addresses on the appropriate boundary (in terms of the amount of data for each round of transfer) for the transfer source and destination addresses. Otherwise, an address error may occur.
SYS-DMAC channels 0-15 and channels 16-47 are assigned to be used by different Peripheral IPs. Regarding access to CRC module, SYS-DMAC channels 0-15 cannot access CRC module. On the other hand, SYS-DMAC channel 16-47 can access CRC module.

(2) Module Stop

While the SYS-DMAC is operating, the module stop register (MSTPCR2) should not be set to stop the SYS-DMAC. If the SYS-DMAC is stopped in this way, results of the transfer that was in progress cannot be guaranteed.

(3) Address Error

When a DMA address error is generated, reset the registers of the channel on which the error has occurred and then start transfer anew.

(4) Aborting DMA Transfer

To abort a DMA transfer, disable the interrupt signal and set the DE bit in the DMA channel control register (DMACHCR) to 0 to disable the DMA transfer. If the TE and DSE bits are set when DMA transfer is aborted, these bits should be initialized. There is a possibility that TE and DSE will not be set with synchronized timing after transmission, so it's necessary to recognize the following three possibilities and take measures accordingly.

1. The DSE and TE bits are set to 1 before initialization of DMACHCR, but after the interrupt was disabled.
   The TE and DSE bits are initialized within the DMA transfer initialization sequence.
2. The DSE and TE bits are set to1 and the controller fails to abort the transfer, after the interrupt was disabled.
   When the DE bit has become 0 after DMA transfer initialization, check the TE and DSE bits. If the TE or DSE bit is 1, go through the DMA transfer initialization process.
3. The TE and DSE bits are not cleared to 0 but the transfer is aborted, after the interrupt is disabled.
   The TE or DSE bits are not set because data for transfer still remain after transfer is aborted.

Note: Initialization of DMA transfer during execution of the last transfer leads to a delay in setting of the TE and DSE bits, so include a dummy read.

Figure 23.17 shows an example of processing to abort DMA transfer.

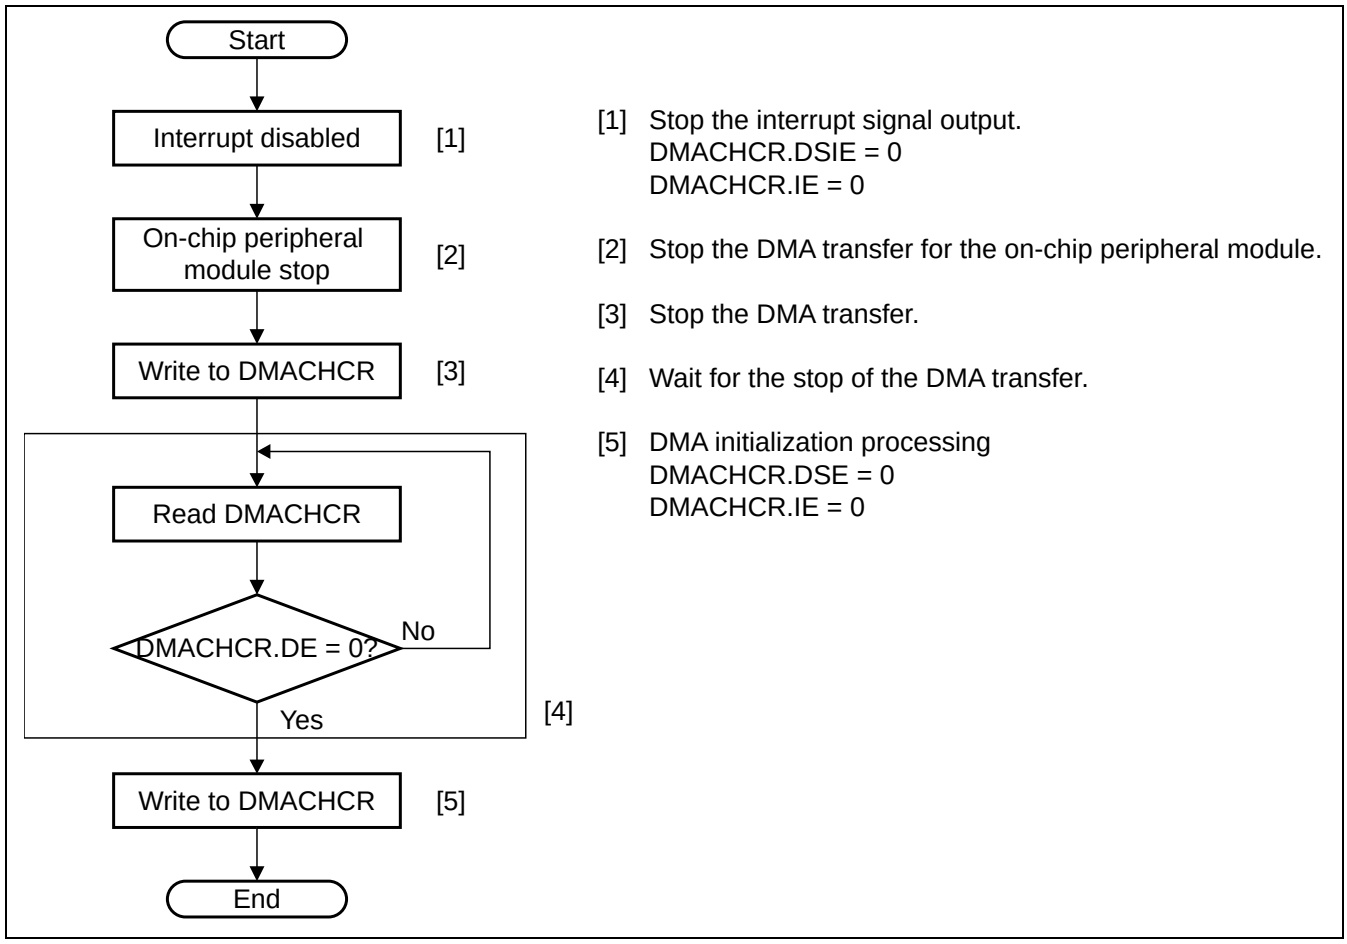


Figure 23.17 Example of Processing to Abort DMA Transfer

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

24.1 Overview

This product allows selection of a master boot processor through the MD7 and MD6 pins. When Cortex-A53, Cortex-A57 is selected as a master boot processor, setting the MD[4:1] pins enables on-chip ROM boot, external ROM boot or XIP(eXecute In Place) mode boot. This module is provided for all RZ/G Series 2nd Generation products.

24.1.1 Features

- Either Cortex-A53, Cortex-A57 can be selected as a master boot processor through the MD7 and MD6 pins. Selection of a master boot processor is described in Table 24.2 Mode Pin Configuration (2).
- The following boot devices are supported through MD[4:1] pins. Selection of a boot device is described in Table 24.1 Mode Pin Configuration (1). Check supported boot device for each product.
  - External ROM (Area 0, local bus)
  - HyperFlash ROM (Max. 320Mbps per pin) and Serial Flash ROM
  - eMMC
  - USB download
  - SCIF as serial downloader
- The boot sequence of HyperFlash, Serial Flash ROM and eMMC using DMA.

  Cortex-A53, Cortex-A57 master boot processor executes the instructions in on-chip ROM. Data including Boot ROM parameters, address information and data size information of IPL* are transferred from the Serial/HyperFlash ROM and eMMC to System RAM (on-chip RAM). Then the amount of data specified by data size information is transferred to the on-chip RAM. After the transfer, the processor jumps to the address specified by address information of IPL.
- XIP (eXecute In Place) mode of Hyper Flash and Serial Flash boot is supported.
- The initial execution state of Cortex-A57 and Cortex-A53 can be selected through MD15 pin.

Note: * IPL: Initial Program Loader. IPL can be selected by Boot ROM parameter except for eMMC boot.

24.1.2 External Pins

24.1.2.1 MD Pins

Boot device, master boot processor and AArch32/64 can be selected through MD pins.

	SD Card/MMC Interfaces	eMMC Alternative Boot operation
	USB High-Speed Module (HS-USB)	USB download mode

24.2 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

24.2.1 Boot Operation Overview

The boot address of the master boot processor is controlled by RESET module. It depends on boot device selection through MD[4:1] pins and AArch64/32 selection through MD15 pin.

If external ROM or XIP mode boot is selected, the processor can directly fetch from the target device. If the boot device except for external ROM and XIP mode is selected, the processor boots from on-chip Boot ROM and executes the boot sequence described “HyperFlash/Serial Flash ROM using DMA Boot sequence” and “eMMC using DMA boot sequence” section. 5KB or 3KB data are transferred from the target boot device to System RAM. Then IPL is transferred to System RAM. Then the processor jumps to the specified address.

If MD[4:1] reserved setting is selected, error message can be outputted via SCIF.

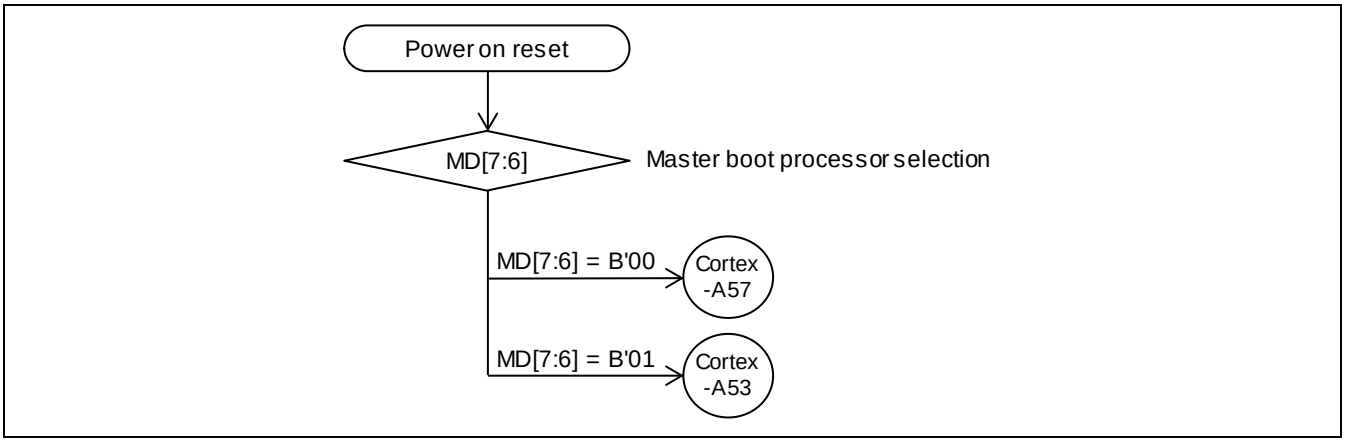

Figure 24.1 Master Boot processor selection

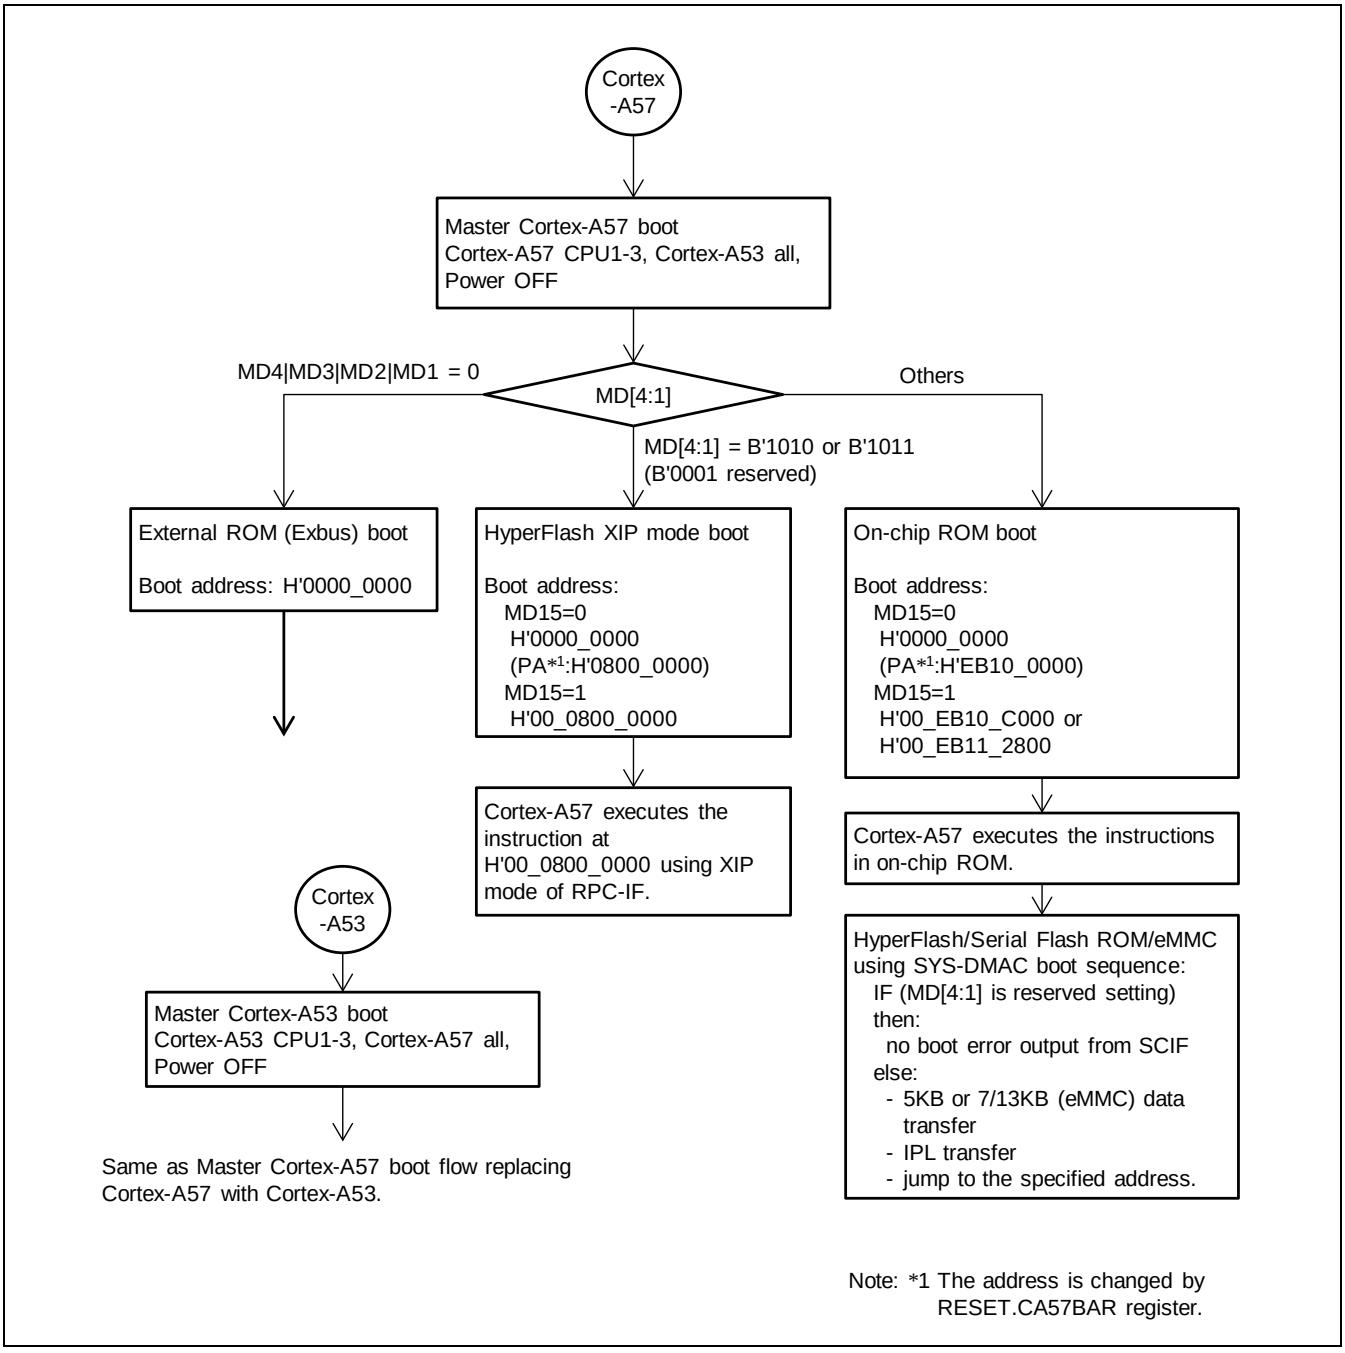

Figure 24.2 Cortex-A57, Cortex-A53, boot operation overview

24.2.2 Boot Address Control

Boot address is controlled by RESET module. If Cortex-A57 at AArch64 boot is selected through MD15 and MD[7:6] pins, RESET.CA57CPU0BARH/L register function is used to specify the boot address. If Cortex-A57 at AArch32 and on-chip ROM boot is selected, RESET.CA57BAR register function is used to specify the boot address. Cortex-A53's boot address is the same as replacing Cortex-A57 with Cortex-A53.

24.2.3 Boot Parameters

1) Boot ROM parameters (External Flash ROM Address H'0000_0000)

Boot ROM parameters are 4bytes and it should be on the top address of serial flash. It controls boot flow.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0[1]	0[1]	0
R/W:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IPLAB SELR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	—	Reserved
0	IPLABSELR	B’0	R/W	IPL A/B-Side Select bit. 0: IPL A-Side is loaded. 1: IPL B-Side is loaded. eMMC boot do not support this function.

24.2.4 Hyper/Serial ROM Using DMA Boot Sequence

1. The master boot processor jumps to H'EB10_0000 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E AArch32) or H'00_EB10_C000(RZ/G2M V1.3, RZ/G2M V3.0 AArch64) or H'00_EB11_2800 (RZ/G2H, RZ/G2N, RZ/G2E AArch64). The processor executes the instructions in Boot ROM and 5KB data are transferred from Serial Flash, HyperFlash to System RAM using SYS-DMAC channel 0.
2. These 5KB data contain Boot parameters, address information and data size information of IPL-A and IPL-B. Either IPL-A or IPL-B can be selected by Boot ROM parameters.
3. The amount of data specified by data size information is transferred to System RAM. After the transfer, the master processor jumps to the address specified by address information of IPL.

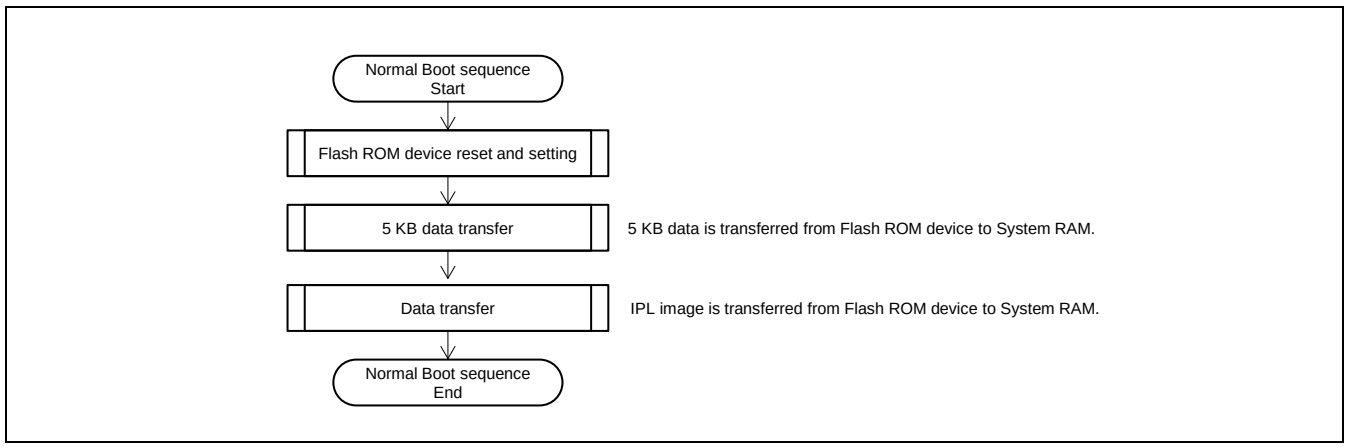

Figure 24.3 Hyper/Serial Flash using SYS-DMA boot sequence

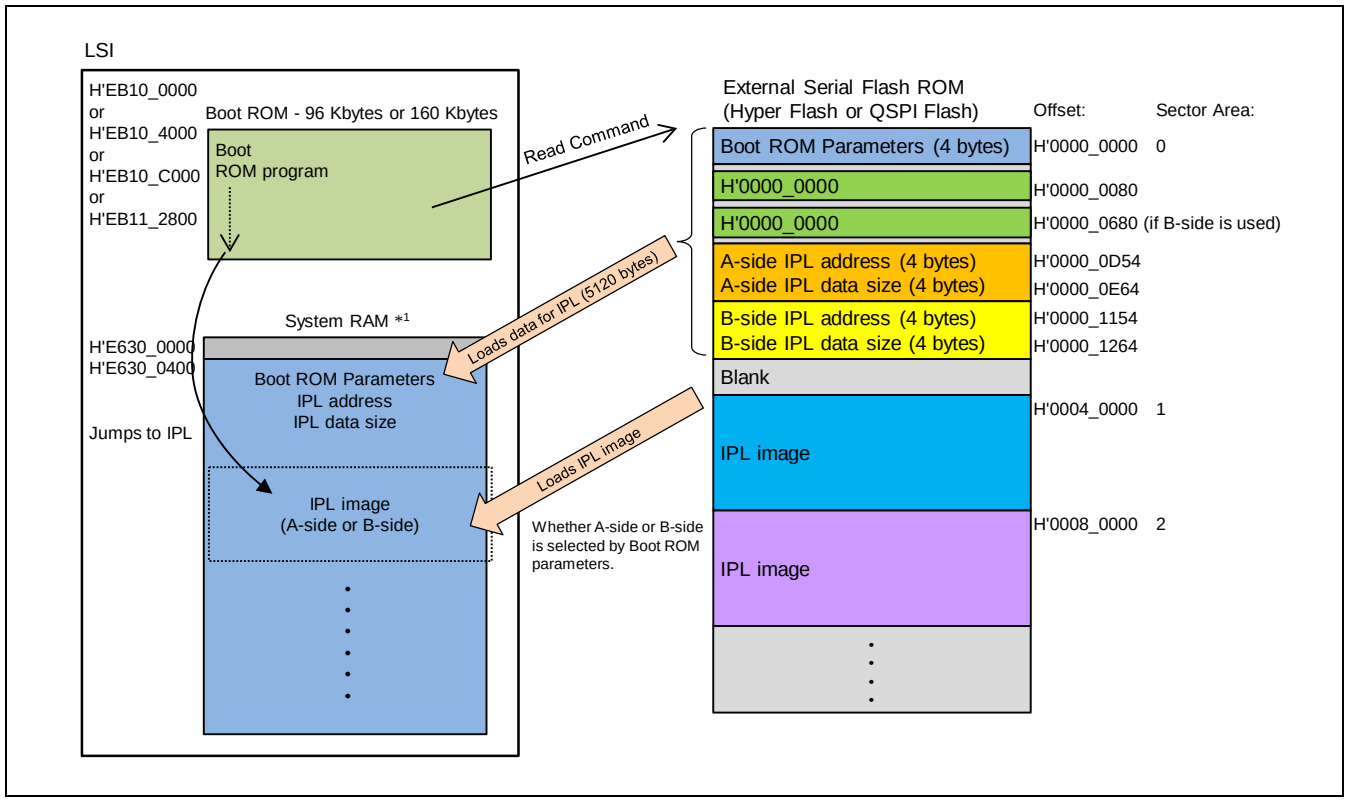

Figure 24.4 IPL transfer and Program image

24.2.5 eMMC Using DMA Boot Sequence

1. The master boot processor jumps to H'EB10_0000 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E AArch32) or H'00_EB10_C000(RZ/G2M V1.3, RZ/G2M V3.0 AArch64) or H’00_EB11_2800 (RZ/G2H, RZ/G2N, RZ/G2E AArch64). The processor executes the instructions in Boot ROM and 3KB data are transferred from eMMC to System RAM using MMC’s DMA with 512-Byte transfer size.
2. These 3KB data contain Boot parameters, address information and data size information of IPL.
3. The amount of data specified by data size information is transferred to System RAM. After the transfer, the master processor jumps to the address specified by address information of IPL.

If boot operation from partition 1 fails, switching from boot partition 1 to partition 2 (dual boot mode) is performed.

Note: eMMC device must meet the following conditions.

- eMMC device that conforms to JEDEC eMMC standard 4.4 or higher
- Set the EXT_CSD register byte179, PARTITION_CONFIG bit[6] = H’0(No boot acknowledge sent).
- Set the EXT_CSD register byte179, PARTITION_CONFIG bit[5:3] = H’1 (Boot Area partition1).
- Set the EXT_CSD register byte177, BOOT_BUS_CONDITIONS bit[4:3] = H’1(50MHz SDR).
- Set the EXT_CSD register byte177, BOOT_BUS_CONDITIONS bit[1:0] = H’2(x8 bus widths).
- eMMC device’s IO voltage should be 1.8V.
- Place the boot data in eMMC boot area Partition 1 and 2 if dual boot mode is used.

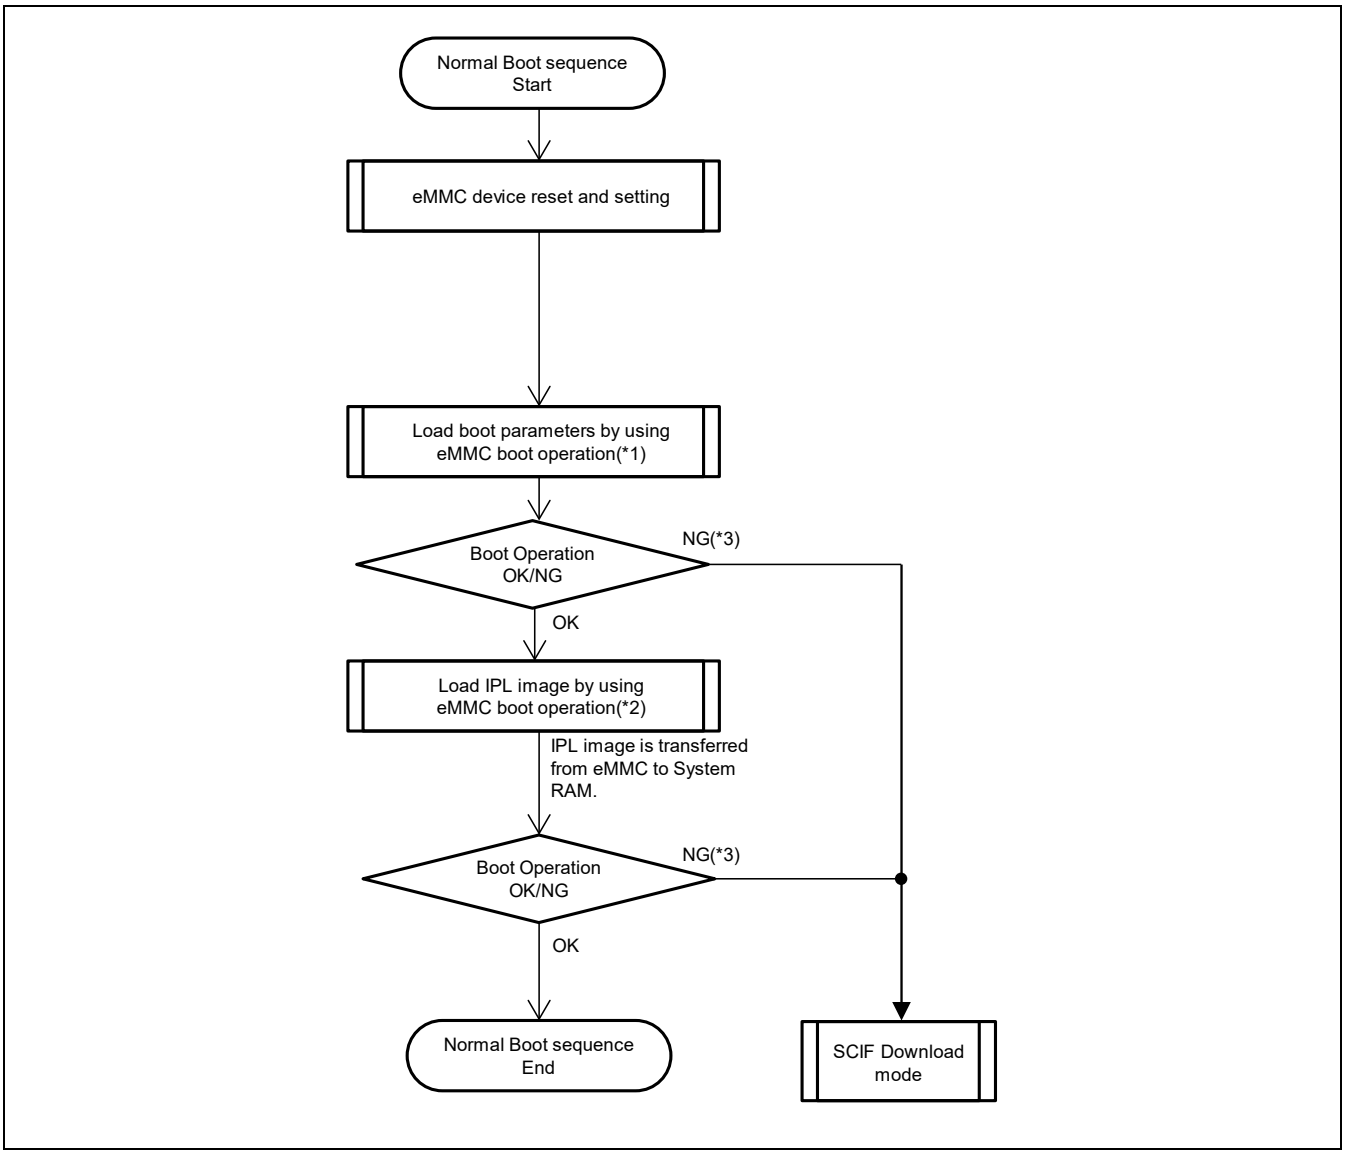

Figure 24.5 eMMC using DMA boot sequence

(*1) CMD0 is issued three times to transfer boot parameters, with argument + H'F0F0_F0F0, + H'FFFF_FFFA, + H'0000_0000.

(*2) As with (*[1]), CMD0 is also used during IPL image transfer.

(*3) If there is a parameter error in eMMC Boot, an error message will be output and SCIF Download mode will start. Below is an example of error message.

```
Transfer Error!
0x00000000 0x0009A17A 0x00000008 0x00000019
SCIF Download mode (w/o verification)
(C) Renesas Electronics Corp.
-- Load Program to System RAM ---------- please send !
```

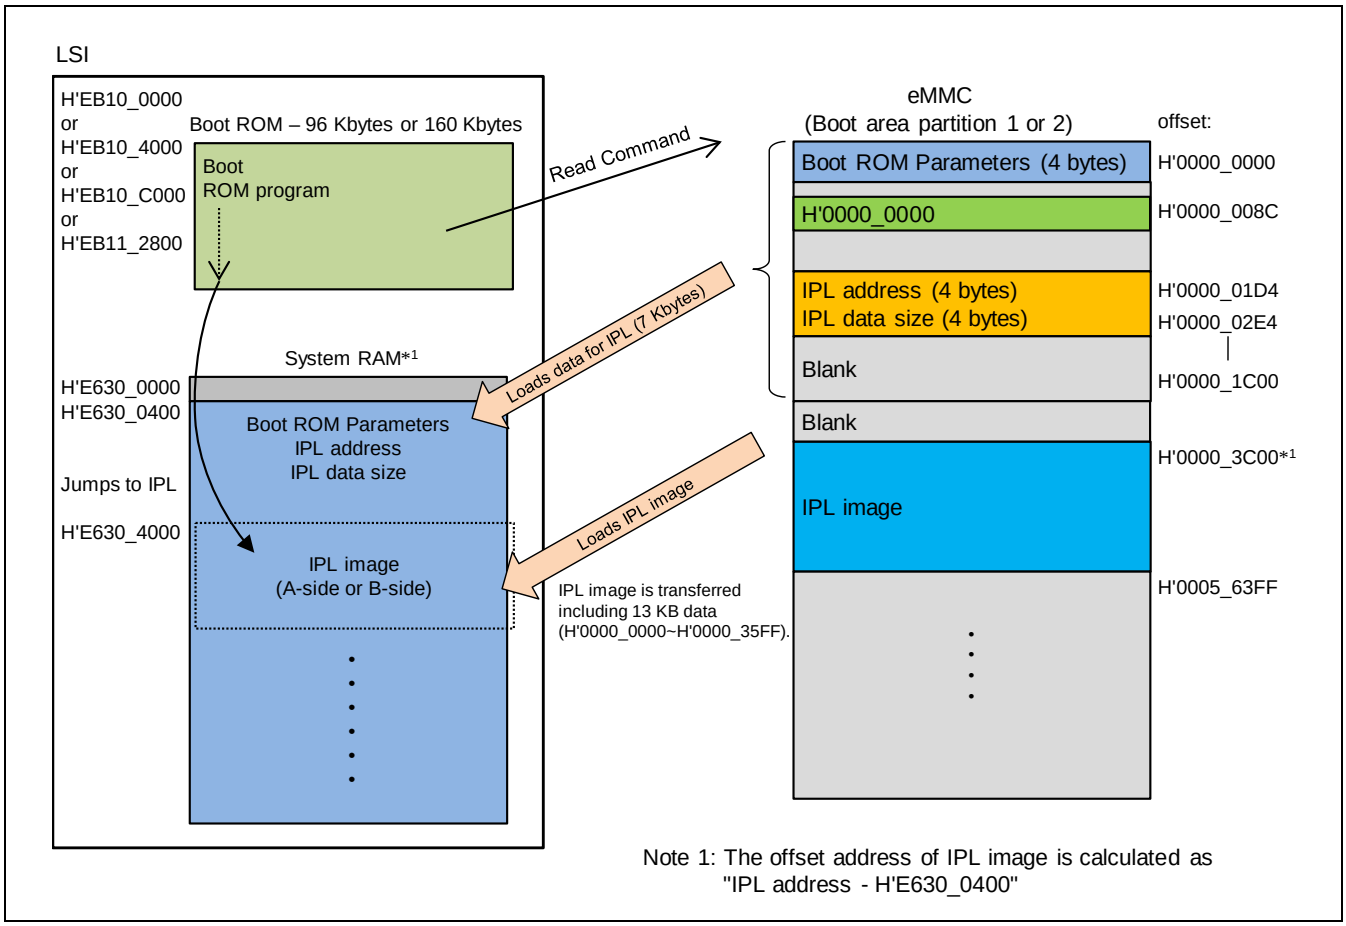

Figure 24.6 IPL transfer and Program image(eMMC)

24.2.6 SCIF Download Mode

SCIF download mode uses SCIF2_A serial ports. Data from Host PC is transferred to System RAM The transfer specification is below.

- Baud rate: 115200bps
- Data length: 8bit
- Parity: none
- Stop bit: 1bit
- Flow control]: none
- Data format: Motorola S-record

The download sequence and data format are below.

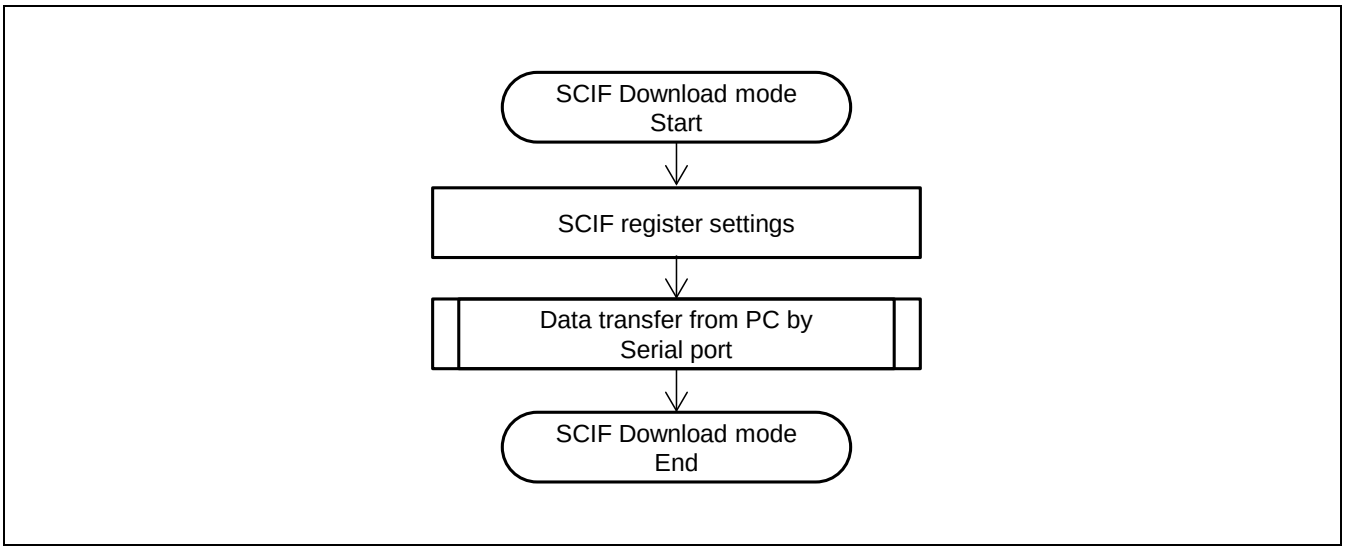

Figure 24.7 SCIF download mode sequence

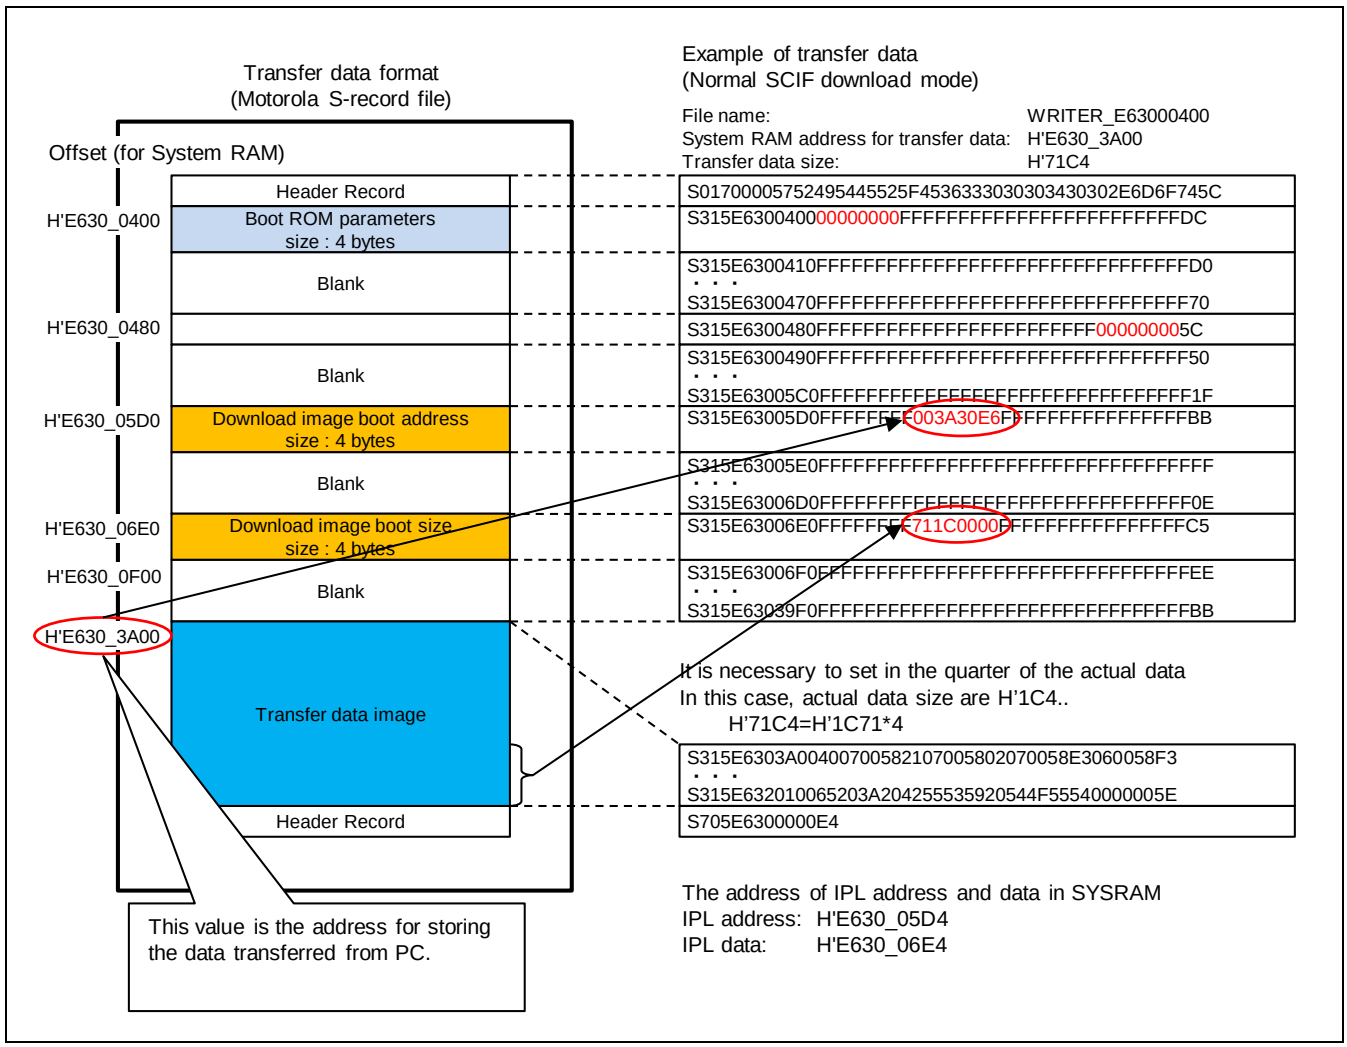

Figure 24.8 SCIF data format for transfer data

24.2.7 USB download mode

USB download mode uses the USB Hight-Speed port, to transfer the data from Host PC to System RAM. The transfer data format is the same as SCIF download mode's. The transfer specification is below.

- Baud rate: up to USB 2.0 High Speed
- Data format: Motorola S-record
- USB Vendor ID: H'045B
- Product ID: RZ/G2N H'248, RZ/G2E H'024D
- Device Class: Communication Device Class (Abstract Control Model)

24.2.8 Boot ROM

The capacity is 96 Kbytes (RZ/G2M V1.3, RZ/G2M V3.0) or 160 Kbytes (RZ/G2H, RZ/G2N, RZ/G2E). AArch32, AArch64 codes are included.

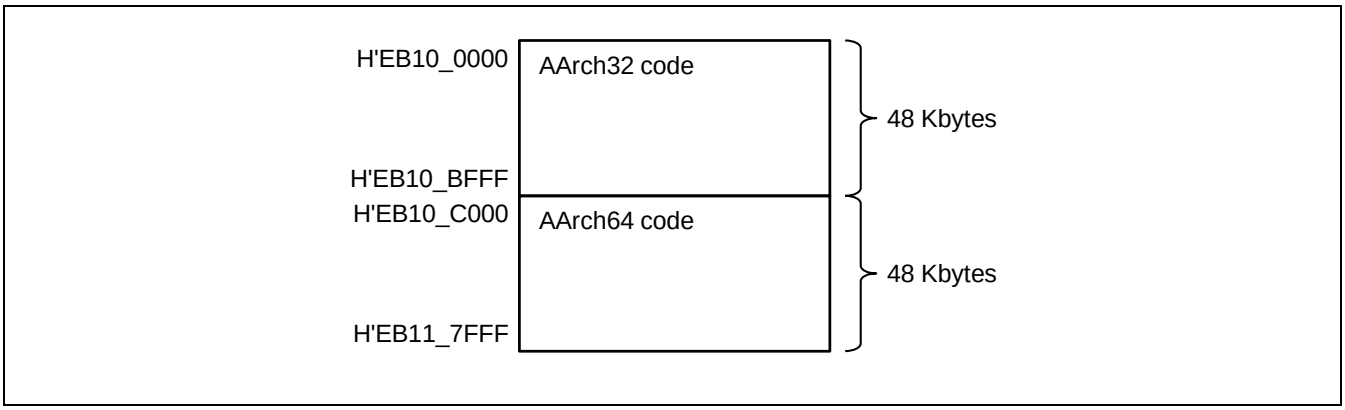

Figure 24.9 Boot ROM memory map (RZ/G2M V1.3, RZ/G2M V3.0)

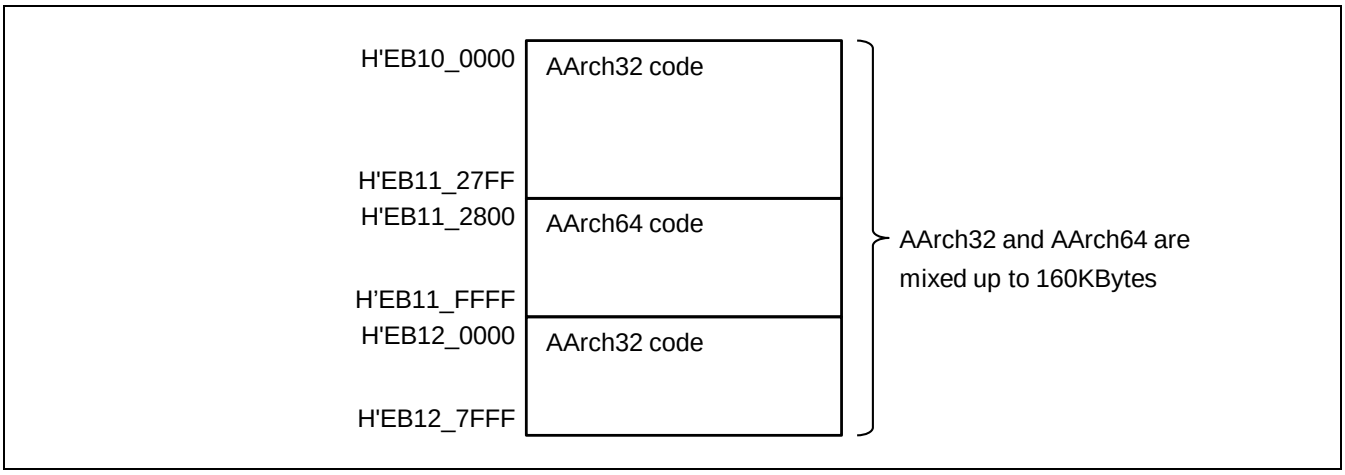

Figure 24.10 Boot ROM memory map (RZ/G2H, RZ/G2N, RZ/G2E)

24.3 Usage Note

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

24.3.1 IPL Address and Data Size Limitation

The IPL end address can be calculated by IPL address and data size. It should be lower than the address below.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: H'E635_67FF

RZ/G2E: H'E635_7FFF

The IPL address of HyperFlash and Serial Flash ROM boot requires 64-byte alignment. And the IPL address of eMMC boot requires 512-byte alignment.

24.3.2 Cleanup

Before jumping to the IPL, Boot ROM program cleans hardware registers used for loading the IPL and the master boot processor, as listed below.

AArch32 Cortex-A57/Cortex-A53

— Disable I-cache.

AArch64 Cortex-A57/Cortex-A53

— SYS-DMAC registers are set to hardware initial value.
— Disables Stack Alignment check. Disables Alignment fault checking. Disable I-cache.

Note

— The PFC setting is not cleared after jumping to the IPL.
— The settings of RPC-IF module for the transfer is automatically set by MD pin settings. Therefore, registers of RPC-IF module are not cleaned in Boot ROM.
— In the case of eMMC boot, initialize the SDHI interface registers.
— IRQ and FIQ are disabled.

24.3.3 Pull-up/down settings

Boot ROM code supports booting from single channel serial flash and does NOT support booting from dual channel serial Flash. Dual channel serial Flash boot can be selected by setting the BSZ bits of CMNCR register in RPC to B’01 after IPL loading.

MD[4:1]	Descriptions	QSPI0_IO2/QSPI0_IO3	QSPI1_SPCLK	QSPI1_IO0/QSPI1_IO1/ QSPI1_IO2/QSPI1_IO3
B’0100	Serial Flash 40MHz	Pull-up	Pull-down	Pull-up

24.3.4 Dual channel Serial Flash(Dual QSPI) boot

Boot ROM code supports booting from single channel serial flash and does NOT support booting from dual channel serial Flash. Dual channel serial Flash boot can be selected by setting the BSZ bits of CMNCR register in RPC to B’01 after IPL loading.

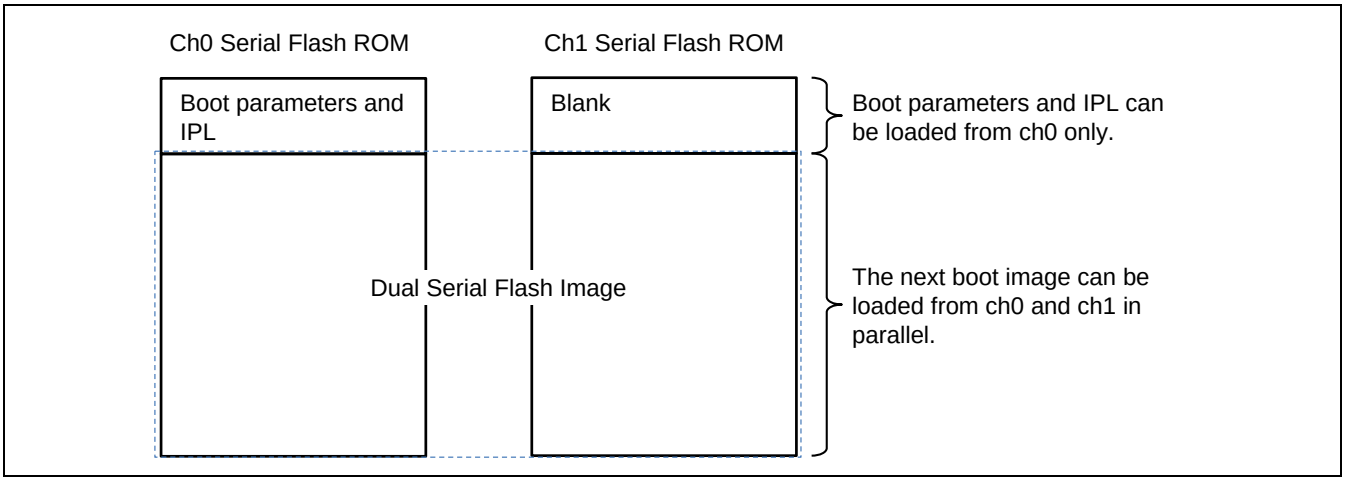

Figure 24.11 Flash image of dual channel Serial Flash booting

25. External Bus Controller for EX-Bus (LBSC)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

25.1 Overview

The LBSC performs bus arbitration and necessary interface conversion for the accesses from the CPU (AXI bus) and outputs them to the external buses. Further, for external bus access, various settings can be specified in the LBSC control registers for the selection of a connection interface type for each area on the external bus or for the adjustment of number of setup/hold cycles on addresses and chip select signals with respect to read/write enable signals. Thus, the LBSC configuration allows diversity in methodology for accessing various external devices that are assigned to their corresponding areas.

The frequency of the external bus clock CLKOUT signal is up to 66.6 MHz. The LBSC outputs bus signals in synchronization with the external bus clock.

25.1.1 Features

The key features of the LBSC include:

- Support for areas 0, 1
  - Each area is allocated to EX-BUS, and SRAM, or byte-control SRAM bus protocol can be selected.
  - Interface, bus size, and wait-cycle insertion can be controlled in each area.
  - Provides bus signals in synchronization with the CLKOUT signal (66.6 MHz/ 44.44 MHz).
- SRAM interface
  - Wait-cycle insertion can be controlled through register settings.
  - Wait cycles can be inserted with the EX_WAIT pins.
  - Connectable bus size: 16 or 8 bits.
- Burst ROM interface (area 0 and CPU access only)
  - Wait-cycle insertion can be controlled through register settings.
  - Burst count can be specified through register settings (cases where this reaches an address branching point are automatically detected, after which the access is broken off).
  - Connectable bus size: 16 or 8 bits
- Byte-control SRAM interface (areas 1 only)
  - SRAM interface with byte control
  - Wait-cycle insertion can be controlled through register settings.
  - Wait cycles can be inserted with the EX_WAIT pins.
  - Connectable bus size: 16 or 8 bits
- Wait timeout
  - Wait timeout detection

    Detection time in ns = period in ns at EX-BUS operating frequency × (the time specified in the EX-BUS wait timeout base counter register (EXBCT) and EX-BUS wait timeout detection counter register (EXTCT))

25.1.2 Block Diagram

Figure 25.1 is a block diagram of the LBSC. Placed on the AXI bus, the LBSC outputs accesses from the CPU in sequence to an external bus according to the settings that are provided in internal registers of the LBSC. For the external bus EX-BUS, either of the SRAM bus protocol can be selected the LBSC has an external wait control input that controls the pulse width. When a request for access is received by an external device, the external device uses this to control the wait for a response to suit the situation at the time of access-request reception.

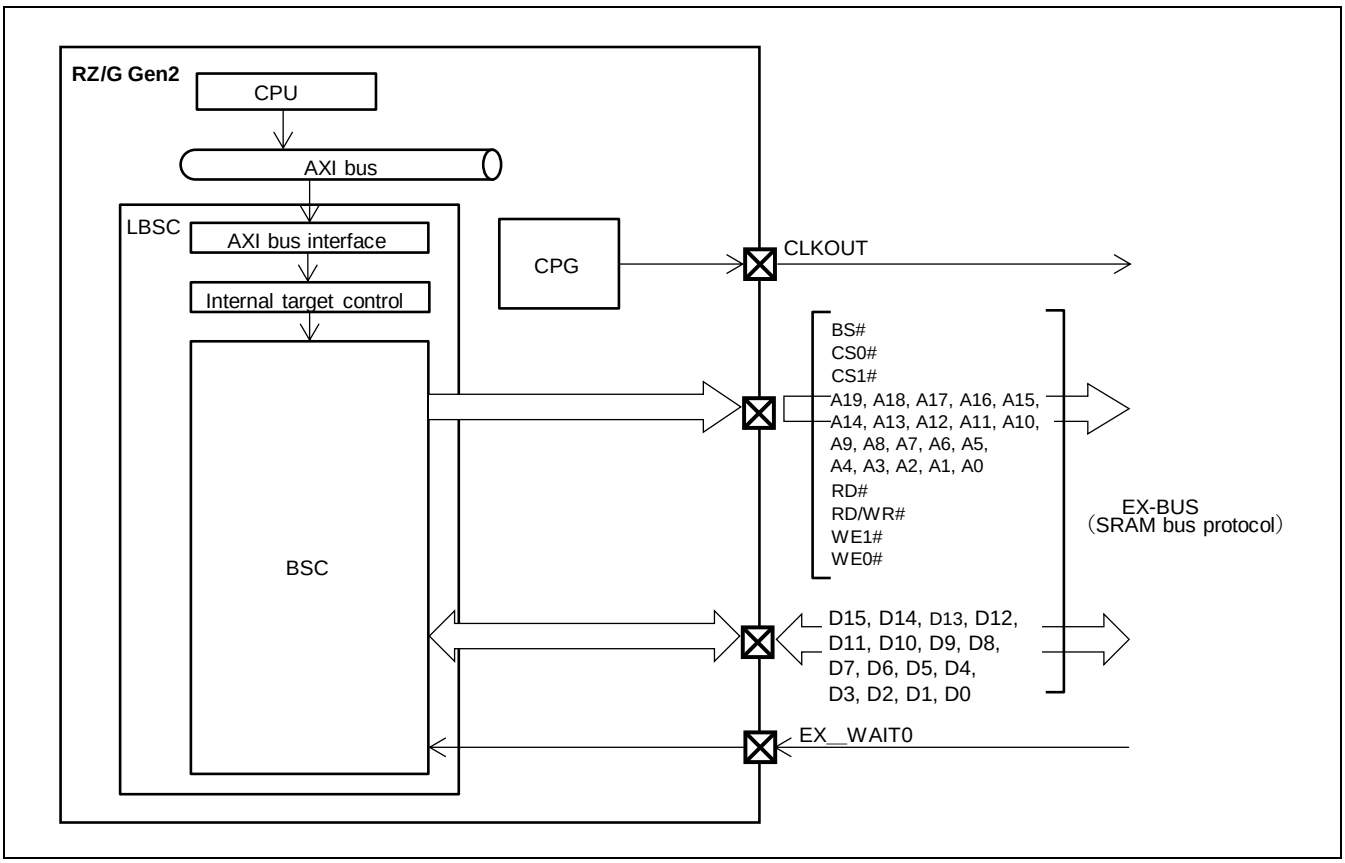

Figure 25.1 Block Diagram of LBSC

25.1.3 LBSC Areas

25.1.3.1 LBSC Support Areas

Figure 25.2 shows LBSC response support areas from the CPU.

The basic configuration of the LBSC supports area 0 and area 1 as external spaces (1Mbytes for each area); Every 1MB address space from H’0010_0000 to H’03FF_FFFF can be used as shadowed area of 1MB from the begging of Area0 (H’0000_0000 – H’000F_FFFF). And every 1MB address space from H’0410_0000 to H’07FF_FFFF can be used as shadowed area of 1MB from the begging of Area1 (H’0400_0000 – H’040F_FFFF). Registers of the BSC is provided in the internal register space of the LBSC.

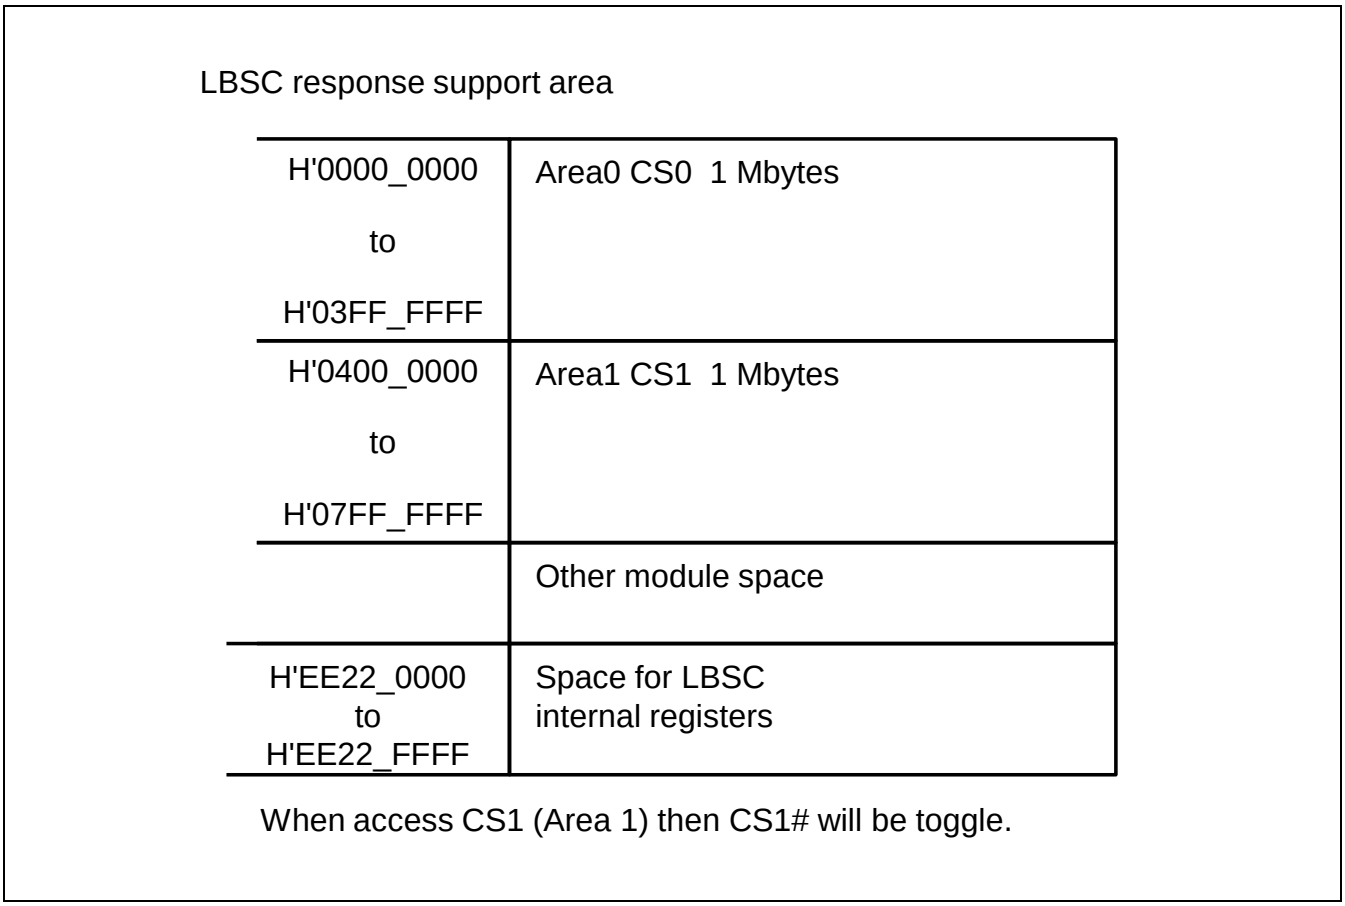

Figure 25.2 LBSC Response Support Areas from the CPU

25.1.3.2 Functionality Supported in Each Area

Table 25.1 lists the functions supported by the LBSC in each area on the EX-BUS.

Table 25.1 Functions Supported in Each Area on EX-BUS

Area	Bus	Capacity	Operating Mode	Guard interval	WAIT Function
0	8/16 bits	1 Mbytes selectable	SRAM Burst ROM	Disabled	Enabled
1	8/16 bits	Fixed to 1 Mbytes	SRAM Byte-control SRAM	Enabled	Enabled

Notes: 1. The bus size for area 0 is specified with the LSI mode pins (MD8 = 0: 8 bits, MD8 = 1: 16 bits).
2. When accessing through EX-BUS, A[0] is output as byte address even if 16-bit bus is selected.

25.1.4 Register Configuration

The LBSC set registers to control the interface, bus size, RD/WE# signal pulse cycles, and setup and hold cycles for the CS# signal with respect to the RD/WE# signal, for each of externally connected devices. Table 25.2 lists registers of the LBSC. Note that correct operation is not guaranteed in principle if each register is modified during external bus access (for register modification in other cases, refer to the note under specific register description).

Table 25.2 LBSC Register Configuration

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

25.2 Register Description

Registers in the LBSC are allocated to and arranged in the address space of the internal bus.

Legend for Register Description

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. When the bit is reserved, the write value should always be 0.

Writing 1 to these bits can cause a malfunction of LBSC.

—/W: Write-only. The read value is undefined.

—/WC1: Write-only. Writing 1 initializes the bit. Writing 0 is ignored.

25.2.1 Area 0 Control Register (CS0CTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CS0CTRL specifies the interface in area 0 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	CS0SZ		—	—	CS0IF	
Initial value:	1	0	0	0	0	0	0	0	0	0	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	—	B’1	R	Reserved These bits are always read as 1. The write value should always be 1.
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	CS0SZ	—	R	Area 0 Bus Size Indication (These bits indicate the value specified by the LSI mode pin MD8.) B’00: Setting prohibited B’01: 8 bits B’10: 16 bits B’11: Setting prohibited
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	CS0IF	B’00	R/W	Area 0 Interface Selection B’00: Standard (SRAM) B’01: Burst ROM B’10: Setting prohibited B’11: Setting prohibited

Notes: 1. Even when the burst ROM interface is selected by setting CS0IF = B'01, burst ROM operation is not available unless appropriate setting is made in CS0BSTCTL. Be sure to specify both CS0BSTCTL and CS0BTPH before using the burst ROM interface.
2. Setting of burst ROM is valid for CPU access only.

25.2.2 Area 1 Control Register (CS1CTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CS1CTRL specifies the interface in area 1 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

25.2.3 Area 0 RD/WE Pulse Control Register (CSWCR0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CSWCR0 specifies the RD/WE# pulse cycles and setup and hold cycles for the CS# signal and address during access to area 0 (EX-BUS). (The settings for read access are ignored when the burst ROM interface is selected.)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WRITE PULSE CYCLE					WRITE CS SETUP CYCLE			—	WRITE CS HOLD CYCLE			—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	READ PULSE CYCLE					READ CS SETUP CYCLE			—	READ CS HOLD CYCLE			—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	WRITE PULSE CYCLE	B’1_1111	R/W	These bits specify the WE# pulse cycles during writing to area 0. B’0_0000: Setting prohibited B’0_0001: 1-cycle pulse B’0_0010: 2-cycle pulse B’0_0011: 3-cycle pulse B’0_0100: 4-cycle pulse : B’1_1101: 29-cycle pulse B’1_1110: 30-cycle pulse B’1_1111: 31-cycle pulse
26 to 24	WRITE CS SETUP CYCLE	B’111	R/W	These bits specify the CS# and address setup cycles with respect to the WE# signal during writing to area 0. B’000: 0 cycle for setup period B’001: 1 cycle for setup period B’010: 2 cycles for setup period : B’110: 6 cycles for setup period B’111: 7 cycles for setup period
23	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	WRITE CS HOLD CYCLE	B’111	R/W	These bits specify the CS# and address hold cycles with respect to the WE# signal during writing to area 0. B’000: 0 cycle for hold period B’001: 1 cycle for hold period B’010: 2 cycles for hold period : B’110: 6 cycles for hold period B’111: 7 cycles for hold period

Bit	Bit Name	Initial Value	R/W	Description
19 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 11	READ PULSE CYCLE	B’1_1111	R/W	These bits specify the RD# pulse cycles during reading from area 0. B’0_0000: Setting prohibited B’0_0001: 1-cycle pulse B’0_0010: 2-cycle pulse B’0_0011: 3-cycle pulse B’0_0100: 4-cycle pulse : B’1_1101: 29-cycle pulse B’1_1110: 30-cycle pulse B’1_1111: 31-cycle pulse
10 to 8	READ CS SETUP CYCLE	B’111	R/W	These bits specify the CS# and address setup cycles with respect to the RD# signal during reading from area 0. B’000: 0 cycle for setup period B’001: 1 cycle for setup period B’010: 2 cycles for setup period : B’110: 6 cycles for setup period B’111: 7 cycles for setup period
7	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	READ CS HOLD CYCLE	B’111	R/W	These bits specify the CS# and address hold cycles with respect to the RD# signal during reading from area 0. B’000: 0 cycle for hold period B’001: 1 cycle for hold period B’010: 2 cycles for hold period : B’110: 6 cycles for hold period B’111: 7 cycles for hold period
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Notes: 1. A minimum of two clock cycles are required for one EX-BUS access cycle and therefore, the setting must satisfy this lower limit.
Setting less than two clock cycles for one access cycle is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.
Example: When CSSetupCycle = B'000, CSHoldCycle = B'000, and PulseCycle = B'0_0001, correct operation is not guaranteed.
2. When controlling wait insertion through LSI external pins (EX_WAIT0), set PulseCycle to B'0_0010 or a larger value. If B'0_0001 or a smaller value is specified, wait insertion through an external pin is disabled.
3. When the burst ROM interface is specified for area 0, the read access-related settings for area 0 in this register is ignored and settings in CS0BTPH are enabled.
4. For details, refer to section 25.3.1, SRAM Interface (Basic Functionality).

25.2.4 Area 1 RD/WE Pulse Control Register (CSWCR1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CSWCR1 specifies the RD/WE# pulse cycles and setup and hold cycles for the CS# signal and address during access to area 1 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WRITE PULSE CYCLE					WRITE CS SETUP CYCLE			—	WRITE CS HOLD CYCLE			—	—	—	—
Initial value:	1	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	1	1	1	1	1	1	1	1	0	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	WRITE PULSE CYCLE	B’1_1111	R/W	These bits specify the WE pulse cycles during writing to area 1. B’0_0000: Setting prohibited B’0_0001: 1-cycle pulse B’0_0010: 2-cycle pulse B’0_0011: 3-cycle pulse B’0_0100: 4-cycle pulse : B’1_1101: 29-cycle pulse B’1_1110: 30-cycle pulse B’1_1111: 31-cycle pulse
26 to 24	WRITE CS SETUP CYCLE	B’111	R/W	These bits specify the CS# and address setup cycles with respect to the WE# signal during writing to area 1. B’000: 0 cycle for setup period B’001: 1 cycle for setup period B’010: 2 cycles for setup period : B’110: 6 cycles for setup period B’111: 7 cycles for setup period
23	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	WRITE CS HOLD CYCLE	B’111	R/W	These bits specify the CS# and address hold cycles with respect to the WE# signal during writing to area 1. B’000: 0 cycle for hold period B’001: 1 cycle for hold period B’010: 2 cycles for hold period : B’110: 6 cycles for hold period B’111: 7 cycles for hold period
19 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	READ PULSE CYCLE	B'1_1111	R/W	These bits specify the RD# pulse cycles during reading from area 1. B'0_0000: Setting prohibited B'0_0001: 1-cycle pulse B'0_0010: 2-cycle pulse B'0_0011: 3-cycle pulse B'0_0100: 4-cycle pulse : B'1_1101: 29-cycle pulse B'1_1110: 30-cycle pulse B'1_1111: 31-cycle pulse
10 to 8	READ CS SETUP CYCLE	B'111	R/W	These bits specify the CS# and address setup cycles with respect to the RD# signal during reading from area 1. B'000: 0 cycle for setup period B'001: 1 cycle for setup period B'010: 2 cycles for setup period : B'110: 6 cycles for setup period B'111: 7 cycles for setup period
7	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	READ CS HOLD CYCLE	B'111	R/W	These bits specify the CS# and address hold cycles with respect to the RD# signal during reading from area 1. B'000: 0 cycle for hold period B'001: 1 cycle for hold period B'010: 2 cycles for hold period : B'110: 6 cycles for hold period B'111: 7 cycles for hold period
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Notes: 1. A minimum of two clock cycles are required for one EX-BUS access cycle and therefore, the setting must satisfy this lower limit.
Setting less than two clock cycles for one access cycle is not expected in the design of this LSI, and if attempted correct operation is not guaranteed.
Example: When CSSetupCycle = B'000, CSHoldCycle = B'000, and PulseCycle = B'0_0001, correct operation is not guaranteed.
2. When controlling wait insertion through LSI external pins (EX_WAIT0), set PulseCycle to B'0_0010 or a larger value. If B'0_0001 or a smaller value is specified, wait insertion through an external pin is disabled.
3. For details, refer to section 25.3.1, SRAM Interface (Basic Functionality).

25.2.5 Area 0 External Wait Control Register (CSPWCR0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CSPWCR0 makes settings for external wait signal during access to area 0 (EX-BUS) (the settings are ignored when the burst ROM interface is selected).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	V	RB	WINV	—	—	EXWT0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	V	B'0	R/W	Area 0 External Wait Signal Enable/Disable 0: Disabled 1: Enabled
4	RB	B'0	R/W	Area 0 READY/BUSY Logic Selection 0: BUSY logic 1: READY logic
3	WINV	B'0	R/W	Area 0 External Wait Signal Polarity 0: Does not invert the polarity of the area 0 external wait signal. 1: Inverts the polarity of the area 0 external wait signal.
2	—	B'0	R/W	Reserved The write value must always be 0. Operation is not guaranteed if setting 1.
1	—	B'0	R/W	Reserved The write value must always be 0. Operation is not guaranteed if setting 1.
0	EXWT0	B'0	R/W	Area 0 EX_WAIT0 Enable 0: Disables EX_WAIT0 for area 0. 1: Enables EX_WAIT0 for area 0.

Notes: 1. When this register setting is made valid (bit V = 1), any one of bits EXWT0 must be set to 1.
2. When bit V = 0, the settings in EXWT0 are ignored. In area 0, this register setting is ignored in read access when the burst ROM interface is selected. For details on wait control, refer to section 25.3.1, SRAM Interface (Basic Functionality).

25.2.6 Area 1 External Wait Control Register (CSPWCR1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CSPWCR1 makes settings for external wait input pins during access to area 1 (EX-BUS).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	V	B'0	R/W	Area 1 External Wait Signal Enable/Disable 0: Disabled 1: Enabled
4	RB	B'0	R/W	Area 1 READY/BUSY Logic Selection 0: BUSY logic 1: READY logic
3	WINV	B'0	R/W	Area 1 External Wait Signal Polarity 0: Does not invert the polarity of the area 1 external wait signal. 1: Inverts the polarity of the area 1 external wait signal.
2	—	B'0	R/W	Reserved The write value must always be 0. Operation is not guaranteed if setting 1.
1	—	B'0	R/W	Reserved The write value must always be 0. Operation is not guaranteed if setting 1.
0	EXWT0	B'0	R/W	Area 1 EX_WAIT0 Enable 0: Disables EX_WAIT0 for area 1. 1: Enables EX_WAIT0 for area 1.

Notes: 1. When this register setting is made valid (bit V = 1), any one of bits EXWT0 must be set to 1.
2. When bit V = 0, the settings in EXWT0 are ignored. For details on wait control, refer to section 25.3.1, SRAM Interface (Basic Functionality).

25.2.7 External Wait Input Control Register (EXWTSYNC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: EXWTSYNC controls whether or not to synchronize the external wait pins (EXWAIT0).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EXWT SYNC0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	—	B'0	R/W	Reserved The write value should always be 0.
3	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	—	B'0	R/W	Reserved The write value must always be 0. Operation is not guaranteed if setting 1.
1	—	B'0	R/W	Reserved The write value must always be 0. Operation is not guaranteed if setting 1.
0	EXWTSYNC0	B'0	R/W	0: Does not synchronize EX_WAIT0 (the original EX_WAIT0 is synchronous with CLKOUT). 1: Synchronizes EX_WAIT0 (the original EX_WAIT0 is asynchronous with CLKOUT).

Note: For details on wait control, refer to section 25.3.1, SRAM Interface (Basic Functionality).

25.2.8 Area 0 Burst Control Register (CS0BSTCTL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CS0BSTCTL specifies the burst length for area 0 when the burst ROM interface is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	A0BST[2:0]			—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 11	A0BST[2:0]	B’000	R/W	Area 0 Burst Length for Burst ROM Interface B’001: 4 access cycles B’010: 8 access cycles B’011: 16 access cycles B’100: 32 access cycles Others: No burst transfer
10 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Notes: 1. This register is valid only when the burst ROM interface is selected (CS0IF = B'01 in CS0CTRL).
2. Set bits A0BST2 to A0BST0 to an appropriate value so that (area 0 bus size) x (burst length set in this register) becomes 32 bytes or less.
3. For details, refer to section 25.3.2, CPU (AXI Bus) → Burst ROM Interface.

25.2.9 Area 0 Burst Pitch Set Register (CS0BTPH)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CS0BTPH specifies the burst pitches for the first access cycle and the second and later cycles for area 0 when the burst ROM interface is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	A0H	A0W[3:0]				—	A0B[2:0]		
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	A0H	B’0	R/W	Specifies the CS# and address hold cycles with respect to the RD# signal for area 0 in the burst ROM interface. 0: 0 cycle for hold period 1: 1 cycle for hold period
7 to 4	A0W[3:0]	B’1111	R/W	These bits specify the burst pitch (wait cycles to be inserted) after the first burst cycle for area 0 in the burst ROM interface. B’0000: Setting prohibited B’0001: Setting prohibited B’0010: 2 cycles B’0011: 3 cycles B’0100: 4 cycles : B’1101: 13 cycles B’1110: 14 cycles B’1111: 15 cycles
3	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	A0B[2:0]	B’111	R/W	These bits specify the burst pitch (wait cycles to be inserted) after the second burst cycle for area 0 in the burst ROM interface. B’000: Setting prohibited B’001: 1 cycle B’010: 2 cycles : B’110: 6 cycles B’111: 7 cycles

Notes: 1. Be sure to specify this register before specifying CS0BSTCTL.
2. For details, refer to section 25.3.2, CPU (AXI Bus) → Burst ROM Interface.

25.2.10 Area 1 Guard Setting Register (CS1GDST)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: CS1GDST specifies the guard interval (period of access prohibition) between sequential access cycles in area 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	CS1GD	TIMER_SET			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CS1GD	B’0	R/W	0: Makes the TIMER_SET setting invalid. 1: Makes the TIMER_SET setting valid.
3 to 0	TIMER_SET	B’0000	R/W	Guard Interval (Period of Access Prohibition) between Sequential Access Cycles for Area 1 B’0000: 0 clock cycle B’0001: 1 clock cycle B’0010: 2 clock cycles B’0011: 3 clock cycles B’0100: 4 clock cycles : B’1101: 13 clock cycles B’1110: 14 clock cycles B’1111: 15 clock cycles

Notes: 1. The TIMER_SET setting is ignored when CS1GD = 0.
2. This register must not be dynamically modified regardless of whether area 1 is being accessed.
3. The actual guard interval between sequential access cycles on the EX-BUS is (register setting) + (idle cycles due to hardware processing).
4. For details, refer to section 25.3.1 (4), Controlling Guard Intervals

25.2.11 BSC Interrupt Source Status Register (BCINTSR)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Function: BCINTSR indicates the status of the BSC interrupt source.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	EXW_ TOADR	H'0000_0000	R/W	Indication of the address for which attempted access to the EX-BUS by the AXI bus reached timeout

Note: This register is readable and writable. To clear this register, write 0s to all bits.

25.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

25.3.1 SRAM Interface (Basic Functionality)

The BSC reads access requests from the CPU stored in the FIFO mounted in the LBSC module and writes them to the EX-BUS. By default, all spaces, areas 0 and 1 are all set for SRAM interface. The pulse width for access signals in this SRAM access interface can be varied according to register settings. Thus, the SRAM interface has functionality for easily accommodating devices with various access specifications, connected on the EX-BUS. In addition, to support low-speed external devices, the guard-interval control functionality is provided for insertion of the appropriate interval for each bus access; and the SRAM interface receives wait-for-response requests (or access complete signals) from external devices on a synchronous/asynchronous-selectable and polarity-selectable basis, thus ensuring flexibility in bus design. Figure 25.3 and Figure 25.4 show SRAM interface timing charts for AXI → EX-BUS conversions.

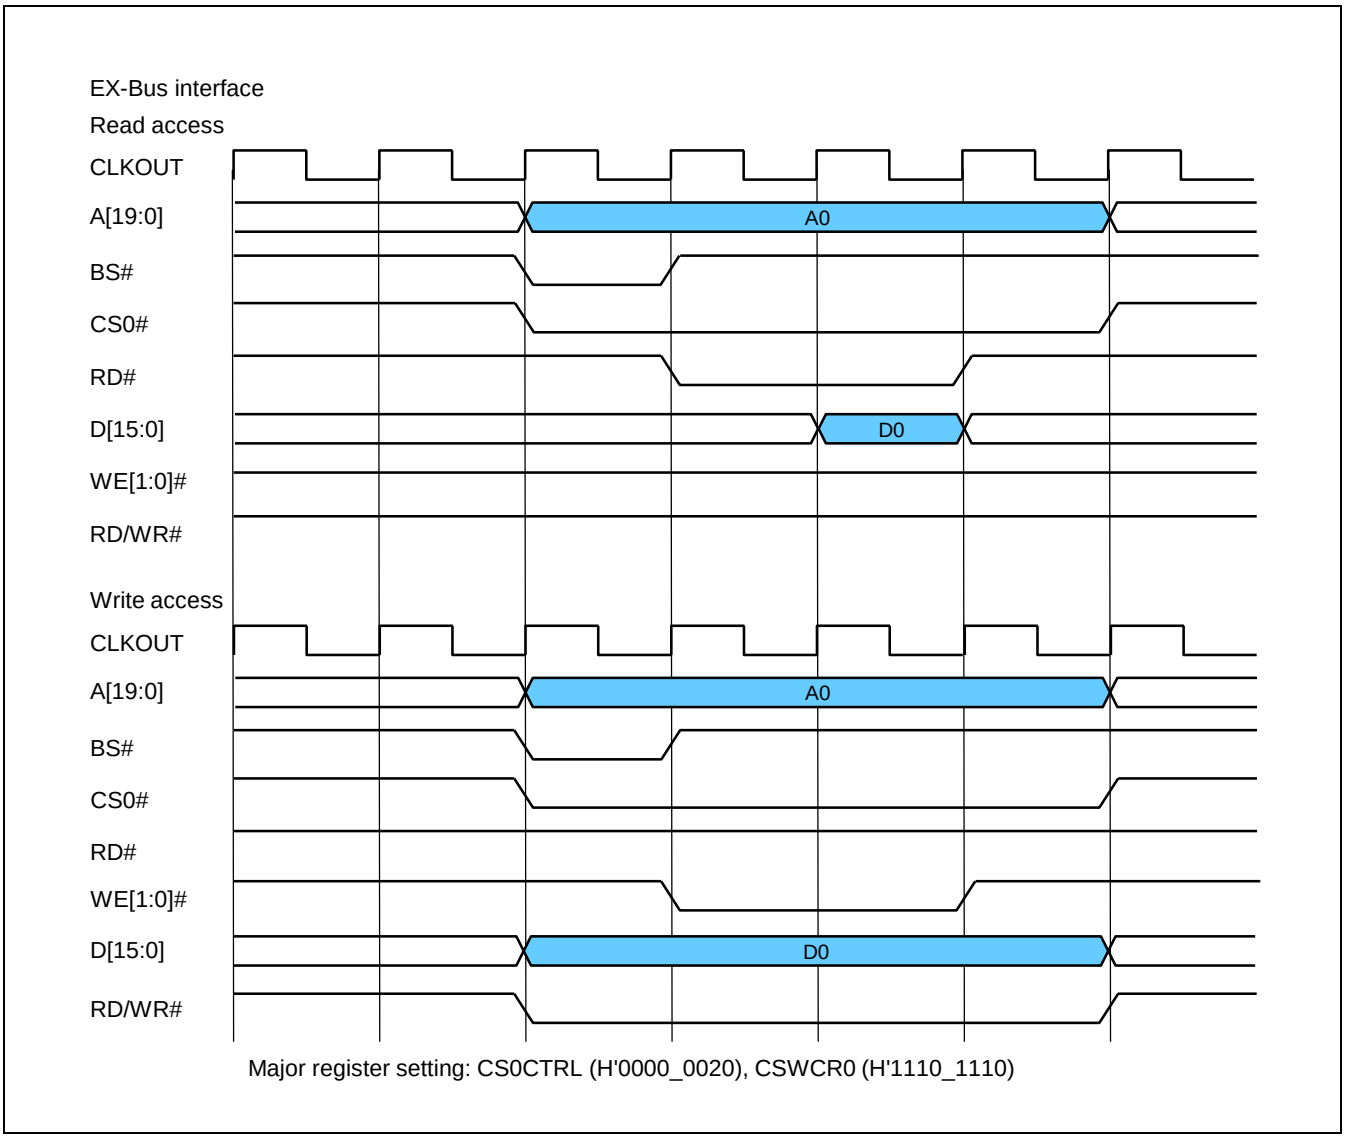

Figure 25.3 Basic Timing Chart for Access from AXI to SRAM (Area 0)

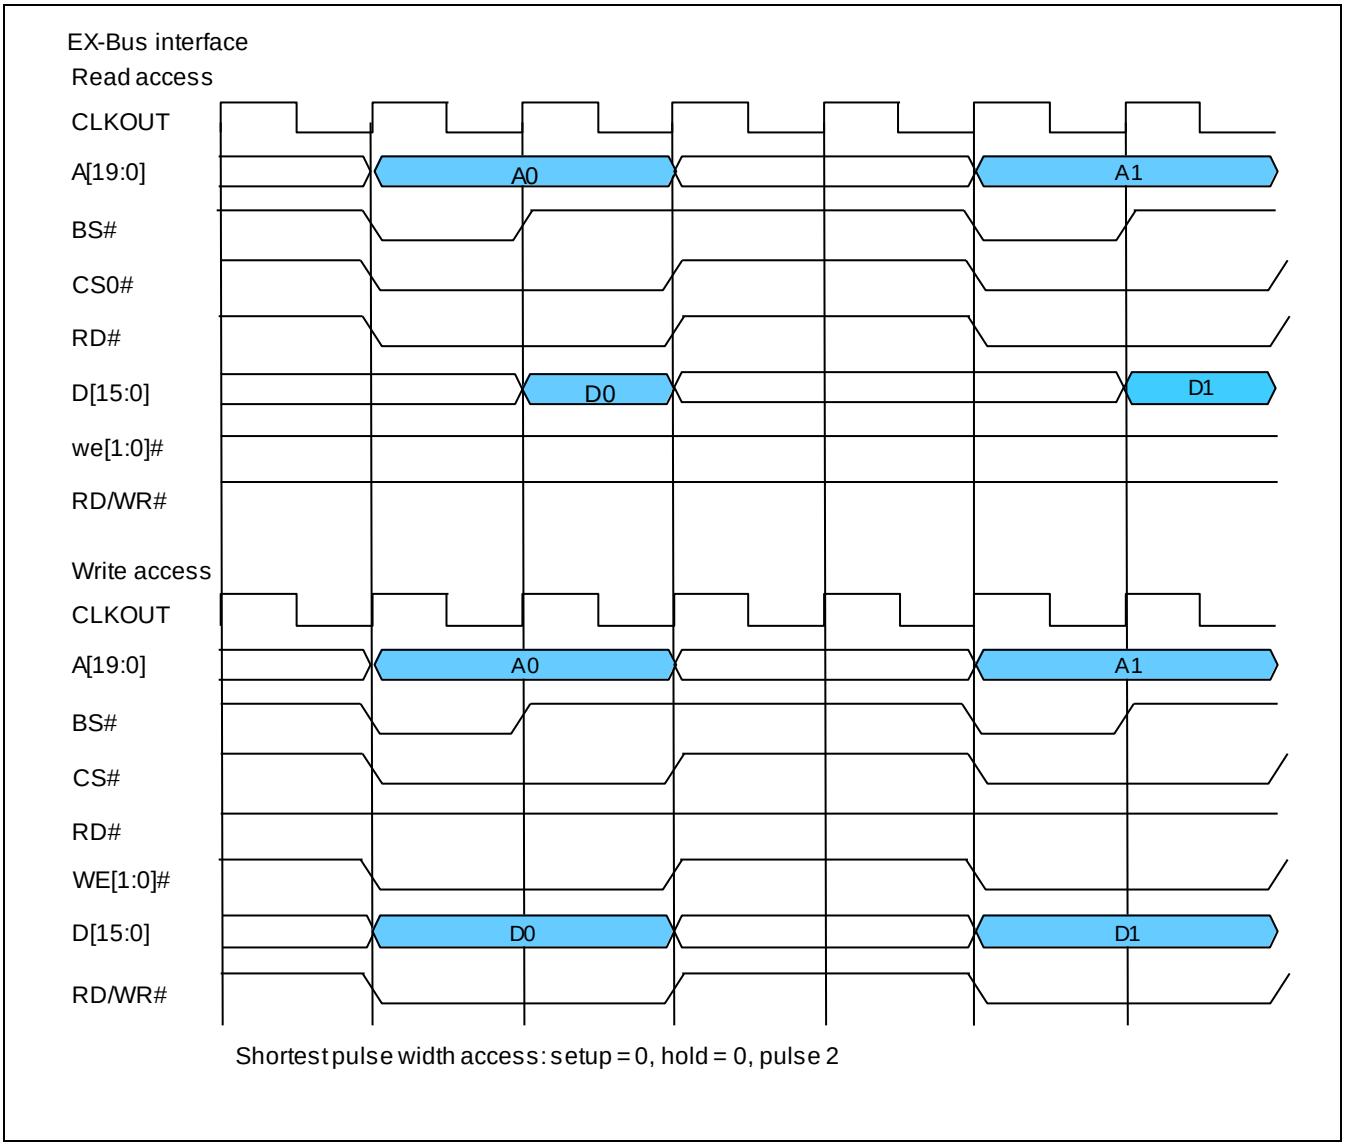

Figure 25.4 Basic Timing Chart for Access from AXI to SRAM (Shortest Pulse Width × Shortest PIO Consecutive Accesses)

Figure 25.4 is an example of the basic SRAM interface waveform with the shortest pulse width, wherein the same waveform occurs twice in succession.

If consecutive PIO access requests are made from the CPU (AXI bus), the access interval will be 2 clock cycles, as indicated in the above waveforms, regardless of whether the preceding or succeeding access request is for the same area or for different areas. The access interval can be extended by means of the guard setting registers.

(1) Address Generation/Alignment

When making access to the EX-BUS as an SRAM interface Figure 25.5 provides an overview of address generation and data alignment/write enable conversions.

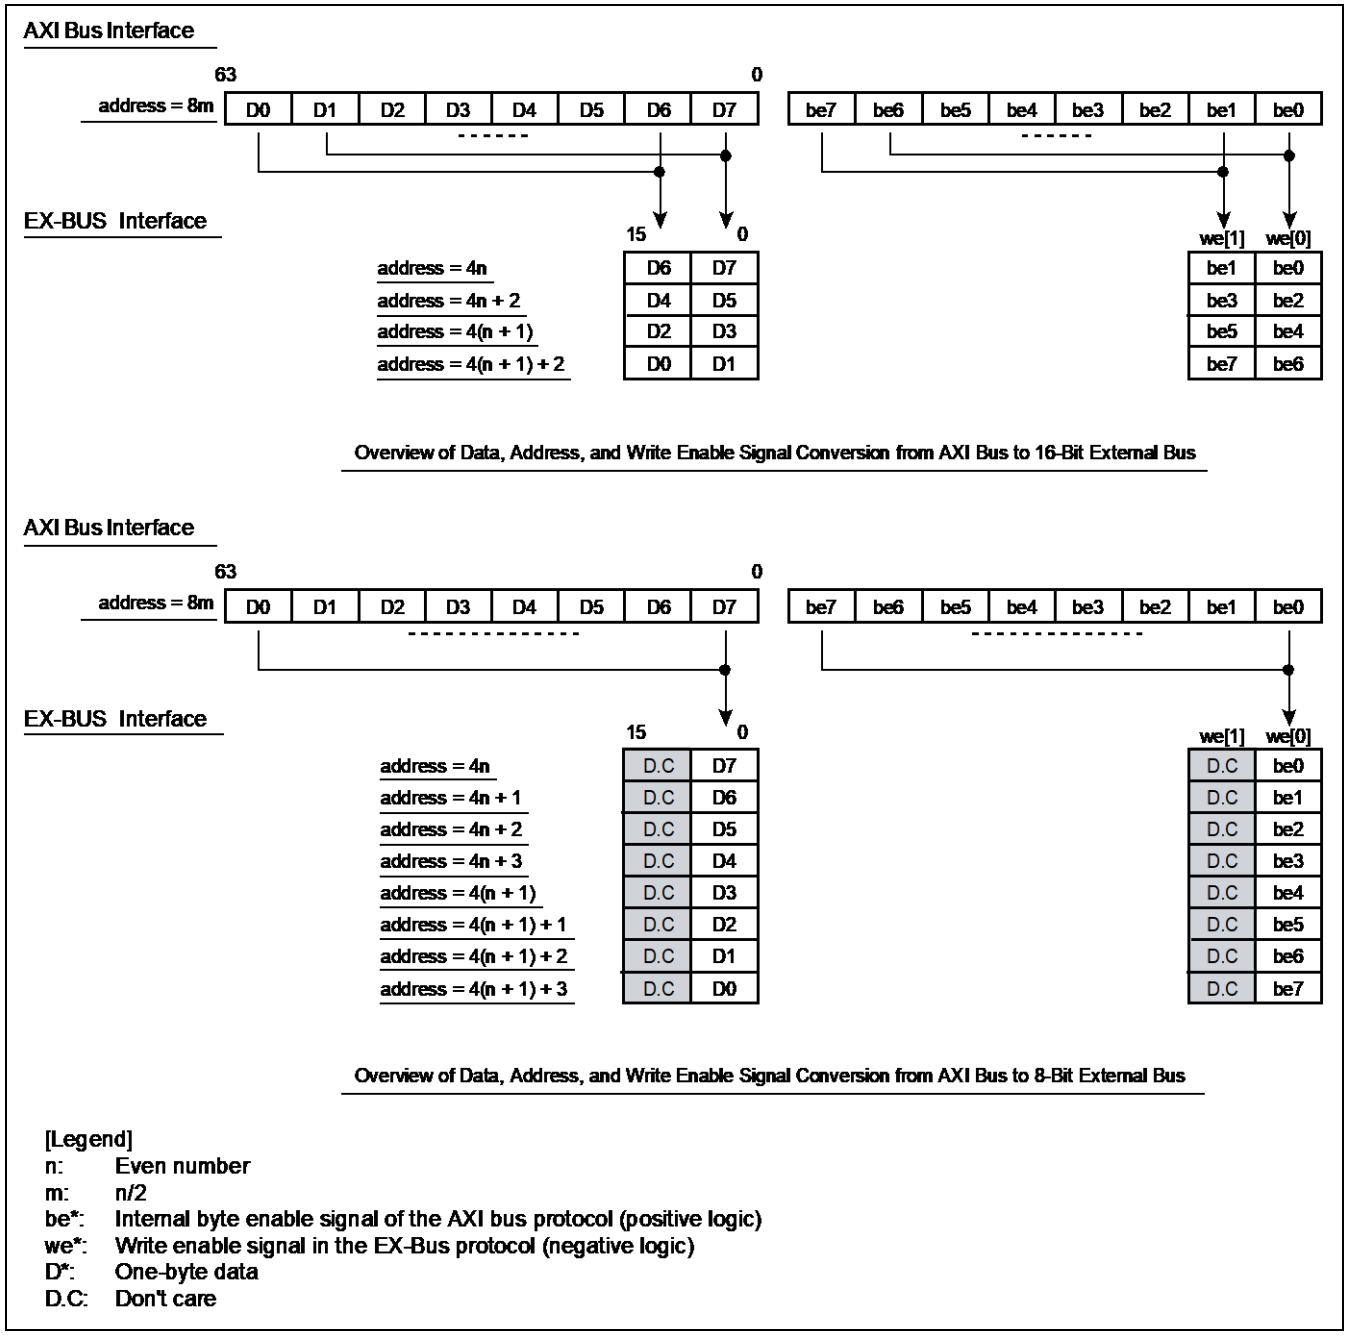

Figure 25.5 Overview of Data, Address, and Write Enable Signal Conversion from CPU (64-Bit AXI Bus) to External Bus

(2) Setting the Pulse Width for an Access Signal

When making access to the EX-BUS, the LBSC can set the setup or hold time for addresses, RD/WR#, and CS# signals based on WE# signals and RD# signals, and the pulse width for WE# and RD# signals in units of clock cycles, according to the values that are set for each area by means of the CSWCR0, CSWCR1 registers. (During a burst ROM read operation, however, the LBSC conforms to CS0BTPH settings rather than CSWCR0 settings. The pulse width for WE# or RD# signal that is stored in a register can be extended by an externally supplied EX_WAIT signal. The minimum total value that is set should be two clock cycles.

(3) External Wait Control

The LBSC controls the external wait signal (EX_WAIT) from a device connected to the EX-BUS based on settings that are provided on external wait control registers (CSPWCR0, CSPWCR1) and the external wait input control register (EXWTSYNC). The external wait control registers permit the selection of the four types of interfaces to accommodate various types of specifications, whether the wait signal input from an external device is based on the READY logic (posting a READY status) or BUSY logic (posting a BUSY status), or which signal polarity is in effect.

Figure 25.6 shows waveforms for the four wait signal patterns that can be input and the waveforms for the wait signals internal to the LBSC after conversion according to the register settings.

The external wait input control register allows the switching between the synchronous/asynchronous handling of external wait input signals. The default is to treat such signals on a synchronous basis. Figure 25.7 shows external wait input timings for synchronization/asynchronization. In the figure, the position indicated by the symbol * represents the point at which the LBSC determines whether or not external wait is in effect. Specifically, for synchronization, the position is one clock cycle before the point at which the WE# and RD# signals would normally be negated by pulse width settings. If external wait is in effect at this position, the pulse width for the WE# or RD# signal continues to extend until the wait status becomes the ready status. If the pulse width for the WE# or RD# signal is extended by the EX_WAIT signal, the address and the RD/WR# and CS# signals are negated when the hold time is satisfied. If the synchronization setting is switched to the asynchronization setting, any external wait is nullified unless there is an external wait two clock cycles before the * position, or three clock cycles before the point in which the WE# and RD# signals would normally be negated.

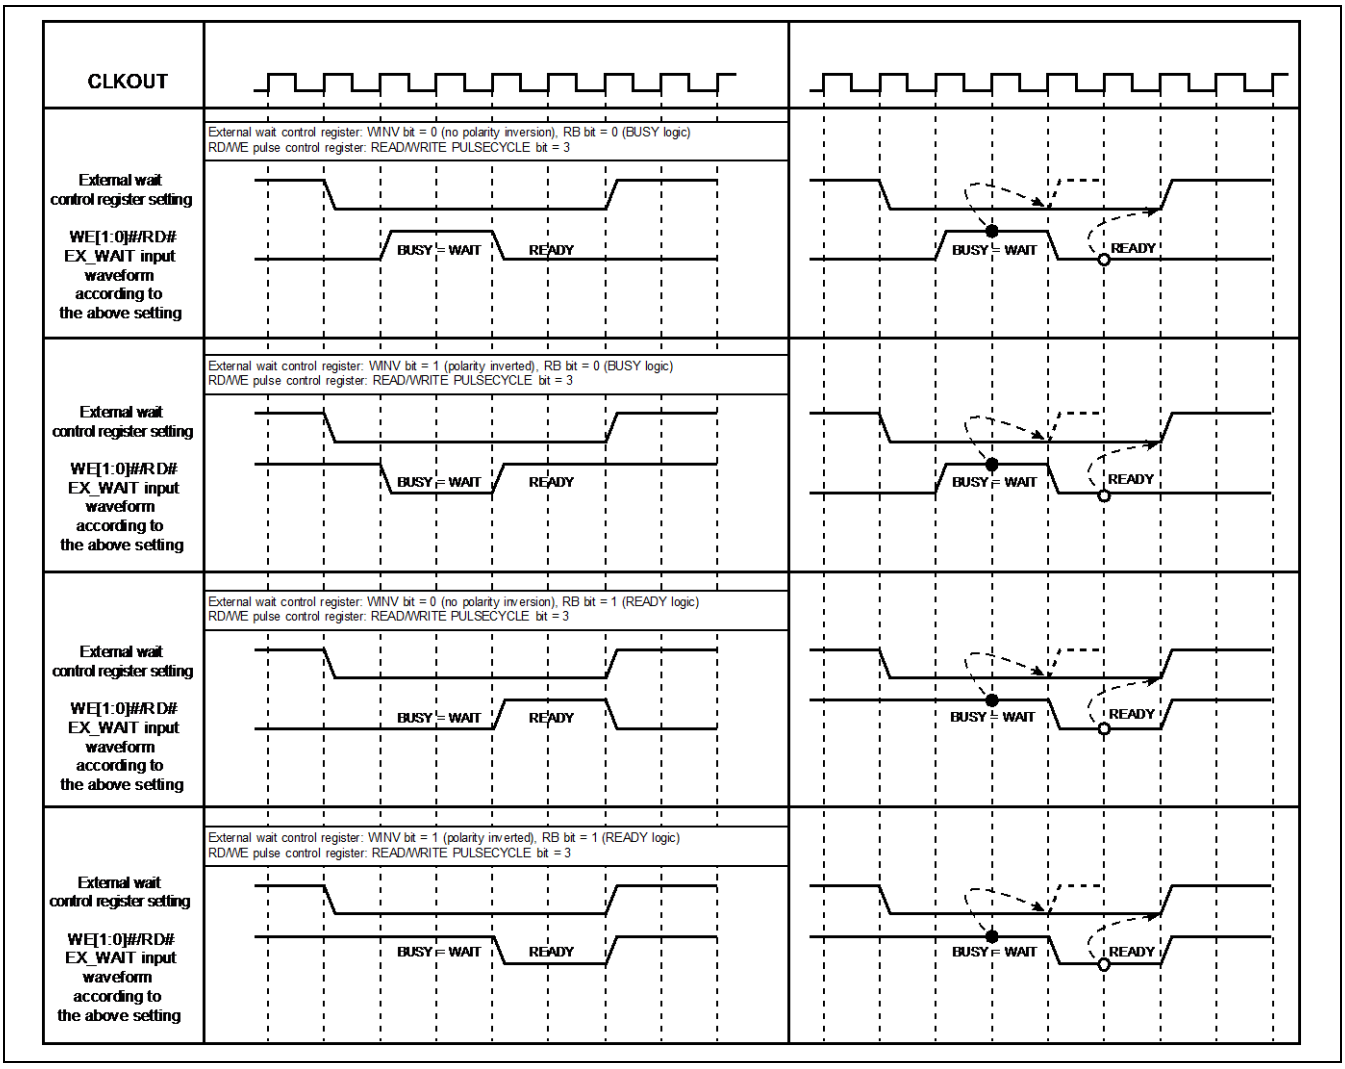

Figure 25.6 Waveforms of Converted External Wait Interface

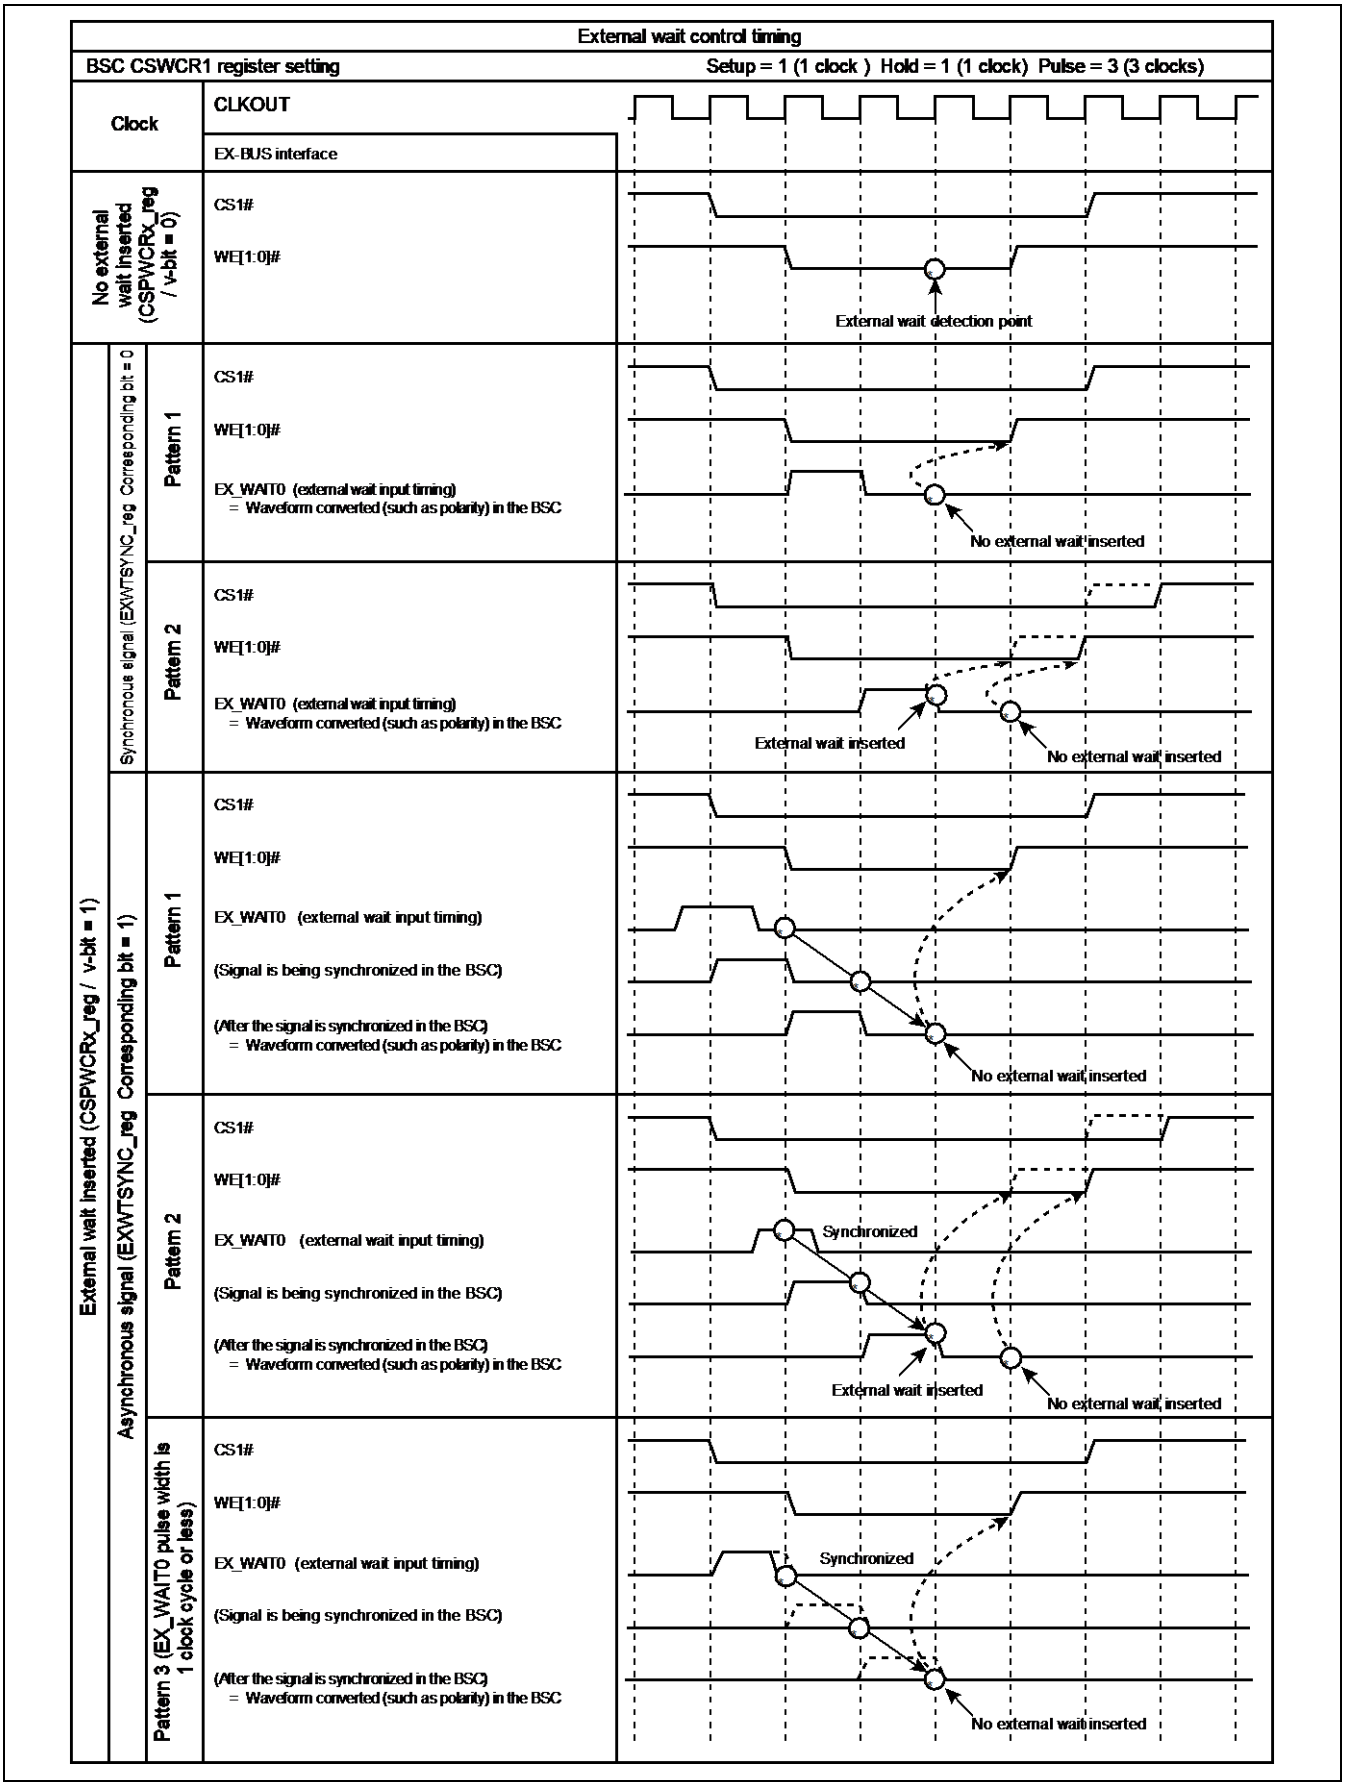

Figure 25.7 Waveforms of External Wait Input Signals

(4) Controlling Guard Intervals

For some external devices, the transition of the data lines to the high-Z state after completion of read access takes a relatively long time. To prevent any contention for the data bus when further access over the EX-BUS proceeds immediately after a read operation for such a device, the LBSC supports a function to guard against further access over a given interval following each bus access. The function is also effective for external devices that have difficulty coping with consecutive reception of access requests. Specifically, set the number of clock cycles over which guarding against access applies in the guard setting register (CS1GDST,) for the given area. (Even if the value assigned to the guard setting register is 0, hardware processing before a further bus access request is issued requires at least 2 clock cycles between PIO and PIO, Therefore, in PIO accesses, the actual interval on the EX-BUS is 2 clock cycles when value in the guard setting register is 0 or 1. And it is 1 clock cycles plus the setting for number of clock cycles in the guard setting register when the setting value is 2 or more.)

After access to a given area, the guard interval is assigned corresponding to the register for that area, regardless of the kind of access or target space of the next access request. Note, however, that there is no guard setting register for area 0. Therefore, guard intervals are not set up for access that immediately follows access to this area. Since area 0 is supposed to be for the connection of general-purpose memory such as ROM, SRAM, or flash-ROM, guard intervals should not be necessary for this area. Figure 25.8 is a basic timing chart to illustrate the concept of guard-interval control.

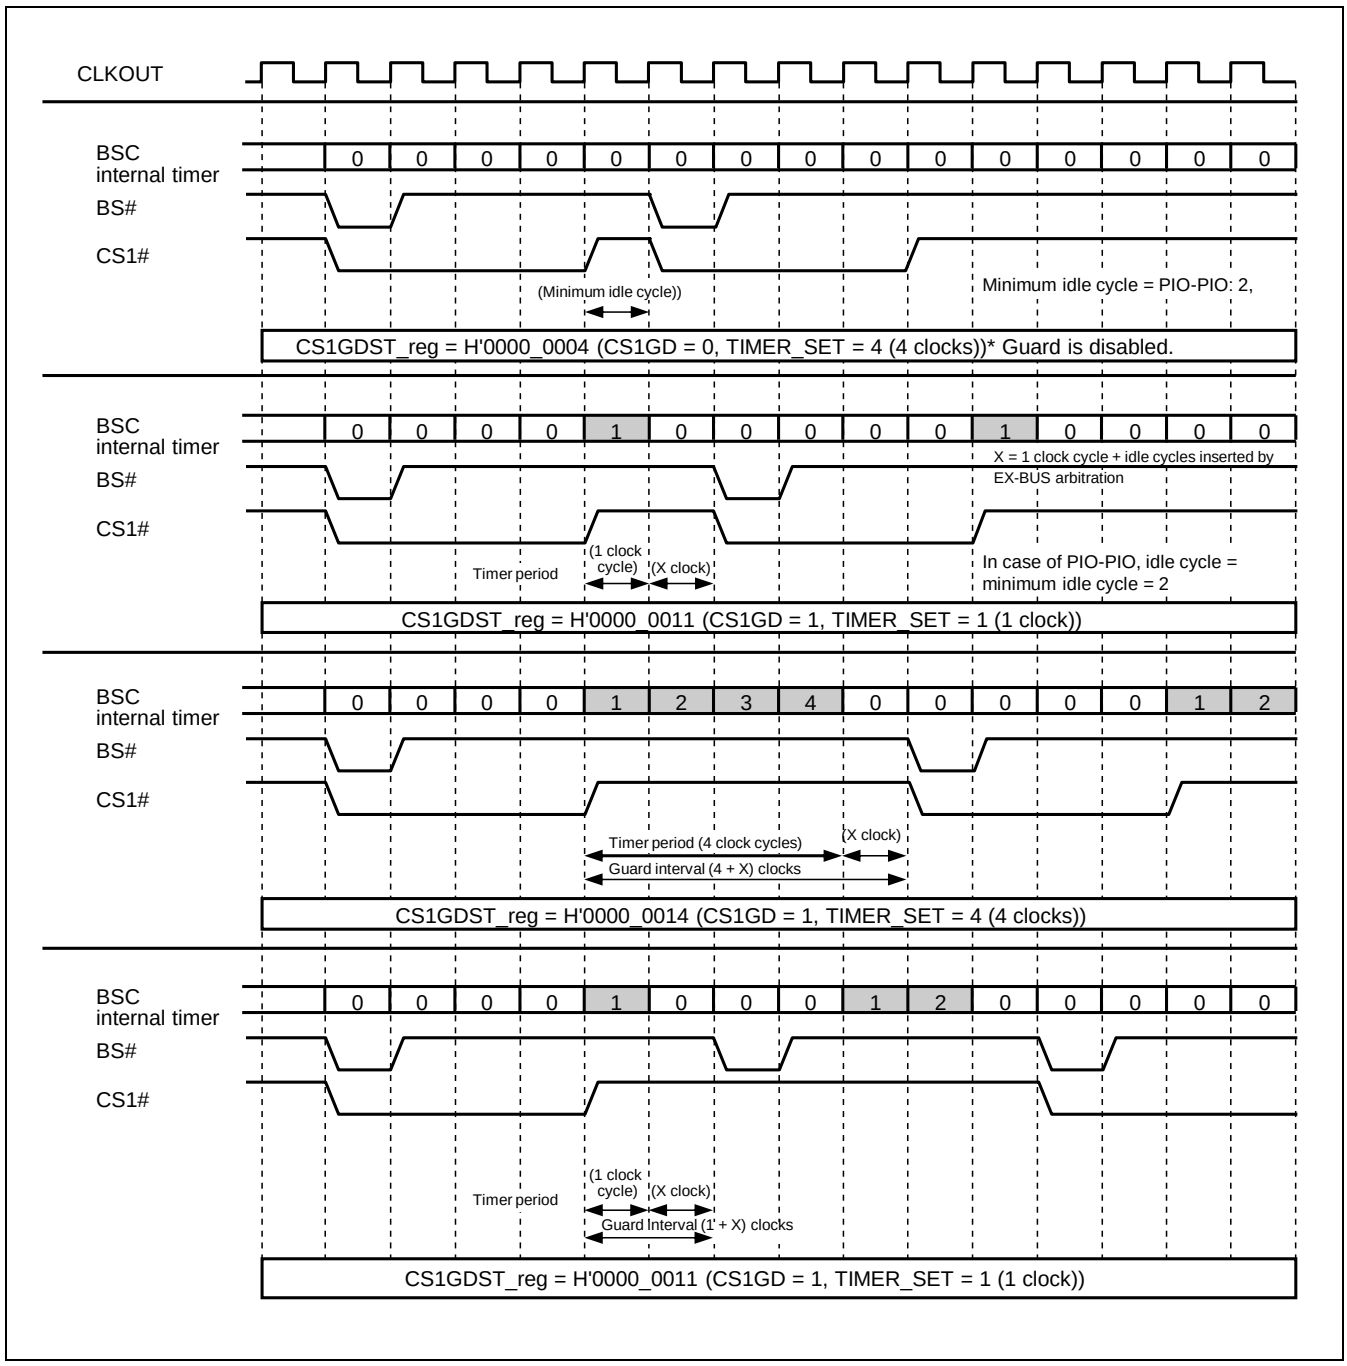

Figure 25.8 Concept of Guard-Interval Control

25.3.2 CPU (AXI Bus) → Burst ROM Interface

For area 0 on the EX-BUS, the BSC supports a page-mode read burst ROM interface. Switching to the burst ROM interface is performed by CS0CTRL settings. Because burst ROM access operations begin immediately after setting CS0CTRL, values must be pre-assigned to the CS0BTPH and CS0BSTCTL. In CS0BTPH, burst ROM access waveforms can be assigned, such as a first-cycle burst pitch, second and subsequent cycle burst pitches, and CS# signal hold cycles on the RD# signal. A burst access count (burst length) can be assigned to CS0BSTCTL. A burst access count should be assigned according to the component specifications for the actual external ROM that is connected.

In two kinds of exceptional cases, however, the BSC handles access with a burst count less than the specified burst count. The first are those cases where the CPU requests access to fewer data than the specified burst count. In such cases, access is terminated on completion of processing for the number of bytes requested by the CPU, even though the specified burst count has not been reached. The second are those cases where a variable burst address boundary is crossed in the midst of a specified burst count. In such cases, access is terminated immediately before the boundary is crossed, and the burst access is divided up, with the remainder of the access executed in a second round. The reason for this behavior is that the variable address boundaries for burst ROM devices, by which the LBSC must abide, are defined. Table 25.3 shows the LBSC's methodology for breaking off burst access.

Table 25.3 Methodology for Breaking off Bust Access

Burst Count Assigned in CS0BSTCTL	Bus Width	
	8-Bit Bus Width	16-Bit Bus Width
4	Break at a change of A2	Break at a change of A3 (A0 not connected)
8	Break at a change of A3	Break at a change of A4 (A0 not connected)
16	Break at a change of A4	Break at a change of A5* (A0 not connected)
32	Break at a change of A5*	(Setting prohibited)

Note: * Since A5 never changes in the midst of a 32-byte burst operation (a 32-byte boundary), access is not broken off in the case indicated by *, and the specified number of access operations proceed.

As described above, in burst ROM access, the LBSC performs a maximum of 32-byte access to accommodate CPU cache fill while performing access breakup. However, because this operation involves access on 32-byte boundaries, for setting a burst ROM device, the user should specify wrap-around settings instead of continuous burst operations.

Depending on the mode of burst ROM connection, burst operations can also be accommodated in the synchronous burst mode. When using the LBSC in synchronous burst mode, the user should not receive the Wait signals that are output by the burst ROM. Instead, a first-word data output latency should be assigned to the configuration register of the burst ROM, and CS0BTPH should be set as the pitch for the first word and this latency. For the second and subsequent words, a pitch count of 2 should be assigned to both the configuration register of the burst ROM and CS0BTPH. Subject to the AC characteristics of the burst ROM and given frequency for the EX-BUS, if a pitch count of 1 is assigned to, data reception timing can lag behind due to the fact that the burst ROM has a data output delay of approximately 13ns. Figure 25.9 shows a basic timing chart for the burst ROM interface.

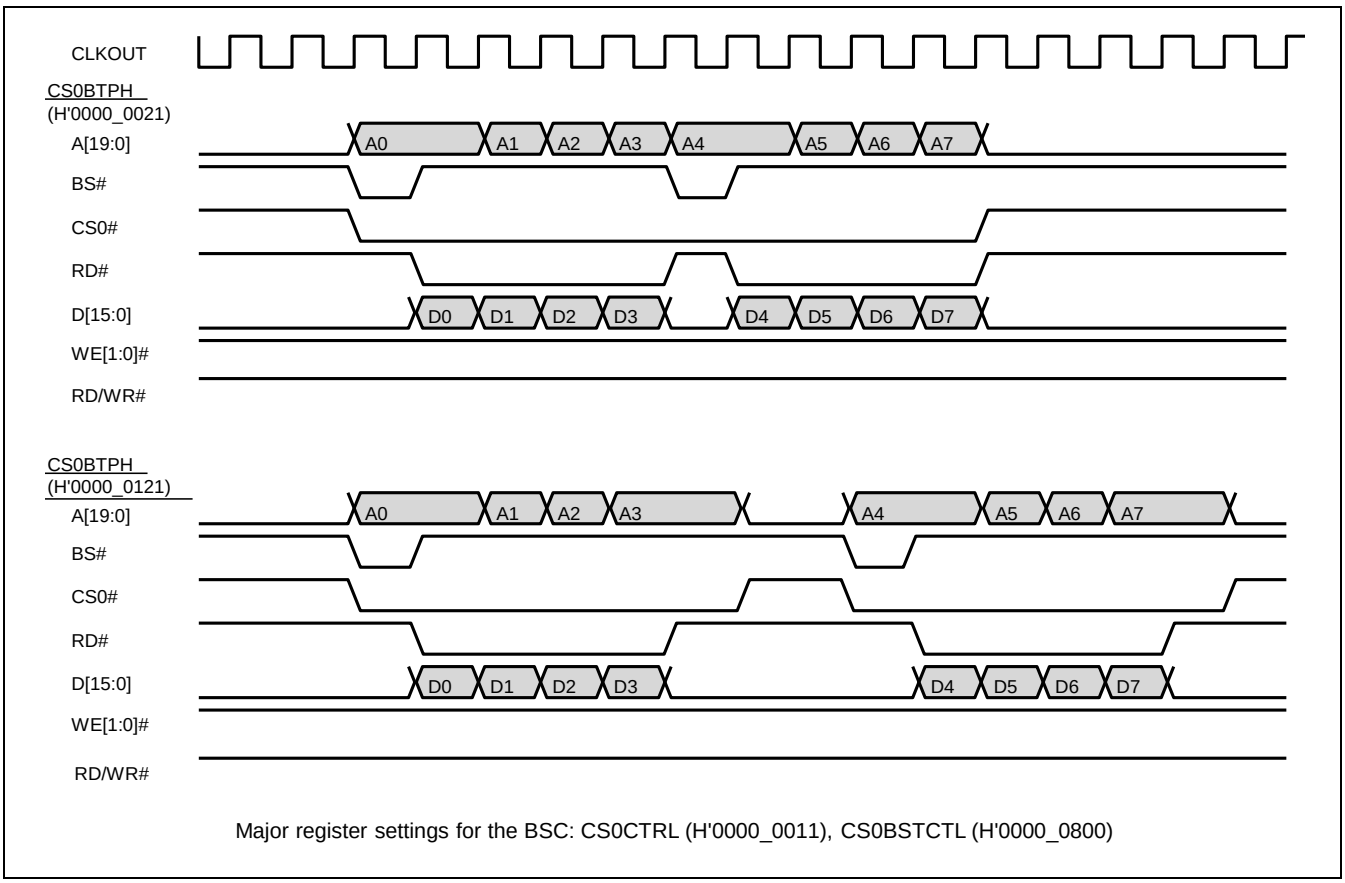

Figure 25.9 Timing Chart for Burst ROM Interface

25.3.3 CPU (AXI Bus) → Byte Control SRAM Interface

With respect to EX-BUS area 1, the LBSC supports byte-control SRAM interface from the CPU (AXI bus). Byte-control SRAM interface is a memory interface in which byte select strobe signal WE# is output in both read and write cycles. Write timing for byte-control SRAM interface is the same as that for SRAM interface. In read access, however, WE# is output at a different timing. In read access, WE# is output for a read byte only. The assertion timing of WE# can be selected with the CS1BRM bit in the CS1CTRL register to be the same as that of CS# or RD#. In default setting, SRAM operating mode is set for each area. Accordingly, along with the setting of assertion timing, byte-control SRAM mode should be set in the registers corresponding to a given area (CS1CTRL).

(1) Byte-control SRAM Interface

- The WE# assertion period can be selected by the CS1BRM bit to be the same as that of CS# or RD#.
- In read access, WE# is asserted only for a valid access byte. (For example, when a byte is read from a device with the byte-control SRAM interface and a bus width of 16 bits, any one of the WE# bits is asserted.)
- The waveform in write access is the same as that for SRAM interface.

(2) Basic Timing Charts

Figure 25.10 shows the basic timing chart for byte-control SRAM interface.

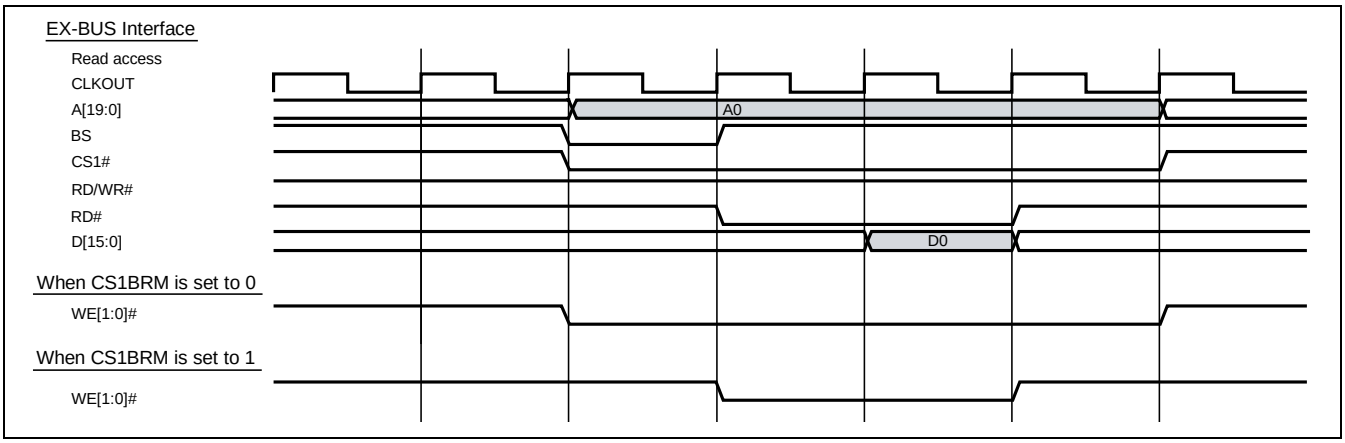

Figure 25.10 Waveforms for Byte-Control SRAM Interface

25.3.4 Wait Timeout

For the detection of timeout in waiting for access to the EX-BUS, the BSC monitors the states of the EX_WAIT0 signals* from external devices. When an external device is waiting for more than a certain length of time, this is detected as an EX-BUS wait timeout error. The error is reflected in a register within the BSC, and forces the termination of access to the EX-BUS interface.

The value of the timeout counter is specified in a total of 32 bits, consisting of the EXW_TOBCNT bits in the EX-TIME wait timeout detection base counter register (EXBCT) and the EXW_TOCNT bits in the EX-BUS wait timeout detection counter register (EXTCT). EXW_TOBCNT is a 20-bit counter that operates at the EX-BUS operating frequency (CLKOUT). EXW_TOCNT is a 12-bit counter that counts up by one every time the EXW_TOBCNT bits overflow.

Writing 0s to all of the bits specifies the maximum time until overflow. The required detection time depends on the EX-BUS operating frequency as defined in the following formula.

Detection time in ns = period in ns at EX-BUS operating frequency × {EXW_TOCNT, EXW_TOBCNT}

25.4 Usage Notes

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

Keep the following notes in mind when using this LBSC.

25.4.1 Pin Multiplexing

When starting this LSI, be sure to set multiplexed pins appropriately using the LSI pin multiplexing set register.

Also, make pull-up resistor settings using the LSI pin pull-up control registers.

For details on the specific set values, refer to section 8, Pin Function Controller (PFC).

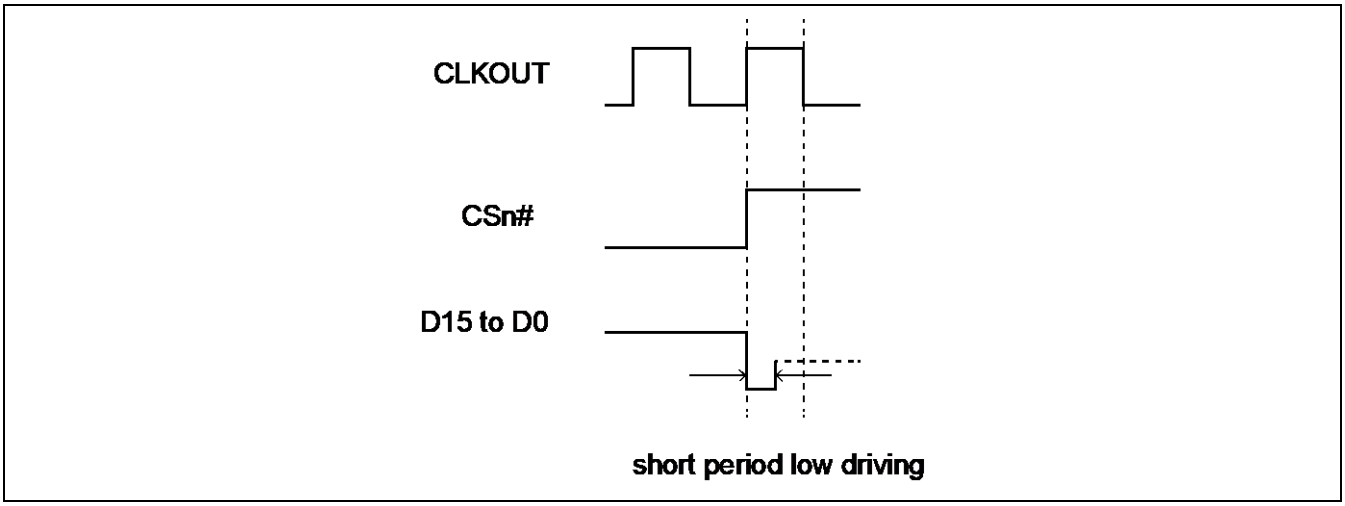

Figure 25.11

When using QSPI or HSCIF booting by mode pins setting (MD [3:1]), the area 0 beginning 256-kByte space (H'00_0000 0000 to H'00_0003_FFFF) cannot be accessed from the LBSC even after booting.

26. External Bus Controller for LPDDR4/DDR3L SDRAM (DBSC4)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

26.1 Overview

The external bus controller (DBSC4) supports DDR3L SDRAM and LPDDR4 SDRAM. The DBSC4 contains AXI bus controller, cache, a scheduler, device controller, and a register controller. The AXI bus controller receives requests from multiple AXI buses and performs protocol conversion to suit the bus in the DBSC4. The scheduler makes schedules for the requests stored in the cache block. The device controller converts requests that follow the internal bus protocol to command-level requests, and reads from and writes to the SDRAM in response to commands. The register controller reads from and writes to the control registers that set the operations of the DBSC4.

The DBSC4 enables the maximum use of SDRAM bus bandwidth using the following functions:

(1) Multibank operation that improves the page hit rate.
(2) Preceding execution of the bank activate commands for subsequent requests.

26.1.1 Definition of Terms and Symbols

The following terms and symbols are used throughout the DBSC4 specifications:

- In some cases, DDR3L/ LPDDR4 SDRAM is abbreviated as SDRAM.
- ceil(x) is the smallest integer which is greater than or equal to real number x.
- floor(x) is the greatest integer which is less than or equal to real number x.

RZ/G2H has the following two modes.

(1) Memory area swap mode.

(2) Memory area non-swap mode.

These modes are abbreviated as follows in this section.

(1) RZ/G2H: Memory area swap and non-swap mode. Both modes are common.

(2) RZ/G2H (Swap): Memory area swap mode.

(3) RZ/G2H (Non-swap): Memory area non-swap mode.

Table 26.1 DBSC4 Functions

Item	Function
Multibank supported	Supports 8-bank multibank operation per ranks per channels
Number of banks	Supports eight banks
External bus width	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]: 32 bits x 2 channels [RZ/G2N]: 32 bits x 1 channel [RZ/G2E]: 32 bits x 1 channel, 16-bit bus width x 1channel
Preceding activate functions	Determines the content of subsequent requests in a request queue and performs preceding activate processing for the bank to be accessed during an empty command cycle upon page-miss.
Operating modes	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]: Burst length: LPDDR4:16 (fixed) Burst type: Sequential (fixed) [RZ/G2E]: Burst length: DDR3L:8 (fixed) Burst type: Sequential (fixed) DLL-off mode for the DDR3L-SDRAM is not supported.
Power-down mode	Supports self-refresh mode and precharged power-down mode. Combined use of the power-down mode and address translation function allows the SDRAM partial array self-refresh function to be effectively implemented.
Address order (address translation function)	The addresses arranged in descending order are: rank address, row address, bank address, and column address. (The 3-bit bank address can be divided into two parts. One can be placed in the upper half of the row address and the other in the lower half. Register settings can be used to determine how to divide the bank address.)

Item	Function
Timing setting	The following timing settings can be specified: CAS latency, CAS write latency, ACT to READ or ACT to WRITE minimum period, PRE period, ACT to ACT or ACT to REF minimum period, ACT to PRE minimum period, ACT(A) to ACT(B) minimum period, four active window minimum period, READ to PRE minimum period, write recovery period, READ to WRITE minimum period, WRITE to READ minimum period, REF to ACT or REF to REF (all banks) minimum period, minimum period over which CKE is held high, and minimum period over which CKE is held low Only 0 is supported for additive latency (AL).
Refreshes	Average interval and the maximum pulling-in count are set by the register. If an empty cycle for request is found, preceding refresh can be performed.
ZQ calibration operation	Supports the automatic ZQCS/ZQCL issuing function. After auto-refresh, the ZQCS/ZQCL command is issued to DDR3L-SDRAM. The frequency of issuing ZQCS/ZQCL can be specified through register settings in units of the auto-refresh count. The intervals between auto-refresh and ZQCS/ZQCL and between ZQCS/ZQCL and auto-refresh can also be specified through register settings.
PHY interface	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]: 32-bit bus width x 2channels [RZ/G2N]: 32-bit bus width x 1channel [RZ/G2E]: 32-bit bus width x 1channel, 16-bit bus width x 1channel
Memory to be connected	[RZ/G2H]: LPDDR4-SDRAM compliant with JEDEC JESD209-4A. (Supports memory with sizes from 4 Gbits to 16 Gbits. One LPDDR4-SDRAM can be connected to one channel) [RZ/G2M V1.3, RZ/G2M V3.0]: LPDDR4-SDRAM compliant with JEDEC JESD209-4A. (Supports memory with sizes from 4 Gbits to 16 Gbits. One LPDDR4-SDRAM can be connected to one channel) 2 ranks/channel support [RZ/G2N]: LPDDR4-SDRAM compliant with JEDEC JESD209-4A. (Supports memory with sizes from 4 Gbits to 16 Gbits. One LPDDR4-SDRAM can be connected to one channel) [RZ/G2E]: DDR3L-SDRAM compliant with JEDEC JESD79-3-1A.01. (In the case of SDRAM with a data bus width of 8 bits, memory with sizes from 512 Mbits to 4 Gbits size are supported and four DDR3L- SDRAM can be connected to one channel. In the case of SDRAM with a data bus width of 16 bits, memory with sizes from 512 Mbits to 8 Gbits is supported and one or two DDR3L- SDRAM can be connected to one channel. Note that SDRAM with a data bus width of 4 bits is not supported.) 1 rank/channel support.
DBI (Data Bus Inversion)	LPDDR4 function support.
Cache	[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0]: 64KB x 2 [RZ/G2N, RZ/G2E]: 64KB x 1

27.2.1 Address of System RAM

Address of System RAM is shown in the table below.

Table 27.1 Address of System RAM

Address	Notice
RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, and RZ/G2N H'E630_0000 to H'E635_FFFF	H'E633_0000 to H'E635_FFFF is shadow RAM area of H'E63A_0000 to H'E63C_FFFF.
RZ/G2E H'E630_0000 to H'E631_FFFF	There is no shadow RAM area.

Note: Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

28. 3D Graphics Engine (3DGE)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

28.1 Overview

The PowerVR Series6XT Rogue architecture builds on the Series6 architecture that consumes the lowest memory bandwidth in the industry while delivering the best performance per mm2 and per mW. The Series6XT architecture features market-leading scalability, supporting implementations up to eight compute clusters that scale linearly in GFLOPS and texturing rates. With OpenGL ES support across the range, Series6XT provides among the highest performance OpenGL ES GPUs in the industry.

The PowerVR Series7XE family is a range of ultra-efficient, highly-featured GPUs. The Series7XE range enables the latest games and apps on devices which require high quality UIs at optimum price points.

The PowerVR Series8XE family of GPUs drives cost reduction in entry-level and mass market devices optimized to deliver the best user experience in a limited silicon area budget. The GPU family enables low-cost devices to benefit from the latest apps by supporting OpenGL ES.

- RZ/G2H, RZ/G2M V1.3 and RZ/G2M V3.0 integrate PowerVR GX6650 and GX6250 in a family of PowerVR Series6XT GPU cores respectively
- PowerVR GX6250 and GX6650 are fully-featured implementations with two and six shading clusters respectively.
- System Level Cache provides caching of all types of workload data. 128 KB capacity.
- RZ/G2N integrates PowerVR GE7800 in a family of PowerVR Series7XE GPU cores.
- System Level Cache provides cashing of all types of workload data. 64 KB capacity.
- RZ/G2E integrates PowerVR GE8300 in a family of PowerVR Series8XE GPU cores.
- System Level Cache provides cashing of all types of workload data. 64 KB capacity.
- OpenGL ES 3.1 supported

28.1.1 Features

- Tile-based deferred rendering architecture with concurrent processing of multiple tiles
- Multi-threaded Unified Shading Cluster (USC) engine incorporating pixel shader, vertex shader, and GP-GPU
- (compute shader) functionality
- USC incorporates an ALU architecture with high SIMD efficiency
- Fully virtualized memory addressing, supporting unified memory architecture
- Fine-grained task switching, workload balancing and power management
- Advanced DMA driven operation for minimum host CPU interaction
- Dedicated texture load DMA engine and basic ROP engine
- Programmable high quality image anti-aliasing
- Lossless texture and parameter data compression
- Dedicated processor for RogueXT/XE core firmware execution

28.1.2 Block Diagram

The PowerVR GX6650 has six shading clusters. The six shading clusters and other processing blocks are divided into five power-domains (RGX-A, RGX-B, RGX-C, RGX-D and RGX-E). Figure 28.1 shows the block diagram of the PowerVR GX6650 and the corresponding power-domains.

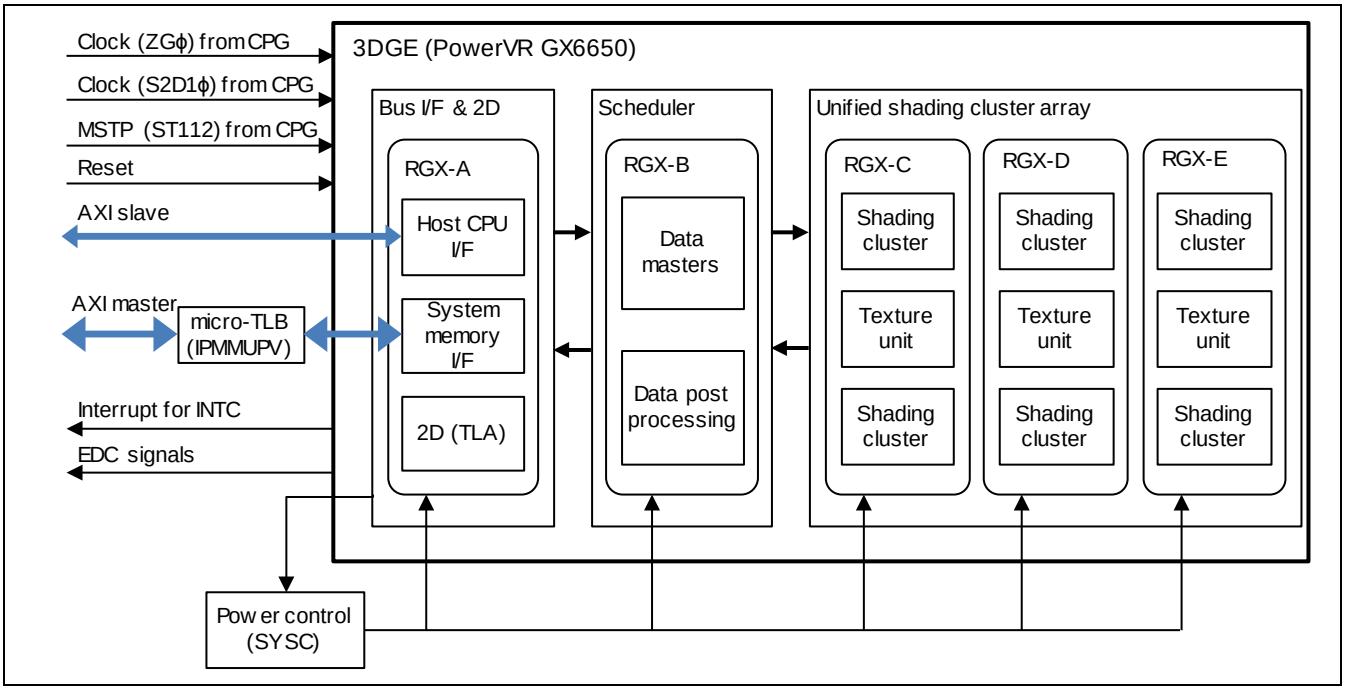

Figure 28.1 Block Diagram of PowerVR GX6650

The PowerVR GX6250 has two shading clusters. The two shading clusters and other processing blocks are divided into two power-domains (RGX-A and RGX-B). Figure 28.2 shows the block diagram of the PowerVR GX6250 and the corresponding power-domains.

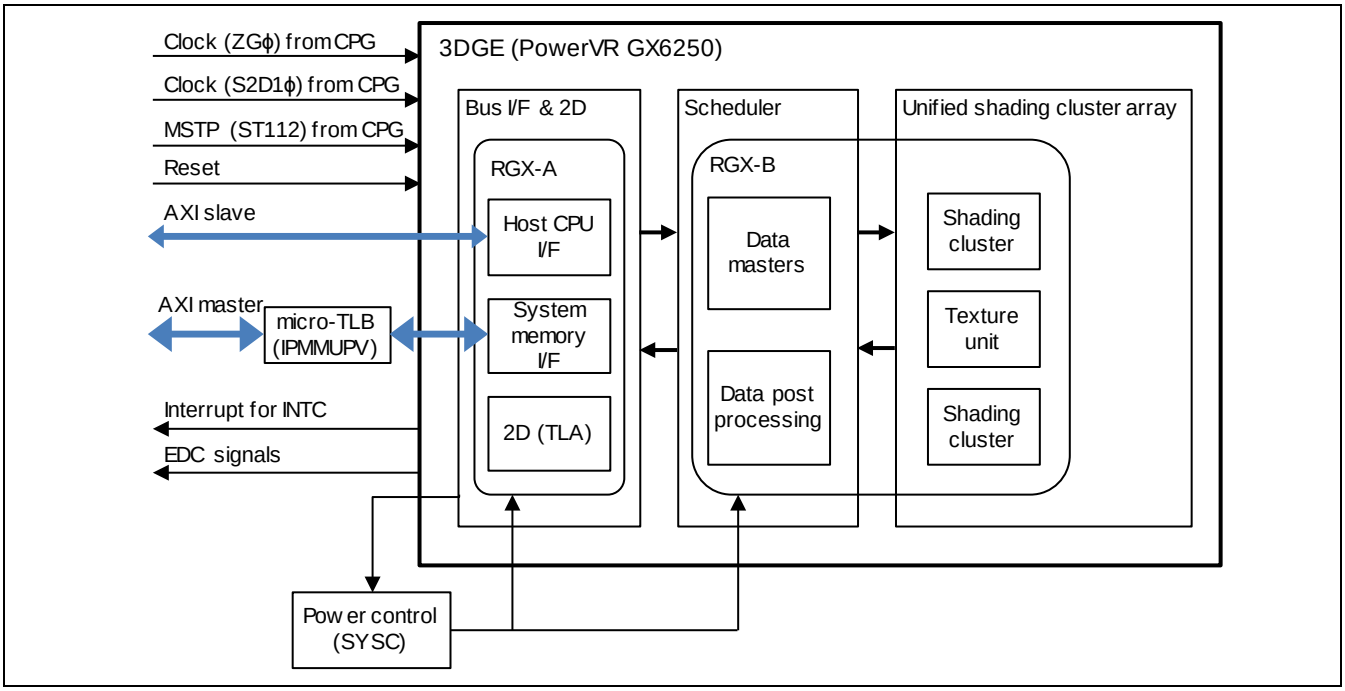

Figure 28.2 Block Diagram of PowerVR GX6250

The PowerVR GE7800 has a single shading cluster. Figure 28.3 shows the block diagram of the PowerVR GE7800 and the corresponding power-domains (RGX-A and RGX-B).

29. CSI2

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

29.1 Overview

The CSI2 is an MIPI CSI-2 (Camera Serial Interface 2) receiver module.

It is supported MIPI CSI-2 V1.1 and MIPI D-PHY V1.1.

It includes the PHY and LINK modules. The PHY module incorporates a DPHY

- The RZ/G2H has two CSI2 set: one 4-lane CSI2, one 2-lane CSI2.
- The RZ/G2M V1.3 has two CSI2 sets: one 4-lane CSI2, one 2-lane CSI2.
- The RZ/G2M V3.0 has two CSI2 sets: one 4-lane CSI2, one 2-lane CSI2.
- The RZ/G2N has two CSI2 set: one 4-lane CSI2, one 2-lane CSI2.
- The RZ/G2E has one CSI2 set: one 2-lane CSI2.

The received signals are input to the PHY modules; the LINK modules receive the byte data output from the PHY modules; and the PHY modules extract the image data (embedded data included), data type, and channel information before outputting the data to the following VIN module. Here, the LINK modules generate the vertical sync signals (VD), field signals (FLD), horizontal sync signals (HD, EBD_HD), data enable signals (PE), byte enable signals (PEB) for each channel, and outputs them to the VIN module.

The LINK modules have the APB interface but the PHY modules have no bus interfaces. The LINK registers are used to control the PHY modules and monitor the state of the PHY modules.

Note: CSI2 module name of RZ/G2E is CSI40(CSI4LNK0), but the module is 2-lane CSI2.

29.1.1 Features

The CSI2 module has the following features.

(1) From 80-Mbps to 1.5-Gbps transfer rate of MIPI CSI-2*1 (refer to section 29.3.1)
(2) ECC 1-bit error correction and 2-bit or more error detection of a packet header (refer to section 29.3.2)
(3) CRC error detection of a payload data part (refer to section 29.3.3)
(4) Generation of VD (vertical sync), HD (horizontal sync), and FLD (field) signals (refer to section 29.3.4)
(5) Four-channel output (refer to section 29.3.5)
(6) Interrupts (refer to section 29.3.6)
(7) Lane swapping (refer to section 29.3.7)
(8) Initial setting of PHY through register setting (refer to section 29.3.8)
(9) PHY control and monitoring through register setting (refer to section 29.3.9)
(10) Interrupt generation by ULP status, and reception error status (refer to section 29.3.10)
(11) Support data type (refer to section 30 Video Input Module (VIN)

Notes: 1. Up to 1.1-Gbps transfer rate of MIPI CSI-2 in RZ/G2E.

Notes: 1. Only 1 can be written to clear the flag; bits 27, 4, and 3 are read-only bits and any value cannot be written to.
2. Only 1 can be written to clear the flag.
3. No supported except for 32 bits Access Size.
4. Initial value will differ for each product. For detail, refer to Register Description.

29.1.5 Connected Module

Table 29.3 Connected Module

Connected Modules	Function of the Connected Modules
VIN	Output of image data
CPG	Output and control of the clock signals, execution of software reset
INTC*1	Interrupt controller

Notes: 1. Interrupt channel correspondence is as follow:
For details about interrupt channel, refer to chapter 12A Interrupt Controller (INTC-AP).

CSI2 ch	Interrupt ch
CSI20 (CSI2LNK0)	CSI2.ch0
CSI40 (CSI4LNK0)	CSI2.ch2

29.2 Register Description

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.

R: Read-only. The write value should always be 0.

—/WB: Write-only. The read value is undefined.

29.2.1 Control Timing Select Register (TREF)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TREF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TREF	B’1	R/W	Register value reflection timing select 1: Immediately (Don’t change from initial value)

29.2.2 Software Reset Register (SRST)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SRST	B’0	R/W	Software reset control 0: Normal 1: Reset This bit resets the control circuit in the CSI2 block. To reset the circuit, set this bit to 1. Be sure to set this bit to 0 to cancel a reset. A software reset does not initialize the CSI2 registers.

Note: The settings of this register are applied the instant the register is set (immediate reflection).

29.2.3 PHY Operation Control Register (PHYCNT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHUTDOWNZ	RSTZ
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ENABLECLK	ENABLE_3	ENABLE_2	ENABLE_1	ENABLE_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	SHUTDOWNZ	B'0	R/W	Shuts down the PHY when this bit is 0.
16	RSTZ	B'0	R/W	Initializes the PHY when this bit is 0.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ENABLECLK	B'0	R/W	Clock lane operation enable 0: Disables operation. 1: Enables operation. When any of the ENABLE_3 to ENABLE_0 bits are set to 1, be sure to set the ENABLECLK bit to 1.
3	ENABLE_3	B'0	R/W	Data lane 3 operation enable [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: Disables operation. 1: Enables operation. Note: When 2-lane PHY is connected, this setting has no effect.
2	ENABLE_2	B'0	R/W	Data lane 2 operation enable [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] 0: Disables operation. 1: Enables operation. Note: When 2-lane PHY is connected, this setting has no effect.
1	ENABLE_1	B'0	R/W	Data lane 1 operation enable 0: Disables operation. 1: Enables operation.
0	ENABLE_0	B'0	R/W	Data lane 0 operation enable [RZ/G2M V1.3, RZ/G2M V3.0] 0: Disables operation. 1: Enables operation.
				Data lane 0 operation enable [RZ/G2H, RZ/G2N] 0: Disables operation. 1: Enables operation. This bit must set to 1.

Note: The settings of this register are applied the instant the register is set (immediate reflection). Set this register while data input is suspended (a sensor is halted); never change the settings of this register during operation.

Note: ENABLE_* signal don't must be set 3 lanes. For example, ENABLE_0, 1, 2 is set to 1'b1 and ENABLE_3 is set to 1'b0.

29.2.4 Checksum Control Register (CHKSUM)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECC_EN	CRC_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ECC_EN	B'1	R/W	ECC process control 0: Disabled 1: Enabled This bit controls ECC process of the packet header (PH) for Low Level Protocol (LLP). Set this bit to 1 to use ECC. When set to 0, data is always processed assuming it has no errors and thus no errors are corrected.
0	CRC_EN	B'1	R/W	CRC checksum process control 0: Disabled 1: Enabled This bit controls checksum process of the long packet data for Low Level Protocol (LLP). Set this bit to 1 to use CRC checksum. When set to 0, data is always processed assuming it has no errors.

Note: The settings of this register are applied the instant the register is set (immediate reflection). Set this register while data input is suspended (a sensor is halted); never change the settings of this register during operation.

29.2.5 Channel Data Type Select Register (VCDT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VCDT2_EN	—	—	—	—	—	SEL_VC2		—	SEL_DT2_ON	SEL_DT2

R/W:	R/W	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	VCDT2_EN	B’1	R/W	Channel 1 enable 0: Disabled 1: Enabled This bit enables or disables channel 1. When set to 0, VD[1] and FLD[1] are fixed to low and TAG = 1 is not generated.
30 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	SEL_VC2	B’01	R/W	Channel 1 select channel [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] H’0 to H’3 These bits specify the virtual channels for channel 1 to capture. Channels can be selected from among four channels from H0 to H3. Channel 1 is output when the value of this register matches the received virtual channel.
				Channel 1 select channel [RZ/G2E] H’0 to H’1 These bits specify the virtual channels for channel 1 to capture. Channels can be selected from among four channels from H0 to H1. Channel 1 is output when the value of this register matches the received virtual channel.
23	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	SEL_DT2_ON	B’0	R/W	Channel 1 select data type enable 0: Disabled 1: Enabled This bit enables or disables data type match function using SEL_DT2. When set to 0, channel 1 is output even when the setting of SEL_DT2 does not match the received data type as long as it matches the virtual channel. When set to 1, channel 1 is output only when the setting of SEL_DT2 matches the received data type and the virtual channel.

Bit	Bit Name	Initial Value	R/W	Description
21 to 16	SEL_DT2	H'1E	R/W	Channel 1 select data type H'00 to H'3F These bits specify the data type for channel 1 to capture. The CSI2 LINK module outputs the received payload data as it is regardless of the data type when SEL_DT2_ON is set to 0 whereas there are some restrictions on the corresponding data type (such as color format) for the following VIN module.
15	VCDT_EN	B’1	R/W	Channel 0 enable 0: Disabled 1: Enabled This bit enables or disables channel 0. When set to 0, VD[0] and FLD[0] are fixed to low and TAG = 0 is not generated.
14 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SEL_VC	B’00	R/W	Channel 0 select channel [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] H'0 to H'3 These bits specify the virtual channels for channel 0 to capture. Channels can be selected from among four channels from H'0 to H'3. Channel 0 is output when the value of this register matches the received virtual channel.
				Channel 0 select channel [RZ/G2E] H'0 to H'1 These bits specify the virtual channels for channel 0 to capture. Channels can be selected from among four channels from H'0 to H'1. Channel 0 is output when the value of this register matches the received virtual channel.
7	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	SEL_DT_ON	B’0	R/W	Channel 0 select data type enable 0: Disabled 1: Enabled This bit enables or disables data type match function using SEL_DT. When set to 0, channel 0 is output even when the setting of SEL_DT does not match the received data type as long as it matches the virtual channel. When set to 1, channel 0 is output only when the setting of SEL_DT matches the received data type and the virtual channel.
5 to 0	SEL_DT	H'1E	R/W	Channel 0 select data type [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E] H'00 to H'3F These bits specify the data type for channel 0 to capture. The CSI2 LINK module outputs the received payload data as it is regardless of the data type when SEL_DT_ON is set to 0 whereas there are some restrictions on the corresponding data type (such as color format) for the following VIN module.

Notes: 1. This register should be set during initial sequence.
2. In the table above, “virtual channel” refers to a channel through which data flows from the camera and “channel” refers to an output channel of the CSI2.

29.2.6 Channel Data Type Select Register 2 (VCDT2)

31	VCDT4_EN	B’1	R/W	Channel 3 enable 0: Disabled 1: Enabled This bit enables or disables channel 3. When set to 0, VD[3] and FLD[3] are fixed to low and TAG = 3 is not generated.
30 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25, 24	SEL_VC4	H'3	R/W	Channel 3 select channel H'0 to H'3 These bits specify the virtual channels for channel 3 to capture. Channels can be selected from among four channels from H'0 to H'3. Channel 3 is output when the value of this register matches the received virtual channel.
23	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	SEL_DT4_ON	B’0	R/W	Channel 3 select data type enable 0: Disabled 1: Enabled This bit enables or disables data type match function using SEL_DT4. When set to 0, channel 3 is output even when the setting of SEL_DT4 does not match the received data type as long as it matches the virtual channel. When set to 1, channel 3 is output only when the setting of SEL_DT4 matches the received data type and the virtual channel.
21 to 16	SEL_DT4	H'1E	R/W	Channel 3 select data type H'00 to H'3F These bits specify the data type for channel 3 to capture. The CSI2 LINK module outputs the received payload data as it is regardless of the data type when SEL_DT4_ON is set to 0 whereas there are some restrictions on the corresponding data type (such as color format) for the following VIN module.

Bit	Bit Name	Initial Value	R/W	Description
15	VCDT3_EN	B'1	R/W	Channel 2 enable 0: Disabled 1: Enabled This bit enables or disables channel 2. When set to 0, VD[2] and FLD[2] are fixed to low and TAG = 2 is not generated.
14 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SEL_VC3	H'2	R/W	Channel 2 select channel H'0 to H'3 These bits specify the virtual channels for channel 2 to capture. Channels can be selected from among four channels from H'0 to H'3. Channel 2 is output when the value of this register matches the received virtual channel.
7	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	SEL_DT3_ ON	B'0	R/W	Channel 2 select data type enable 0: Disabled 1: Enabled This bit enables or disables data type match function using SEL_DT3. When set to 0, channel 2 is output even when the setting of SEL_DT3 does not match the received data type as long as it matches the virtual channel. When set to 1, channel 2 is output only when the setting of SEL_DT3 matches the received data type and the virtual channel.
5 to 0	SEL_DT3	H'1E	R/W	Channel 2 select data type H'00 to H'3F These bits specify the data type for channel 2 to capture. The CSI2 LINK module outputs the received payload data as it is regardless of the data type when SEL_DT3_ON is set to 0 whereas there are some restrictions on the corresponding data type (such as color format) for the following VIN module.

Notes: 1. This register should be set during initial sequence.
2. In the table above, "virtual channel" refers to a channel through which data flows from the camera and "channel" refers to an output channel of the CSI2.

29.2.7 Frame Data Type Select Register (FRDT)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	FLD_NUM	All 0	R/W	Even field number setting These bits specify the value for detecting the even field of the interlaced image. For detecting the even field, the WC value (16 bits) of the Frame Start packet is referred to. When the WC value matches the setting of these bits, the field is detected as the even field. During the frame period, the CSIR_FLD signal stays High.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	FLD_DET_SEL	B’00	R/W	Even field detection condition select b’00: The field is detected as the even field when FLD_NUM matches WC. b’01: The field is detected as the even field when FLD_NUM[0] matches WC[0]. b’10: The field is detected as the even field when FLD_NUM[0] matches WC[8]. b’11: Setting is prohibited.
3	FLD_EN4	B’0	R/W	Channel 3 even field detection control This bit turns on or off even field detection of channel 3. To use the detection feature, set 1 to this bit. It should be set to 1’b0 when input image is progressive sequence.
2	FLD_EN3	B’0	R/W	Channel 2 even field detection control This bit turns on or off even field detection of channel 2. To use the detection feature, set 1 to this bit. It should be set to 1’b0 when input image is progressive sequence.
1	FLD_EN2	B’0	R/W	Channel 1 even field detection control This bit turns on or off even field detection of channel 1. To use the detection feature, set 1 to this bit. It should be set to 1’b0 when input image is progressive sequence.

Bit	Bit Name	Initial Value	R/W	Description
0	FLD_EN	B'0	R/W	Channel 0 even field detection control This bit turns on or off even field detection of channel 0. To use the detection feature, set 1 to this bit. It should be set to 1'b0 when input image is progressive sequence.

Note: This register should be set during initial sequence.

29.2.9 Automatic Standby Control Register (ASTBY)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	VD_MSK_CYCLE						—	—	VD_MSK_EN	AUTO_STANDBY_EN				
Initial value:	0	0	1	1	1	1	1	1	0	0	1	0	0	0	0	1
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	VD_MSK_CYCLE	H'3F	R/W	VD masking cycle These bits specify the period to mask VD when a frame start error (FS is received and another FS is received before FE is received) occurs. When a frame start error occurs, the VD signal does not go low (Vsync is not generated); VD masking function generates the period for which VD = low. VD masking period = 4 * VD_MSK_CYCLE * input clock. (about input clock, refer to 29.3.14) [Max value] VD masking period should be smaller than period from Short Packet (Frame start) of EOT to Long Packet of SOT. [Min Value] 5 or more (VD masking period is 20 * input clock).
7, 6	—	B'00	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5	VD_MSK_EN	B'1	R/W	VD masking enable 0: Disables masking VD. 1: Enables masking VD. This bit enables or disables VD masking function when a frame start error occurs. When this bit is set to enable the function, VD are masked for the period specified with the VD_MSK_CYCLE bits.
4 to 0	AUTO_ STANDBY_ EN	H'01	R/W	Automatic standby control 0: Does not initialize VD or FLD. 1: Initializes VD and FLD [0]: ECC 2-bit error [1]: ECC 1-bit error on receiving FS [2]: ECC 1-bit error on receiving FE [3]: ECC 1-bit error on receiving data other than FS or FE [4]: CRC error These bits control initialization of VD and FLD when an error occurs. To initialize the signals, set 1 to these bits.

29.2.10 Long Data Type Setting Register 0 (LNGDT0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

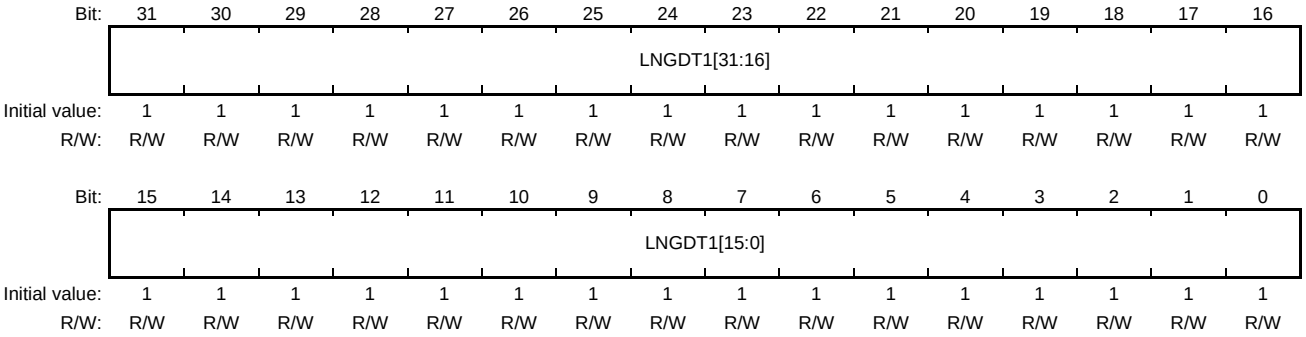
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LNGDT0[31:16]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LNGDT0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LNGDT0	H'FFFF_0000	R/W	Long data type setting 0: Short packet 1: Long packet This register is combined with LNGDT1 register as in LNGDT = {LNGDT1, LNGDT0}. When LNGDT[received DT[5:0]] is 1, data is determined as a long packet and it is determined as a short packet when 0. According to the MIPI standard, DT = H'00 to H'0F is defined as a short packet and DT = H'10 to H'3F is defined as a long packet; to satisfy these conditions, the initial values of LNGDT are 0 in bits 0 to 15 and 1 in bits 16 to 63.

29.2.11 Long Data Type Setting Register 1 (LNGDT1)

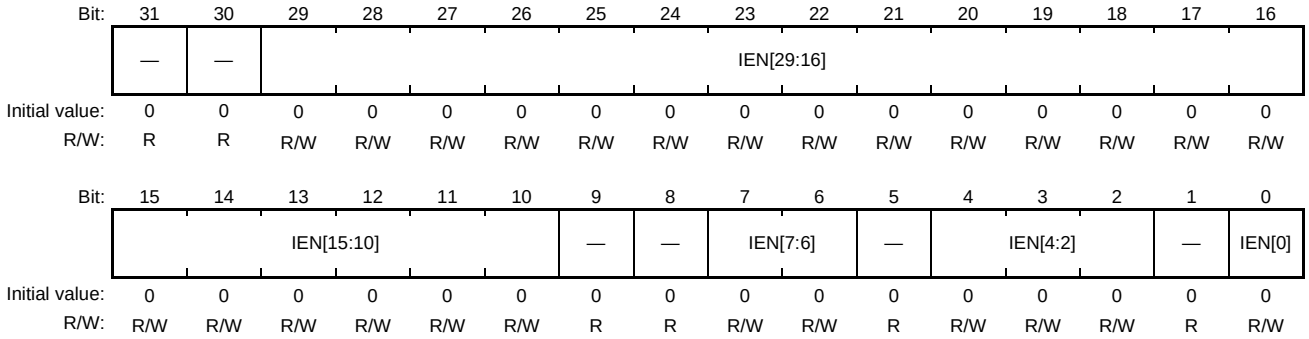
RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	LNGDT1	H'FFFF_FFFF	R/W	Long data type setting 1 0: Short packet 1: Long packet These bits set the long packet or short packet as the data type (assigns H'3F to H'20).

29.2.12 Interrupt Enable Register (INTEN)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	B'00	R	Reserved These bits are always read as 0. The write value should always be 0.
29	IEN[29]	B'0	R/W	Interrupt 29 (INT_EBD_CH0) enable 0: Disables the interrupt. 1: Enables the interrupt.
28	IEN[28]	B'0	R/W	Interrupt 28 (INT_LESS_THAN_WC) enable 0: Disables the interrupt. 1: Enables the interrupt.
27	IEN[27]	B'0	R/W	Interrupt 27 (INT_AFIFO_OF) enable 0: Disables the interrupt. 1: Enables the interrupt.
26	IEN[26]	B'0	R/W	Interrupt 26 (INT_VD4_START) enable 0: Disables the interrupt. 1: Enables the interrupt.
25	IEN[25]	B'0	R/W	Interrupt 25 (INT_VD4_END) enable 0: Disables the interrupt. 1: Enables the interrupt.

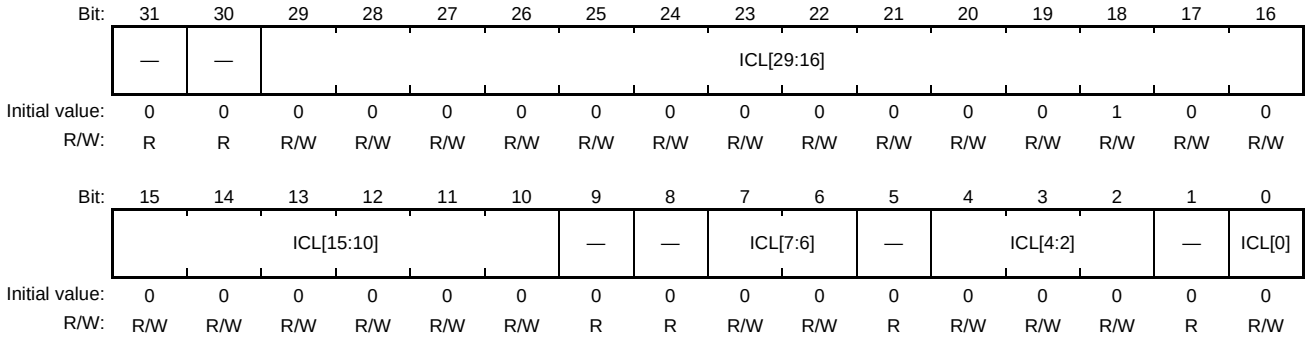
14	IEN[14]	B'0	R/W	Interrupt 14 (INT_HD_WC_ZERO) enable 0: Disables the interrupt. 1: Enables the interrupt.
13	IEN[13]	B'0	R/W	Interrupt 13 (INT_FRM_SEQ_ERR1) enable 0: Disables the interrupt. 1: Enables the interrupt.
12	IEN[12]	B'0	R/W	Interrupt 12 (INT_FRM_SEQ_ERR0) enable 0: Disables the interrupt. 1: Enables the interrupt.
11	IEN[11]	B'0	R/W	Interrupt 11 (INT_ECC_ERR) enable 0: Disables the interrupt. 1: Enables the interrupt.
10	IEN[10]	B'0	R/W	Interrupt 10 (INT_ECC_CRCT_ERR) enable 0: Disables the interrupt. 1: Enables the interrupt.
9	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
7	IEN[7]	B'0	R/W	Interrupt 7 (INT_ULPS_START) enable 0: Disables the interrupt. 1: Enables the interrupt.
6	IEN[6]	B'0	R/W	Interrupt 6 (INT_ULPS_END) enable 0: Disables the interrupt. 1: Enables the interrupt.
5	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	IEN[4]	B'0	R/W	Interrupt 4 (INT_ERRSOTHS) enable 0: Disables the interrupt. 1: Enables the interrupt.
3	IEN[3]	B'0	R/W	Interrupt 3 (INT_ERRSOTSYNCHS) enable 0: Disables the interrupt. 1: Enables the interrupt.
2	IEN[2]	B'0	R/W	Interrupt 2 (INT_ERRESC) enable 0: Disables the interrupt. 1: Enables the interrupt.
1	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	IEN[0]	B'0	R/W	Interrupt 0 (INT_ERRCONTROL) enable 0: Disables the interrupt. 1: Enables the interrupt.

Notes: 1. The settings of this register are applied the instant the register is set (immediate reflection).
2. Do not change the settings in this register while the CSI2 is operating.

29.2.13 Interrupt Source Mask Register (INTCLOSE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	B’00	R	Reserved These bits are always read as 0. The write value should always be 0.
29	ICL[29]	B’0	R/W	Interrupt 29 (INT_EBD_CH0) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
28	ICL[28]	B’0	R/W	Interrupt 28 (INT_LESS_THAN_WC) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
27	ICL[27]	B’0	R/W	Interrupt 27 (INT_AFIFO_OF) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
26	ICL[26]	B’0	R/W	Interrupt 26 (INT_VD4_START) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
25	ICL[25]	B’0	R/W	Interrupt 25 (INT_VD4_END) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
24	ICL[24]	B’0	R/W	Interrupt 24 (INT_VD3_START) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
23	ICL[23]	B’0	R/W	Interrupt 23 (INT_VD3_END) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
22	ICL[22]	B’0	R/W	Interrupt 22 (INT_VD2_START) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
21	ICL[21]	B’0	R/W	Interrupt 21 (INT_VD2_END) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.

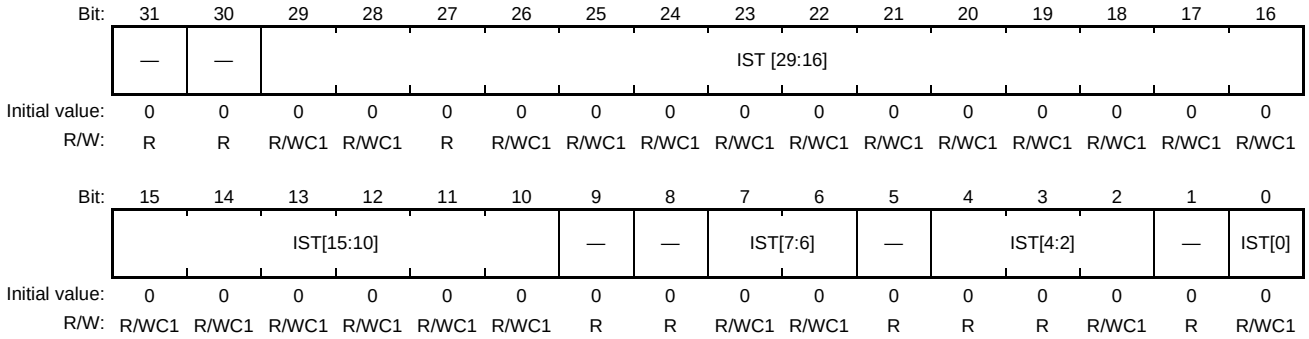
Bit	Bit Name	Initial Value	R/W	Description
20	ICL[20]	B'0	R/W	Interrupt 20 (INT_VD_START) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
19	ICL[19]	B'0	R/W	Interrupt 19 (INT_VD_END) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
18	ICL[18]	B'1	R/W	Interrupt 18 (INT_SHP_STB) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
17	ICL[17]	B'0	R/W	Interrupt 17 (INT_FSFE) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
16	ICL[16]	B'0	R/W	Interrupt 16 (INT_LNP_STB) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
15	ICL[15]	B'0	R/W	Interrupt 15 (INT_CRC_ERR) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
14	ICL[14]	B'0	R/W	Interrupt 14 (INT_HD_WC_ZERO) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
13	ICL[13]	B'0	R/W	Interrupt 13 (INT_FRM_SEQ_ERR1) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
12	ICL[12]	B'0	R/W	Interrupt 12 (INT_FRM_SEQ_ERR0) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
11	ICL[11]	B'0	R/W	Interrupt 11 (INT_ECC_ERR) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
10	ICL[10]	B'0	R/W	Interrupt 10 (INT_ECC_CRCT_ERR) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
9	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
7	ICL[7]	B'0	R/W	Interrupt 7 (INT_ULPS_START) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
6	ICL[6]	B'0	R/W	Interrupt 6 (INT_ULPS_END) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
5	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	ICL[4]	B'0	R/W	Interrupt 4 (INT_ERRSOTHS) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
3	ICL[3]	B'0	R/W	Interrupt 3 (INT_ERRSOTSYNCHS) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
2	ICL[2]	B'0	R/W	Interrupt 2 (INT_ERRESC) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.
1	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	ICL[0]	B'0	R/W	Interrupt 0 (INT_ERRCONTROL) source mask 0: Enables the interrupt source. 1: Masks the interrupt source.

Note: The settings of this register are applied the instant the register is set (immediate reflection).

29.2.14 Interrupt Status Monitor Register (INTSTATE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	B’00	R	Reserved These bits are always read as 0. The write value should always be 0.
29	IST[29]	B’0	R/WC1	Interrupt 29 (INT_EBD_CH0) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 29 is a reception end interrupt of embedded data from output Ch0. It is generated when the embedded data is received.
28	IST[28]	B’0	R/WC1	Interrupt 28 (INT_LESS_THAN_WC) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 28 is an error interrupt that is generated when the length of payload data of a long packet is less than the WC value.
27	IST[27]	B’0	R	Interrupt 27 (INT_AFIFO_OF) monitor (read-only) 0: Normal 1: The interrupt has been generated. Interrupt 27 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. IST[27] does not have the corresponding register (DFF); the OR of the lanes of the interrupt error status monitoring register (IEST[11:8]) generates the interrupt. Therefore, the interrupt is cleared using the interrupt error status monitoring register. Check the relevant registers such as the PHY data lane monitoring register since synchronization between lanes may not be taken or data may not be received in a specific lane.

Bit	Bit Name	Initial Value	R/W	Description
26	IST[26]	B'0	R/WC1	Interrupt 26 (INT_VD4_START) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 26 is generated by the start of VD4 output from the CSI2 (a frame start interrupt). It is issued in synchronization with the rising edge of the CSIR_VD[3] signal.
25	IST[25]	B'0	R/WC1	Interrupt 25 (INT_VD4_END) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 25 is generated by the end of VD4 output from the CSI2 (a frame end interrupt). It is issued in synchronization with the falling edge of the CSIR_VD[3] signal.
24	IST[24]	B'0	R/WC1	Interrupt 24 (INT_VD3_START) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 24 is generated by the start of V output from the CSI2 (a frame start interrupt). It is issued in synchronization with the rising edge of the CSIR_VD[2] signal.
23	IST[23]	B'0	R/WC1	Interrupt 23 (INT_VD3_END) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 23 is generated by the end of V output from the CSI2 (a frame end interrupt). It is issued in synchronization with the falling edge of the CSIR_VD[2] signal.
22	IST[22]	B'0	R/WC1	Interrupt 22 (INT_VD2_START) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 22 is generated by the start of VD2 output from the CSI2 (a frame start interrupt). It is issued in synchronization with the rising edge of the CSIR_VD[1] signal.

Bit	Bit Name	Initial Value	R/W	Description
21	IST[21]	B'0	R/WC1	Interrupt 21 (INT_VD2_END) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 21 is generated by the end of VD2 output from the CSI2 (a frame end interrupt). It is issued in synchronization with the falling edge of the CSIR_VD[1] signal.
20	IST[20]	B'0	R/WC1	Interrupt 20 (INT_VD_START) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 20 is generated by the start of VD output from the CSI2 (a frame start interrupt). It is issued in synchronization with the rising edge of the CSIR_VD[0] signal.
19	IST[19]	B'0	R/WC1	Interrupt 19 (INT_VD_END) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 19 is generated by the end of VD output from the CSI2 (a frame end interrupt). It is issued in synchronization with the falling edge of the CSIR_VD[0] signal.
18	IST[18]	B'0	R/WC1	Interrupt 18 (INT_SHP_STB) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 18 is a short packet reception interrupt. It is issued upon reception of short packets such as Frame Start and Frame End packets.
17	IST[17]	B'0	R/WC1	Interrupt 17 (INT_FSFE) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 17 is a frame packet reception interrupt. It is issued upon reception of short packets of Frame Start and Frame End packets.

Bit	Bit Name	Initial Value	R/W	Description
16	IST[16]	B'0	R/WC1	Interrupt 16 (INT_LNP_STB) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 16 is a long packet reception interrupt. It is issued upon reception of long packets such as YUV data and Embedded Data.
15	IST[15]	B'0	R/WC1	Interrupt 15 (INT_CRC_ERR) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 15 is a CRC error interrupt. It is issued if there is a data error in a long packet. To perform the CRC check, set the CRC_EN bit in the CHKSUM register to 1.
14	IST[14]	B'0	R/WC1	Interrupt 14 (INT_HD_WC_ZERO) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 14 is a WC (word count) zero interrupt. It is issued when the WC value in the packet header of a long packet is zero.
13	IST[13]	B'0	R/WC1	Interrupt 13 (INT_FRM_SEQ_ERR1) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 13 is a frame sequence error 1 interrupt. It is issued when an illegal Frame End packet is received. Specifically, it is issued in the following cases (assuming that the same channel is used): - A Frame End packet is received before a Frame Start packet is received. - Frame End packets are continuously received.
12	IST[12]	B'0	R/WC1	Interrupt 12 (INT_FRM_SEQ_ERR0) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 12 is a frame sequence error 0 interrupt. It is issued when an illegal Frame Start packet is received. Specifically, it is issued in the following case (assuming that the same channel is used): - Frame Start packets are continuously received.

Bit	Bit Name	Initial Value	R/W	Description
11	IST[11]	B'0	R/WC1	Interrupt 11 (INT_ECC_ERR) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 11 is an ECC error interrupt. It is issued when two or more bits of errors are found in a packet header. To perform the ECC processing, set the ECC_EN bit in the CHKSUM register to 1.
10	IST[10]	B'0	R/WC1	Interrupt 10 (INT_ECC_CRCT_ERR) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 10 is an ECC 1-bit correction interrupt. It is issued when 1-bit correction is performed for a packet header during ECC processing. To perform the ECC processing, set the ECC_EN bit in the CHKSUM register to 1.
9	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
7	IST[7]	B'0	R/WC1	Interrupt 7 (INT_ULPS_START) monitor [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 7 is an ultra-low power data transfer start interrupt. This bit is set to high when any of the lanes shifts to the ULP state. For the lane state, see the description of the PHY data lane monitoring register (PHDLM).
				Interrupt 7 (INT_ULPS_START) monitor [RZ/G2H, RZ/G2N] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 7 is an ultra-low power data transfer start interrupt. This bit is set to high when any of the lanes shifts to the ULP state. For the lane state, see the description of the PHY data lane monitoring register (PHDLM). It is need to write to 1'b1 after initial sequence of PHY.

Bit	Bit Name	Initial Value	R/W	Description
6	IST[6]	B’0	R/WC1	Interrupt 6 (INT_ULPS_END) monitor [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 6 is an ultra-low power data transfer end interrupt. This bit is set to high when no lanes are in the ULP state. For the lane state, see the description of the PHY data lane monitoring register (PHDLM).
				Interrupt 6 (INT_ULPS_END) monitor [RZ/G2H, RZ/G2N] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 6 is an ultra-low power data transfer end interrupt. This bit is set to high when no lanes are in the ULP state. For the lane state, see the description of the PHY data lane monitoring register (PHDLM). It is need to write to 1’b1 after initial sequence of PHY.
5	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	IST[4]	B’0	R	Interrupt 4 (INT_ERRSOTHS) monitor (read-only) 0: Normal 1: The interrupt has been generated. Interrupt 4 is a synchronized SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in any of the lanes. For the lane state, see the description of the interrupt error status monitoring register (INTERRSTATE). IST[4] does not have the corresponding register (DFF); the OR of the lanes of the interrupt error status monitoring register (IEST[7:4]) generates the interrupt. Since the ERRSOTHS_[3-0] input from the PHY are pulse signals, the state are not retained. Therefore, the interrupt error status register is provided as the interrupt status register for each lane. Therefore, the interrupt is cleared using the interrupt error status monitoring register.

Bit	Bit Name	Initial Value	R/W	Description
3	IST[3]	B'0	R	Interrupt 3 (INT_ERRSOTSYNCHS) monitor (read-only) 0: Normal 1: The interrupt has been generated. Interrupt 3 is a non-synchronizable SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in any of the lanes. For the lane state, see the description of the interrupt error status monitoring register (INTERRSTATE). IST[4] does not have the corresponding register (DFF); the OR of the lanes of the interrupt error status monitoring register (IEST[7:4]) generates the interrupt. Since the ERRSOTSYNCHS_[3-0] input from the PHY are pulse signals, the state are not retained. Therefore, the interrupt error status register is prepared as the interrupt status register for each lane. Therefore, the interrupt is cleared using the interrupt error status monitoring register.
2	IST[2]	B'0	R/WC1	Interrupt 2 (INT_ERRESC) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 2 is an escape mode entry error interrupt. It is issued when an unrecognizable escape entry command is received. This bit is set to high when an error is detected in any of the lanes. For the lane state, see the description of the PHY ESC error monitoring register (PHEERM). Even after the interrupt is cleared, the PHEERM register retains the high- level state until a stop state is received.
1	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	IST[0]	B'0	R/WC1	Interrupt 0 (INT_ERRCONTROL) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Interrupt 0 is a PHY control error interrupt. It is issued when a transition is made to an incorrect line state. This bit is set to high when an error is detected in any of the lanes. For the lane state, see the description of the PHY ESC error monitoring register (PHEERM). Even after the interrupt is cleared, the PHEERM register retains the high-level state until a stop state is received.

29.2.15 Interrupt Error Status Monitor Register (INTERRSTATE)

Note: * For reserved bit (Bit Name: —). Refer to the following table.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	IEST[15]	B’0	R/WC1	Error interrupt 15 (INT_FIFO_OF_3) monitor [RZ/G2H, RZ/G2N, RZ/G2E] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated.Error interrupt 11 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. When ICL27 (interrupt source mask register) is set to 1, INT_FIFO_OF_3 is cleared to 0.
	—	B’0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
14	IEST[14]	B’0	R/WC1	Error interrupt 14 (INT_FIFO_OF_2) monitor [RZ/G2H, RZ/G2N, RZ/G2E] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 11 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. When ICL27 (interrupt source mask register) is set to 1, INT_FIFO_OF_2 is cleared to 0.
	—	B’0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
13	IEST[13]	B'0	R/WC1	Error interrupt 13 (INT_FIFO_OF_1) monitor [RZ/G2H, RZ/G2N, RZ/G2E] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 11 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. When ICL27 (interrupt source mask register) is set to 1, INT_FIFO_OF_1 is cleared to 0.
	—	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
12	IEST[12]	B'0	R/WC1	Error interrupt 12 (INT_FIFO_OF_0) monitor [RZ/G2H, RZ/G2N, RZ/G2E] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 11 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. When ICL27 (interrupt source mask register) is set to 1, INT_FIFO_OF_0 is cleared to 0.
	—	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
11	IEST[11]	B'0	R/WC1	Error interrupt 11 (INT_AFIFO_OF_3) monitor [RZ/G2M V1.3, RZ/G2M V3.0] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Note: When 2-lane PHY is connected, the interrupt is not generated. Error interrupt 11 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. When ICL27 (interrupt source mask register) is set to 1, INT_AFIFO_OF_3 is cleared to 0.
	—	B'0	R	Reserved [RZ/G2H, RZ/G2N, RZ/G2E] This bit is always read as 0. The write value should always be 0.

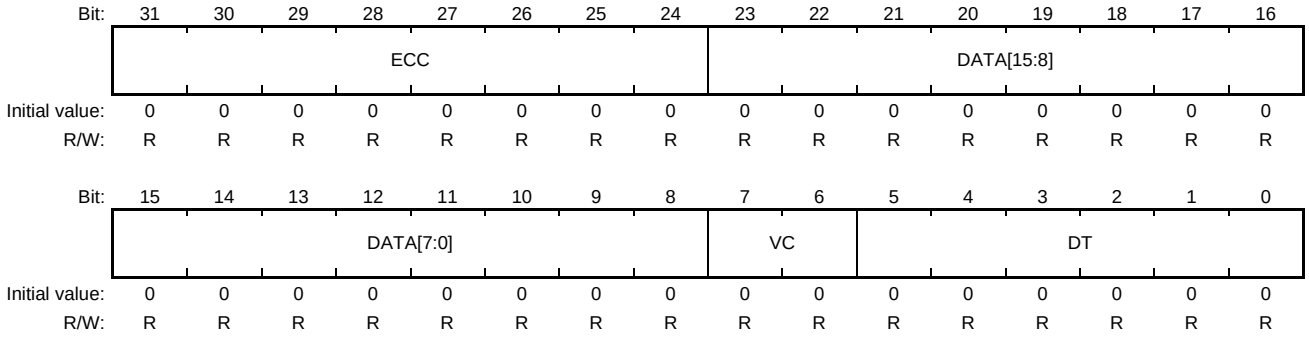
Bit	Bit Name	Initial Value	R/W	Description
10	IEST[10]	B'0	R/WC1	Error interrupt 10 (INT_AFIFO_OF_2) monitor [RZ/G2M V1.3, RZ/G2M V3.0] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Note: When 2-lane PHY is connected, the interrupt is not generated. Error interrupt 10 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. When ICL27 (interrupt source mask register) is set to 1, INT_AFIFO_OF_2 is cleared to 0.
	—	B'0	R	Reserved [RZ/G2H, RZ/G2N, RZ/G2E] This bit is always read as 0. The write value should always be 0.
9	IEST[9]	B'0	R/WC1	Error interrupt 9 (INT_AFIFO_OF_1) monitor [RZ/G2M V1.3, RZ/G2M V3.0] When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 9 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. When ICL27 (interrupt source mask register) is set to 1, INT_AFIFO_OF_1 is cleared to 0.
	—	B'0	R	Reserved [RZ/G2H, RZ/G2N, RZ/G2E] This bit is always read as 0. The write value should always be 0.
8	IEST[8]	B'0	R/WC1	Error interrupt 8 (INT_AFIFO_OF_0) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 8 is an overflow interrupt of the asynchronous FIFO, in which HS data from PHY is stored. When ICL27 (interrupt source mask register) is set to 1, INT_AFIFO_OF_0 is cleared to 0.
7	IEST[7]	B'0	R/WC1	Error interrupt 7 (INT_ERRSOTHS_3) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Note: When 2-lane PHY is connected, the interrupt is not generated. Error interrupt 7 is a synchronized SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in lane 3. When ICL04 (interrupt source mask register) is set to 1, INT_ERRSOTHS_3 is cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
6	IEST[6]	B'0	R/WC1	Error interrupt 6 (INT_ERRSOTHS_2) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Note: When 2-lane PHY is connected, the interrupt is not generated. Error interrupt 6 is a synchronized SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in lane 2. When ICL04 (interrupt source mask register) is set to 1, INT_ERRSOTHS_2 is cleared to 0.
5	IEST[5]	B'0	R/WC1	Error interrupt 5 (INT_ERRSOTHS_1) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 5 is a synchronized SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in lane 1. When ICL04 (interrupt source mask register) is set to 1, INT_ERRSOTHS_1 is cleared to 0.
4	IEST[4]	B'0	R/WC1	Error interrupt 4 (INT_ERRSOTHS_0) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 4 is a synchronized SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in lane 0. When ICL04 (interrupt source mask register) is set to 1, INT_ERRSOTHS_0 is cleared to 0.
3	IEST[3]	B'0	R/WC1	Error interrupt 3 (INT_ERRSOTSYNCHS_3) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Note: When 2-lane PHY is connected, the interrupt is not generated. Error interrupt 3 is a non-synchronizable SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in lane 3. When ICL03 (interrupt source mask register) is set to 1, INT_ERRSOTSYNCHS_3 is cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
2	IEST[2]	B'0	R/WC1	Error interrupt 2 (INT_ERRSOTSYNCHS_2) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Note: When 2-lane PHY is connected, the interrupt is not generated. Error interrupt 2 is a non-synchronizable SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in lane 2. When ICL03 (interrupt source mask register) is set to 1, INT_ERRSOTSYNCHS_2 is cleared to 0.
1	IEST[1]	B'0	R/WC1	Error interrupt 1 (INT_ERRSOTSYNCHS_1) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 1 is a non-synchronizable SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in lane 1. When ICL03 (interrupt source mask register) is set to 1, INT_ERRSOTSYNCHS_1 is cleared to 0.
0	IEST[0]	B'0	R/WC1	Error interrupt 0 (INT_ERRSOTSYNCHS_0) monitor When this bit is written to, the interrupt is cleared. 1: Clears the interrupt. When read, the status is monitored. 0: Normal 1: The interrupt has been generated. Error interrupt 0 is a non-synchronizable SOT (start of transfer) error interrupt during HS reception. This bit is set to high when an error is detected in lane 0. When ICL03 (interrupt source mask register) is set to 1, INT_ERRSOTSYNCHS_0 is cleared to 0.

29.2.16 Short Packet Data Register (SHPDAT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ECC	All 0	R	ECC data received
23 to 8	DATA	All 0	R	Short packet data received
7, 6	VC	B’00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type received

SHPDAT is a register to read the received short packet data. The value of this register is stored in the FIFO and the number of packets stored can be checked by reading the short packet count register (SHPCNT). Short packets with the data types H'00 (frame start), H'01 (frame end), and H'08 (Generic Short Packet Code 1, DSI End of Transmission) are not stored.

29.2.17 Short Packet Count Register (SHPCNT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF

R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7, 6	L3SEL	H'3	R/W	LINK lane 3 select bits H'0: Uses PHY lane 0 H'1: Uses PHY lane 1 H'2: Uses PHY lane 2 H'3: Uses PHY lane 3 Note: When 2-lane PHY is connected, this setting has no effect. These bits select a PHY lane to be assigned to LINK lane 3. These bits should be set before the start of PHY operation and should not be modified during operation.
5, 4	L2SEL	H'2	R/W	LINK lane 2 select bits H'0: Uses PHY lane 0 H'1: Uses PHY lane 1 H'2: Uses PHY lane 2 H'3: Uses PHY lane 3 Note: When 2-lane PHY is connected, this setting has no effect. These bits select a PHY lane to be assigned to LINK lane 2. These bits should be set before the start of PHY operation and should not be modified during operation.
3, 2	L1SEL	H'1	R/W	LINK lane 1 select bits H'0: Uses PHY lane 0 H'1: Uses PHY lane 1 H'2: Uses PHY lane 2 H'3: Uses PHY lane 3 These bits select a PHY lane to be assigned to LINK lane 1. These bits should be set before the start of PHY operation and should not be modified during operation.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	L0SEL	H'0	R/W	LINK lane 0 select bits H'0: Uses PHY lane 0 H'1: Uses PHY lane 1 H'2: Uses PHY lane 2 H'3: Uses PHY lane 3 These bits select a PHY lane to be assigned to LINK lane 0. These bits should be set before the start of PHY operation and should not be modified during operation.

[RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E]

When modifying this register, be sure to set ENABLE_[3-0] appropriately. For example, when L1SEL = H'3 and L0SEL = H'2 are set to perform two-lane transfer using PHY lanes 3 and 2, it is necessary to set:

ENABLE_3 = 1, ENABLE_2 = 1, ENABLE_1 = 0, ENABLE_0 = 0, and ENABLECLK = 1.

Note: The settings of this register are applied the instant the register is set (immediate reflection).

[RZ/G2H, RZ/G2N]

When modifying this register, must be set ENABLE_0 to 1.

29.2.20 PHY Test Interface Write Register (PHTW)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	—	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	DWEN	TESTDIN_DATA

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	ULPSACTIVENOT_3	B'1	R	This bit indicates the ULP state on lane 3. Negative logic Note: When 2-lane PHY is connected, this bit is fixed to 0. After the completion of ULP, the pin is set to high without waiting for Twakeup.
14	ULPSACTIVENOT_2	B'1	R	This bit indicates the ULP state on lane 2. Negative logic Note: When 2-lane PHY is connected, this bit is fixed to 0. After the completion of ULP, the pin is set to high without waiting for Twakeup.
13	ULPSACTIVENOT_1	B'1	R	This bit indicates the ULP state on lane 1. Negative logic After the completion of ULP, the pin is set to high without waiting for Twakeup.
12	ULPSACTIVENOT_0	B'1	R	This bit indicates the ULP state on lane 0. Negative logic After the completion of ULP, the pin is set to high without waiting for Twakeup.
11	RXULPSESC_3	B'0	R	This bit indicates the ULP state on lane 3. Note: When 2-lane PHY is connected, this bit is fixed to 0. After the completion of ULP, the pin is set to low without waiting for Twakeup.
10	RXULPSESC_2	B'0	R	This bit indicates the ULP state on lane 2. Note: When 2-lane PHY is connected, this bit is fixed to 0. After the completion of ULP, the pin is set to low without waiting for Twakeup.
9	RXULPSESC_1	B'0	R	This bit indicates the ULP state on lane 1. After the completion of ULP, the pin is set to low without waiting for Twakeup.

Bit	Bit Name	Initial Value	R/W	Description
8	RXULPSESC_0	B'0	R	This bit indicates the ULP state on lane 0. After the completion of ULP, the pin is set to low without waiting for Twakeup.
7	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	STOPSTATEDATA_3	B'0	R	This bit indicates the stop state on lane 3. Note: When 2-lane PHY is connected, this bit is fixed to 0.
2	STOPSTATEDATA_2	B'0	R	This bit indicates the stop state on lane 2. Note: When 2-lane PHY is connected, this bit is fixed to 0.
1	STOPSTATEDATA_1	B'0	R	This bit indicates the stop state on lane 1.
0	STOPSTATEDATA_0	B'0	R	This bit indicates the stop state on lane 0.

29.2.27 Packet Header 0 Monitor Register 0 (PH0M0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	CRC	All 0	R	Received CRC
15 to 0	CAL_CRC	All 0	R	CRC result calculated from the received data

CRCM1 is a register to monitor the CRC currently received and CRC calculated from the received data (previous data of CRCM0).

29.2.42 SOT Error Count Register (SERRCNT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ERRSOTHS_COUNT							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	ERRSOTHS_COUNT	H'00	R	Synchronized SOT error count These bits monitor the number of synchronized SOT errors. The count is the sum of the errors on each lane.

29.2.43 SOTSYNC Error Count Register (SSERRCNT)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	ERRSOTSYNCHS			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	ERRSOTSYNCHS	H'0	R	Non-synchronizable SOT error count These bits monitor the number of non-synchronizable SOT errors. The count is the sum of the errors on each lane. After this error is input, no synchronization signal is generated. If the asynchronous FIFO for storing data from the PHY overflows here, the internal registers shift to the abnormal state. In this case, the state can only be restored by resetting the CSI2 control circuit using the software reset register (within the CSI2 module) or inputting a software reset from an external module after resetting the PHY and stopping the normal lane data from the PHY.

29.2.44 ECC_CRCT Count Register (ECCCM)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
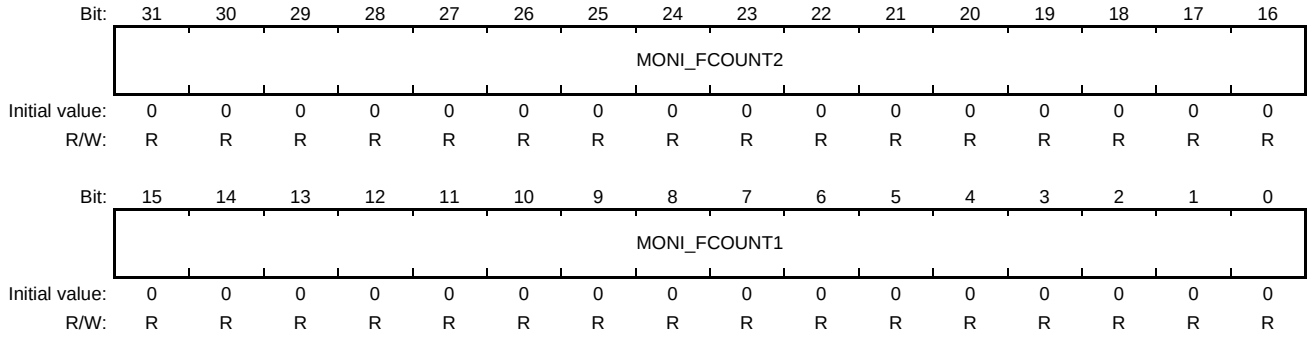
31 to 16	MONI_ LINECNT4	All 0	R	Channel 3 received line count These bits monitor the number of lines of the most recently received frame on channel 3.
15 to 0	MONI_ LINECNT3	All 0	R	Channel 2 received line count These bits monitor the number of lines of the most recently received frame on channel 2.

29.2.51 Frame Count Monitor Register (FCNTM)

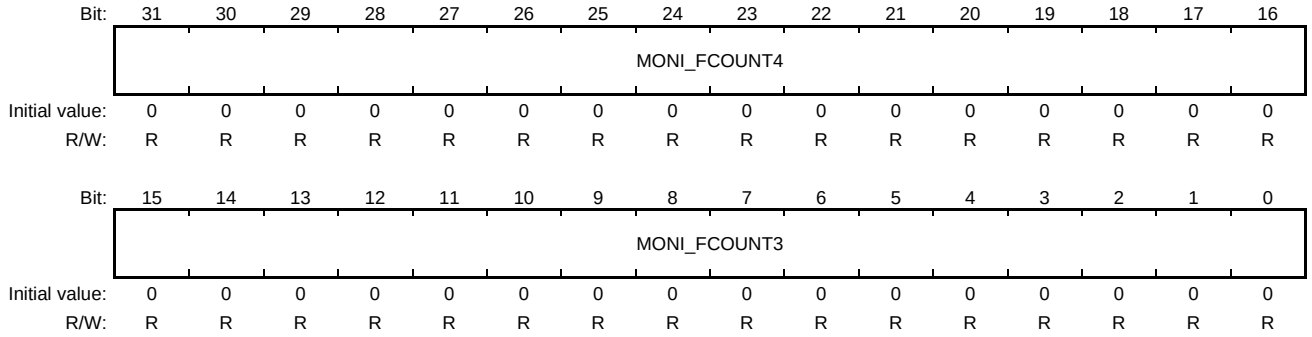
RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	MONI_ FCOUNT2	All 0	R	Channel 1 received frame count These bits monitor the number of frames which have been received so far on channel 1.
15 to 0	MONI_ FCOUNT1	All 0	R	Channel 0 received frame count These bits monitor the number of frames which have been received so far on channel 0.

29.2.52 Frame Count Monitor Register 2 (FCNTM2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	—



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	MONI_ FCOUNT4	All 0	R	Channel 3 received frame count These bits monitor the number of frames which have been received so far on channel 3.
15 to 0	MONI_ FCOUNT3	All 0	R	Channel 2 received frame count These bits monitor the number of frames which have been received so far on channel 2.

29.2.53 PHY Data IN Monitor Register (PHYDIM)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RXDATAHS_3								RXDATAHS_2							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RXDATAHS_1								RXDATAHS_0							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	RXDATAHS_3	H'00	R	Byte data received on data lane 3 Note: When 2-lane PHY is connected, these bits are fixed to 0.
23 to 16	RXDATAHS_2	H'00	R	Byte data received on data lane 2 Note: When 2-lane PHY is connected, these bits are fixed to 0.
15 to 8	RXDATAHS_1	H'00	R	Byte data received on data lane1
7 to 0	RXDATAHS_0	H'00	R	Byte data received on data lane 0

PHYDIM is a register to monitor byte data input from the PHY.

29.2.54 PHY Input Monitor Register (PHYIM)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RXCLK_CNT	—	—	—	—	—	—	—	RXVALIDHS_3	RXVALIDHS_2	RXVALIDHS_1	RXVALIDHS_0	RXACTIVEHS_3	RXACTIVEHS_2	RXACTIVEHS_1	RXACTIVEHS_0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	RXCLK_CNT	B'0	R	RXCLK counter 0 This bit monitors signals toggled at the rising edge of RXCLK.
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	RXVALIDHS_3	B'0	R	Data lane 3 HS valid signal Note: When 2-lane PHY is connected, this bit is fixed to 0. This bit monitors the valid signal on lane 3 input from the PHY.
22	RXVALIDHS_2	B'0	R	Data lane 2 HS valid signal Note: When 2-lane PHY is connected, this bit is fixed to 0. This bit monitors the valid signal on lane 2 input from the PHY.
21	RXVALIDHS_1	B'0	R	Data lane 1 HS valid signal This bit monitors the valid signal on lane 1 input from the PHY.
20	RXVALIDHS_0	B'0	R	Data lane 0 HS valid signal This bit monitors the valid signal on lane 0 input from the PHY.
19	RXACTIVEHS_3	B'0	R	Data lane 3 HS active signal Note: When 2-lane PHY is connected, this bit is fixed to 0. This bit monitors the active signal on lane 3 input from the PHY.
18	RXACTIVEHS_2	B'0	R	Data lane 2 HS active signal Note: When 2-lane PHY is connected, this bit is fixed to 0. This bit monitors the active signal on lane 2 input from the PHY.
17	RXACTIVEHS_1	B'0	R	Data lane 1 HS active signal This bit monitors the active signal on lane 1 input from the PHY.
16	RXACTIVEHS_0	B'0	R	Data lane 0 HS active signal This bit monitors the active signal on lane 0 input from the PHY.
15 to 12	RXSYNCHS_3_CNT	H'0	R	Data lane 3 HS synchronization signal count Note: When 2-lane PHY is connected, these bits are fixed to 0. This bit monitors the count of RSYNCHS_3 input from the PHY.
11 to 8	RXSYNCHS_2_CNT	H'0	R	Data lane 2 HS synchronization signal count Note: When 2-lane PHY is connected, these bits are fixed to 0. This bit monitors the count of RSYNCHS_2 input from the PHY.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	RXSYNCHS_1_CNT	H'0	R	Data lane 1 HS synchronization signal count This bit monitors the count of RSYNCHS_1 input from the PHY.
3 to 0	RXSYNCHS_0_CNT	H'0	R	Data lane 0 HS synchronization signal count This bit monitors the count of RSYNCHS_0 input from the PHY.

29.2.55 VIN Data Monitor Register (VINDM)

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

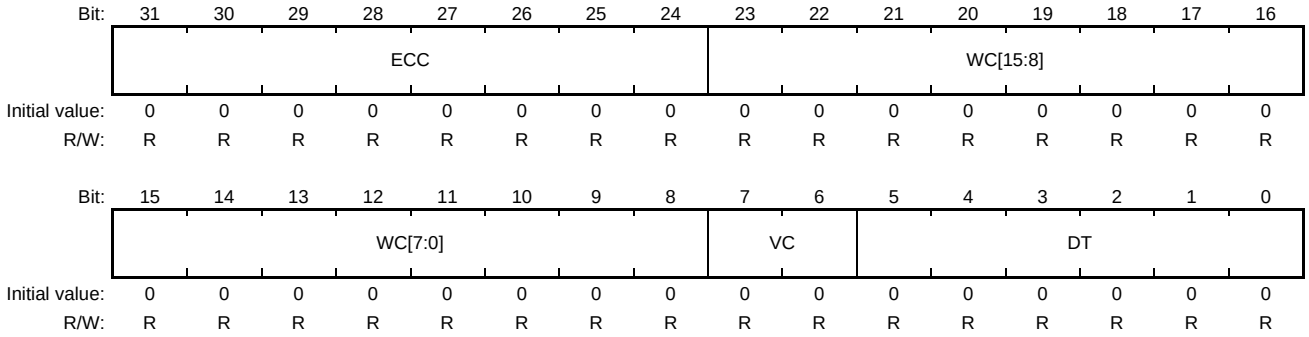
Note: * For reserved bit (Bit Name: —). Refer to the following table.

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	ENABLECLK	B'0	R	Lane enable signal to the clock lane
3	ENABLE_3	B'0	R	Lane enable signal to data lane 3 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
	—	B'0	R	Reserved [RZ/G2E] This bit is always read as 0. The write value should always be 0.
2	ENABLE_2	B'0	R	Lane enable signal to data lane 2 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
	—	B'0	R	Reserved [RZ/G2E] This bit is always read as 0. The write value should always be 0.
1	ENABLE_1	B'0	R	Lane enable signal to data lane 1
0	ENABLE_0	B'0	R	Lane enable signal to data lane 0

PHYOM is a register to monitor the lane enable signal output from the CSI2 to the PHY.

29.2.60 Packet Header Monitor Registers 1 to 8 (PHM1 to PHM8)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ECC	All 0	R	ECC data received
23 to 8	WC	All 0	R	Word count data received
7, 6	VC	B'00	R	Virtual channel data received
5 to 0	DT	H'00	R	Data type data received

PHM1 to PHM8 are registers to monitor the received packet header.

Data is stored in PHM1 first, and the data is shifted to PHM2 when the received packet header changes. After data is stored in PHM8, data is stored in PHM1 again.

29.2.61 Packet Period Monitor Registers 1 to 8 (PPM1 to PPM8)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PACKET_PERIOD_MON[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

29.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

29.3.1 Transfer Rate

This module supports a transfer rate of from 80 Mbps to 1.5 Gbps*[1].

1.5 Gbps transmission is shown in Figure 29.6.

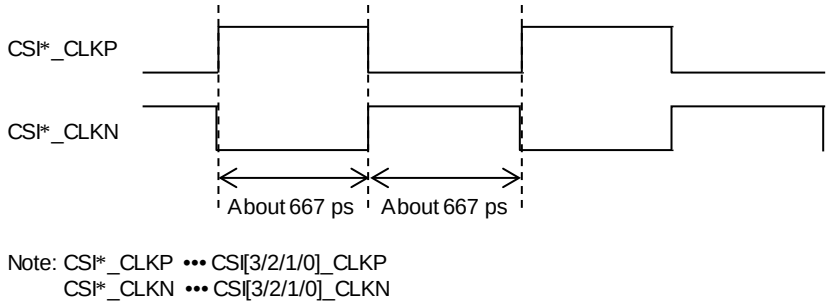

Figure 29.6 CSI2 Transfer Rate

Notes: 1. Up to 1.1Gbps transfer rate of MIPI CSI-2 in RZ/G2E.

29.3.2 ECC 1-Bit Error Correction and 2-Bit or More Error Detection of a Packet Header

An interrupt can be generated upon ECC 1-bit error correction and 2-bit or more error detection.

Interrupt Source	Register Bit Name	Bit
ECC 2-bit or more error	ECC_ERR	[11]
ECC 1-bit error correction	ECC_CRCT_ERR	[10]

The ECC_EN bit in the checksum control register (CHKSUM) can enable or disable the function.

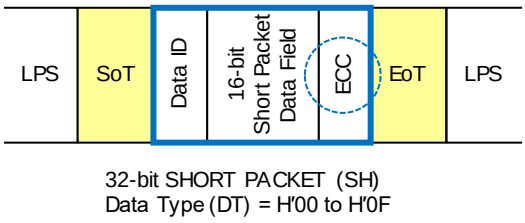

Figure 29.7 MIPI CSI-2 Short Packet

29.3.3 CRC Error Detection of a Payload Data Part

An interrupt can be generated upon CRC error detection.

Interrupt Source	Register Bit Name	Bit
CRC error	CRC_ERR	[15]

The CRC_EN bit in the checksum control register (CHKSUM) can enable or disable the function.

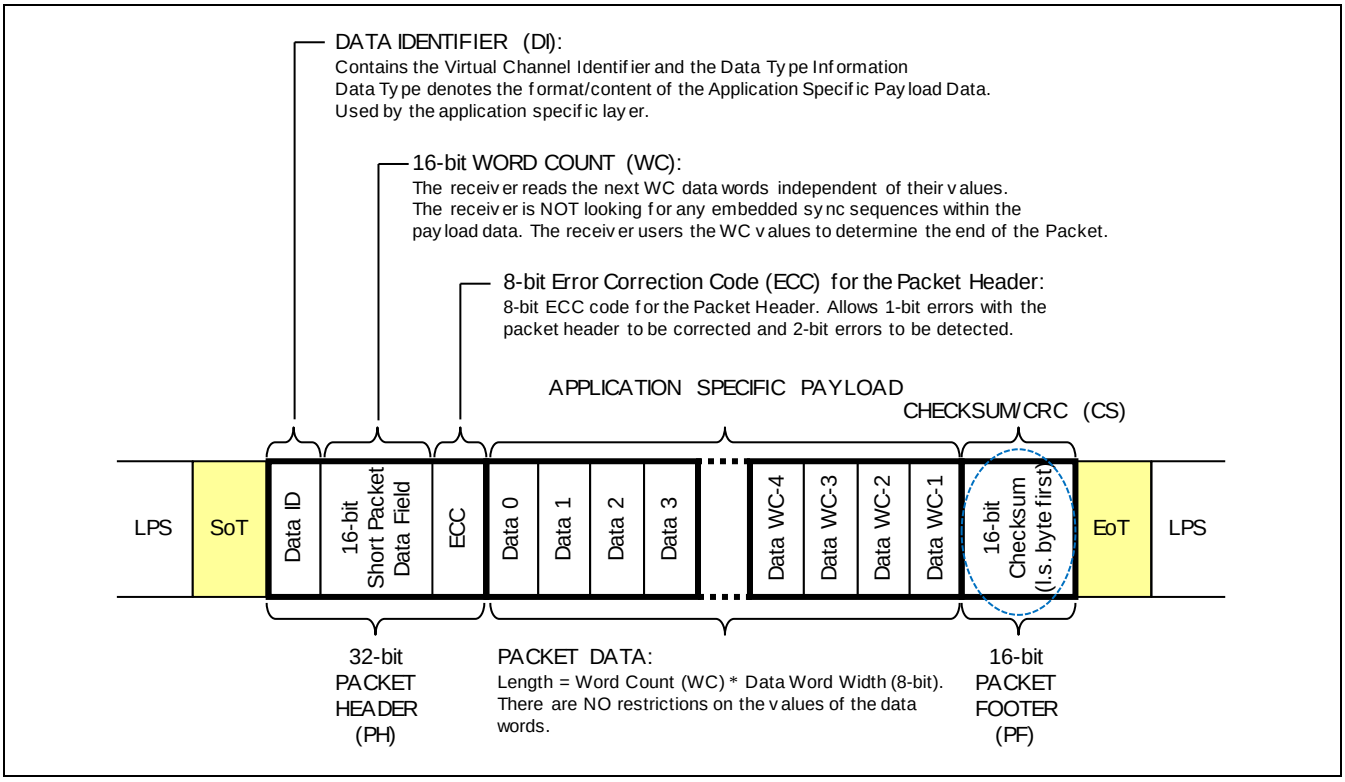

Figure 29.1 MIPI CSI-2 Long Packet

29.3.4 Generation of VD (vertical sync), HD (horizontal sync), and FLD (field) Signals

(1) VD

When a frame start short packet is received, VD is driven high. When a frame end short packet is received, VD is driven low. (This applies to the channel specified with the VC value in the packet header.)

(2) HD

When the sync signal of a long packet (SOT) is received, HD is driven high. When the number of the received long packets reaches the WC value in the packet header, HD is driven low. The frame start short packet of the reception channel should be received in advance. When Embedded is received, this applies to EBD_HD.

(3) FLD

When a frame start short packet is received, if the field value of the short packet data satisfies the condition specified with the field detection control register (FLD), FLD is driven high. When a frame end short packet is received, FLD is driven low. (This applies to the channel specified with the VC value in the packet header.)

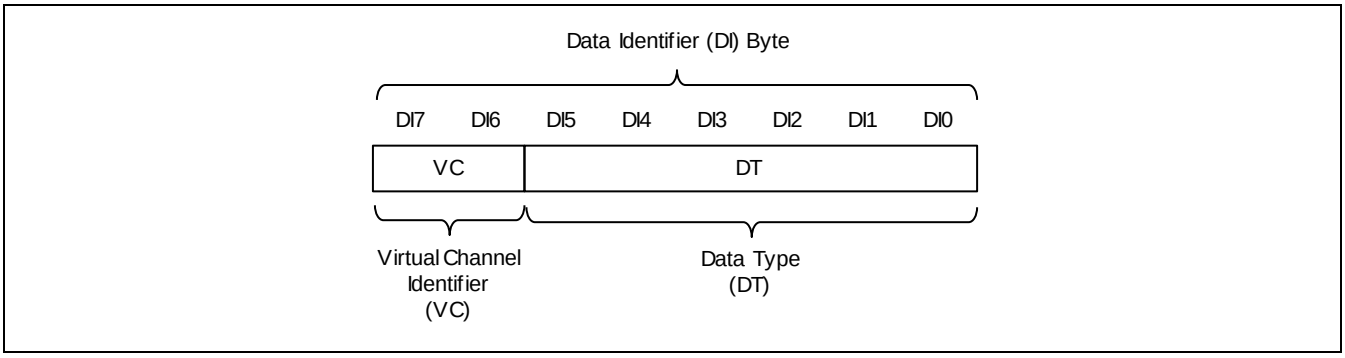

Figure 29.9 MIPI CSI-2 DI

Table 29.4 MIPI CSI-2 Short Packet Data Type Codes

data type	Description
H'00	Frame Start Code
H'01	Frame End Code
H'02	Line Start Code (Optional)
H'03	Line End Code (Optional)
H'04 to H'07	Reserved

29.3.5 Four-Channel Output

As shown in Figure 29.10 and Figure 29.11 interleaved transmission of up to four virtual channels is possible with the RZ/G Gen2 CSI2*1. Therefore, the VD and FLD signals for each channel are output to the following VIN module. (There are four VD and four FLD signals.) The TAG signal, which indicates the reception channels, is also output to the VIN module. The received virtual channels and the channels to be output to the VIN module can be changed by setting the SEL_VC*(* = null, 2 to 4) bits in the relevant registers (channel data type select register VCDT and channel data type select register 2 VCDT2).

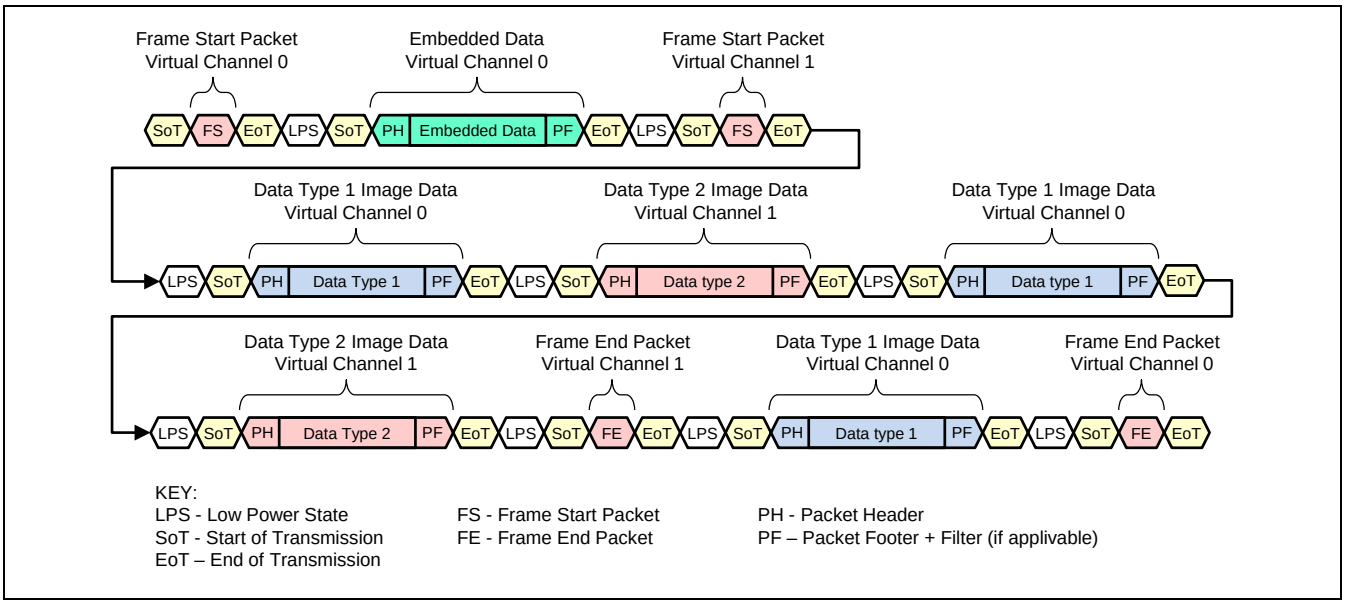

Figure 29.20 MIPI CSI-2 Interleaved Transmission 1

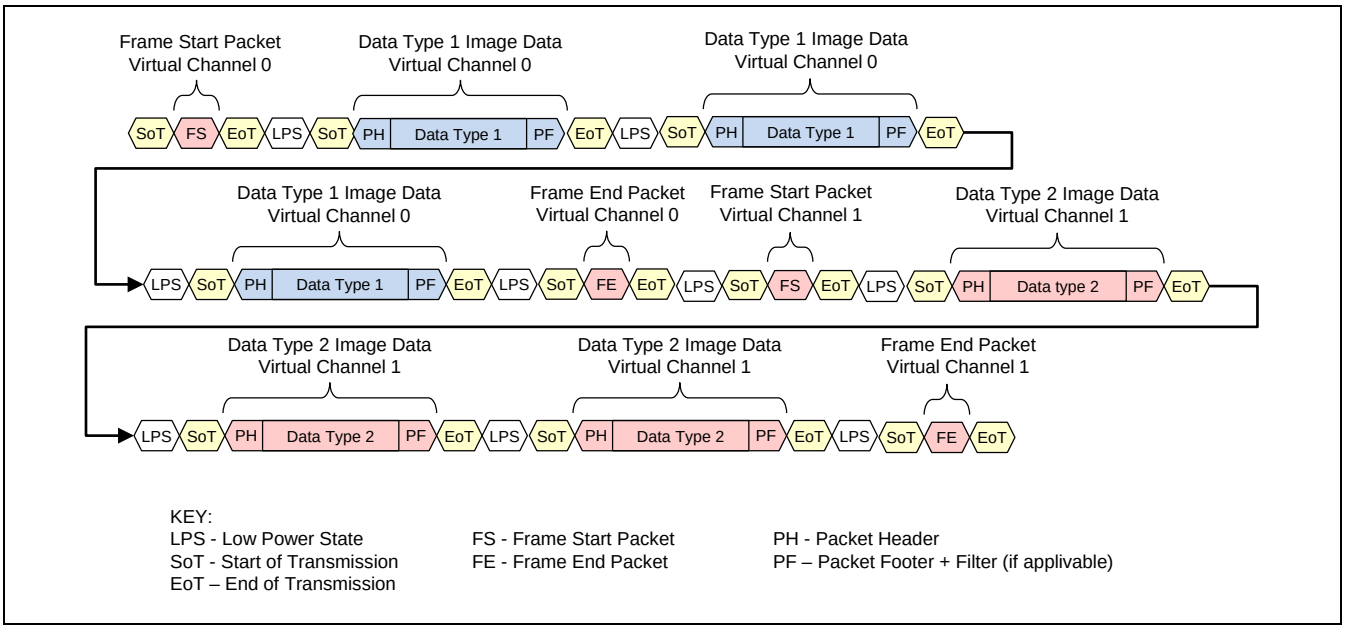

Figure 29.11 MIPI CSI-2 Interleaved Transmission 2

Note: *1. Interleaved transmission of up to two virtual channels (virtual channel 0 and 1) is possible with the RZ/G2E CSI2.

29.3.6 Interrupts

Table 29.5 Interrupt Registers

Function	Register Name
Monitors interrupt state.	INTSTATE
Monitors interrupt error state.	INTERRSTATE
Enables interrupts.	INTEN
Masks interrupt sources.	INTCLOSE

As shown in Figure 29.12, the FIFO_OF_[3/2/1/0] (overflow of synchronous FIFO), AFIFO_OF_[3/2/1/0] (overflow of asynchronous FIFO), ERRSOTHS_[3/2/1/0] (synchronized SOT (start of transfer) error) and ERRSOTSYNCHS_[3/2/1/0] (non-synchronizable SOT (start of transfer) error) have the corresponding interrupt error status monitoring register bits for each channel. To clear the status, write 1 to the corresponding INTERRSTATE register bit.

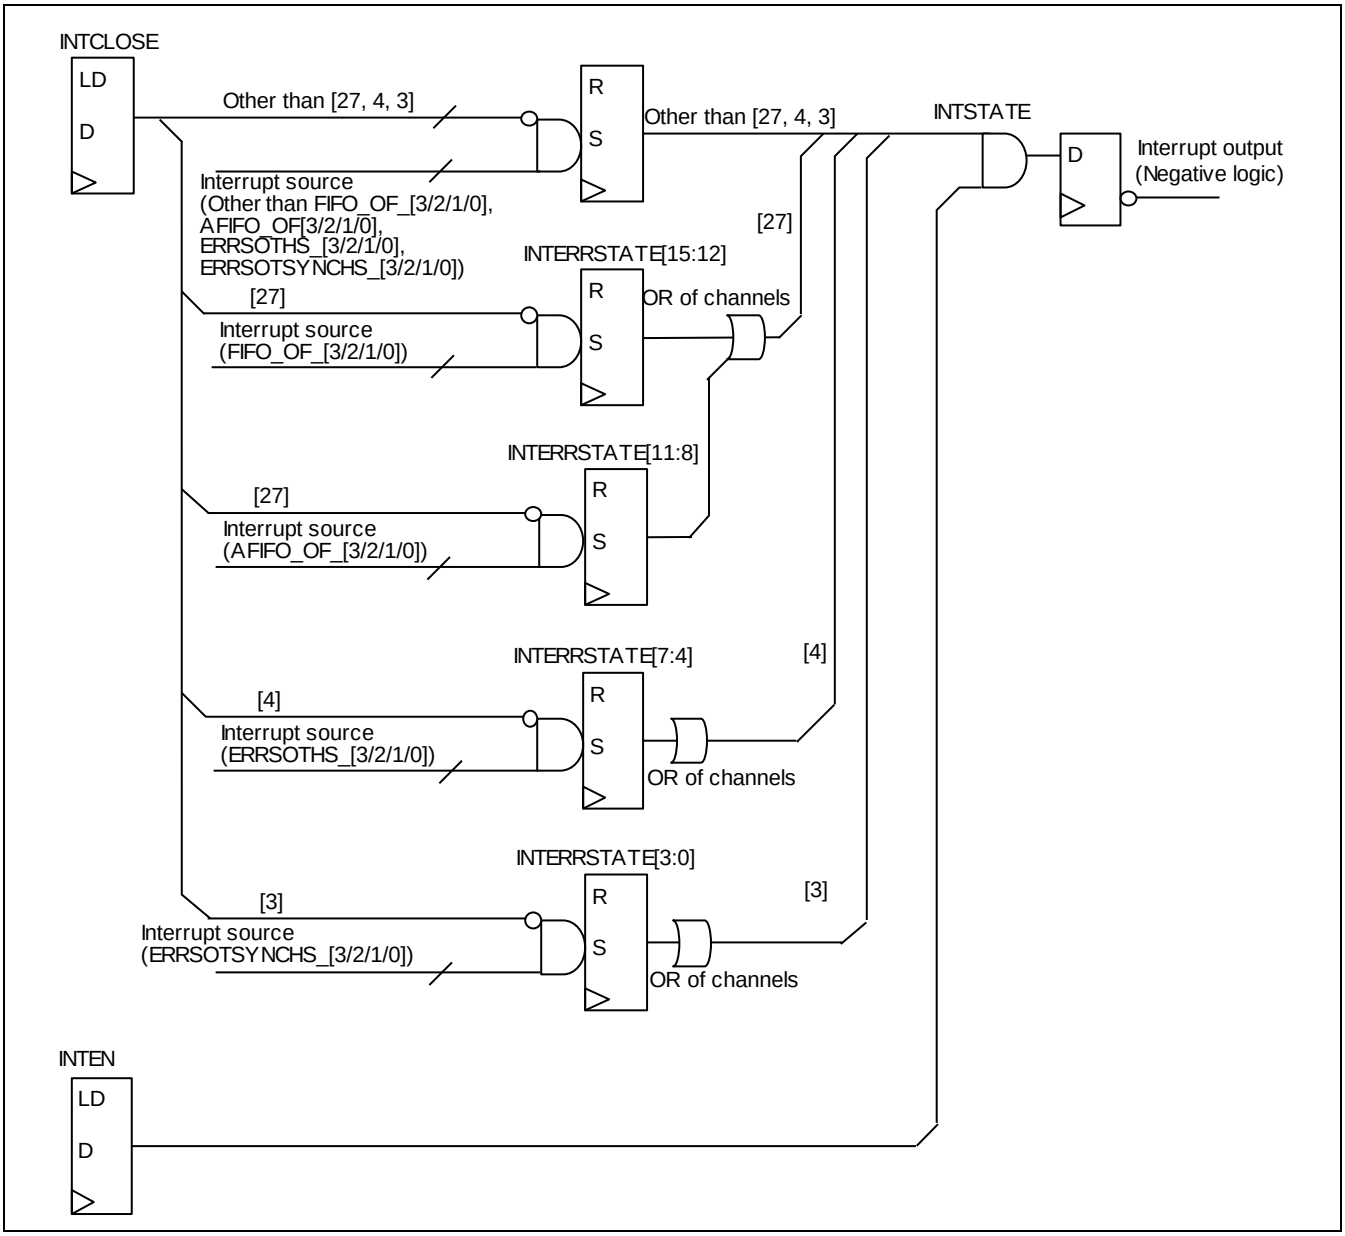

Figure 29.12 Interrupt Structure

Table 29.6 Interrupt Bit Assignments

Interrupt Source	Register Bit Name	Bit
Reception of embedded data from output channel 0	EBD_CH0	[29]
Long packet payload data count less than WC value	LESS_THAN_WC	[28]
Overflow of asynchronous FIFO for storing HS data	AFIFO_OF	[27]
Start of frame on output channel 3 (rising edge of CSIR_VD[3] signal)	VD4_START	[26]
End of frame on output channel 3 (falling edge of CSIR_VD[3] signal)	VD4_END	[25]
Start of frame on output channel 2 (rising edge of CSIR_VD[2] signal)	VD3_START	[24]
End of frame on output channel 2 (falling edge of CSIR_VD[2] signal)	VD3_END	[23]
Start of frame on output channel 1 (rising edge of CSIR_VD[1] signal)	VD2_START	[22]
End of frame on output channel 1 (falling edge of CSIR_VD[1] signal)	VD2_END	[21]
Start of frame on output channel 0 (rising edge of CSIR_VD[0] signal)	VD_START	[20]
End of frame on output channel 0 (falling edge of CSIR_VD[0] signal)	VD_END	[19]
Reception of a short packet (reception of short packets such as Frame Start and Frame End)	SHP	[18]
Reception of a frame packet (reception of short packets of Frame Start and Frame End)	FSFE	[17]
Reception of a long packet	LNP	[16]
CRC error	CRC_ERR	[15]
Reception of WC = 0	HD_WC_ZERO	[14]
Reception of an illegal frame end packet (Frame End is received without receiving Frame Start.)	FRM_SEQ_ERR1	[13]
Reception of an illegal frame start packet (After reception of Frame Start, Frame Start is received again without receiving Frame End)	FRM_SEQ_ERR0	[12]
ECC 2-bit or more error	ECC_ERR	[11]
ECC 1-bit correction	ECC_CRCT_ERR	[10]
—	—	[9]
—	—	[8]
Start of ultra-low power state	ULPS_START	[7]
End of ultra-low power state	ULPS_END	[6]
—	—	[5]
Synchronized SOT (start of transfer) error during HS reception	ERRSOTHS	[4]
Non-synchronizable SOT (start of transfer) error during HS reception	ERRSOTSYNCHS	[3]
Escape mode entry error	ERRESC	[2]
—	—	[1]
PHY control error	ERRCONTROL	[0]

Table 29.7 Bit Assignments in Error Status Monitor Register

Interrupt Source	Register Bit Name	Bit
Overflow of synchronous FIFO for storing HS data on lane 3*1	FIFO_OF_3	[15]
Overflow of synchronous FIFO for storing HS data on lane 2*1	FIFO_OF_2	[14]
Overflow of synchronous FIFO for storing HS data on lane 1*1	FIFO_OF_1	[13]
Overflow of synchronous FIFO for storing HS data on lane 0*1	FIFO_OF_0	[12]
Overflow of asynchronous FIFO for storing HS data on lane 3	AFIFO_OF_3	[11]
Overflow of asynchronous FIFO for storing HS data on lane 2	AFIFO_OF_2	[10]
Overflow of asynchronous FIFO for storing HS data on lane 1	AFIFO_OF_1	[9]
Overflow of asynchronous FIFO for storing HS data on lane 0	AFIFO_OF_0	[8]
Synchronized SOT (start of transfer) error during HS reception on lane 3	ERRSOTHS_3	[7]
Synchronized SOT (start of transfer) error during HS reception on lane 2	ERRSOTHS_2	[6]
Synchronized SOT (start of transfer) error during HS reception on lane 1	ERRSOTHS_1	[5]
Synchronized SOT (start of transfer) error during HS reception on lane 0	ERRSOTHS_0	[4]
Non-synchronizable SOT (start of transfer) error during HS reception on lane 3	ERRSOTSYNCHS_3	[3]
Non-synchronizable SOT (start of transfer) error during HS reception on lane 2	ERRSOTSYNCHS_2	[2]
Non-synchronizable SOT (start of transfer) error during HS reception on lane 1	ERRSOTSYNCHS_1	[1]
Non-synchronizable SOT (start of transfer) error during HS reception on lane 0	ERRSOTSYNCHS_0	[0]

Note: *1. ,RZ/G2H, RZ/G2N, RZ/G2E only

Table 29.8 MIPI CSI-2 PHY/ Annex A.1 Signal Description

Error Signals	Description
ERRSOTHS	Start-of-Transmission (SoT) Error. If the High-Speed Sot leader sequence is corrupted, but in such a way that proper synchronization can still be achieved, this active high signal is asserted for one cycle of RXBYTECLKHS. This is considered to be a "soft error" in the leader sequence and confidence in the payload data is reduced.
ERRSOTSYNCHS	Start-of-Transmission Synchronization Error. If the High-Speed Sot leader sequence is corrupted in a way that proper synchronization cannot be expected, this active high signal is asserted for one cycle of RXBYTECLKHS.
ERRESC	Escape Entry Error. If an unrecognized escape entry command is received, this active high signal is asserted and remains asserted until the next change in line state.
ERRCONTROL	Control Error. This active high signal is asserted when an incorrect line state sequence is detected. For example, if a turn-around request or escape mode request is immediately followed by a Stop state instead of the required Bridge state, this signal is asserted and remains asserted until the next change in line state.

29.3.7 Lane Swapping

The LINK can modify lane assignment for the data received from the PHY by setting the relevant register (see section 29.2.19). This capability is provided for flexible pin assignment to compensate for the MIPI CSI-2 has no connector specification.

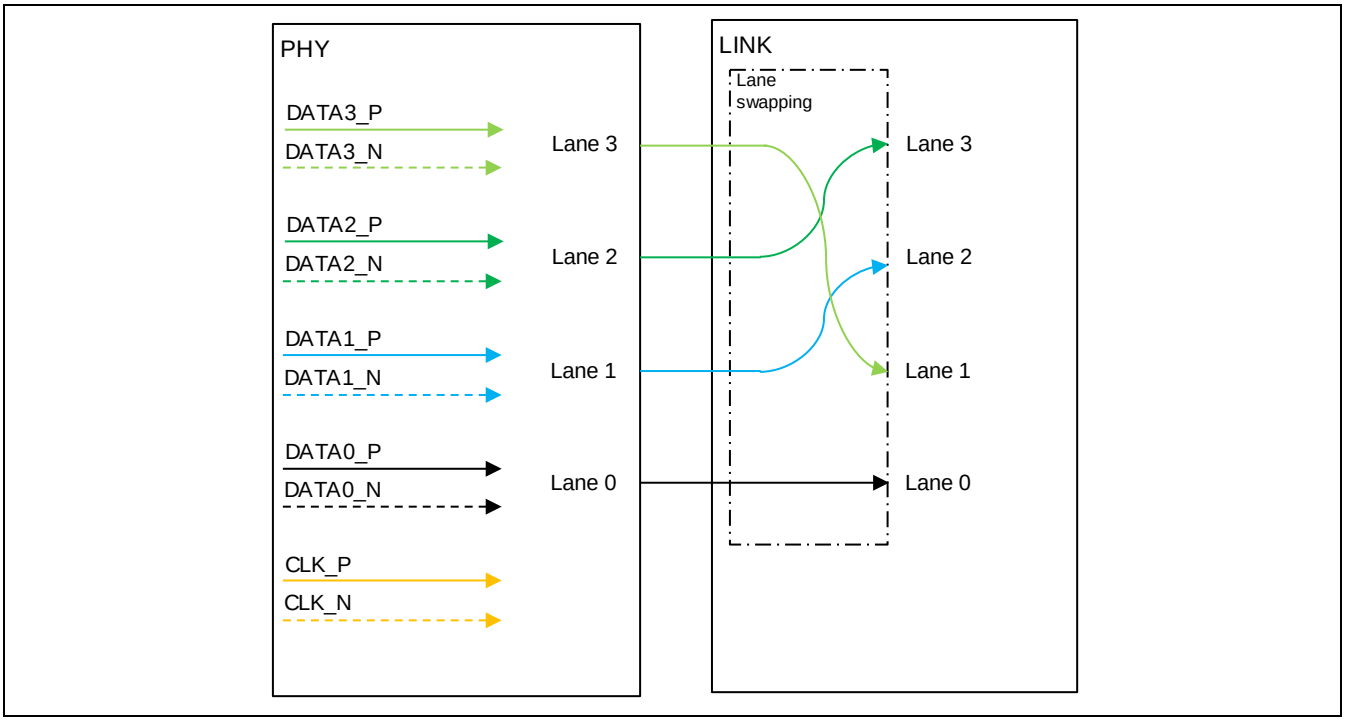

Figure 29.13 Example of Lane Swapping

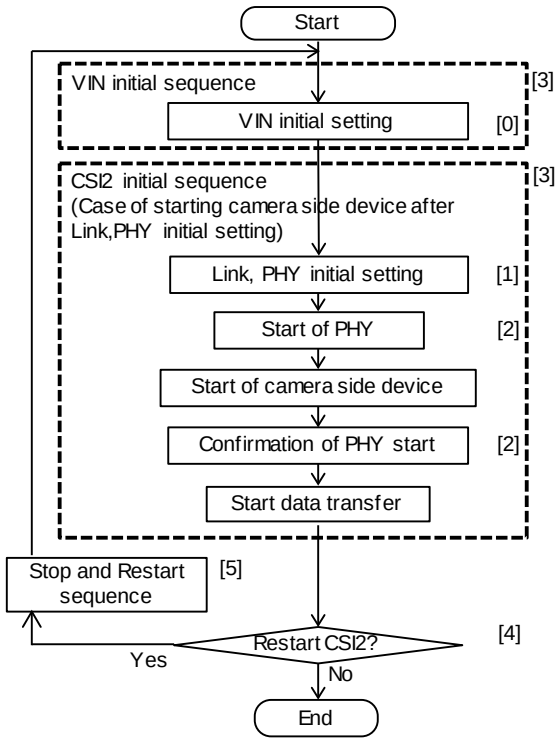
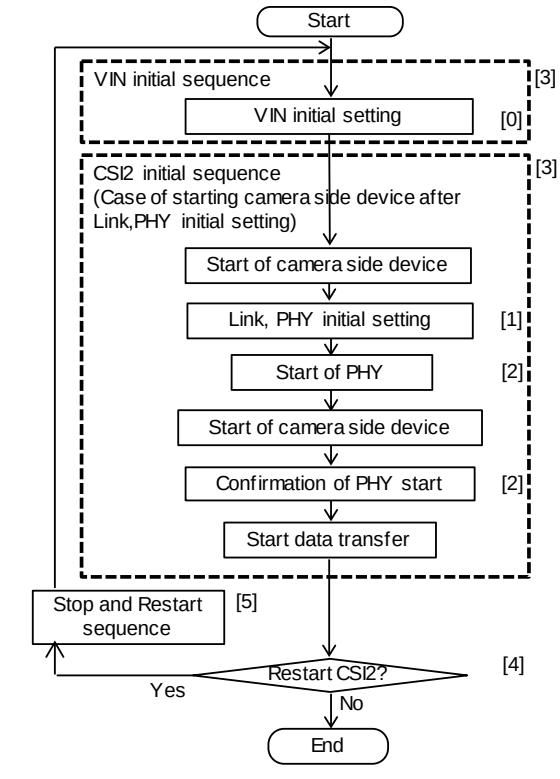
29.3.8 Initial Setting of PHY

It is possible to run VIN initial sequence either before or after CSI2 initial sequence (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E).



[0]: If previous step is Start, see section 30.3.17, Initialize Procedure.
If previous step is Stop and Restart sequence, see section 30.3.19 Capture Restarting procedure.
[1]: See Figure 29.16
[2]: RZ/G2H :See Figure 29.17
RZ/G2M V1.3:See Figure 29.18
RZ/G2M V3.0:See Figure 29.18
RZ/G2E :See Figure 29.19
RZ/G2N :See Figure 29.20
[3]: There is no problem with starting CSI2 initial sequence bfore VIN initial sequence.
[4]: It is necessary to restart sequence of CSI2 for changing the camera side device setting.
[5]: Stop and Restart sequence is related to VIN and CPG modules too. For details, see the following sections; section 30.3.18, Capture stop procedure and Enter Standby Mode of section 29.3.12 or Software Reset Execution of section 29.3.13.

Figure 29.14 Example of Video Module Initial Setting Procedure 1



[0]: If previous step is Start, see section 30.3.17, Initialize Procedure.
If previous step is Stop and Restart sequence, see section 30.3.19 Capture Restarting procedure.
[1]: See Figure 29.16
[2]: RZ/G2H :See Figure 29.17
RZ/G2M V1.3:See Figure 29.18
RZ/G2M V3.0:See Figure 29.18
RZ/G2E :See Figure 29.19
RZ/G2N :See Figure 29.20
[3]: There is no problem with starting CSI2 initial sequence bfore VIN initial sequence.
[4]: It is necessary to restart sequence of CSI2 for changing the camera side device setting.
[5]: Stop and Restart sequence is related to VIN and CPG modules too. For details, see the following sections; section 30.3.18, Capture stop procedure and Enter Standby Mode of section 29.3.12 or Software Reset Execution of section 29.3.13.

Figure 29.15 Example of Video Module Initial Setting Procedure 2

To initially set the PHY IP, the TESTCLR bit in the PHY test interface clear register must be cleared to 0.

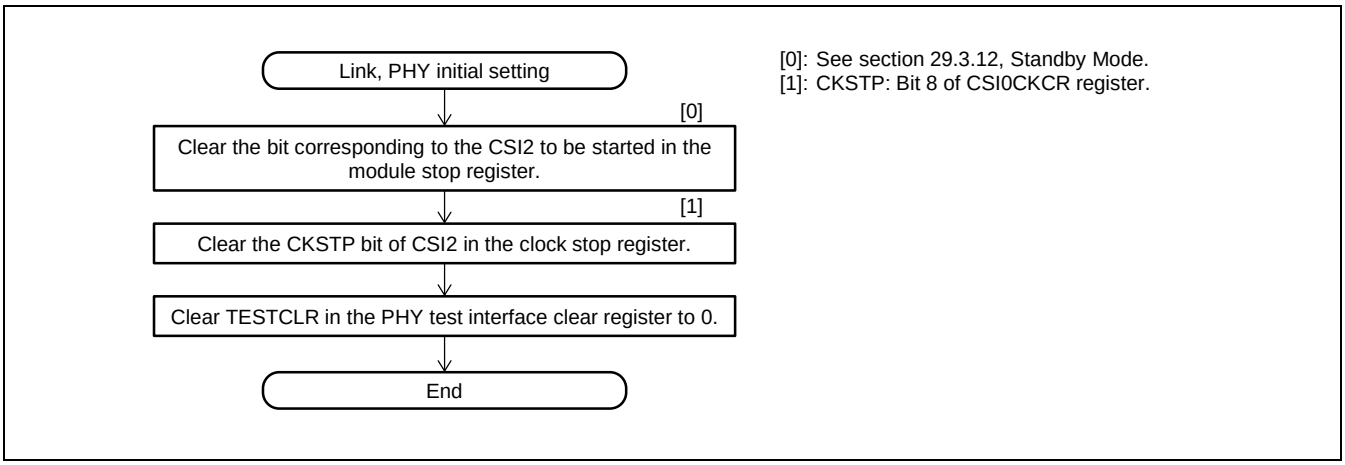


Figure 29.16 Example of PHY Initial Setting Procedure

29.3.9 PHY Control and Monitoring through Register Setting

The PHY IP can be controlled by setting the relevant LINK registers. For register functions, see section 29.2.3, 29.2.8, 29.2.18, 29.2.20*1, 29.2.23*3 and 29.2.62*2.

The PHY IP status can be monitored through the relevant LINK registers. For register functions, see section 29.2.25 and 29.2.26.

Notes: 1. Except for RZ/G2M V1.3, RZ/G2M V3.0.
2. Except for RZ/G2M V1.3, RZ/G2M V3.0, and RZ/G2E.
3. Except for RZ/G2E.

(1) Case 1 Stable data transfer starting procedure

1. Start the CSI-2 module of the camera without starting data transfer.
2. Start the CSI2 PHY module of the RZ/G Gen2.
3. Start data transfer from the camera.

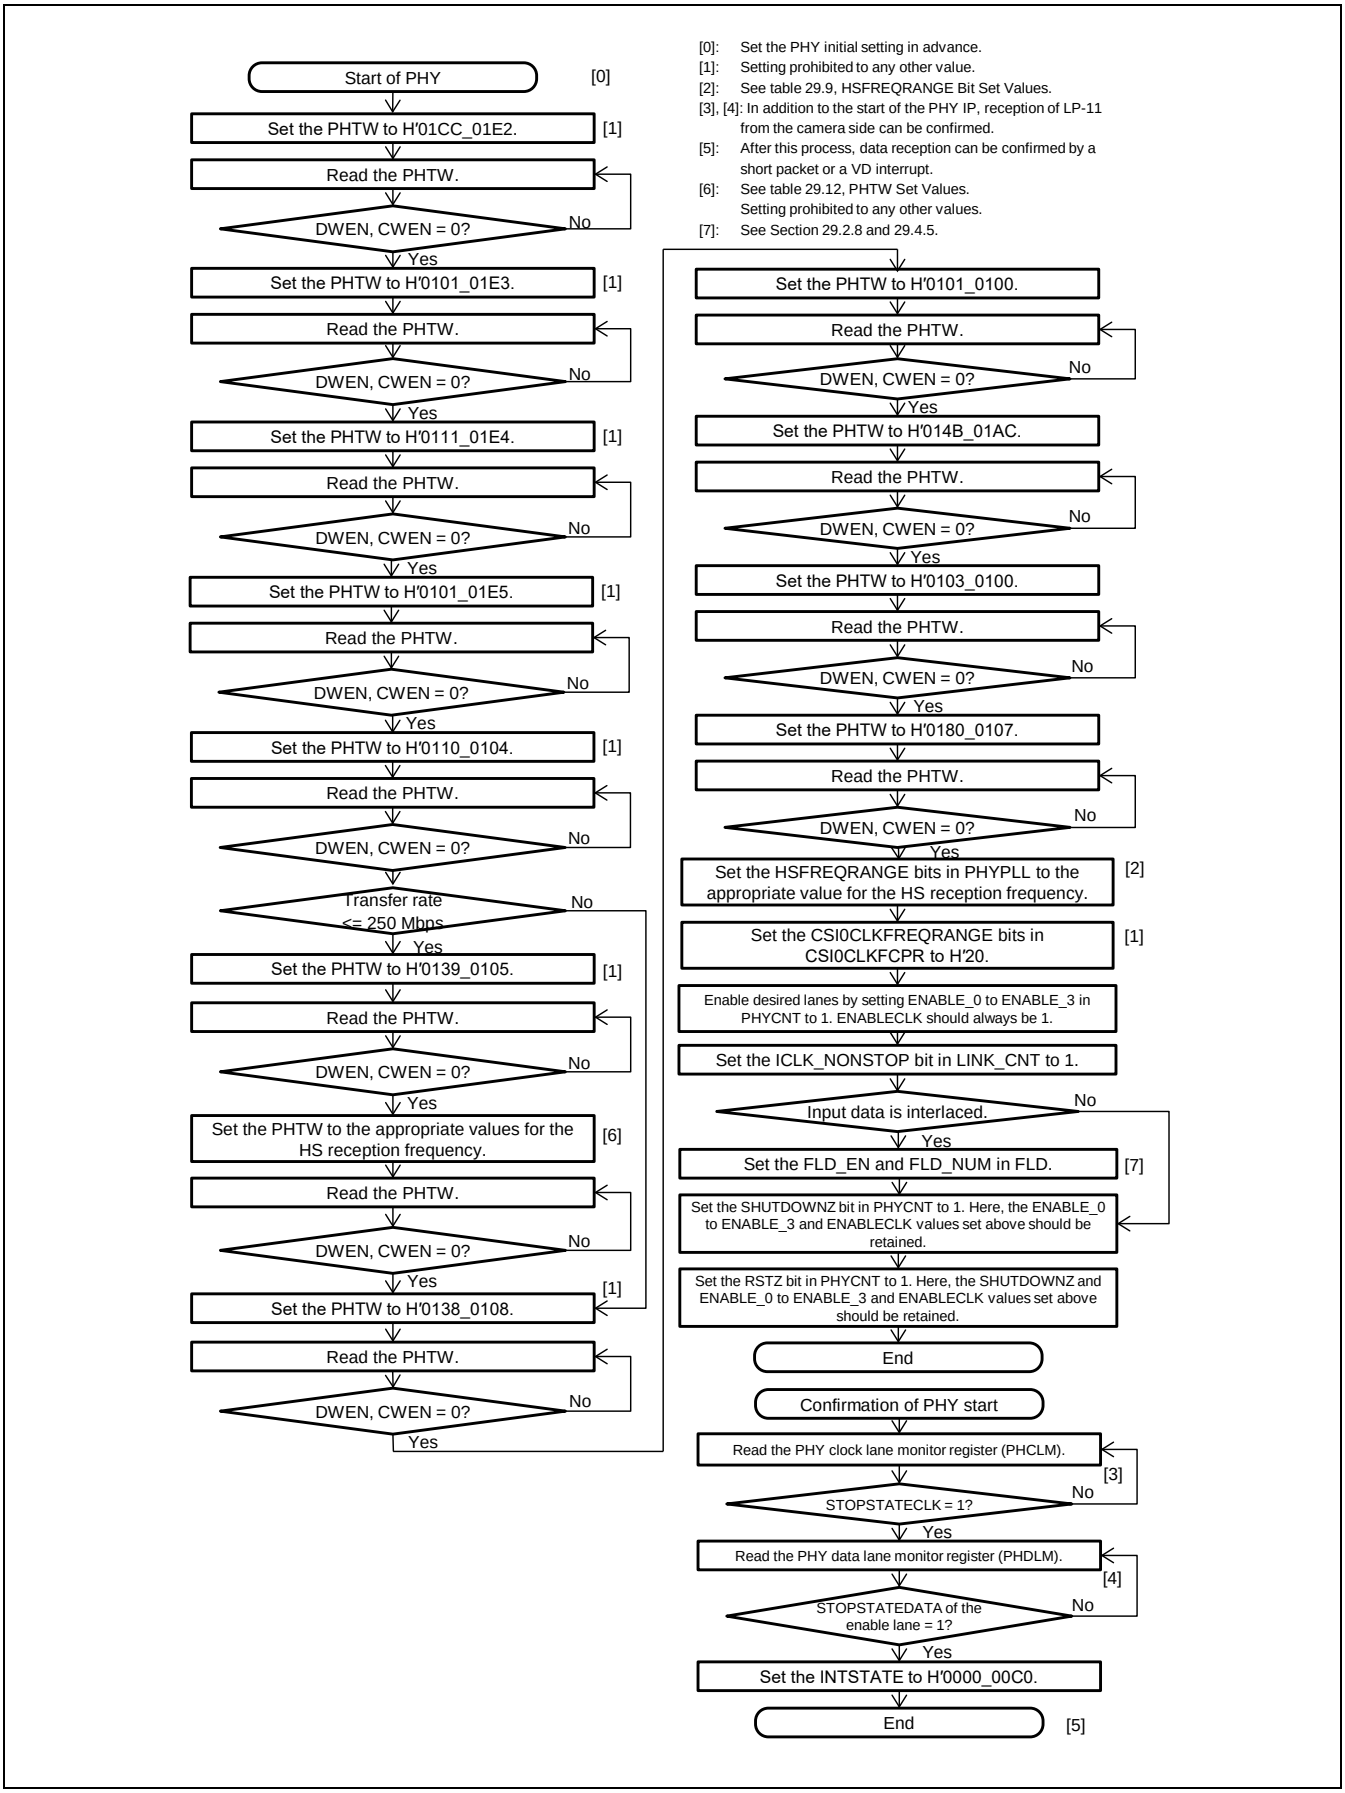

Figure 29.17 Example of PHY Starting Procedure in RZ/G2H (Stable)

250	H'018E_01F1

Table 29.13 Causes for Abnormal Reception

Symptom	Condition	State	Possible Causes	
PHY will not start.	Data is not transferred from the camera.	STOPSTATE = low	Internal	The CSI2 (CSI40 or 20) channel started is different from the output channel on the camera side.
				CFG_CLK has been stopped.
				Module standby mode
				Software reset state (of CPG output)
				RSTZ = 0
				SHUTDOWNZ = 0
				ENABLE = 0, ENABLECLK = 0 on reception lane
			External	No lane connected
				CSI2 on the camera side has not been started.
				CSI2 on the camera side is not outputting LP-11.
	Data is transferred from the camera.	STOPSTATE is always low.	External	Camera side starts earlier and continues outputting data without stopping the clock lane (LP-11 has never been received.).
Reception failure	Data is transferred from the camera.	ERRSOTHS or ERRSOTSYNCHS is generated.	Internal	Different phases between the clock and data. Measures: Adjust the phase physically. Reduce the transfer rate.
				HSFREQRANGE value does not correspond to the transfer rate. Measures: Change the HSFREQRANGE set values.
		No interrupts are generated though ERRSOTHS or ERRSOTSYNCHS is not generated.	Internal	Abnormal voltage level Measures: Adjust the voltage level physically. Reduce the transfer rate.
		ECC error, CRC error, or asynchronous FIFO overflow occurs.	Internal	No ENABLE bits of the lanes during transmission are 1.
				Incorrect lane connection Measures: Change the connections. Perform lane swapping.
		Clock lane is placed in ULP state.	Internal	Incorrect P/N connection of clock lane Measures: Change the connections.
Reception failure	Data is transferred from the camera.	No output or abnormal output though no error occurs.	External	Incorrect transmission protocol Measures: Transfer data in the order: Frame Start → Payload data → Frame End.
				Transfer at 1.5 Gbps or faster (4-lane transfer only)
			Internal	Incorrect LINK register setting (Same values in SEL_VC*, VCDT*_EN = 0 (* = null, 2 to 4))

29.3.10 Interrupt Generation by ULP Status, and Reception Error Status

Table 29.14 MIPI CSI-2 Escape Entry Code

Escape Mode Action	Command Type	Entry Command Pattern (first bit transmitted to last bit transmitted)
Ultra-Low Power State	mode	B'0001 1110
Undefined-1	mode	B'1001 1111
Undefined-2	mode	B'1101 1110

- The ULP (ultra-low power) status start and end interrupts can be generated.

Interrupt Source	Register Bit Name	Bit
Start of ultra-low power state	ULPS_START	[7]
End of ultra-low power state	ULPS_END	[6]

The state of the lanes can be monitored through the PHY clock lane monitoring register (PHCLM) and PHY data lane monitoring register (PHDLM).

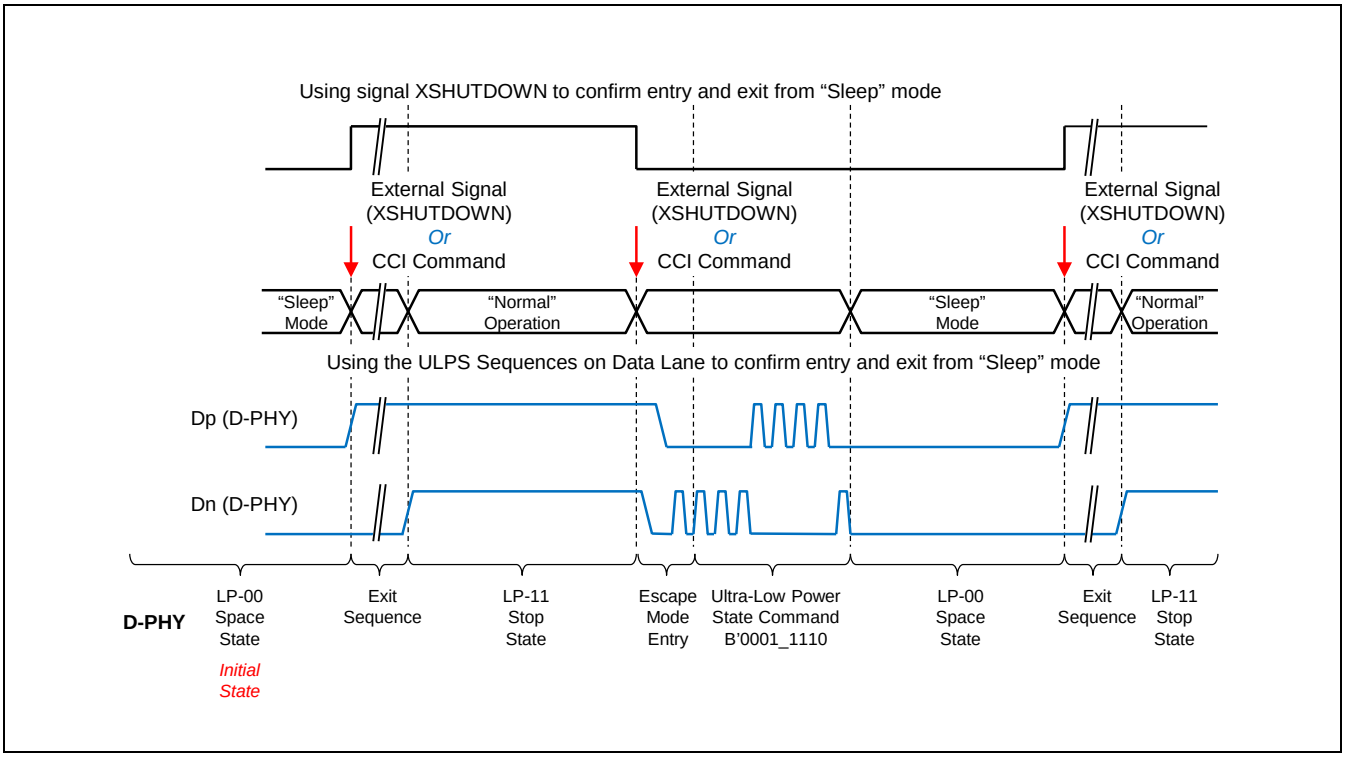

Figure 29.23 MIPI CSI-2 ULPS

- The reception error status interrupt can be generated.

Interrupt Source	Register Bit Name	Bit
Synchronized SOT (start of transfer) error during HS reception	ERRSOTHS	[4]
Non-synchronizable SOT (start of transfer) error during HS reception	ERRSOTSYNCHS	[3]
Escape mode entry error	ERRESC	[2]
—	—	[1]
PHY control error	ERRCONTROL	[0]

The error lanes related to ERRSOTHS and ERRSOTSYNCHS can be monitored through the interrupt error status monitoring register (INTERRSTATE) and the other error lanes can be monitored through the PHY ESC error monitoring register (PHEERM).

29.3.11 Monitoring Function

(1) Monitoring function

For monitoring of the packet header, see section 29.2.27 to 29.2.39 and 29.2.60 to 29.2.61; for monitoring of CRC reception data, see section 29.2.40 and 29.2.41; and for monitoring of the module internal signals used for debugging, see section 29.2.43 to 29.2.59.

29.3.12 Standby Mode

The CSI2 module can gate the clock signals to reduce power consumption. Module standby mode can be set by controlling the module stop register 7 (RMSTPCR7 and SMSTPCR7) of the clock pulse generator (CPG) module. CSI2 channels CSI40, CSI20 correspond to bits 16, 15, and 14 in the RMSTPCR7 and SMSTPCR7 registers, respectively. To release any of the CSI2 channels from standby mode, enable the corresponding the bits in the RMSTPCR7 and SMSTPCR7 registers. Enabling the bits allows all types of access to the channel.

To set any of the CSI2 channels to standby mode, execute the following procedure using the register corresponding to the channel.

[Enter Standby Mode]

1. Set RSTZ and SHUTDOWNZ to 0 in the PHY operation control register (PHYCNT).
2. Set TESTCLR to 1 in PHY Test Interface Clear register (PHTC).
3. Set the corresponding bit in the SRCR7 register of the Clock Pulse Generator (CPG) module (about SRCR7, refer to section 29.3.13).
4. Wait 100us.
5. Disable the corresponding bits in the RMSTPCR7 and SMSTPCR7 registers of the Clock Pulse Generator (CPG) module.

To set any of the CSI2 channels to operating mode from standby mode, execute the following procedure using the register corresponding to the channel.

[Exit Standby Mode]

1. Enable the corresponding bits in the RMSTPCR7 and SMSTPCR7 registers of the Clock Pulse Generator (CPG) module.
2. Set the corresponding bit in the SRSTCLR7 register of the Clock Pulse Generator (CPG) module (about SRSTCLR7, refer to section 29.3.13).
3. Return to Figure 29.16 [1] after step 2 of Exit Standby Mode.

29.3.13 Software Reset

A software reset can be set by controlling the software reset register 7 (SRCR7) and software reset clear register 7 (SRSTCLR7) of the clock pulse generator (CPG) module. CSI2 channels CSI40, CSI20 correspond to bits 16, 15, and 14 in the SRCR7 and SRSTCLR7 registers, respectively. To apply a software reset to any of the CSI2 channels, set the corresponding bit in the SRCR7 register. Enabling the bit initializes all the registers of the corresponding CSI2 channel. To cancel a software reset of any of the CSI2 channels, set the corresponding bit in the SRSTCLR7 register.

VIN module should be reset or stopped capture before reset of CSI2.

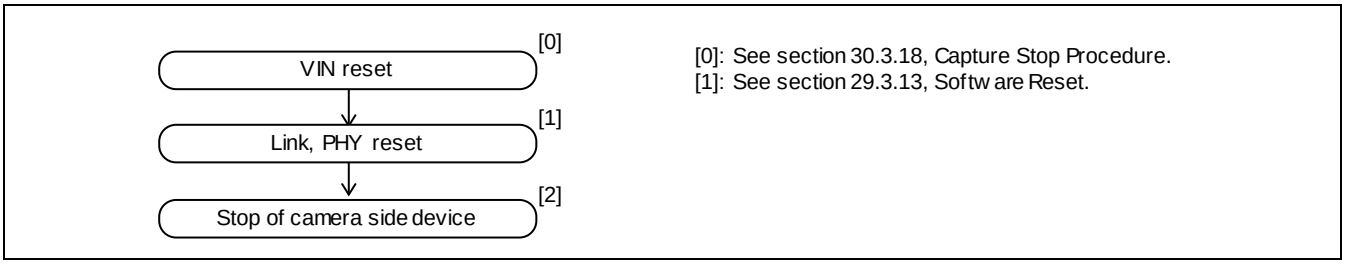

Figure 29.24 Example of Video Module Reset Procedure

To apply a software reset to any of the CSI2 channels, execute the following procedure using the register corresponding to the channel.

[Software Reset Execution]

1. Set the corresponding bit in the SRCR7 register of the Clock Pulse Generator (CPG) module.

[Software Reset Cancellation]

To cancel a software reset of any of the CSI2 channels and start the channel, execute the following procedure using the register corresponding to the channel.

1. Set the corresponding bit in the SRSTCLR7 register of the Clock Pulse Generator (CPG) module.
2. Return to Figure 29.16 [1] after step 1 of Software Reset Cancellation.

29.3.14 Input Clock Signals

(1) CSI2 LINK module

CPG clock input signals:

RZ/G2H: S2D1ϕ (x_sck) and S2D2ϕ (x_bck)

RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: S0D2ϕ (x_sck) and S0D4ϕ (x_bck)

RZ/G2E: S1D2ϕ (x_sck) and S1D4ϕ (x_bck)

The CSI2 module pin name is enclosed in ( ).

(2) CSI2 PHY module

CPG clock input signals: CSI0ϕ (CFG_CLK)

The CSI2 module pin name is enclosed in ( ).

29.4 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

29.4.1 MIPI CSI-2 Transfer Rate

As described in section 29.3.1, a transfer rate must not exceed 1.5 Gbps*[1]. If data is received at a rate exceeding 1.5 Gbps*[1], the following VIN cannot receive data, resulting in loss of the received data.

Notes: 1. Up to 1.1-Gbps transfer rate of MIPI CSI-2 in RZ/G2E.

29.4.2 PHY Operation Control Register (PHYCNT)

When setting any of the ENABLE_3 to ENABLE_0 bits to 1, be sure to set the ENABLECLK bit to 1. All the ENABLE_3 to ENABLE_0 and ENABLECLK bits are initially zero.

29.4.3 Channel Data Type Select Register VCDT and Channel Data Type Select Register VCDT2

The SEL_VC to SEL_VC4 bits must not be set to the same value. (A single virtual channel cannot be output to the multiple output channels.) If the same value is actually required, set to 0 the VCDT_EN to VCDT4_EN bits of the channels that are not to be output.

29.4.4 Synchronization Error during HS (Hi-Speed) Reception

If normal HS reception fails, the PHY outputs a synchronization error to the LINK. When a synchronization error occurs, the PHY may not output HS reception data to the LINK. If this occurs only in the specific lane, the lane synchronization function prevents the FIFO in the LINK from being read thus causing an overflow. The synchronization error and overflow can be monitored through the interrupt error status monitoring register (INTERRSTATE) by setting the interrupt source mask register (INTCLOSE) to 0.

After an overflow occurs, the FIFO should be initialized by software reset. About software reset, refer to section 29.3.13 Software Reset.

29.4.5 FLD Signal

Since the FLD signal is not generated in the initial state, appropriately set the field detection control register (FLD) in order to generate the FLD signal.

It is shown about Interlaced Video Example at Figure 29.25.

In this case (frame number of even field is H’0002), set FLD_NUM to same value as frame number of even field (H’0002) in field detection control register (FLD) and set FLE_EN* to 1 in field detection control register (FLD).

Note: Frame number is included in FS and FE. Frame number increments by 1 every FS packet with the same virtual channel and is periodically reset to one e.g. 1, 2, 1,2,1,2.

If frame number of even field is H’0001, set FLD_NUM to H’0001.

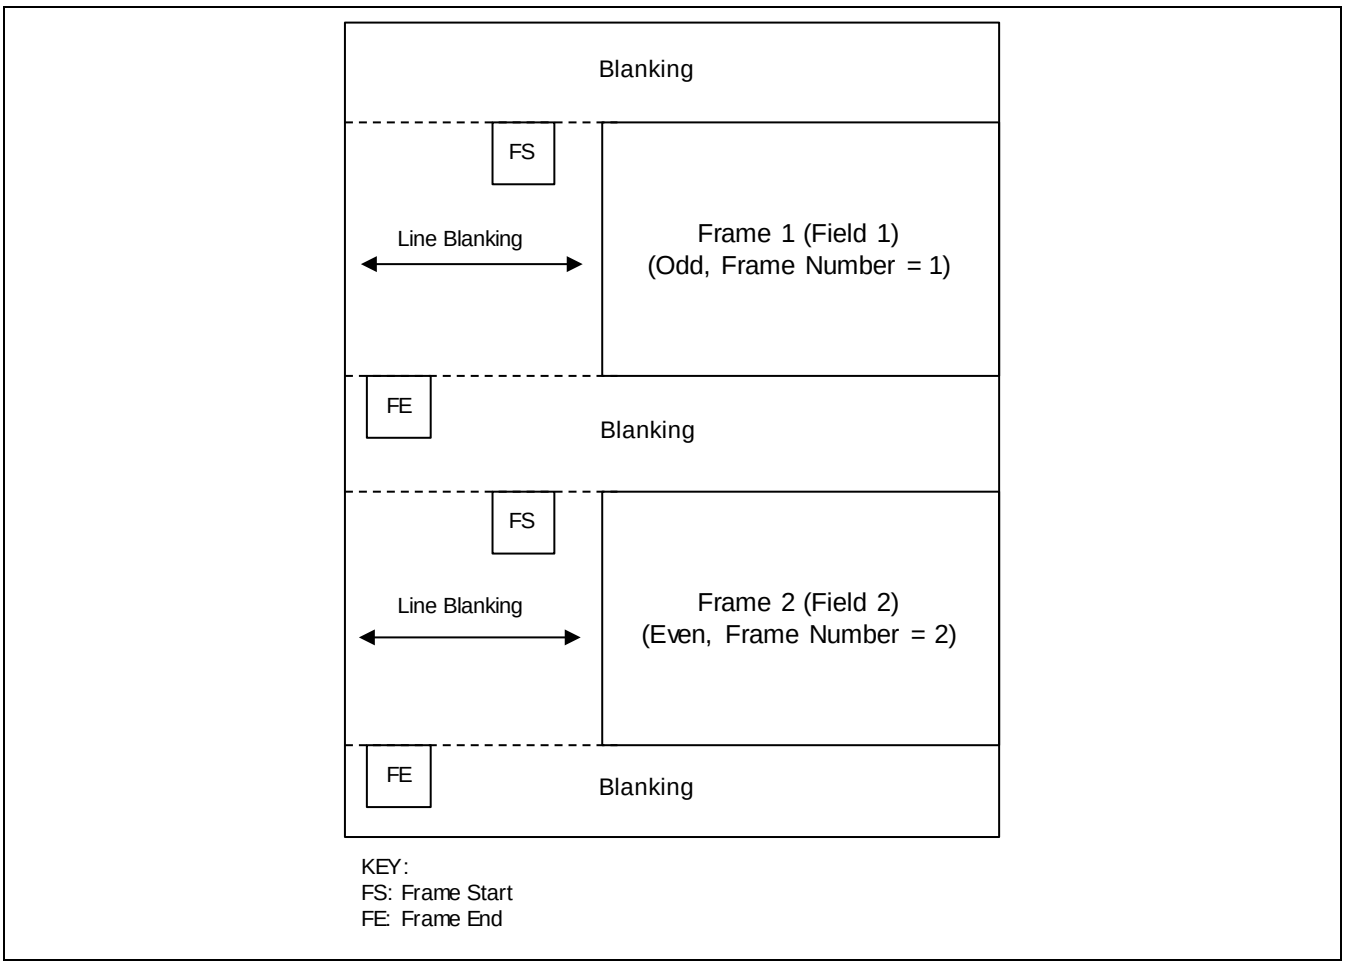

Figure 29.25 Interlaced Video Example

29.4.6 INT_LESS_THAN_WC

When debugging INT_LESS_THAN_WC, only use one of virtual channel.

29.4.7 Transfer Rate of Interleaved Transmission

When some virtual channels are used, the transfer rate input to PHY should be same each virtual channel.

In order to maintain the frame rate, the transfer rate should be a total value of each virtual channel.

29.4.8 Lane Setting

CSI2 supports to set number of lane as below.

Table 29.15 CSI2 supports number of lanes

	Support lane setting	
Product	**CSI40**	**CSI20**
RZ/G2H	4/2/1	2/1
RZ/G2M V1.3	4	2/1
RZ/G2M V3.0	4/2/1	2/1
RZ/G2N	4/2/1	2/1
RZ/G2E	2/1	—

29.4.9 V-blanking Period

In order to receive correctly, the minimum v-blanking period is as follows.

It requires 3 lines or more v-blanking.

Note: v-blanking = period from Frame End packet to Frame Start packet.
The minimum and maximum value of VD_MSK_CYCLE does not mean that supported minimum and maximum v-blanking period.

29.4.10 Notes on data

Input data not conformant to MIPI CSI-2 standard might cause CSI2 module to hang or unexpected operation.

30. Video Input Module (VIN)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

30.1 Overview

The video input module (hereinafter abbreviated as VIN) is a video capture module that stores in external memory YCbCr-422 data through the ITU-R BT.601, ITU-R BT.656, or ITU-R BT.709 interface and RGB data through the ITU-R BT.601 or ITU-R BT.709 interface.

The module has up to eight video channels that can independently control the capture of data into a capture area of up to 4096 × 4096 pixels. It can also provide vertical and horizontal scaling of the data by up to three and two times, respectively.

For captured video data, the VIN provides a color space conversion function from YCbCr-422 to RGB, a format conversion function from RGB to ARGB.

As the VIN internally generates a field signal, it can capture progressive data.

Input of data through digital pins (only present for video channels 4 and 5) and through the MIPI Alliance CSI-2 interfaces is possible.

Notes: 1. For detailed specifications of the MIPI CSI-2 interface, see section 29.
2. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock of Digital pin is 100 MHz.
3. The upper limits on size clipping depends on the use case.
4. The number of video input channels for each product is as follows:

RZ/G2H:	8 channels
RZ/G2M V1.3:	8 channels
RZ/G2M V3.0:	8 channels
RZ/G2N:	8 channels
RZ/G2E:	2 channels

30.1.1 Features

(1) Video Channels 0 and 4

The following input interfaces can be selected for these channels.

Table 30.1 Input Interface for Video Channels 0 and 4 for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, Channel 4 for RZ/G2E

			Second Generation RZ/G Series Products			
Interface (CSI2)	**Data Width**	**Data Type**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
Interface (MIPI CSI-2)	—	YCbCr-422 8-bit data*1	√	√	√	√
Interface (MIPI CSI-2)	—	YCbCr-422 10-bit data*1*2	√	√	√	√
Interface (MIPI CSI-2)	—	RGB-888 data*1	√	√	√	√
Interface (MIPI CSI-2)	—	8-bit user defined data (RAW8)*1	√	√	√	√

Notes: 1. Inputs are in the formats which conform to the standard for the MIPI CSI-2 interface.
2. Disable the XY scaling settings when using the YCbCr-422 10-bit format (only the 100% scaling is enabled).

Table 30.2 Input Interface for Video Channel 4 for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E

			Second Generation RZ/G Series Products			
Interface (Digital Pins)	**Data Width**	**Data Type**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
ITU-R BT.601/BT.709*1*3	8/10/12 bits	YCbCr-422 data (UYVY format)	√	√	√	√
ITU-R BT.601/BT.709*3/ BT.1358*2	16/20/24 bits	YCbCr-422 data (8/10/12 bits (Y) + 8/10/12 bits (CbCr) format)	√	√	√	√
ITU-R BT.656*1	8/10/12 bits	YCbCr-422 data (UYVY format)	√	√	√	√
ITU-R BT.601/BT.709*3	18 bits	RGB-666 data	√	√	√	√
ITU-R BT.601/BT.709*3	24 bits	RGB-888 data	√	√	√	√
RAW	12 bits	RAW12	√	√	√	√

Notes: 1. Disable the XY scaling settings when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.656 interface (only the 100% scaling is enabled).
2. Disable the XY scaling settings when using the 20/24-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.1358 interface (only the 100% scaling is enabled).
3. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock of Digital pin is 100 MHz

(2) Video Channels 1 and 5

The following input interfaces can be selected for these channels.

Table 30.3 Input Interface for Video Channels 1 and 5 for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, Channel 5 for RZ/G2E

			Second Generation RZ/G Series Products			
Interface (CSI2)	**Data Width**	**Data Type**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
Interface (MIPI CSI-2)	—	YCbCr-422 8-bit data*1	√	√	√	√

Interface (MIPI CSI-2)	—	8-bit user defined data (RAW8)*1	√	√	√	√
Interface (MIPI CSI-2)	—	8-bit embedded data*1	—	—	—	√

Notes: 1. Inputs are in the formats which conform to the standard for the MIPI CSI-2 interface.
2. Disable the XY scaling settings when using the YCbCr-422 10-bit format (only the 100% scaling is enabled).

Table 30.4 Input Interface for Video Channel 5 for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2E

			Second Generation RZ/G Series Products			
Interface (Digital Pins)	**Data Width**	**Data Type**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
ITU-R BT.601/BT.709*1*3	8/10/12 bits	YCbCr-422 data (UYVY format)	√	√	√	√
ITU-R BT.601/BT.709*3/ BT.1358*2	16 bits	YCbCr-422 data (8 bits (Y) + 8 bits (CbCr) format)	√	√	√	√
ITU-R BT.656*1	8/10/12 bits	YCbCr-422 data (UYVY format)	√	√	√	√
RAW	12 bits	RAW12	√	√	√	√

Notes: 1. Disable the XY scaling settings when using the 10/12-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.656 interface (only the 100% scaling is enabled).
2. Disable the XY scaling settings when using the 20/24-bit YCbCr-422 format in the ITU-R BT.601, BT.709, or BT.1358 interface (only the 100% scaling is enabled).
3. When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock of Digital pin is 100 MHz.

(3) Video Channels 2 and 6 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N)

The following input interfaces can be selected for these channels.

Table 30.5 Input Interface for Video Channels 2 and 6 for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N

			Second Generation RZ/G Series Products			
Interface (CSI2)	**Data Width**	**Data Type**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
Interface (MIPI CSI-2)	—	YCbCr-422 8-bit data*1	√	√	√	—
Interface (MIPI CSI-2)	—	YCbCr-422 10-bit data*1	√	√	√	—
Interface (MIPI CSI-2)	—	RGB-888 data*1	√	√	√	—
Interface (MIPI CSI-2)	—	8-bit user defined data (RAW8)*1	√	√	√	—

Note: 1. Inputs are in the formats which conform to the standard for the MIPI CSI-2 interface.

(4) Video Channels 3 and 7 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N)

The following input interfaces can be selected for these channels.

Table 30.6 Input Interface for Video Channels 3 and 7 for RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N

			Second Generation RZ/G Series Products			
Interface (CSI2)	**Data Width**	**Data Type**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
Interface (MIPI CSI-2)	—	YCbCr-422 8-bit data*1	√	√	√	—
Interface (MIPI CSI-2)	—	YCbCr-422 10-bit data*1	√	√	√	—
Interface (MIPI CSI-2)	—	RGB-888 data*1	√	√	√	—
Interface (MIPI CSI-2)	—	8-bit embedded data*1	√	√	√	—

Note: 1. Inputs are in the formats which conform to the standard for the MIPI CSI-2 interface.

(5) Internal Sync Signal Generation

For video data capturing through the ITU-R BT.601 or ITU-R BT.709 interface, the field signal can be internally generated even if the input sync signals stops (In video data capture through the ITU-R BT.656 interface, only the field signal is generated).

(6) Capture Mode

The following four modes can be selected to capture the interlace images. In addition, single frame capture or continuous frame capture mode can be selected.

Triple-buffering control is provided in accordance with the captured field image and frame image to coordinate with the video capture mode of the display module.

- Odd-field capture mode
- Even-/odd-field capture mode
- Even-field capture mode
- Full interlace capture mode

(7) Vertical and Horizontal Scaling

- Video channels 0, 1, 4, and 5 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N only)
  Factors for scaling up or down can be set to values in the range from one sixteenth to three in the vertical direction and from one sixteenth to two in the horizontal direction.
- Video channels 4 and 5 (RZ/G2E only)
  Factors for scaling up or down can be set to values in the range from one sixteenth to three in the vertical direction and from one sixteenth to two in the horizontal direction.
- Video channels 2, 3, 6, and 7 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N only)
  These channels do not support scaling up or down in either direction.

Notes: 1. When scaling-up is used, horizontal size that can be input is up to 2048 pixel.
2. When scaling-down is used, horizontal size that can be output is up to 2048 pixel.

(8) Size Clipping

- Video channels 0, 1, 4, and 5 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N only)
  The VIN module has two clipping circuits, which independently handle images with up to 4096 × 4096 pixels. Any capture size within this limit can be specified before or after scaling.
- Video channels 4 and 5 (RZ/G2E only)
  The VIN module has two clipping circuits, which independently handle images with up to 4096 × 4096 pixels. Any capture size within this limit can be specified before or after scaling.
- Video channels 2, 3, 6, and 7 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N only)
  The VIN module has one clipping circuit, which independently handles images with up to 4096 × 4096 pixels. However, it does not support scaling.

Note: The upper limits on size clipping depend on the use case.

(9) Color Space Conversion

Color space conversion can be performed from YC to RGB or from RGB to YC. Desired conversion coefficients can be specified through registers to adjust colors.

(10) Lookup Table (LUT) Density Conversion

The lookup table (LUT) density can be converted from 10 bits to 8 bits for each pixel according to the color space conversion result.

Note: When the density conversion function is not used, the upper 8 bits of data are output.

(11) Image Data Format Conversion

To the density-converted YCbCr444 or RGB888 image data, the following data format conversions are available:

- YCbCr image data
  - Y/Cb/Cr 8-bit multiplex conversion
  - YCbCr444 → YC separation (separated into Y and CbCr components.)
  - YCbCr444 → Y component extraction
- RGB image data
  - RGB-888 → 32 bits/pixel conversion
  - RGB-888 → RGB-565 (16 bits/pixel) conversion
  - RGB-888 → ARGB-1555 (16 bits/pixel) conversion
  - RGB-888 → RGB-888 (32 bits/pixel) conversion

Note: The lookup table is common to the YCbCr and RGB formats.

(12) Memory Output Data Format

Format-converted image data can be transferred to the memory. The following shows the available formats of the data stored.

- YCbCr image data
  - Y/Cb/Cr422, 8-bit multiplexed
  - Y/Cb/Cr, 10-bit multiplexed
  - Y/Cb/Cr, 12-bit multiplexed
  - YC separation, YCbCr422, Y, 8-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr420, Y, 8-bit Cb/Cr, 8-bit multiplexed *1*2
  - YC separation, YCbCr422, Y, 10-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 12-bit Cb/Cr, 8-bit multiplexed
  - YC separation, YCbCr422, Y, 10-bit Cb/Cr, 10-bit multiplexed
  - YC separation, YCbCr422, Y, 12-bit Cb/Cr, 12-bit multiplexed
  - YC separation, Y data, 8-bit
  - YC separation, Y data, 10-bit
  - YC separation, Y data, 12-bit
- RGB image data
  - RGB-565 (16 bits/pixel)
  - ARGB-1555 (16 bits/pixel)
  - RGB-888 (32 bits/pixel)
  - ARGB-8888 (32 bits/pixel)

Notes: 1. Video channels 0, 1, 4, and 5 only support these formats.
2. When outputs are in the YCbCr420 format, disable any settings for XY scaling (scaling up and down are not available in this case).

Note: * Fix the pins at a high or low level.
— These pins are not present on the given devices.

30.1.4 Register Configuration

Table 30.10 through Table 30.13 show the VIN register configuration for each channel.

Notes: Do not write to any addresses other than listed below. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed below are undefined. The access size is no supported except for 32 bits.

* For the internal update mode, refer to the description of the VUP bit in the main control register (VnMC).

Δ: The internal update mode supports VnMC.CLP[1:0], VnMC.DPINE, VnMC.FOC, VnMC.LUTE bit only.

(1) Channels 0 and 4

Table 30.10 VIN0 and VIN4 Registers

30.1.5 Connected Module

Table 30.14 Connected Modules

Connected Modules	Function of the Connected Modules
CSI2	Input of image data
CPG	Input reset and clock stop signal
INTC	Interrupt controller

30.2 Register Description

[Legend]

—: Reserved. The write value should always be 0.

Initial value: Register value after a reset

R/W: Readable/writable. The written value can be read.

R: Read-only. The write value should always be 0.

Vn: Video channel n

30.2.1 Video n Main Control Register (VnMC)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: Availability of channels:
n = 0 to 7 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N), n = 4 to 5 (RZ/G2E)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 30	—	B'0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
29, 28	CLP[1:0]	B'00	R/W	Pixel Data Clipping When the input image data is in the YCbCr format, these bits specify the data clip value for clipping the YCbCr-RGB color conversion input data to the nominal range prescribed in the ITU-R BT.601 standard.

CLP	Luminance	Color Difference	
b'00	No clipping	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	Initial value
b'01	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	16 or a smaller value is clipped to 16. 240 or a greater value is clipped to 240.	
b'10	No clipping	16 or a smaller value is clipped to 128. 240 or a greater value is clipped to 128.	
b'11	No clipping	No clipping	

Note: These bits support the internal update mode.

27	DPINE	B'0	R/W	This bit is used to select the source of the field signal. 0: MIPI CSI-2 interfaces 1: Digital pins Note: This bit is should be set to 0 in other than the below video channels. video channels 4 and 5 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

Bit	Bit Name	Initial Value	R/W	Description
30	SCLE	B'0	R/W	This bit is used to enable or disable scaling by the UDS. 0: Disables scaling by the UDS. 1: Enables scaling by the UDS. Notes:1. This bit is only present for video channels 0, 1, 4, and 5. 2. Do not set this bit to 1 for both video channels 0 and 1 at the same time. 3. Do not set this bit to 1 for both video channels 4 and 5 at the same time.
25 to 22	—	H'0	R	Reserved This bits are always read as 0. The write value should always be 0.
21	FOC	B'0	R/W	Field Order Control This bit controls the field order for full interlace capturing. 0: Top field = Odd field (field 1) 1: Top field = Even field (field 2) Note: This bit supports the internal update mode.
20	LUTE	B'0	R/W	Lookup Table Enable This bit enables lookup table conversion from 10 bits to 8 bits. 0: LUT is not used. 1: LUT is used. Notes: 1. To perform LUT conversion, the conversion table should be set with VnLUTP and VnLUTD. 2. This bit supports the internal update mode.
19	YCAL	B'0	R/W	YCbCr-422 Input Data Alignment This bit controls data alignment for YCbCr-422 input. 0: When the multiplexed CbCr interface is set, capturing is performed with Y in the upper bits and CbCr in the lower bits. 1: When the multiplexed CbCr interface is set, capturing is performed with CbCr in the upper bits and Y in the lower bits.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	INF[2:0]	B'000	R/W	Input Interface Format These bits specify the image format input to the VIN. [Digital Pins] b'000: ITU-R BT.656 8-bit YCbCr-422 input*1 b'001: ITU-R BT.601/BT.709 8-bit YCbCr-422 input*1 b'010: ITU-R BT.656 10/12-bit YCbCr-422 input*1 b'011: ITU-R BT.601/BT.709 10/12-bit YCbCr-422 or RAW12 input*1 b'100: Prohibit b'101: ITU-R BT.601/BT.1358 16-bit YCbCr-422 input*1 b'110: ITU-R BT.601/BT.709 24-bit RGB-888 input*1 b'111: ITU-R BT.601/BT.709 18-bit RGB-666 input*1 [MIPI CSI-2] b'000: Prohibit b'001: YCbCr-422 8-bit data input*1 b'010: Prohibit b'011: YCbCr-422 10-bit data input*1 b'100: 8-bit user defined data (RAW8) or 8-bit embedded input*1 b'101: Prohibit b'110: RGB-888 data input*1 b'111: Prohibit
15, 14	DC[1:0]	B'00	R/W	Dithering Mode Control These bits select the dithering mode for conversion from RGB888 to RGB565/ARGB1565. b'00: Dithering with cumulative addition b'01: Ordered dithering b'10: Setting prohibited b'11: Setting prohibited
13, 12	EXINF[1:0]	B'00	R/W	Extension Interface Select b'00: Data extension is not performed b'01: Combined with the INF setting, 8-bit data extension is performed. b'10: Combined with the INF setting, 10-bit data extension is performed. b'11: Combined with the INF setting, 12-bit data extension is performed.
11	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	VUP	B'0	R/W	VIN Register Update Control This bit specifies the internal register update timing after writing register. See the list of registers for applicable registers. 0: The register contents are updated immediately after register writing. 1: The register contents are updated after a valid field is detected in the ITU-R BT.601 data or the field (F) bit changes in the ITU-R BT.656 data.
9 to 7	—	B'0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	EN	B'0	R/W	Endian Type This bit specifies the endian type for data to be output to external memory. 0: Image data is packed and allocated in little endian. 1: Image data is packed and allocated in big endian. Note: When allocating the YCbCr422 (UYVY format) data in big endian, be sure to set the BPSM bit in VnDMR to 1.
5	EC	B'0	R/W	Error Correction Control This bit specifies whether error correction with the parity bit is performed on the ITU-R BT.656 input. 0: Error correction is not performed on the ITU-R BT.656 input. 1: Error correction with the parity bit is performed on the ITU-R BT.656 input. Error correction must not be performed in the following cases: • When data is captured in the ITU-R BT.601 interface • When input data does not meet the standard of the ITU-R BT.656 parity bit
4, 3	IM[1:0]	B'00	R/W	Interlace Mode These bits specify the capture mode. Do not modify this setting during capture operation. b'00: Odd-field (field 1) capture mode Handles only odd fields as frames and stores them in external memory. b'01: Odd-/even-field capture mode Handles odd and even fields as separate frames and stores them in external memory. This mode is available only in continuous frame capture mode. b'10: Even-field (field 2) capture mode Handles only even fields as frames and stores them in external memory. b'11: Full interlace mode Handles combinations of odd and even fields as single frames and stores them in external memory.
2	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	BPS	B'0	R/W	Color Space Conversion Bypass Mode 0: The input YCbCr data is converted into the RGB color space and RGB data is converted into the YCbCr color space*2. 1: Color space conversion is not performed. Note: YCbCr→RGB or RGB→YCbCr conversion is performed with the coefficients specified by the YC-RGB conversion coefficient register or RGB-YC coefficient register.
0	ME	B'0	R/W	Module Enable This is the enable bit for the VIN. Set this bit before setting the Frame Capture (VnFC) register. 0: The module operation is stopped. 1: The module operation is enabled. *3

Notes: 1. Table 30.15 shows the combinations of interfaces which can be set by the input interface format (the INF bits in VnMC) and extension interface select (the EXINF bit in VnMC). Do not make the other settings.
2. Table 30.16 shows the image data which can be converted according to the color space conversion bypass mode settings (set by the BPS bit in VnMC).
3. To stop capturing operation, only set the ME bit to 0. Do not change the other bit settings.

Table 30.15 Capture Interface Settings

Interface		VnMC/EXINF	VnMC/INF
ITU-R BT.656 (multiplexed YCbCr422)	8 bits	00	000
	10 bits	00	010
	12 bits	11	010

Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
7 to 5	—	B'000	R	Reserved These bits are always read as 0. The write value should always be 0.
4, 3	FBS[1:0]	B'11	R	Frame Buffer Status These bits show the frame buffer status. b'00: The latest valid frame buffer has the base address defined by the memory base 1 register. b'01: The latest valid frame buffer has the base address defined by the memory base 2 register. b'10: The latest valid frame buffer has the base address defined by the memory base 3 register. b'11: There is no valid frame buffer. Note: When video capture is operating, this bit should be read after the FIS bit in VnINTS is set to 1.
2	FS	B'0	R	Field Status This bit shows the type of the current capture field. 0: The current field is an odd field (field 1). 1: The current field is an even field (field 2). Note: When video capture is operating, this bit should be read after the FIS bit in VnINTS is set to 1.
1	AV	B'0	R	Active Video Status This bit shows whether the current field is in the active video area defined by the pre-clipping register. 0: The current field is not in the active video area. 1: The current field is in the active video area. Note: This bit will be 0 if no input data is captured.

Bit	Bit Name	Initial Value	R/W	Description
0	CA	B'0	R	Video Capture Active Status This bit shows the current video capture operation status. This bit is updated by the captured field signal. 0: Video capture is not operating. 1: Video capture is operating. Note: In field capture mode, this bit is set to 1 even for the field that does not capture data.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CC	B'0	R/W	Continuous Frame Capture Mode This bit specifies the continuous frame capture mode. In this mode, the first capture frame is written into the memory address specified by the memory base 1 (VnMB1) register. After that, the capture operation is repeated in the order of MB2, MB3, MB1, MB2, and such. Writing 0 into this bit during continuous capture operation will immediately terminate the capture operation if the current frame is completed or it has not been captured. After the capture operation resumed by writing 1 into this bit, the memory address that first capture frame is written is depending on the value indicated by the frame buffer status (FBS[1:0]) bits in the module status (VnMS) register. 0: The continuous frame capture mode is not set. 1: The continuous frame capture mode is set. Note: When the capture is started with the SC bit set to 1 before setting this bit to 1, the first capture frame is written into the memory address specified by the memory base 2 (VnMB2) register.
0	SC	B'0	R/W	Single Frame Capture Mode This bit specifies the single frame capture mode. In this mode, the capture frame is written into the memory address specified by the memory base 1 (VnMB1) register. Immediately after this bit is set to 1, the frame buffer status (FBS) bits in MS are initialized and the SC bit is also cleared to 0. 0: The single frame capture mode is not set. 1: The single frame capture mode is set. Note: Do not set this bit to 1 when the interlace mode (IM) bits in the main control register (VnMC) are set to 01 (odd-/even-field capture mode).

Note: Do not specify the single frame capture mode and continuous frame capture mode at the same time.

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 4	IS[8:0]	All 0	R/W	Image Stride These bits specify the image stride in 16-pixel units. • When the UDS is in use: Specify a value no less than the post-clipping width (CL_HSIZE). • When the UDS is not in use: Specify a value no less than the pre-clipping width (EPPrC - SPPrC). Note: The below table describes the stride register settings for a line stride alignment to 128 bytes. This is the recommended setting and ideal for the bus performance. The minimum requirement for line stride alignment is 32 bytes. Using line stride alignments less than 128 bytes will influence the bus performance of the system.
3 to 0	—	H'0	R	Reserved bits that indicate the lower-order four bits of the image stride. These bits are always read as 0. The write value should always be 0.

Output format	Setting Unit (Pixel)	Byte / Pixel
YCbCr-422, 8 bits	64	2

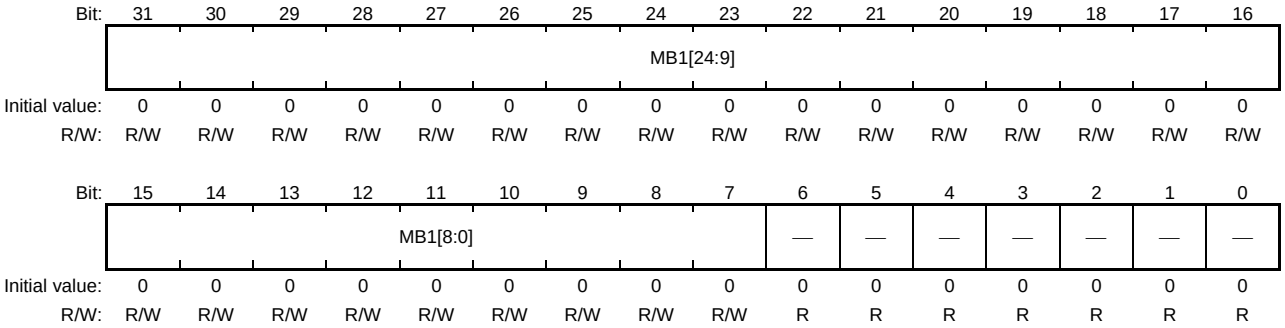
30.2.10 Video n Memory Base 1 Register (VnMB1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: Availability of channels:
n = 0 to 7 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N), n = 4 to 5 (RZ/G2E)



Bit	Bit Name	Initial Value	R/W	Description
31 to 7	MB1[24:0]	All 0	R/W	Memory Base Address 1 These bits specify the transfer start address in frame buffer 1. Specify a value for physical address bits [31:7] in units of 128 bytes. If the module is in continuous frame capture mode, this value is used as the MB1 address in the following capture sequence: MB1→ MB2 → MB3 → MB1 → MB2 → MB3. In single frame capture mode, this value is used as the capture address. Specify a memory address taking into account the image size so that the image data does not exceed an area boundary on the address map.
6 to 0	—	All 0	R	Reserved bits that indicate the lower-order seven bits of memory base address 1 (a multiple of 128 bytes). These bits are always read as 0. The write value should always be 0.

30.2.11 Video n Memory Base 2 Register (VnMB2)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

Notes: 1. This bit is reserved in RZ/G2M V1.3, RZ/G2M V3.0.

Bit	Bit Name	Initial Value	R/W	Description
31	FIE2	B'0	R/W	Field Interrupt Enable 2 This bit enables or disables INTC output for field interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: Field interrupts are disabled. 1: Field interrupts are enabled.
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
21	—/EYEE	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
			R/W	Reserved. Keep initial value. [RZ/G2H, RZ/G2N, RZ/G2E]
20	—/EUEE	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
			R/W	Reserved. Keep initial value. [RZ/G2H, RZ/G2N, RZ/G2E]
19	—/EVEE	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
			R/W	Reserved. Keep initial value. [RZ/G2H, RZ/G2N, RZ/G2E]
18	—/SEE	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
			R/W	Reserved. Keep initial value. [RZ/G2H, RZ/G2N, RZ/G2E]

Bit	Bit Name	Initial Value	R/W	Description
17	VFE	B'0	R/W	VSYNC Falling Edge Detect Interrupt Enable This bit enables or disables VSYNC falling edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYNC falling edge detect interrupts are disabled. 1: VSYNC falling edge detect interrupts are enabled.
16	VRE	B'0	R/W	VSYNC Rising Edge Detect Interrupt Enable This bit enables or disables VSYNC rising edge detect interrupts. Interrupt signals by this enable bit is asserted irrespective of whether capture is taking place. 0: VSYNC rising edge detect interrupts are disabled. 1: VSYNC rising edge detect interrupts are enabled.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	FIE	B'0	R/W	Field Interrupt Enable This bit enables or disables field-switching interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Field-switching interrupts are disabled. 1: Field-switching interrupts are enabled.
3	CEE	B'0	R/W	Correction Error Interrupt Enable This bit enables or disables interrupts due to error correction in the timing reference code (SAV/EAV) described in the ITU-R BT.656 specification. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: ITU-R BT.656 timing reference code error interrupts are disabled. 1: ITU-R BT.656 timing reference code error interrupts are enabled.
2	SIE	B'0	R/W	Scanline Interrupt Enable This bit enables or disables scanline interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: Scanline interrupts are disabled. 1: Scanline interrupts are enabled.
1	EFE	B'0	R/W	End of Frame Interrupt Enable This bit enables or disables end of frame interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: End of frame interrupts are disabled. 1: End of frame interrupts are enabled.
0	FOE	B'0	R/W	FIFO Overflow Interrupt Enable This bit enables or disables FIFO overflow interrupts. This interrupt enable setting is valid when the CA bit in VnMS is 1. 0: FIFO overflow interrupts are disabled. 1: FIFO overflow interrupts are enabled.

Notes: 1. This bit is reserved in RZ/G2M V1.3, RZ/G2M V3.0.

Bit	Bit Name	Initial Value	R/W	Description
31	FIS2	B'0	R/W	Field Interrupt Status 2 This bit shows that the field has changed. This bit is set to 1 when a valid field is detected in the ITU-R BT.601 interface or the F bit defined in ITU-R BT.656 changes. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
30 to 24	—	All 0	R	Reserved These bits are always read as 0 or 1. The write value should always be 0.
23	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
21	—/EYER	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
			R/W	Reserved. Keep initial value. [RZ/G2H, RZ/G2N, RZ/G2E]
20	—/EUER	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
			R/W	Reserved. Keep initial value. [RZ/G2H, RZ/G2N, RZ/G2E]
19	—/EVER	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
			R/W	Reserved. Keep initial value. [RZ/G2H, RZ/G2N, RZ/G2E]
18	—/SER	B'0	R	Reserved [RZ/G2M V1.3, RZ/G2M V3.0] This bit is always read as 0. The write value should always be 0.
			R/W	Reserved. Keep initial value. [RZ/G2H, RZ/G2N, RZ/G2E]

Bit	Bit Name	Initial Value	R/W	Description
17	VFS	B'0	R/W	VSYNC Falling Edge Detect Interrupt Status This bit shows that a VSYNC falling edge has been detected in the ITU-R BT.601 input. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
16	VRS	B'0	R/W	VSYNC Rising Edge Detect Interrupt Status This bit shows that a VSYNC rising edge has been detected in the ITU-R BT.601 input. After being set to 1, this bit is cleared to 0 by writing 1. Note: This bit is set to 1 irrespective of whether or not capture is taking place. Be sure to clear this bit to 0 before using it.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	FIS	B'0	R/W	Field Interrupt Status This bit shows that a field has been captured in the active capture operation. This bit is set to 1 when a valid field is detected in the ITU-R BT.601 interface or the F bit defined in ITU-R BT.656 changes. After being set to 1, this bit is cleared to 0 by writing 1.
3	CES	B'0	R/W	Correction Error Interrupt Status This bit shows that the timing reference code in the active capture operation has an error involving at least two bits. After being set to 1, this bit is cleared to 0 by writing 1. This bit is set to 1 if the EC bit in VnMC is enabled and the timing reference code has an error involving at least two bits. If a 1-bit error occurs when the EC bit is enabled, this bit is not set to 1.
2	SIS	B'0	R/W	Scanline Interrupt Status This bit shows that the number of lines specified by VnSI has been reached in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. This bit is set to 1 at the next line start timing after the value in the VnLC register matches the VnSI register setting. This timing is shown in Figure 30.12, Scanline Interrupt Status Generation Timing.
1	EFS	B'0	R/W	End of Frame Interrupt Status This bit shows that the last frame has been reached in the active capture operation. This bit is set to 1 at the end of even field (field 2). After being set to 1, this bit is cleared to 0 by writing 1.
0	FOS	B'0	R/W	FIFO Overflow Interrupt Status This bit shows that the FIFO has overflowed in the active capture operation. After being set to 1, this bit is cleared to 0 by writing 1. If the FIFO overflows, the FIFO data is overwritten by the pixel data captured after the overflow, and the resultant data is sent to the frame buffer.

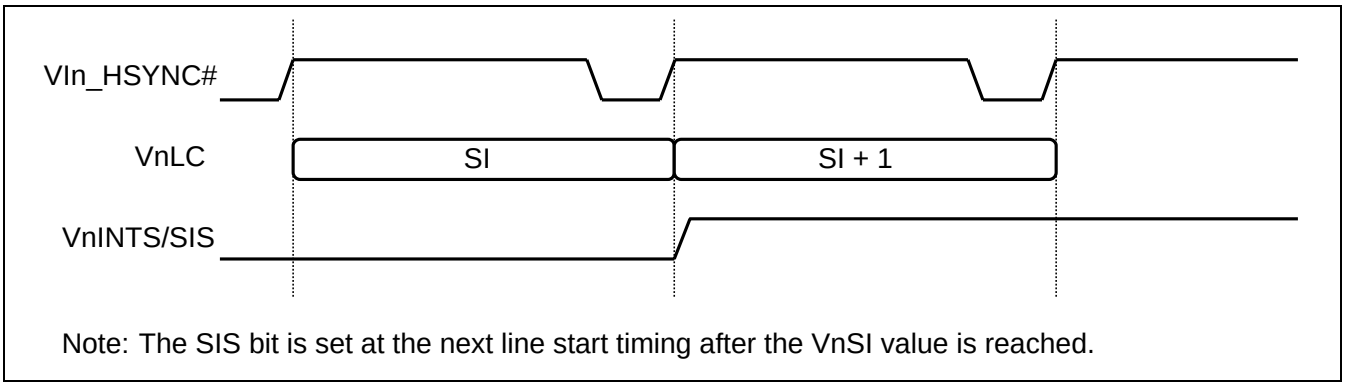

Figure 30.12 Scanline Interrupt Status Generation Timing

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SI[11:0]	All 0	R/W	Scanline Interrupt Setting These bits specify a value to be compared with the VnLC register value in each field while the SIE bit in the VnIE register is set to 1. When this value matches the VnLC register value, an interrupt signal is asserted. Note: When these bits are set to H'000, the scanline interrupt status bit (SIS) in the VnINTS is always 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	A8BIT[7:0]	All 0	R/W	Alpha 8 These bits set the alpha value for the ARGB8888 format output.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EVA	B’0	R/W	Even Field Address Offset This bit specifies the address offset of the even field (field 2) in memory in odd-/even-field capture mode. 0: Data are stored from the base address in external memory. 1: Data are stored from the base address plus the memory width in external memory.
15	—	B’0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 12	YMODE[2:0]	B’000	R/W	YC Data Transfer Mode These bits specify the transfer method of Y/CbCr when the data conversion mode (DTMD) is 10 (YC separation). b’000: Both Y and CbCr data are transferred to memory b’001: Only Y data is transferred to memory as 8-bit data b’010: 10-bit Y data is converted to 16-bit data and both Y and CbCr data are transferred to memory. b’011: 10-bit Y data is converted to 16-bit data and only Y data is transferred to memory. b’100: 12-bit Y data is converted to 16-bit data and both Y and CbCr data are transferred to memory. b’101: 12-bit Y data is converted to 16-bit data and only Y data is transferred to memory. b’110: Setting prohibited b’111: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
11	YC_THR	B'0	R/W	YC Data Through Mode Y and CbCr data are transferred to memory as 10-bit or 12-bit data according to the input format by setting this bit. 0: Y and CbCr data are transferred to memory according to YMODE[2:0] bits. 1: Y and CbCr data are transferred to memory as 10-bit or 12-bit data according to the input format.
10 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	EXRGB	B'0	R/W	Extension RGB Conversion Mode 0: RGB data extension processing is not performed. 1: Data is extended to 32-bit RGB conversion when DTMD[1:0] is set to 00 or 01 as the data conversion mode.
7 to 5	—	B'000	R	Reserved These bits are always read as 0. The write value should always be 0.
4	BPSM	B'0	R/W	Output Data Byte Swap Mode 0: Bytes are not swapped in output data. 1: Bytes are swapped in output data. Note: When YCbCr-422 data is output in big endian, data is transferred in the YUYV format in most cases. To transfer data in the UYVY format, set this bit to 1.
3	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	ABIT	B'0	R/W	Alpha Bit This bit specifies the alpha value for data in ARGB-1555 output mode. 0: The alpha value is set to 0. 1: The alpha value is set to 1.
1, 0	DTMD[1:0]	B'00	R/W	Data Conversion Mode These bits set the format for storing RGB888 or YCbCr444 data after LUT conversion, in the external memory. *1 b'00: Data is not converted. b'01: RGB is converted to ARGB before output. b'10: YC is separated before output. *2 b'11: YC is separated before output (YCbCr420 format) *3,

Notes: 1. The data conversion modes that can be set are shown in Table 30.18. Do not set any other mode that is not listed in the table. RGB and YCbCr data after LUT conversion should be set as shown in Table 30.18.
2. Do not set for any other data format except for YCbCr422; set YC separation only for YCbCr data format.
3. Do not make this setting for video channels 2, 3, 6 and 7.

Table 30.18 Data Conversion Settings

- RGB Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	Remarks
RGB-565 (16 bits/pixel) format	000	0	0	00	
RGB-888 (32 bits/pixel) format	000	1	0	00	
ARGB-1555 (16 bits/pixel) format	000	0	0	01	The alpha bit is set with the ABIT bit in VnDMR.
ARGB-8888 (32 bits/pixel) format	000	1	0	01	The alpha bit is set with the A8BIT bit in VnDMR.

- YCbCr Data Conversion Modes

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	Remarks
YCbCr-422 (8 bits) transfer	000	0	0	00	Set the BPSM bit in VnDMR to 1 to transfer in UYVY format in big endian. Make these settings if the setting of the INF[2:0] bits in VnMC is B'100.
YCbCr-422 (10 or 12 bits) transfer*	000	0	1	00	Data selection of 10-bit or 12-bit is according to the input format.
Y (8 bits)/CbCr separation transfer	000	0	0	10/11	CbCr transfer destination is determined by the VnUVAOF register setting. Setting the DTMD[1:0] bits to B'11 is only allowed for video channels 0, 1, 4, and 5.
Y (10 or 12 bits)/CbCr separation transfer*	000	0	1	10	Data selection of 10-bit or 12-bit is according to the input format.
Y (8 bits) transfer	001	0	0	10	
Y (16 bits)/CbCr separation transfer	010/100	0	0	10	CbCr transfer destination is determined by the VnUVAOF register setting.
Y (16 bits) transfer	011/101	0	0	10	

Note: If any combination of values not listed above is specified, correct operation is not guaranteed.

- 8-bit user defined data Mode

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	Remarks
RAW8 or Embedded	000	0	0	00	MIPI CSI-2 IF Only

- 12bit RAW data Mode

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ DTMD[1:0]	Remarks
RAW12	000	0	1	00	Digital Pins Interface Only

30.2.18 Video n Data Mode Register 2 (VnDMR2)

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	FPS	B'0	R/W	Field Signal Polarity Select This bit specifies the polarity of the input field signal in the ITU-R BT.601 interface. 0: 0/1 = Odd field (field 1)/Even field (field 2) 1: 0/1 = Even field (field 2)/Odd field (field 1)
30	VPS	B'0	R/W	Vsync Signal Polarity Select This bit specifies the polarity of the input vertical sync signal in the ITU-R BT.601 interface. 0: Active low 1: Active high
29	HPS	B'0	R/W	Hsync Signal Polarity Select This bit specifies the polarity of the input horizontal sync signal in the ITU-R BT.601 interface. 0: Active low 1: Active high
28	CES	B'0	R/W	Clock Enable Signal Polarity Select This bit specifies the polarity of the input clock enable signal in the ITU-R BT.601. 0: Active high 1: Active low
27	DES	B'0	R/W	Data Extension Select This bit is used to select how data are expanded to 12 bits within the VIN module. 0: Empty bits in the input data are repeatedly expanded from the highest-order bit. 1: Empty bits will be padded with zeros. This bit must be set to 1 when the YCbCr-422 interface is in use.
30 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
23	CHS	B'0	R/W	Clock Enable Hsync Select The HSYNC signal (VIn_HSYNC#) input from the pin is internally used as the clock enable signal. 0: Clock enable signal (VIn_CLKENB) input from the pin is internally used as the clock enable signal. 1: HSYNC signal (VIn_HSYNC#) input from the pin is internally used as the clock enable signal. Note: When using ITU-R BT.601, BT.709, BT.1358 interface, and the VIn_CLKENB pin is unused, the CHS bit must be set to 1.
22	YDS	B'0	R/W	YCbCr422 8-bit Data Input Pin Select This bit specifies the YCbCr422 8-bit data input pins. 0: VIn_DATA[7:0] pins 1: VIn_DATA[15:8] pins Note: This bit can only be set when the YCbCr-422 interface is in use.
21 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	FTEV	B'0	R/W	VSYNC Field Toggle Mode Enable The VSYNC field toggle mode changes the capture field signal level according to the count of input VSYNC signal assertion. As the VIN controls capture operation only when the input field signal level changes, select the VSYNC field toggle mode when capturing progressive images or MIPI CSI-2 input data. 0: The field toggle function according to the VSYNC count is disabled. 1: The field toggle function according to the VSYNC count is enabled. The period before a toggle should be specified in the VLV bits. Note: Do not set both FTEH and FTEV at the same time.
16	FTEH	B'0	R/W	HSYNC Field Toggle Counter Enable 0: The field toggle function according to the capture active line is disabled. 1: The field toggle function according to the capture active line is enabled. The period before a toggle should be specified in the HLV bits. Note: Do not set both FTEH and FTEV at the same time.
15 to 12	VLV[3:0]	H'0	R/W	VSYNC Field Toggle Mode Transition Period These bits specify the count of vertical sync signal input before the VSYNC field toggle mode is entered. After a transition to the VSYNC field toggle mode, the capture field signal is toggled every time VSYNC is input. When a change in the input field signal is detected, the toggle mode is canceled. H'0: The field signal is toggled at every VSYNC input. H'1: Toggle mode is entered after VSYNC is input once. H'2: Toggle mode is entered after VSYNC is input two times. H'3: Toggle mode is entered after VSYNC is input three times. : H'E: Toggle mode is entered after VSYNC is input 14 times H'F: Toggle mode is entered after VSYNC is input 15 times. Note: If the field signal changes while the transition period is counted, the counter is initialized.

Bit	Bit Name	Initial Value	R/W	Description
11 to 0	HLV[11:0]	H'000	R/W	HSYNC Field Toggle Count Value The HSYNC field toggle counter counts the capture active lines. If the external field signal does not change before the prespecified counter value is reached, the capture field signal is toggled. H'000: The field signal is toggled for every valid line. H'001: The field signal is toggled for every two valid lines. H'002: The field signal is toggled for every three valid lines. : H'FFF: The field signal is toggled for every 4096 valid lines. Note: For the period before a toggle, specify a value greater than one VSYNC period.

30.2.19 Video n UV Address Offset Register (VnUVAOF)

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	UVAOF[24:0]	All 0	R/W	UV Data Address Offset These bits specify the transfer offset address for the YC separation YCbCr-422 UV and YCbCr-420 UV data. Specify bits 31 to 7 of the physical address in 128-byte units. Note: The specified address should be equal to or greater than the Y transfer size. Otherwise, the overwriting of Y data occurs.
6 to 0	—	All 0	R	Reserved bits that indicate the 128-byte boundary of the UVAOF value. These bits are always read as 0. The write value should always be 0.

30.2.20 YC-RGB Conversion Coefficient Registers

YC→RGB color space conversion is performed with the following formula. Each of the coefficients can be set through the registers. Here, if 8-bit data format is set, the coefficient registers set with the YMUL, CSUB, and YSUB bits in the VnCSCC1 register, RCRMUL and GCRMUL bits in the VnCSCC2 register and GCBMUL and BCBMUL bits in the VnCSCC3 register are used to convert the color space. When 10-bit/12-bit data format is set, the YMUL2 bit in the VnCSCE1 register, CSUB2 and YSUB2 bits in the VnCSCE2 register, RCRMUL2 and GCRMUL2 bits in the VnCSCE3 register, GCBMUL2 and BCBMUL2 bits in the VnCSCE4 register are used in color space conversion.

$$R = \left[\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right] \times (Y - \left[\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right]) + \left[\begin{array}{c}VnCSCC2/\\RCRMUL[9:0]\\or\\VnCSCE3/\\RCRMUL2[13:0]\end{array}\right] \times (Cr - \left[\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right])$$

$$G = \left[\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right] \times (Y - \left[\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right]) - \left[\begin{array}{c}VnCSCC2/\\GCRMUL[9:0]\\or\\VnCSCE3/\\GCRMUL2[13:0]\end{array}\right] \times (Cr - \left[\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right]) - \left[\begin{array}{c}VnCSCC3/\\GCBMUL[9:0]\\or\\VnCSCE4/\\GCBMUL2[13:0]\end{array}\right] \times (Cb - \left[\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right])$$

$$B = \left[\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right] \times (Y - \left[\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right]) + \left[\begin{array}{c}VnCSCC3/\\BCBMUL[9:0]\\or\\VnCSCE4/\\BCBMUL2[13:0]\end{array}\right] \times (Cb - \left[\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right])$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial value.

$R = 1.164 \times (Y - 16) + 1.596 \times (Cr - 128)$

$G = 1.164 \times (Y - 16) - 0.813 \times (Cr - 128) - 0.392 \times (Cb - 128)$

$B = 1.164 \times (Y - 16) + 2.017 \times (Cb - 128)$

31	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
30	AMD	B'0	R/W	Pixel Count at Scale-Up Specifies the number of pixels generated through scale-up in the UDS. This bit setting is ignored for scale-down. 0: Pixel count after scale-up is $1 + \langle(n - 1) \times$ scale-up factor$\rangle$ 1: Pixel count after scale-up is $\langle n \times$ scale-up factor$\rangle$ Note: n: Number of pixels input to UDS
29	—	B'0	R	Reserved This bit is always read as 0. The write value should always be 0.
28	BLADV	B'0	R/W	Bilinear or Nearest Neighbor Interpolation Characteristic Control Controls the characteristics of bilinear or nearest neighbor interpolation. Setting this bit to 1 improves the aliasing characteristics at ×1/2 to 1/8 scaling (VnUDS_SCALE.VMANT/HMANT = 2 to 8). Note that the apparent resolution around edges may deteriorate. In multi-tap mode, this control is not available; to use this control, set the BC bit to 0.
27 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	BC	B'0	R/W	Pixel Component Interpolation Method at Scale-Up/Down Specifies the method for interpolating pixel components at scale-up/-down. 0: Bilinear or nearest neighbor interpolation method is used 1: Interpolation method equivalent to 4 to 17 taps in accordance with the scaling factor is used (multi-tap mode)

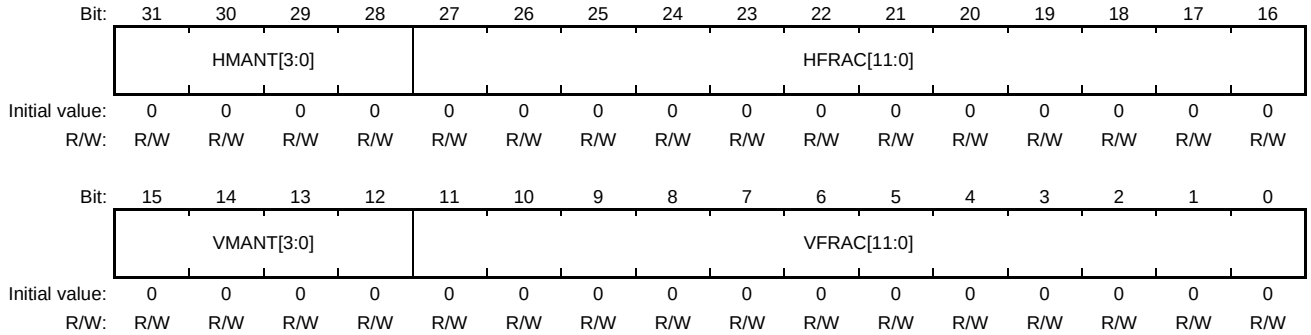
Bit	Bit Name	Initial Value	R/W	Description
19	—	B'0	R	Reserved These bits are always read as 0. The write value should always be 0.
18	NE_RCR	B'0	R/W	R/Cr Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the R/Cr component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
17	NE_GY	B'0	R/W	G/Y Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the G/Y component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
16	NE_BCB	B'0	R/W	B/Cb Interpolation Method When Bilinear/Nearest Neighbor Interpolation is Selected Specifies the interpolation method of the B/Cb component when bilinear/nearest neighbor interpolation is selected (BC = 0). 0: Bilinear method 1: Nearest neighbor method*
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: * This method can be used only when the scale-up/-down factor is 1/1 to 1/4.

30.2.21.2 Video n Scaling Factor Register (VnUDS_SCALE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Note: Availability of channels:
n = 0, 1, 4, and 5 (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N), n = 4 to 5 (RZ/G2E)



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	HMANT[3:0]	H'0	R/W	Multiplier (Integral Part) of Horizontal Scaling Factor These bits specify the integral part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 30.19.
27 to 16	HFRAC[11:0]	H'000	R/W	Multiplier (Fractional Part) of Horizontal Scaling Factor These bits specify the fractional part of the horizontal scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'800 to H'FFF can be specified when an image is upscaled (the HMANT value is 0) in the horizontal direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the HMANT value is not 0) in the horizontal direction. Select a value within the range shown in Table 30.19.
15 to 12	VMANT[3:0]	H'0	R/W	Multiplier (Integral Part) of Vertical Scaling Factor These bits specify the integral part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'0 to H'F can be specified. Select a value within the range shown in Table 30.20.
11 to 0	VFRAC[11:0]	H'000	R/W	Multiplier (Fractional Part) of Vertical Scaling Factor These bits specify the fractional part of the vertical scaling factor. The image size to be obtained changes according to this setting. Calculate an appropriate value using the formula shown later to obtain a desired image size. A value from H'556 to H'FFF can be specified when an image is upscaled (the VMANT value is 0) in the vertical direction. A value from H'000 to H'FFF can be specified when an image is downscaled (the VMANT value is not 0) in the vertical direction. Select a value within the range shown in Table 30.20.

The HMANT and HFRAC bits set the scale-up/-down factor for an image in the horizontal direction, and the VMANT and VFRAC bits set the scale-up/-down factor for an image in the vertical direction. The UDS operation switches between horizontal scale-up and horizontal scale-down according to the HMANT and HFRAC bit settings, as shown in Table 30.19. (Setting a value outside the ranges of Table 30.19 in UDS operation is prohibited). Table 30.36 and 30.20 show the settings in the horizontal and vertical directions.

Note that settings for scaling in the horizontal direction and settings for scaling in the vertical direction can be made independently. Therefore, a setting for scale-up in the horizontal direction and scale-down in the vertical direction is possible. In such a case, because the formula (described later) for obtaining the image size after scale-up/-down is different between scale-up and scale-down, a formula matching the scale-up or scale-down operation should be selected independently for the horizontal direction and vertical direction.

Table 30.19 Switching of Horizontal Scale-Up/Down Operation According to HMANT and HFRAC Bit Settings

HMANT	HFRAC	UDS Operation
H'0	H'800 to H'FFF	Scale-up
H'1	H'000	Same size (no scale-up/-down)
	H'001 to H'FFF	Scale-down
H'2 to H'F	H'000 to H'FFF	

Table 30.20 Switching of Vertical Scale-Up/Down Operation According to VMANT and VFRAC Bit Settings

VMANT	VFRAC	UDS Operation
H'0	H'556 to H'FFF	Scale-up
H'1	H'000	Same size (no scale-up/-down)
	H'001 to H'FFF	Scale-down
H'2 to H'F	H'000 to H'FFF	

Described here is the method for calculating the size of the upscaled/downscaled image that was obtained based on this register setting. First, define the variables necessary for calculating the horizontal size of the upscaled/downscaled image, as shown below.

$$hscale = \frac{4096}{4096 \times m_h + f_h}$$

m_h is the value of VnUDS_SCALE.HMANT, and f_h is the value of VnUDS_SCALE.HFRAC. This formula expresses the estimate of the scale-up/-down factor processed by the UDS. If the horizontal size of the image before scale-up/-down is set as $hsize_{org}$, the horizontal size of the image after scale-up/-down can be roughly obtained through $hsize_{org} \times hscale$.

Similarly, define the variables necessary for calculating the vertical size of the upscaled/downscaled image.

$$vscale = \frac{4096}{4096 \times m_v + f_v}$$

When setting m_v as the value of VnUDS_SCALE.VMANT, f_v as the value of VnUDS_SCALE.VFRAC, and $vsize_{org}$ as the vertical size of the image before scale-up/-down, the vertical size of the image after scale-up/-down can be roughly obtained through $vsize_{org} \times vscale$.

When the UDS performs scale-down with the settings of Table 30.19, using the variables defined so far, the horizontal size of the downscaled image $hsize_{down\_scaled}$ and the vertical size of the downscaled image $vsize_{down\_scaled}$ become as follows:

$$hsize_{down\_scaled} = \left\langle 1 + \left(\left\langle 1 + \frac{\left\langle hsize_{org} - 1 \right\rangle}{m_h'} \right\rangle - 1 \right) \times m_h' \times hscale \right\rangle$$

$$vsize_{down\_scaled} = \left\langle 1 + \left(\left\langle 1 + \frac{\left\langle vsize_{org} - 1 \right\rangle}{m_v'} \right\rangle - 1 \right) \times m_v' \times vscale \right\rangle$$

Since the division of hscale and vscale has to be executed at the end of the above formulas, respectively, formulas considering the order of operation become as follows:

$$hsize_{down\_scaled} = \left\langle 1 + \left(\left(\left\langle 1 + \frac{\left\langle hsize_{org} - 1 \right\rangle}{m_h'} \right\rangle - 1 \right) \times m_h' \times 4096 \right) \Big/ (4096 \times m_h + f_h) \right\rangle$$

$$vsize_{down\_scaled} = \left\langle 1 + \left(\left(\left\langle 1 + \frac{\left\langle vsize_{org} - 1 \right\rangle}{m_v'} \right\rangle - 1 \right) \times m_v' \times 4096 \right) \Big/ (4096 \times m_v + f_v) \right\rangle$$

The value of m_h' or m_v', which is shown in Table 30.21, changes according to the setting of VnUDS_SCALE.HMANT or VnUDS_SCALE.VMANT.

Table 30.21 m_h' or m_v' Setting

VnUDS_SCALE.HMANT Setting (VnUDS_SCALE.VMANT Setting)	m_h' (m_v')
1 to 3	1
4 to 7	2
8 to 15	4

When the UDS performs scale-up with the settings of Table 30.19 and VnUDS_CTRL.AMD is 0, the horizontal size of the upscaled image $hsize_{up\_scaled}$ and the vertical size of the upscaled image $vsize_{up\_scaled}$ become as follows:

$$hsize_{up\_scaled} = \langle 1 + (hsize_{org} - 1) \times hscale \rangle$$
$$vsize_{up\_scaled} = \langle 1 + (vsize_{org} - 1) \times vscale \rangle$$

Similar to the scale-down case, formulas considering the division of hscale and vscale become as follows:

$$hsize_{up\_scaled} = \langle 1 + \left((hsize_{org} - 1) \times 4096 \right) / (4096 \times m_h + f_h) \rangle$$
$$vsize_{up\_scaled} = \langle 1 + \left((vsize_{org} - 1) \times 4096 \right) / (4096 \times m_v + f_v) \rangle$$

When VnUDS_CTRL.AMD is 1, the horizontal size of the upscaled image $hsize_{up\_scaled}$ and the vertical size of the upscaled image $vsize_{up\_scaled}$ become as follows:

$$hsize_{up\_scaled} = \langle hsize_{org} \times hscale \rangle$$
$$vsize_{up\_scaled} = \langle vsize_{org} \times vscale \rangle$$

After considering the division of hscale and vscale, the formulas become as follows:

$$hsize_{up\_scaled} = \langle (hsize_{org} \times 4096)/(4096 \times m_h + f_h) \rangle$$
$$vsize_{up\_scaled} = \langle (vsize_{org} \times 4096)/(4096 \times m_v + f_v) \rangle$$

30.2.21.3 Video n Passband Register (VnUDS_PASS_BWIDTH)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 16	BWIDTH_H [6:0]	H'00	R/W	Horizontal Signal Passband at Image Scale-Up/Down Set these bits following the method described later.
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	BWIDTH_V [6:0]	All 0	R/W	Vertical Signal Passband at Image Scale-Up/Down Set these bits following the method described later.

The method for setting the passband in the horizontal direction of an image is described. When the VnUDS_SCALE.HMANT bits for horizontal scale-up/-down factor setting are not 0, set the BWIDTH_H bits according to the following formula. When the VnUDS_SCALE.HMANT bits are 0, set 64 in the BWIDTH_H bits.

$$BWIDTH\ H = \left\langle 64 \times \frac{4096 \times m_h'}{4096 \times m_h + f_h} \right\rangle \quad (VnUDS\_SCALE.HMANT \neq 0)$$

$$BWIDTH\ H = 64 \quad (VnUDS\_SCALE.HMANT = 0)$$

m_h is the value of VnUDS_SCALE.HMANT, and fh is the value of VnUDS_SCALE.HFRAC. For the mh' value, see Table 30.21. The method for setting the passband in the vertical direction of an image is similar to that for the horizontal direction described earlier. Since only the correspondence relationship of the registers is changed as shown below, replace the variables in the previous explanation as shown below when reading.

BWIDTH_H → BWIDTH_V

m_h' → m_v'

m_h → m_v

f_h → f_v

VnUDS_SCALE.HMANT → VnUDS_SCALE.VMANT

VnUDS_SCALE.HFRAC → VnUDS_SCALE.VFRAC

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	CL_HSIZE [11:0]	All 0	R/W	Clipping Size of Horizontal Pixel Count after Scale-Up/-Down The horizontal width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_HSIZE bits. The setting range is 4 to 2,048 in a scale-down operation (see Table 30.19) and 4 to 2,048 in a scale-up operation. These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VnUDS_SCALE register.
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	CL_VSIZE [11:0]	All 0	R/W	Clipping Size of Vertical Pixel Count after Scale-Up/-Down The vertical width of an image output from the scaling filter is adjusted (clipped or padded) to match the pixel count set in the CL_VSIZE bits. The setting range is 4 to 2,048 in a scale-down operation (see Table 30.20) and 4 to 2,048 in a scale-up operation. These bits always have to be set when using the UDS, regardless of the scale-up, scale-down, or no-scaling setting by the VnUDS_SCALE register.

Figure 30.13 shows the configuration of the UDS. The UDS consists of a scaling filter and clipping circuit, such as the configuration shown in Figure 30.13. The scaling filter and clipping circuit are independent of each other.

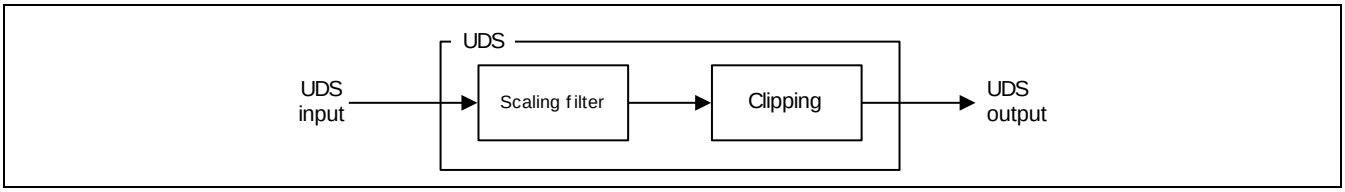

Figure 30.13 UDS Configuration

The size of the image actually output by the scaling filter (refer to section 30.2.21.2 for calculation) is determined from the size of the image input to the scaling filter and the VnUDS_SCALE setting; that is, two types of image are output by the UDS according to the relationship between the size of the image actually output from the scaling filter ($hsize_{scaled}$ and $vsize_{scaled}$) and this register setting as shown in Figure 30.14.

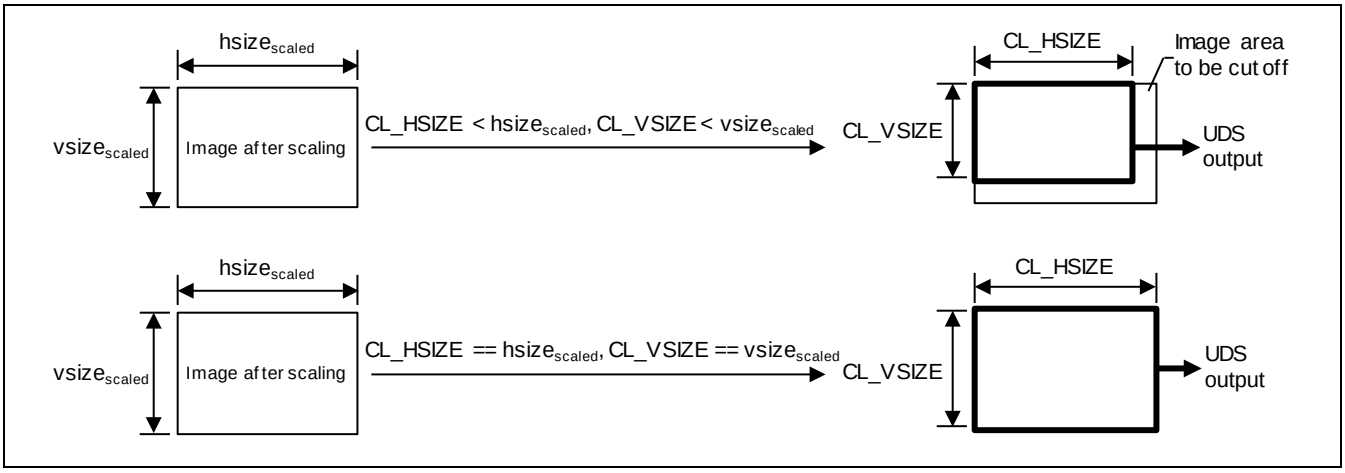

Figure 30.14 UDS Output Image for Each CL_HSIZE/VSIZE Setting

When the settings of the CL_HSIZE and CL_VSIZE bits are smaller than the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the upscaled/downscaled image is clipped to become the UDS output image.

When the settings of the CL_HSIZE and CL_VSIZE bits are equal to the horizontal and vertical pixel counts ($hsize_{scaled}$ and $vsize_{scaled}$) actually output by the scaling filter, the image actually output by the scaling filter becomes the UDS output image without change.

Do not set the CL_HSIZE and CL_VSIZE bits to values that satisfy CL_HSIZE >$hsize_{scaled}$ or CL_VSIZE > $vsize_{scaled}$.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	LTYDT[7:0]	—	R/W	Lookup Table Y Data These bits set the LUT conversion data for Y and R data after color space conversion.
15 to 8	LTCBDT[7:0]	—	R/W	Lookup Table Cb Data These bits set the LUT conversion data for Cb and G data after color space conversion.
7 to 0	LTCRDT[7:0]	—	R/W	Lookup Table Cr Data These bits set the LUT conversion data for Cr and B data after color space conversion.

Note: The 8-bit data after LUT conversion is subjected to upper shift to carry out capture control as 12-bit data.
As for reading from the VnLUTD register, the data read the second time, including dummy read, after the VnLUTP register has been set is valid.

30.2.24 RGB-YC Conversion Coefficient Registers

Color space conversion from RGB to YC is done with the following formula. Each of the coefficients can be set with the registers.

$$Y = YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP$$
$$Cb = CBCLRP \times R + CBCLGP \times G + CBCLBP \times B + CBCLAP$$
$$Cr = YCLRP \times R + YCLGP \times G + YCLBP \times B + YCLAP$$

Note: Set the coefficients for ITU-R BT.601 (8 bits) as the initial value.

$$Y = 0.257 \times R + 0.504 \times G + 0.098 \times B + 16$$
$$Cb = -0.148 \times R - 0.291 \times G + 0.439 \times B + 128$$
$$Cr = 0.439 \times R - 0.368 \times G - 0.071 \times B + 128$$

30.3 Operation

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

30.3.1 Input Interface

The VIN captures video data in the ITU-R BT.601, ITU-R BT.656, ITU-R BT.1358, or ITU-R BT.709 interface and stores it in external memory. The module has four input-interface channels. The interface and data format can be set as desired for each video channel.

The following tables show the interface and data format supported in each product and its channels.

Note: When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock of Digital pin is 100 MHz.

Table 30.22 Video Channels and Supported Interfaces (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N Channels 0 to 3)

				Channel 0	Channel 1	Channel 2	Channel 3
Input interface	MIPI CSI-2	YCbCr-422	8 bits	Supported	Supported	Supported	Supported
			10 bits	Supported	Supported	Supported	Supported
		RGB-888	24 bits	Supported	Supported	Supported	Supported
		8-bit user defined data (RAW8)	8 bits	Supported	Supported	Supported	—
		Embedded	8 bits	—	—	—	Supported
Output interface	RGB output	RGB-565	16 bits	Supported	Supported	Supported	Supported
		ARGB-1555	16 bits	Supported	Supported	Supported	Supported
		RGB-888	32 bits	Supported	Supported	Supported	Supported
		ARGB-8888	32 bits	Supported	Supported	Supported	Supported
	YCbCr output	YCbCr-422 multiplexed	8 bits	Supported	Supported	Supported	Supported
			10 bits	Supported	Supported	Supported	Supported
		YCbCr-420 separated Y/CbCr	Y: 8 bits CbCr: 8 bits	Supported	Supported	—	—
		YCbCr-422 separated Y/CbCr	Y: 8 bits CbCr: 8 bits	Supported	Supported	Supported	Supported
			Y: 10 bits CbCr: 8 bits	Supported	Supported	Supported	Supported
			Y: 10 bits CbCr: 10 bits	Supported	Supported	Supported	Supported
		YCbCr-422 separated Only Y	8 bits	Supported	Supported	Supported	Supported
			10 bits	Supported	Supported	Supported	Supported

Notes: 1. When capturing progressive images or MIPI CSI-2 input data, be sure to enable the internal field signal generation function.
2. Dithering is performed for RGB-888→RGB-565 conversion.
3. RGB data is converted and transferred to memory from the video module after 8-bit precision conversion.
4. For details of output interfaces, see section 30.3.10, Output Data Format.

Table 30.23 Video Channels and Supported Interfaces (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N Channels 4 to 7)

2. Dithering is performed for RGB-888→RGB-565 conversion.
3. RGB data is converted and transferred to memory from the video module after 8-bit precision conversion.
4. For details of output interfaces, see section 30.3.10, Output Data Format.

5. Y 12bit and CbCr 12bit and RAW12 are supported only when using the digital pin.

(1) Multiplexed YCbCr-422 Data Format in ITU-R BT.601 Interface

Data in the multiplexed YCbCr-422 format is a UYVY format (U0Y0V0Y1 format) YCbCr data. The Y, Cb, Cr image data is captured at the rising edges of the input video clock signal.

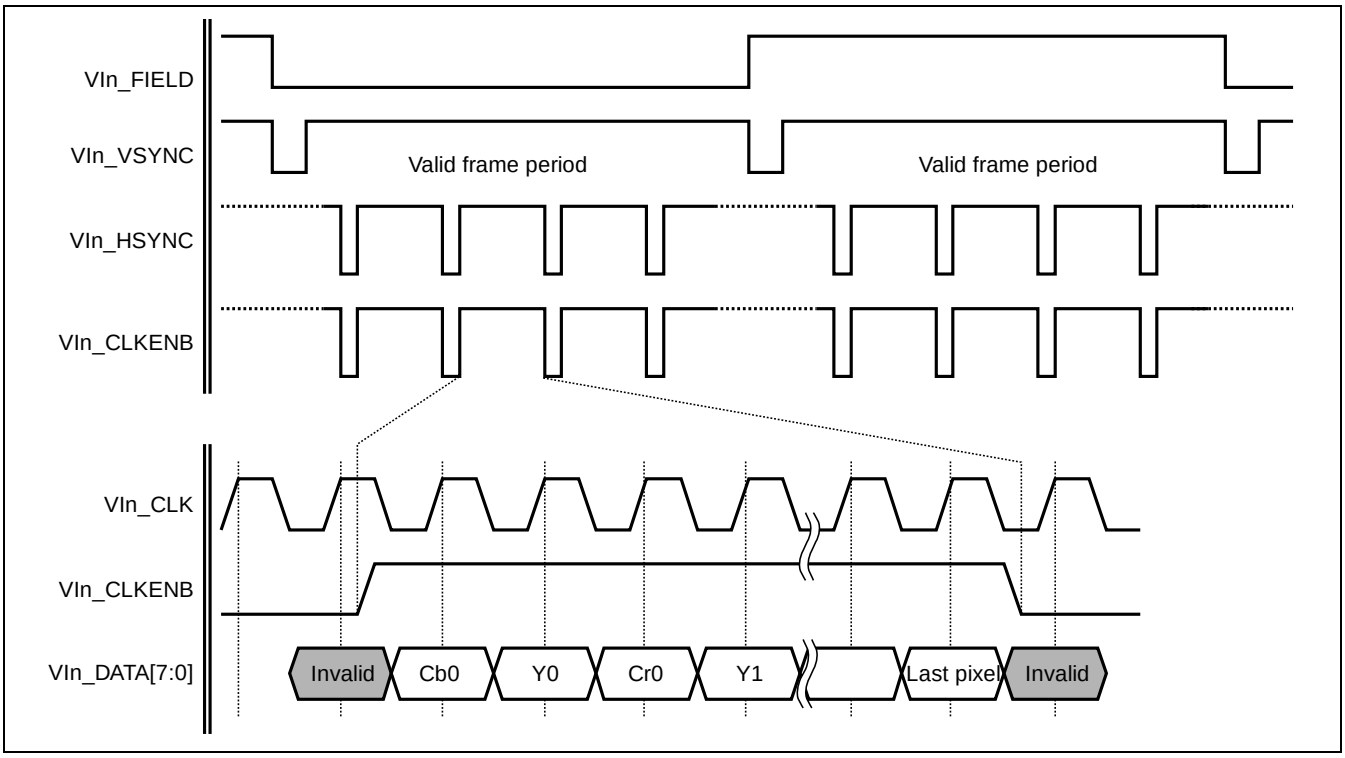

Figure 30.15 Multiplexed YCbCr-422 Data Format

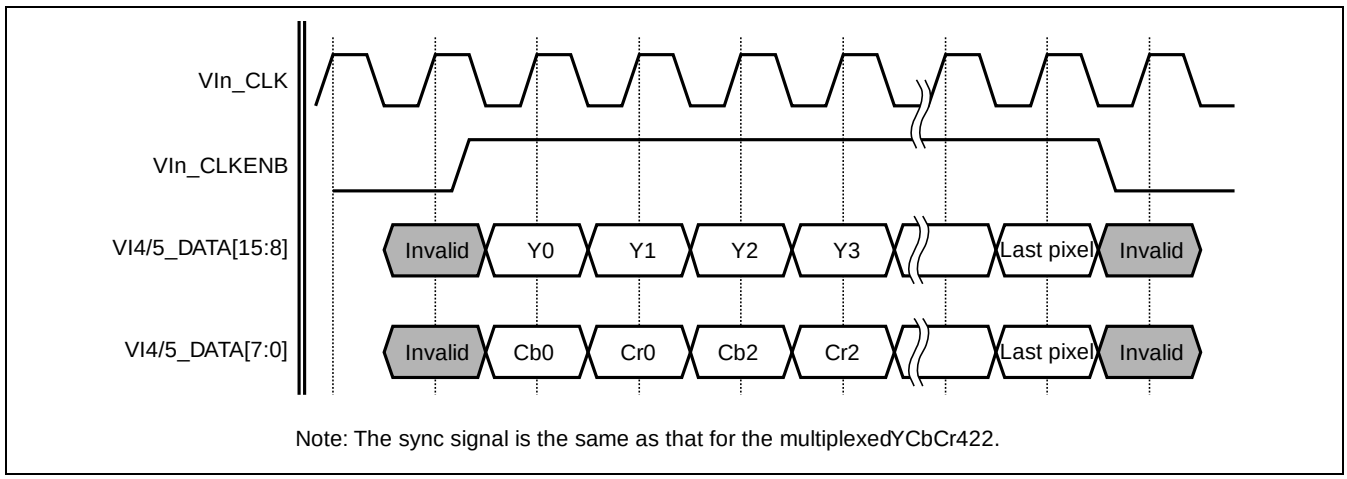
(2) CbCr Multiplexed YCbCr-422 Data Format in ITU-R BT.601/1358 Interface

Data in the CbCr multiplexed YCbCr-422 format is YCbCr data with only the CbCr data being multiplexed. The Y and CbCr image data are captured at the rising edges of the input video clock signal.

Setting the YCAL bit in VnMC to 1 enables the capturing of image data with CbCr data in the upper bits and Y data in the lower bits.



Note: The sync signal is the same as that for the multiplexedYCbCr422.

Figure 30.16 CbCr Multiplexed YCbCr-422 Data Format (Y Data in Upper Bits)

(3) RGB-666 Data Format in ITU-R BT.601 Interface

This data format can be used for the color conversion space in the RGB=4:4:4 format defined in the ITU-R BT.601 standard. The R, G, B image data are captured at the rising edges of the input video clock signal.

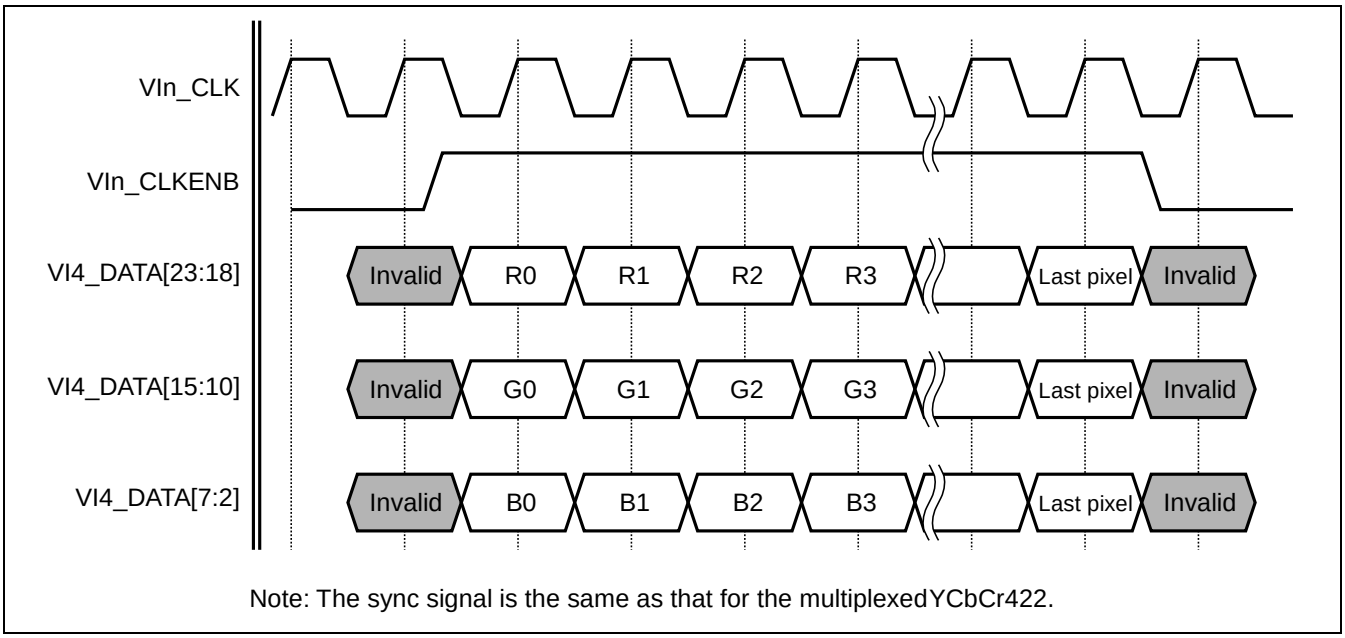


Figure 30.17 RGB-666 Data Format

(4) RGB-888 Data Format in ITU-R BT.601 Interface

This data format can be used for the color conversion space in the RGB=4:4:4 format defined in the ITU-R BT.601. The R, G, B image data are captured at the rising edges of the input video clock signal.

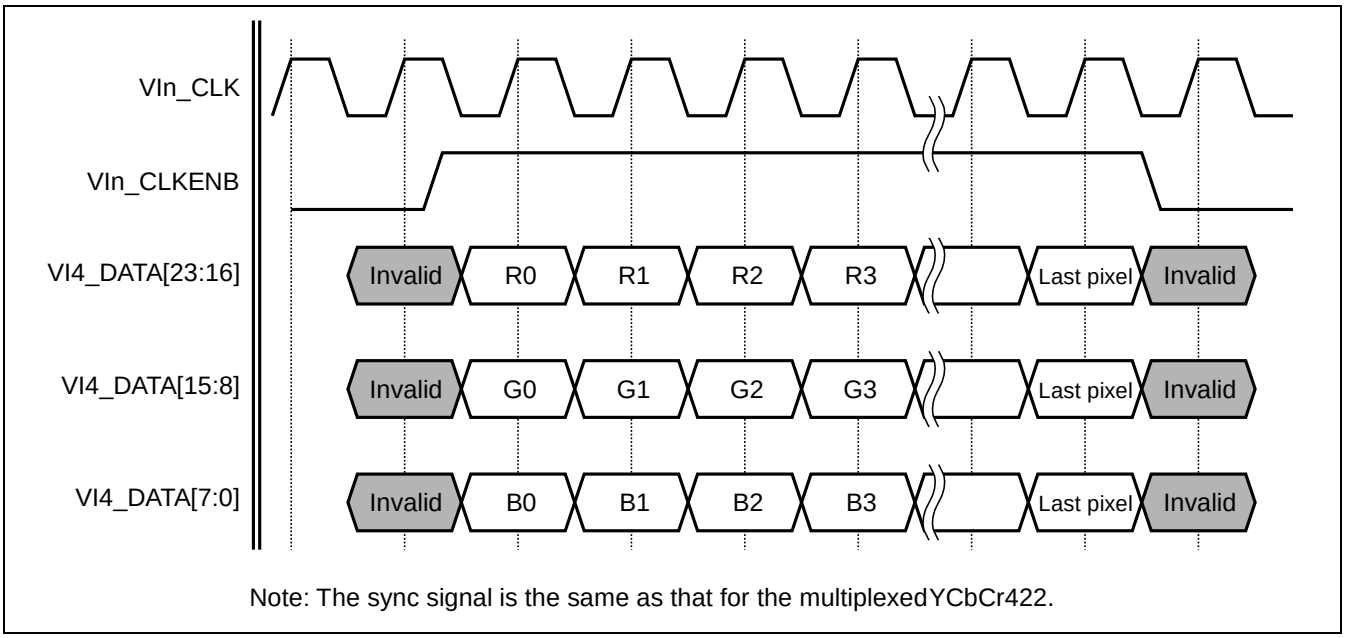

Figure 30.18 RGB-888 Data Format

(5) Multiplexed YCbCr-422 Data Format in ITU-R BT.656 Interface

In the ITU-R BT.656 interface, active data between the start of active video (SAV) and the end of active video (EAV) indicated with the timing reference code is captured.

Table 30.25 Video Timing Reference Code

VINn Image Data (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N)			First Word	Second Word	Third Word	Fourth Word (XY)	
12 bits	10 bits	8 bits					
VIn_DATA[11]	VIn_DATA[9]	VIn_DATA[7]	1	0	0	1	
VIn_DATA[10]	VIn_DATA[8]	VIn_DATA[6]	1	0	0	F	0: Field 1 / 1: Field 2
VIn_DATA[9]	VIn_DATA[7]	VIn_DATA[5]	1	0	0	V	0: elsewhere 1: Field Blanking
VIn_DATA[8]	VIn_DATA[6]	VIn_DATA[4]	1	0	0	H	0: SAV 1: EAV
VIn_DATA[7]	VIn_DATA[5]	VIn_DATA[3]	1	0	0	P3	Protection bit 3
VIn_DATA[6]	VIn_DATA[4]	VIn_DATA[2]	1	0	0	P2	Protection bit 2
VIn_DATA[5]	VIn_DATA[3]	VIn_DATA[1]	1	0	0	P1	Protection bit 1
VIn_DATA[4]	VIn_DATA[2]	VIn_DATA[0]	1	0	0	P0	Protection bit 0
VIn_DATA[3]	VIn_DATA[1]	—	1	0	0	0	
VIn_DATA[2]	VIn_DATA[0]	—	1	0	0	0	
VIn_DATA[1]	—	—	1	0	0	0	
VIn_DATA[0]	—	—	1	0	0	0	

Active data is available with the multiplexed YCbCr-422 data format in the UYVY (U0Y0V0Y1) format. In this interface, timing reference and Y, Cb, Cr image data are captured at the rising edges of the input clock signal.

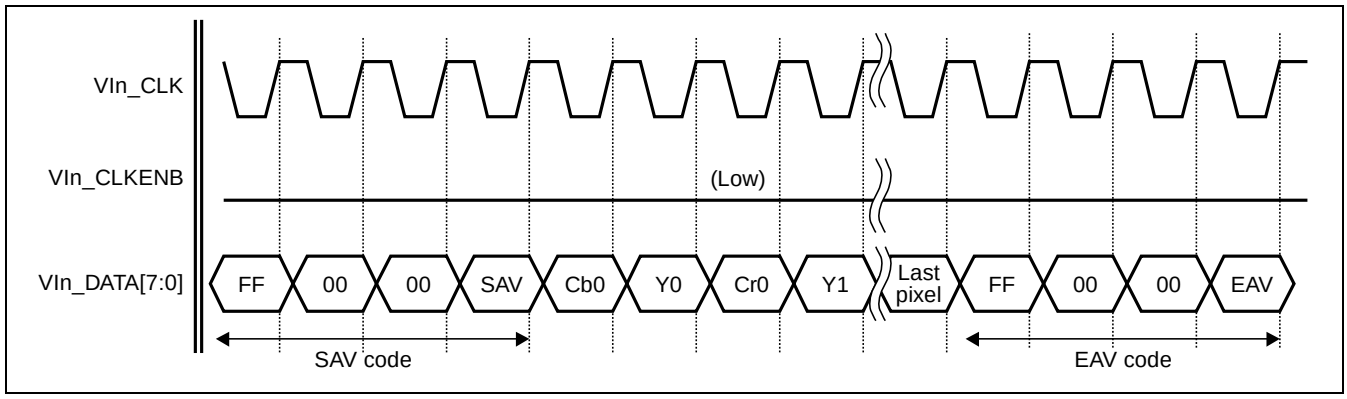

Figure 30.19 Multiplexed YCbCr-422 Data Format

Capturing is controlled based on field information. Therefore, the field signal and timing reference codes should be correct.

(6) RAW12 Data Format in ITU-R BT.601 Interface

The Pn image data is captured at the rising edges of the input video clock signal.

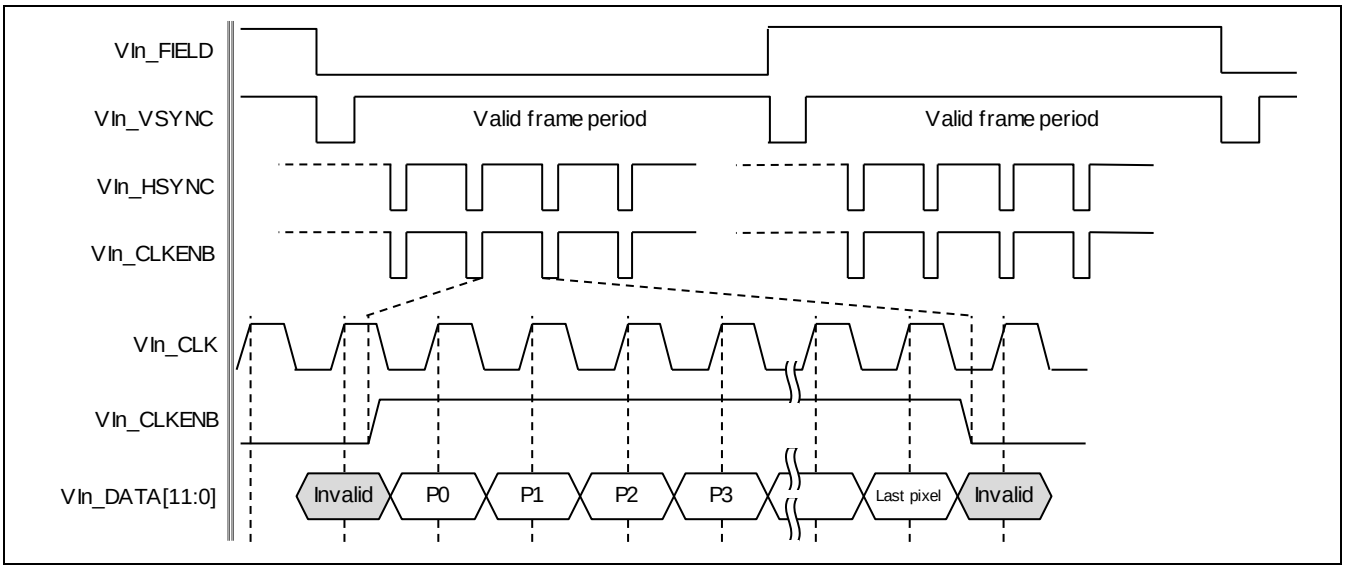

Figure 30.20 RAW12 Data Format

30.3.2 Error Correction

At the time of capturing with ITU-R BT.656, the VIN allows errors to be corrected with the timing reference code (SAV/EAV). The timing reference code (SAV/EAV) of ITU-R BT.656 has four protection bits, which can be used to correct only one-bit errors in the interface.

If the VIN cannot correct errors while the CEE bit in the interrupt enable register (VnIE) has been set to 1, an interrupt signal is generated as soon as the CES bit in the interrupt status (VnINTS) register is set. Note that no interrupt signal is generated if errors can be corrected.

30.3.3 Capture Mode

With the VIN, either of the single frame capture mode or continuous frame capture mode can be selected.

Specifying the capture field in IM bits of the main control (VnMC) register and then setting the SC bit in the frame capture (VnFC) register to 1 provides single frame capture mode. In this mode, the current frame is captured when the SC bit write timing (current scanline position) is smaller than the value of the start line pre-clip (VnSLPrC) register, or the next frame is captured in other cases. The capture data is transferred to the memory address that is set in the memory base 1 (VnMB1) register. For using single frame capture mode, necessary procedure of register setting is as followings.

1. Set 1 to the module enable (ME) bit in the main control register (VnMC).
2. Set 1 to the single frame capture mode (SC) bit in the frame capture register (VnFC).

Note: When using this setting, don't set 2'b01 to the interlace mode (IM) bits in the main control register (VnMC).

Specifying the capture field in IM bits of VnMC and then setting the CC bit of VnFC to 1 provides continuous frame capture mode, in which capture data is sequentially transferred to the addresses that are set in MB1 to MB3. In this case, the latest captured frame ID is shown in the FBS bits in the module status (VnMS) register. For using continuous frame capture mode, necessary procedure of register setting is as followings.

1. Set 1 to the module enable (ME) bit in the main control register (VnMC).
2. Set 1 to the continuous frame capture mode (CC) bit in the frame capture register (VnFC).

Note: Don't set 1 to the single frame capture mode (SC) bit and the continuous frame capture mode (CC) bit at the same time.

When the IM bits in VnMC are set to the full interlace mode, data in the capture start field is stored in every other line in the memory as the odd field (field 1) data and then data in the next field is stored as the even field (field 2) between the written lines so that the top and bottom field lines alternate with each other for interlace composition. The capture start field (top field) can be changed through the FOC bit in VnMC.

The following is a schematic diagram of capturing in full interlace mode when the odd field (field 1) is selected as the top field, the memory width is set to H'200, and VnMB1 is set to H'0000.

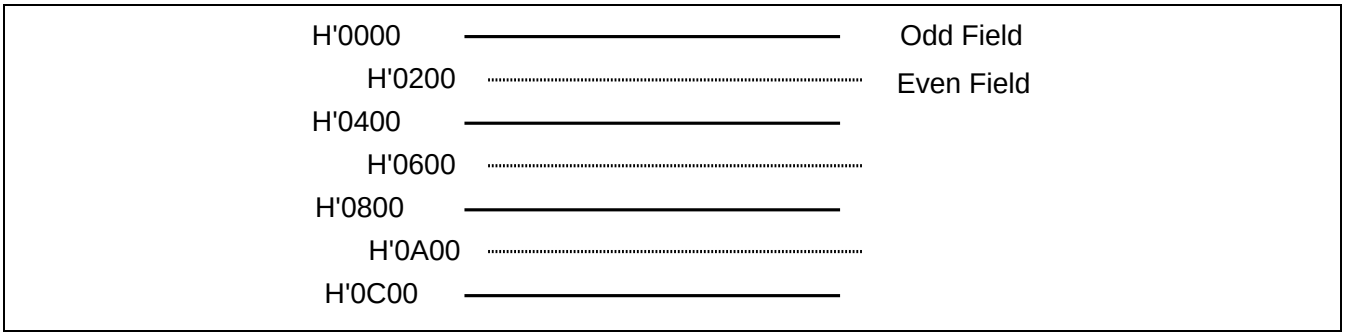

Figure 30.21 Example of Capturing Full Interlace

The VIN starts capture operation after detecting a frame signal switching in the ITU-R BT.601 or 656 interface. When capturing progressive data, in which the field signal does not change, use the internal field signal generation function to toggle the internal field signal. For details, see section 30.2.18.

30.3.4 Size Clipping

Image data that has been captured is pre-clipped according to the settings of the following registers: start line pre-clip (VnSLPrC), end line pre-clip (VnELPrC), start pixel pre-clip (VnSPPrC), and end pixel pre-clip (VnEPPrC).

For post-clipping after horizontal or vertical scaling, see section 30.2.21.5.

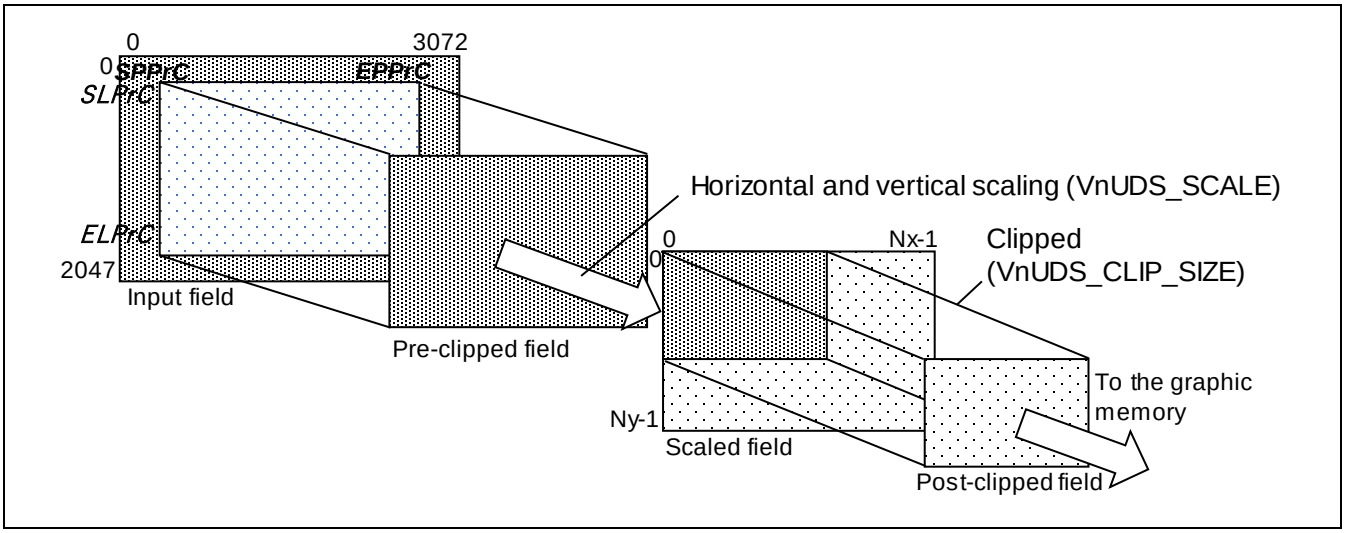

Figure 30.22 Example of Clipping

For all the post-clipped lines, the lengths of individual lines written into the memory are defined by the image stride (VnIS) register. The setting can be larger than the post-clipped frame width, but cannot be smaller than the width. The VnIS register must be filled with a value larger than the horizontal post-clipping width. The input field in the above figure shows an effective image area from the video decoder; the VIN does not allow anything exceeding the image area to be captured.

Note: Each of the following registers specifies a distance from the starting point in the effective image area: start line pre-clip (VnSLPrC), end line pre-clip (VnELPrC), start pixel pre-clip (VnSPPrC), and end pixel pre-clip (VnEPPrC). Specifically, in ITU-R BT.601, the distance is from the starting point of VIn_CLKENB (data enable); in ITU-R BT.656, the distance is from the SAV (start of active video) signal.

30.3.5 Vertical Scaling

For details on scaling in the vertical direction, see section 30.2.21.2.

30.3.6 Horizontal Scaling

For details on scaling in the horizontal direction, see section 30.2.21.2.

30.3.7 Color Conversion Function

(1) YC-RGB Color Conversion

When the data input format is YCbCr, set the BPS bit in the VnMC register to 0 to convert YCbCr data to RGB data. If an 8-bit data format is used for the capture interface, the color conversion is carried out according to the matrix coefficients set in the VnCSCC1, VnCSCC2, and VnCSCC3 registers. Otherwise, it is carried out according to the matrix coefficients set in the VnCSCE1, VnCSCE2, VnCSCE3, and VnCSCE4 registers. All of the input YCbCr data is extended to 12-bit data before carrying out color conversion.

Here, if the BPS bit in VnMC is set to 1, the data is stored in memory as it is in YCbCr format.

$$R = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times \left(Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)\right) + \left(\begin{array}{c}VnCSCC2/\\RCRMUL[9:0]\\or\\VnCSCE3/\\RCRMUL2[13:0]\end{array}\right) \times \left(Cr - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)\right)$$

$$G = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times \left(Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)\right) - \left(\begin{array}{c}VnCSCC2/\\GCRMUL[9:0]\\or\\VnCSCE3/\\GCRMUL2[13:0]\end{array}\right) \times \left(Cr - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)\right) - \left(\begin{array}{c}VnCSCC3/\\GCBMUL[9:0]\\or\\VnCSCE4/\\GCBMUL2[13:0]\end{array}\right) \times \left(Cb - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)\right)$$

$$B = \left(\begin{array}{c}VnCSCC1/\\YMUL[9:0]\\or\\VnCSCE1/\\YMUL2[13:0]\end{array}\right) \times \left(Y - \left(\begin{array}{c}VnCSCC1/\\YSUB[7:0]\\or\\VnCSCE1/\\YSUB2[11:0]\end{array}\right)\right) + \left(\begin{array}{c}VnCSCC3/\\BCBMUL[9:0]\\or\\VnCSCE4/\\BCBMUL2[13:0]\end{array}\right) \times \left(Cb - \left(\begin{array}{c}VnCSCC1/\\CSUB[7:0]\\or\\VnCSCE1/\\CSUB2[11:0]\end{array}\right)\right)$$

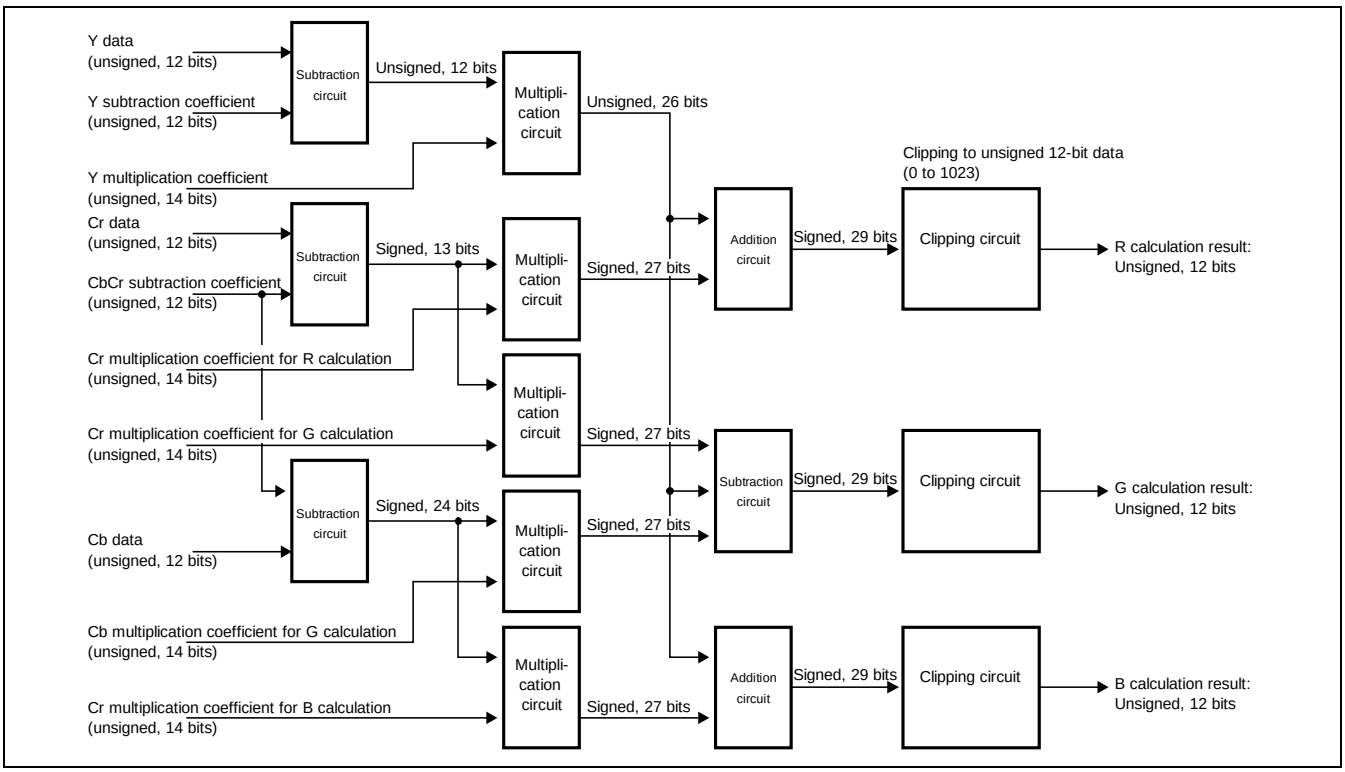

Figure 30.23 YCbCr→RGB Calculation Circuit Configuration

Examples of color space that can be set in YC-RGB conversion coefficient registers are shown below. See the register descriptions for details of the coefficients.

Table 30.26 Examples of YC-RGB Conversion Coefficient Register Settings

YC-RGB Conversion Coefficient	YMUL	YSUB	CSUB	RCRMUL	GCRMUL	GCBMUL	BCBMUL
ITU-R BT.601 (initial value) 16 ≤ Y ≤ 235, 16 ≤ Cb, Cr ≤ 240	1.164	16	128	1.596	0.813	0.392	2.017
Luminance expansion example 1 ≤ Y ≤ 254, 16 ≤ Cb, Cr ≤ 240	1.008	1	128	1.596	0.392	0.813	2.017

Specify an integer in each addition coefficient bit field. For each multiplication coefficient, specify a value obtained by multiplying the desired coefficient value by 256.

Example: When the desired multiplication coefficient is 1.164

$1.164 \times 256 = 297$ (set value: B'0100101001)

Notes: 1. In order to process the data outside the range prescribed by the ITU-R BT.601 standard, set the CLP[1:0] bits in VnMC to 11. The data is clipped to the specified value before color space conversion.
2. The YC-RGB color conversion data is unconditionally rounded to the 0 ≤ R, G, B ≤ 255 range.

(2) RGB-YC Color Conversion

When the data input format is RGB, set the BPS bit in VnMC to 0 for color conversion of RGB data into YCbCr data format. Color conversion from RGB to YCbCr is done according to the matrix coefficients set in RGB-YC conversion coefficient registers (VnYCCR1-VnYCCR3/VnCBCCR1-VnCBCCR3/VnCRCCR1-VnCRCCR3). All of the input RGB data is extended to 12-bit data before color conversion.

If 1 is set to the BPS bit in VnMC, the data will be stored in the memory as it is in RGB format.

$$Y = ((YCLRP \times R + YCLGP \times G + YCLGP \times B) \times 2^{YCLSFT}) + YCALP$$
$$Cb = ((CBCLRP \times R + CBCLGP \times G + CBCLGP \times B) \times 2^{CBCLSFT}) + CBCALP$$
$$Cr = ((CRCLRP \times R + CRCLGP \times G + CRCLGP \times B) \times 2^{CRCLSFT}) + CRCALP$$

The following data rounding functions of RGB-YCbCr color conversion function can be independently set to each pixel. The circuit configuration of Y data is given below.

Table 30.27 Data Rounding Functions of RGB-YC Color Conversion Function

Function	Symbol	Description
Sign extension enable	YEXPEN	Enables/disables signed bits of the matrix multiplication result.
Multiplication result shift down amount	YCLSFT[4:0]	Amount of shift down in the matrix multiplication result
Rounding off enable	YCLHEN	Enables/disables rounding off to the shift down amount.
Clipping enable	YCLCEN	Enables/disables data rounding process between 0 to 1023 of the output data.

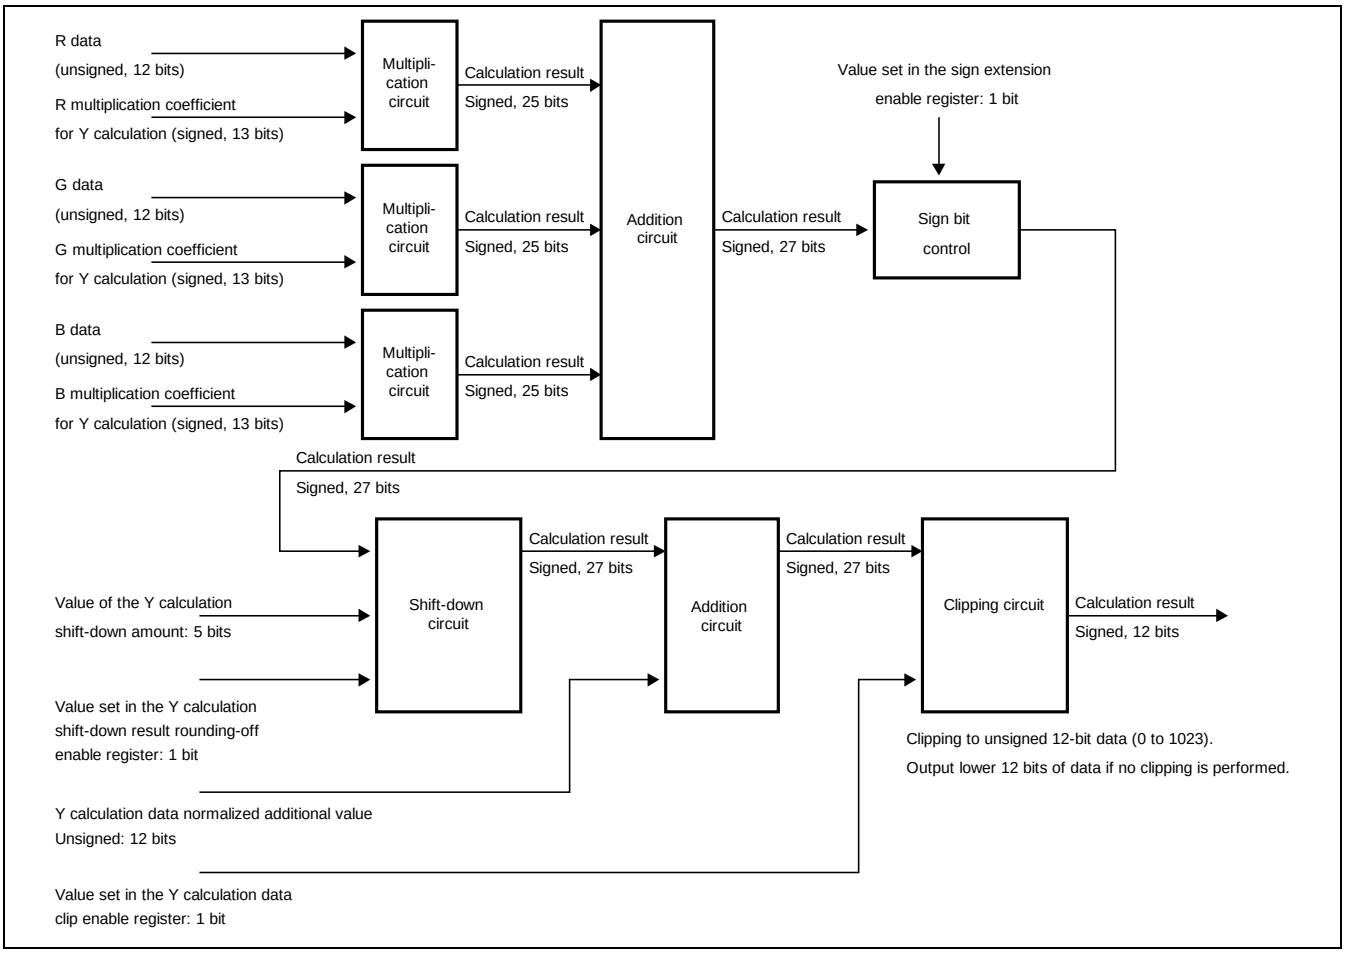

Figure 30.24 Y Data Circuit Configuration of RGB → YCbCr Color Conversion Function

30.3.8 Image Data Format Conversion Functions

(1) Lookup Table (LUT) Density Conversion Function

Set the LUTE bit in VnMC to 1 to enable table conversion of each pixel data of Y, Cb, Cr and R, G, B data after color conversion.

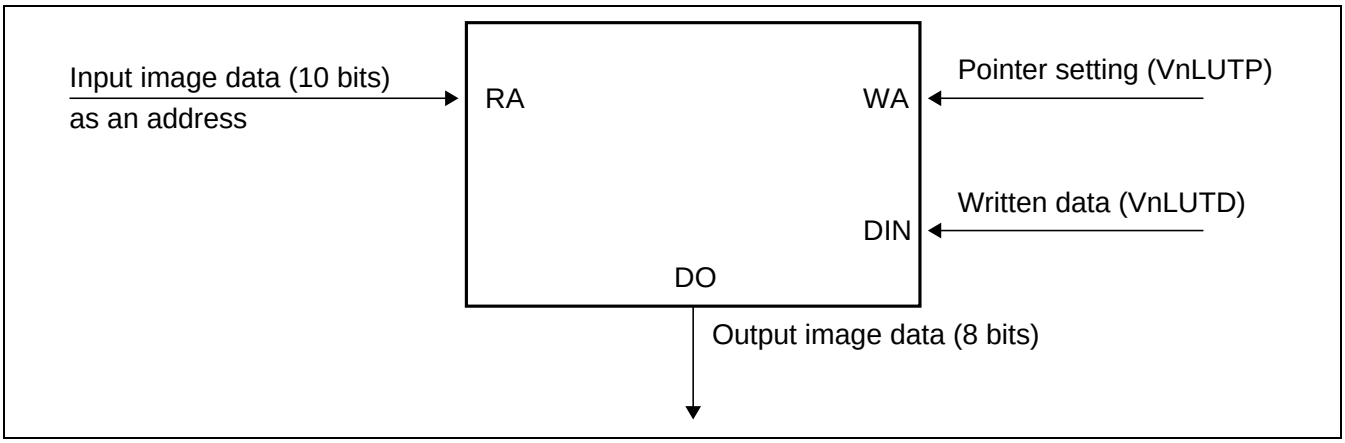

Figure 30.25 Lookup Table

Pointer Access:

The pointer is incremented every time a write access to the VnLUTD register is made.

The incremented data is read when the VnLUTP register is read. Since data is not incremented at read access, the pointer should be set just before reading.

The procedure given below must be followed to access the lookup table.

The lookup table cannot be accessed from the CPU during the conversion process.

(For write/read access to the LUT from the CPU, the LUTE bit in VnMC should be 0.)

Write access:

1. Write the access destination address in VnLUTP.
2. Write the data in VnLUTD.
   Thereby the data will be reflected in the lookup table.
   Also the pointer will automatically increase by 1.
3. Writing to VnLUTD will consecutively update the lookup table.

Read Access:

1. Write the access destination address in VnLUTP.
2. Read VnLUTD. This is dummy read; thus the read data needs to be discarded.
3. Read VnLUTD. This reading allows the address data written in VnLUTP to be acquired.

[Notes on Using the Lookup Table]

1. Set the lookup table only after capture operation has stopped.
2. Rewrite all before using the lookup table.
3. Data set to the lookup table should be within the range compatible to the input bit width.

(2) YCbCr444→YC Separation Function

When transferring YCbCr data to memory, Y data and CbCr data can be separated and transferred to different address spaces.

To perform YCbCr separation transfer, set the DTMD[1:0] bits in the VnDMR register to B'10. In this case, the Y data will be transferred to the address set in the memory base address register and CbCr data will be transferred to the address obtained by adding the value set in the VnUVAOF register to the memory base address register.

If the YMODE[2:0] bits in the VnDMR register are set to B’001 or B’011 or B’101, only Y data will be transferred to memory and CbCr data is not transferred to memory.

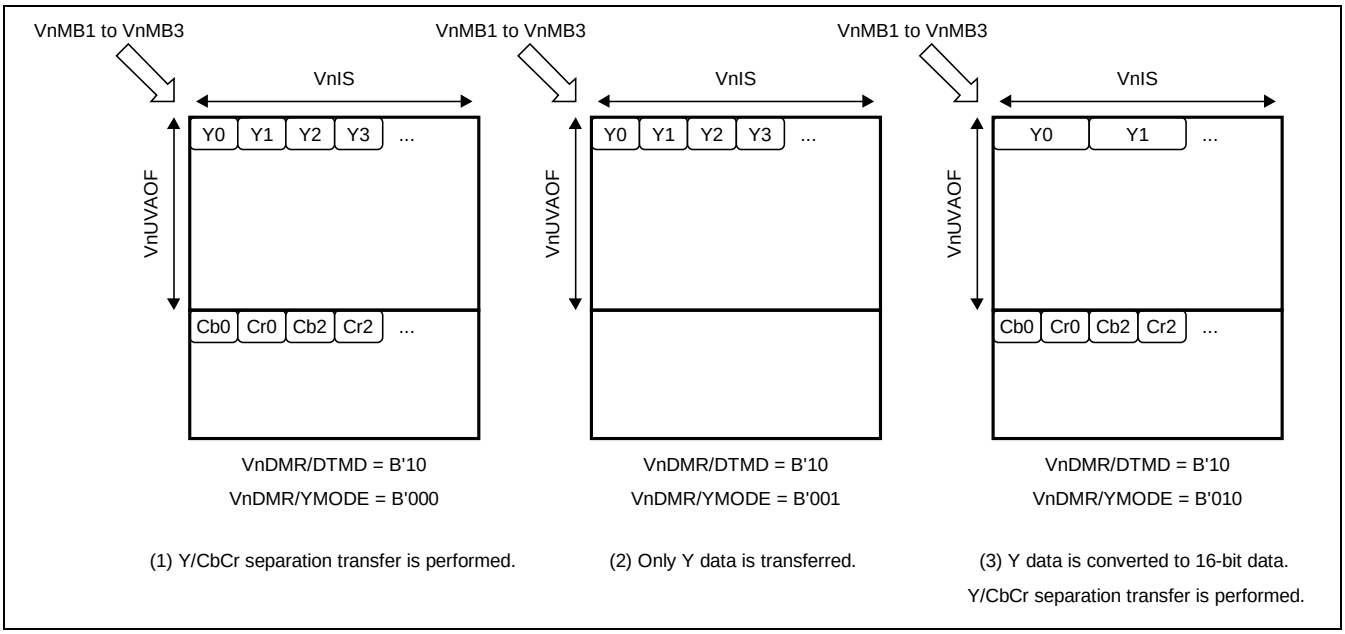

Figure 30.26 Y/Cb/Cr Separation in Big Endian

(3) Dithering Function

Dithering is performed when the internal RGB-888 format after color space conversion is converted to the RGB-565 or RGB-1555 format. The dithering mode can be selected with the DC[1:0] bits in VnMC.

(a) Dithering with Cumulative Addition

Set the DC[1:0] bits in VnMC to B'00 to perform dithering using the cumulative addition method in horizontal pixel units.

$$R_n[7:3] \leq (R_x[7:0] + R_{n-1}[2:0]) >> 3$$
$$G_n[7:2] \leq (G_x[7:0] + G_{n-1}[1:0]) >> 2$$
$$B_n[7:3] \leq (B_x[7:0] + B_{n-1}[2:0]) >> 3$$

Where:
(R_n, G_n, B_n) = Output RGB-565 pixel
(R_x, G_x, B_x) = Input RGB-888 pixel
(R_{n-1}, G_{n-1}, B_{n-1}) = Pseudo random error (LSB of the cumulative error)

(b) Ordered Dithering

Set the DC[1:0] bits in VnMC to B'01 to perform dithering using the ordered dithering method.

$$R_n[7:3] \leq (R_x[7:0] + D42_{xy}) >> 3$$
$$G_n[7:2] \leq (G_x[7:0] + D22_{xy}) >> 2$$
$$B_n[7:3] \leq (B_x[7:0] + D42_{xy}) >> 3$$

Where:
(R*n*, G*n*, B*n*) = Output RGB-565 pixel
(R*x*, G*x*, B*x*) = Input RGB-888 pixel
(D22*xy*, D42*xy*) = Input x, y coordinate dithering matrix result

$$D22 = \begin{bmatrix} 0 & 3 \\ 2 & 1 \end{bmatrix}, D42 = \begin{bmatrix} 0 & 3 & 4 & 7 \\ 2 & 1 & 6 & 5 \end{bmatrix}$$

30.3.9 Internal Field Signal Generation

As the video input module controls capture of data in interlaced mode, correct capture control is not achieved if the external field signal level does not change.

Through the internal field signal generation function, the VIN can control the capture field signal even when the input field signal does not change, such as during progressive data capturing. The following settings can be made for the internal field generation function through the FTEV and FTEH bits in the data mode register 2 (VnDMR2).

- VSYNC field toggle mode (FTEV = 1 in VnDMR2)

  When this setting is made, the VSYNC field toggle mode is entered for capture field signal control if the input field signal does not change for the VSYNC cycles specified by the VLV bits in VnDMR2. The toggle mode is canceled when a change in the external field signal level is detected (the capture operation is controlled according to the input field signal).
- HSYNC field toggle counter (FTEH = 1 in VnDMR2)

  This counter counts the capture active lines. If the external field signal does not change until the count reaches the HLV setting in VnDMR2, the capture field signal is controlled.

Notes: 1. Do not set both the FTEV and FTEH bits in VnDMR2 at the same time.
2. Immediately after cancellation of the toggle mode, capture control is skipped for one VSYNC cycle in some cases depending on the input field signal state.

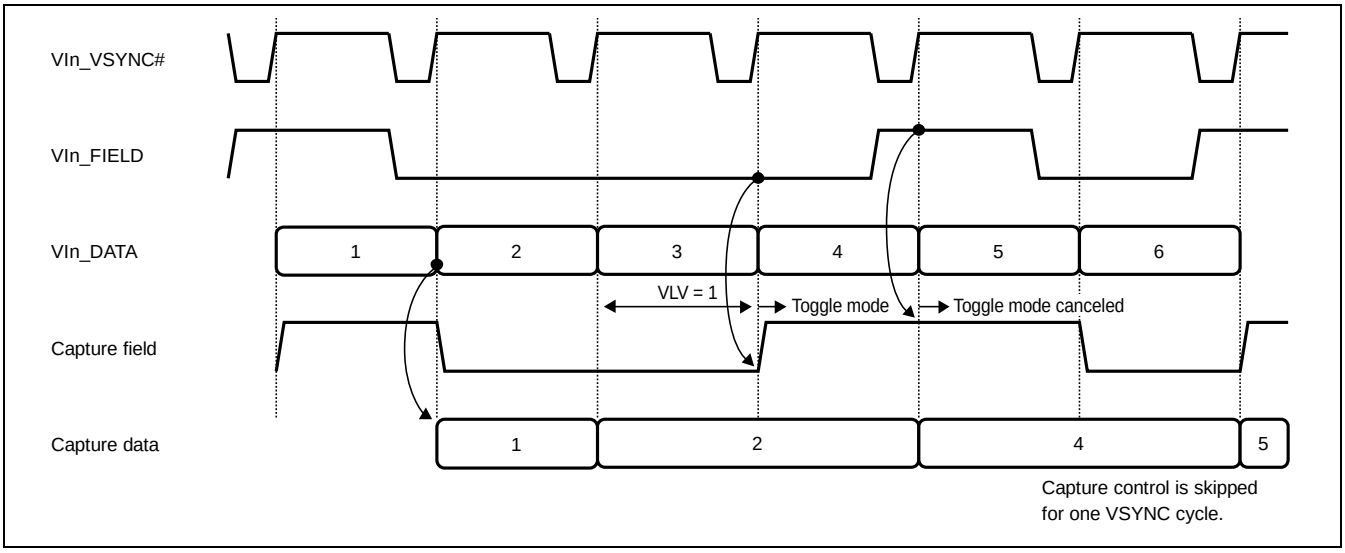

Figure 30.27 Overview and Notes of VSYNC Field Toggle Mode

30.3.10 Output Data Format

The VIN can output image data in the following formats. The figures in this section assume that data is stored in unified memory in little endian.

(1) YC: YCbCr-422, 8 bits

The 8-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below. YC data can be switched between the UYVY format and YUYV format through the BPSM bit in VnDMR.

- BPSM = 0 in VnDMR: UYVY format

8-bit YCbCr-422 data (UYVY format)

D63 to D48	63	56	55	48
Image data 3 and 4	Y3[7:0]		Cr2[7:0]	
D47 to D32	47	40	39	32
Image data 3 and 4	Y2[7:0]		Cb2[7:0]	
D31 to D16	31	24	23	16
Image data 1 and 2	Y1[7:0]		Cr0[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Y0[7:0]		Cb0[7:0]	

- BPSM = 1 in VnDMR: YUYV format

8-bit YCbCr-422 data (YUYV format)

D63 to D48	63	56	55	48
Image data 3 and 4	Cr2[7:0]		Y3[7:0]	
D47 to D32	47	40	39	32
Image data 3 and 4	Cb2[7:0]		Y2[7:0]	
D31 to D16	31	24	23	16
Image data 1 and 2	Cr0[7:0]		Y1[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	Cb0[7:0]		Y0[7:0]	

(2) YC: YCbCr-422, 10 bits

The 10-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below.

Notes: 1. This format needs to set "1" to VnDMR/YC_THR.
2. A word address is output for YCbCr data according to the VnIS register setting.

10-bit YCbCr-422 data (UYVY format)

D127 to D112	127					122	121		112
Image data 8	0	0	0	0	0	0	Y3[9:0]		
D111 to D96	111					106	105		96
Image data 7	0	0	0	0	0	0	Cr2[9:0]		
D95 to D80	95					90	89		80
Image data 6	0	0	0	0	0	0	Y2[9:0]		
D79 to D64	79					74	73		64
Image data 5	0	0	0	0	0	0	Cb2[9:0]		
D63 to D48	63					58	57		48
Image data 4	0	0	0	0	0	0	Y1[9:0]		
D47 to D32	47					42	41		32
Image data 3	0	0	0	0	0	0	Cr0[9:0]		
D31 to D16	31					30	25		16
Image data 2	0	0	0	0	0	0	Y0[9:0]		
D15 to D0	15					10	9		0
Image data 1	0	0	0	0	0	0	Cb0[9:0]		

(3) YC: YCbCr-422, 12 bits

The 12-bit YUV image data in the YC (YCbCr) = 4:2:2 format is shown below.

Notes: 1. This format needs to set "1" to VnDMR/YC_THR.
2. A word address is output for YCbCr data according to the VnIS register setting.

12-bit YCbCr-422 data (UYVY format)

D127 to D112	127			124	123	112
Image data 8	0	0	0	0	Y3[11:0]	
D111 to D96	111			108	107	96
Image data 7	0	0	0	0	Cr2[11:0]	
D95 to D80	95			92	91	80
Image data 6	0	0	0	0	Y2[11:0]	
D79 to D64	79			76	75	64
Image data 5	0	0	0	0	Cb2[11:0]	
D63 to D48	63			60	59	48
Image data 4	0	0	0	0	Y1[11:0]	
D47 to D32	47			44	43	32
Image data 3	0	0	0	0	Cr0[11:0]	
D31 to D16	31			28	27	16
Image data 2	0	0	0	0	Y0[11:0]	
D15 to D0	15			12	11	0
Image data 1	0	0	0	0	Cb0[11:0]	

(4) YC: YC Separation YCbCr-422, 8 bits

This is 8-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Y data

D31 to D16	31	24	23	16
Image data 3 and 4	Y3[7:0]		Y2[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Y1[7:0]		Y0[7:0]	

Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr2[7:0]		Cb2[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Cr0[7:0]		Cb0[7:0]	

(5) YC: YC Separation YCbCr-420, 8 bits

This is 8-bit YUV image data in the YC separated YC (YCbCr) = 4:2:0 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000, setting the DTMD[1:0] bits in VnDMR to B'11 changes the format to 4:2:0 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base.

Y data

D31 to D16	31	24	23	16
Image data 3 and 4	Y03[7:0]		Y02[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Y01[7:0]		Y00[7:0]	

Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr02[7:0]		Cb02[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Cr00[7:0]		Cb00[7:0]	

(6) YC: YC Separation YCbCr-422, Y(10 bits) / C(10 bits)

This is 10-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. This format needs to set "1" to VnDMR/YC_THR.
2. A word address is output for YCbCr data according to the VnIS register setting.

Y data (10 bits)

	63					58	57	48
D63 to D48								
Image data 4	0	0	0	0	0	0	Y3[9:0]	

	47					42	41	32
D47 to D32								
Image data 3	0	0	0	0	0	0	Y2[9:0]	

	31					30	25	16
D31 to D16								
Image data 2	0	0	0	0	0	0	Y1[9:0]	

	15					10	9	0
D15 to D0								
Image data 1	0	0	0	0	0	0	Y0[9:0]	

Cb, Cr data (10 bits)

	63					58	57	48
D63 to D48								
Image data 4	0	0	0	0	0	0	Cr2[9:0]	

	47					42	41	32
D47 to D32								
Image data 3	0	0	0	0	0	0	Cb2[9:0]	

	31					30	25	16
D31 to D16								
Image data 2	0	0	0	0	0	0	Cr0[9:0]	

	15					10	9	0
D15 to D0								
Image data 1	0	0	0	0	0	0	Cb0[9:0]	

(7) YC: YC Separation YCbCr-422, Y(12 bits) / C(12 bits)

This is 12-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV12 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'000 or B'001, setting the DTMD[1:0] bits in VnDMR to B'10 changes the format to 4:2:2 and transfers the UV data to an address which is specified by the addition of the value set in the UV address offset register (VnUVAOF) to the Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'001, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. This format needs to set "1" to VnDMR/YC_THR.
2. A word address is output for YCbCr data according to the VnIS register setting.

Y data (12 bits)

	63			60	59	48
D63 to D48						
Image data 4	0	0	0	0	Y3[11:0]	

	47			44	43	32
D47 to D32						
Image data 3	0	0	0	0	Y2[11:0]	

	31			28	27	16
D31 to D16						
Image data 2	0	0	0	0	Y1[11:0]	

	15			12	11	0
D15 to D0						
Image data 1	0	0	0	0	Y0[11:0]	

Cb, Cr data (12 bits)

	63			60	59	48
D63 to D48						
Image data 4	0	0	0	0	Cr2[11:0]	

	47			44	43	32
D47 to D32						
Image data 3	0	0	0	0	Cb2[11:0]	

	31			28	27	16
D31 to D16						
Image data 2	0	0	0	0	Cr0[11:0]	

	15			12	11	0
D15 to D0						
Image data 1	0	0	0	0	Cb0[11:0]	

(8) YC: YC Separation YCbCr-422, 10 bits

This is 10-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'010 or B'011, setting the DTMD[1:0] bits in VnDMR to B'10 converts 10-bit Y data to 16-bit and changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'011, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. A word address is output for Y data according to the VnIS register setting.
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31					30	25	16
Image data 3 and 4	0	0	0	0	0	0	Y1[9:0]	

D15 to D0	15					10	9	0
Image data 1 and 2	0	0	0	0	0	0	Y0[9:0]	

Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr2[7:0]		Cb2[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Cr0[7:0]		Cb0[7:0]	

(9) YC: YC Separation YCbCr-422, 12 bits

This is 12-bit YUV image data in the YC separated YC (YCbCr) = 4:2:2 format. UV data is supported by the NV16 format only.

If the YMODE[2:0] bits in the data mode register (VnDMR) are set to B'100 or B'101, setting the DTMD[1:0] bits in VnDMR to B'10 converts 12-bit Y data to 16-bit and changes the format to 4:2:2. UV data is transferred to the address obtained by adding the value set in the UV address offset register (VnUVAOF) to Memory Base. If the YMODE[2:0] bits in VnDMR are set to B'101, only Y data can be transferred and UV data cannot be transferred.

Notes: 1. A word address is output for Y data according to the VnIS register setting.
2. A byte address is output for CbCr data according to the VnIS register setting.

Y data

D31 to D16	31			28	27	16
Image data 3 and 4	0	0	0	0	Y1[11:0]	

D15 to D0	15			12	11	0
Image data 1 and 2	0	0	0	0	Y0[11:0]	

Cb, Cr data

D31 to D16	31	24	23	16
Image data 3 and 4	Cr2[7:0]		Cb2[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Cr0[7:0]		Cb0[7:0]	

(10) 16 Bits/Pixel: RGB-565

The RGB levels are expressed through 5 bits for R, 6 bits for G, and 5 bits for B.

16 bits/pixel data (RGB data) format

D15 to D0	15	11	10	5	4	0
Image data	R[4:0]		G[5:0]		B[4:0]	

(11) 16 Bits/Pixel: ARGB-1555

The ARGB levels are expressed through 1 bit for A, 5 bits for R, 5 bits for G, and 5 bits for B. For data conversion to ARGB-1555, the lowest bit of the G data in RGB-565 data is truncated, and the A value specified through the register is added.

Set the DTMD[1:0] bits in the data mode register (VnDMR) to B'01 to specify conversion to ARGB-1555, and specify the A value in the ABIT bit in VnDMR.

16 bits/pixel data (ARGB data) format

D15 to D0	15	14	10	9	5	4	0
Image data	A	R[4:0]		G[4:0]		B[4:0]	

(12) 32 Bits/Pixel: RGB-888

The RGB levels are expressed through 8 bits for R, 8 bits for G, and 8 bits for B. Bits 31 to 24 are fixed to 0.

32 bits/pixel data (RGB data) format

D31 to D16	31							24	23	16
Image data	0	0	0	0	0	0	0	0	R[7:0]	

D15 to D0	15	8	7	0
Image data	G[7:0]		B[7:0]	

(13) 32 Bits/Pixel: ARGB-8888

The ARGB levels are expressed through 8 bits for A, 8 bits for R, 8 bits for G, and 8 bits for B. The A value specified by the A8BIT[7:0] bits in VnDMR is set in bits 31 to 24.

32 bits/pixel data (ARGB data) format

D31 to D16	31	24	23	16
Image data	A[7:0]		R[7:0]	

D15 to D0	15	8	7	0
Image data	G[7:0]		B[7:0]	

(14) RAW: 12 bits

The 12-bit RAW image data format is shown below.

Notes: 1. This format needs to set "1" to VnDMR/YC_THR.
2. A word address is output for RAW data according to the VnIS register setting.

12-bit RAW data format

D127 to D112	127			124	123		112
Image data 8	0	0	0	0	P7[11:0]		
D111 to D96	111			108	107		96
Image data 7	0	0	0	0	P6[11:0]		
D95 to D80	95			92	91		80
Image data 6	0	0	0	0	P5[11:0]		
D79 to D64	79			76	75		64
Image data 5	0	0	0	0	P4[11:0]		
D63 to D48	63			60	59		48
Image data 4	0	0	0	0	P3[11:0]		
D47 to D32	47			44	43		32
Image data 3	0	0	0	0	P2[11:0]		
D31 to D16	31			28	27		16
Image data 2	0	0	0	0	P1[11:0]		
D15 to D0	15			12	11		0
Image data 1	0	0	0	0	P0[11:0]		

(15) RAW: 8 bits and 8-bit Embedded Data

The 8-bit RAW image data and 8-bit embedded data format are shown below.

Notes: 1. These data are transferred by 4-Byte unit.
2. A byte address is output for RAW data according to the VnIS register setting.

8-bit RAW data format

D63 to D48	63	56	55	48
Image data 7 and 8	P7[7:0]		P6[7:0]	
D47 to D32	47	40	39	32
Image data 5 and 6	P5[7:0]		P4[7:0]	
D31 to D16	31	24	23	16
Image data 3 and 4	P3[7:0]		P2[7:0]	
D15 to D0	15	8	7	0
Image data 1 and 2	P1[7:0]		P0[7:0]	

30.3.11 Endian Conversion

The VIN stores captured data in memory in little endian with the initial settings. Set the EN bit in the main control register (VnMC) to 1 to convert data into big endian before storing in memory.

Endian conversion in word units is controlled through the EN bit in VnMC, and swapping in byte units is controlled through the BPSM bit in the data mode register (VnDMR). For conversion to big endian, specify the BPSM bit as shown in the following table according to the data format specified through the DTMD bits in VnDMR and BPS bit in VnMC.

Table 30.28 Endian Conversion Unit

Data Format	BPS in VnMC	DTMD[1:0] in VnDMR	EXRGB in VnDMR	BPSM in VnDMR	Endian Conversion Unit
RGB-565	0	00	0	0	Word units
RGB-888	0	00	1	0	Longword units
YCbCr-422	1	00	0	1	Byte units
ARGB-1555	0	01	0	0	Word units
ARGB-8888	0	01	1	0	Longword units
YC	1	10	0	0	Byte units

The following figures show endian conversions in 1 byte, 2 byte, and 4 byte units.

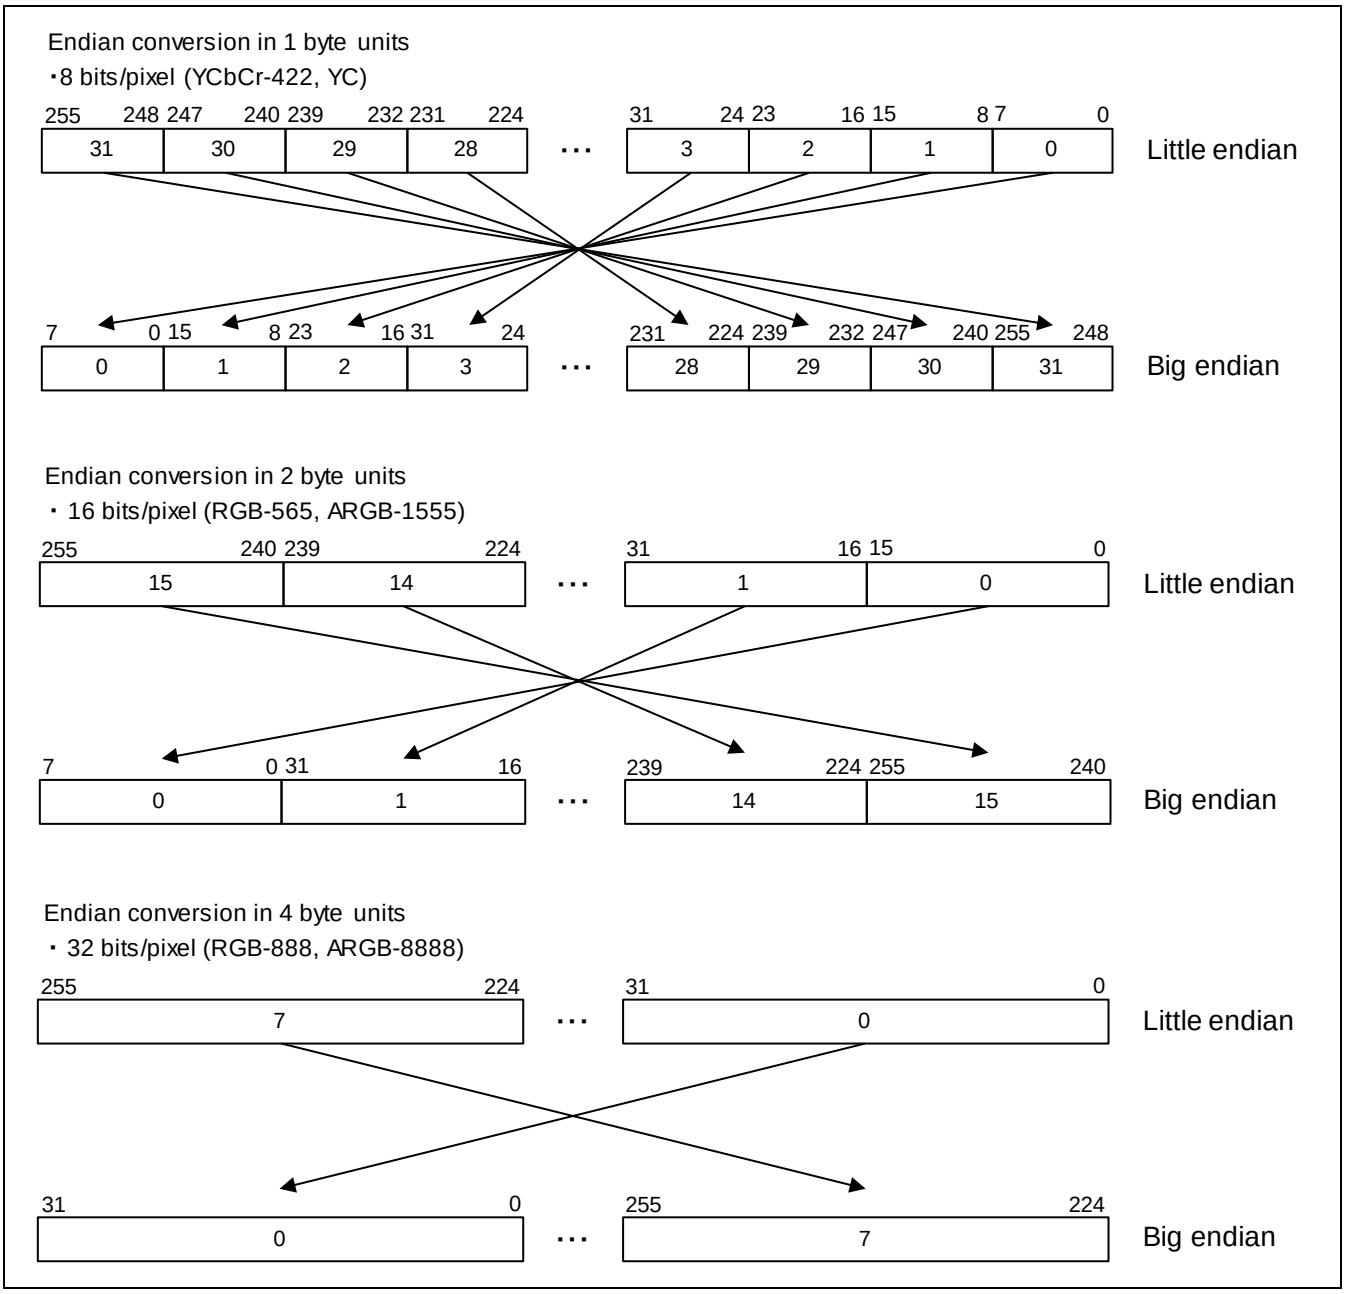

Figure 30.28 Data Alignment Conversion from Little Endian to Big Endian

30.3.12 Module Standby Mode

The LSI supports module standby mode in which clock supply to the VIN is stopped. The video input module should not be accessed during module standby mode.

30.3.13 Transition to Module Standby Mode

1. Clear the module enable (ME) bit in the main control register (VnMC) and the continuous frame capture (CC) bit and the single frame capture (SC) bit in the frame capture register (VnFC) to 0 to stop the video input module.
2. Confirm that the capture active (CA) bit in the module status register (VnMS) is cleared to 0*.
3. Stop the clock supply.

Note: * The camera device should be kept operation until the CA bit in VnMS set to 0.

30.3.14 Cancellation of Module Standby Mode and Restarting of Video Input Module

1. Start the clock supply.
2. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
3. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

30.3.15 Interrupts

The Video Input Module is capable of generating 24 interrupt(RZ/G2H, RZ/G2N).
The Video Input Module is capable of generating 8 interrupt(RZ/G2M V1.3, RZ/G2M V3.0).
The Video Input Module is capable of generating 6 interrupt(RZ/G2E).

For details, refer to section 19.

Table 30.29 Interrupt assignment

		Second Generation RZ/G Series Products			
Interrupt Name	**Cause of interrupt**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**

30.3.16 Input and Output of YCbCr-422 Format

The example of input and output of YCbCr-422 format is as followings.
The example is case which the image is input from digital pins.

(1) 10 bits (Valid data is 8bit)

(a) Input: UYVY format and Register Settings

10-bit YCbCr-422 data (UYVY format)

VIn_DATA15 to VIn_DATA0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Y1	*	*	*	*	*	*	Y1[7:0]								*	*
Cr0	*	*	*	*	*	*	Cr0[7:0]								*	*
Y0	*	*	*	*	*	*	Y0[7:0]								*	*
Cb0	*	*	*	*	*	*	Cb0[7:0]								*	*

Note: * Fix the pins at a high or low level.

Interface		VnMC/EXINF	VnMC/INF	VnMC/BPS
Multiplexed YCbCr422	10 bits	00	011	1

(b) Output: UYVY, 8 bits, format and Register Settings

8-bit YCbCr-422 data (UYVY format)

D31 to D16	31	24	23	16
Image data 1 and 2	Y1[7:0]		Cr0[7:0]	

D15 to D0	15	8	7	0
Image data 1 and 2	Y0[7:0]		Cb0[7:0]	

Format of Data Stored in Memory	VnDMR/ YMODE[2:0]	VnDMR/ EXRGB	VnDMR/ YC_THR	VnDMR/ BPSM	VnDMR/ DTMD[1:0]
YCbCr-422 (8 bits) transfer	000	0	0	0	00

(c) Output: UYVY, 10 bits, format and Register Settings

30.3.17 Initialize Procedure

The Initialization procedure of VIN is as followings.

(1) Case of inputting images from CSI-2 module

It is possible to run VIN initial procedure either before or after CSI2 initial procedure.

[VIN initial procedure]

1. Set VIN registers.
2. Set the VSYNC field toggle mode enable (FTEV) bit in the Video n data mode register 2 (VnDMR2) to 1. The VSYNC field toggle mode transition period (VLV[3:0]) bit in the VnDMR2 shall be set to 4'h0.
3. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
4. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

[CSI2 initial procedure]

1. Set the Link and PHY of CSI-2 module registers*[1].
2. Start camera device.
3. Confirm PHY of CSI-2 module starts.

(2) Case of inputting images from Digital Pins

1. Set pin function controller (PFC) registers*[2].
2. Start camera device.
3. Set SRTm bit to 1 in the software reset register n (SRCRn) of the clock pulse generator (CPG) module*[4].
4. Set SRTCLRm to 1 in software reset clearing register n (SRSTCLRn) of clock pulse generator (CPG) module*[4].
5. Set VIN registers.
6. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
7. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

(3) Case of inputting images from CSI-2 module and Digital Pins

It is possible to run VIN initial procedure either before or after CSI2 initial procedure.

[VIN initial procedure]

1. Set pin function controller (PFC) registers*[2].
2. Start camera side device of Digital Pins side.
3. Set SRTm bit to 1 in the software reset register n (SRCRn) of the clock pulse generator (CPG) module*[4].
4. Set SRTCLRm to 1 in software reset clearing register n (SRSTCLRn) of clock pulse generator (CPG) module*[4].
5. Set VIN registers.
6. Set the VSYNC field toggle mode enable (FTEV) bit in the Video n data mode register 2 (VnDMR2) to 1. The VSYNC field toggle mode transition period (VLV[3:0]) bit in the VnDMR2 shall be set to 4'h0*[3].
7. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
8. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

[CSI2 initial procedure]

1. Set the Link and PHY of CSI-2 module registers*[1].
2. Start camera device of MIPI-CSI-2 side.
3. Confirm PHY of CSI-2 module starts.

Notes: 1. For detail, see section 29.
2. For detail, see section 8.
3. This setting is necessary to the channel which input images from CSI29-2 module.
4. For detail, see section 12.

30.3.18 Capture Stop Procedure

The capture stop procedure of VIN is as followings.

(1) Case of inputting images from CSI-2 module

1. Clear the module enable (ME) bit in the main control register (VnMC) and the continuous frame capture (CC) bit and the single frame capture (SC) bit in the frame capture register (VnFC) to 0 to stop the video input module.
2. Confirm that the capture active (CA) bit in the module status register (VnMS) is cleared to 0*3.
3. Set MSTPm bit to 1 in the module stop control register n (RMSTPCRn) of the clock pulse generator (CPG) module*1.
4. Confirm that MSTPSTm bit to 1 in the module stop status register n (MSTPSRn) of the clock pulse generator (CPG) module*1.
5. Set SRTm bit to 1 in the software reset register n (SRCRn) of the clock pulse generator (CPG) module*1.
6. Reset the Link and PHY of CSI-2 module*2.
7. Stop camera device.

(2) Case of inputting images from Digital Pins

1. Clear the module enable (ME) bit in the main control register (VnMC) and the continuous frame capture (CC) bit and the single frame capture (SC) bit in the frame capture register (VnFC) to 0 to stop the video input module.
2. Confirm that the capture active (CA) bit in the module status register (VnMS) is cleared to 0*3.

(3) Case of inputting images from CSI-2 module and Digital Pins

1. Clear the module enable (ME) bit in the main control register (VnMC) and the continuous frame capture (CC) bit and the single frame capture (SC) bit in the frame capture register (VnFC) to 0 to stop the video input module.
2. Confirm that the capture active (CA) bit in the module status register (VnMS) is cleared to 0*3.
3. Set MSTPm bit to 1 in the module stop control register n (RMSTPCRn) of the clock pulse generator (CPG) module*1.
4. Confirm that MSTPSTm bit to 1 in the module stop status register n (MSTPSRn) of the clock pulse generator (CPG) module*1.
5. Set SRTm bit to 1 in the software reset register n (SRCRn) of the clock pulse generator (CPG) module*1.
6. Reset the Link and PHY of CSI-2 module*2.
7. Stop camera device of MIPI-CSI-2 side.

Notes: 1. For detail, see section 12.
2. For detail, see section 29.
3. The camera device should be kept operation until the CA bit in VnMS set to 0.

30.3.19 Capture Restarting procedure

The capture restarting procedure of VIN is as followings.

(1) Case of inputting images from CSI-2 module

It is possible to run VIN initial procedure either before or after CSI2 initial procedure.

[VIN initial procedure]

1. Set SRTCLRm to 1 in software reset clearing register n (SRSTCLRn) of clock pulse generator (CPG) module*[1].
2. Set MSTPm bit to 0 in the module stop control register n (RMSTPCRn) of the clock pulse generator (CPG) module*[1].
3. Confirm that MSTPSTm bit to 0 in the module stop status register n (MSTPSRn) of the clock pulse generator (CPG) module*[1].
4. Set VIN registers.
5. Set the VSYNC field toggle mode enable (FTEV) bit in the Video n data mode register 2 (VnDMR2) to 1. The VSYNC field toggle mode transition period (VLV[3:0]) bit in the VnDMR2 shall be set to 4'h0*[3].
6. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
7. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

[CSI2 initial procedure]

1. Set the Link and PHY of CSI-2 module registers*[2].
2. Start camera device.
3. Confirm PHY of CSI-2 module starts.

(2) Case of inputting images from Digital Pins

1. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
2. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

(3) Case of inputting images from CSI-2 module and Digital Pins

It is possible to run VIN initial procedure either before or after CSI2 initial procedure.

[VIN initial procedure]

1. Set SRTCLRm to 1 in software reset clearing register n (SRSTCLRn) of clock pulse generator (CPG) module*[1].
2. Set MSTPm bit to 0 in the module stop control register n (RMSTPCRn) of the clock pulse generator (CPG) module*[1].
3. Confirm that MSTPSTm bit to 1 in the module stop status register n (MSTPSRn) of the clock pulse generator (CPG) module*[1].
4. Set VIN registers.
5. Set the VSYNC field toggle mode enable (FTEV) bit in the Video n data mode register 2 (VnDMR2) to 1. The VSYNC field toggle mode transition period (VLV[3:0]) bit in the VnDMR2 shall be set to 4'h0*[3].
6. Set the module enable (ME) bit in the main control register (VnMC) to 1 to start the video input module.
7. Set the continuous frame capture (CC) bit or the single frame capture (SC) bit in the frame capture register (VnFC) to 1.

[CSI2 initial procedure]

1. Set the Link and PHY of CSI-2 module registers*[2].
2. Start camera device of MIPI-CSI-2 side.
3. Confirm PHY of CSI-2 module starts.

Notes: 1. For detail, see section 12.
2. For detail, see section 29.
3. This setting is necessary to the channel which input images from CSI-2 module.

30.4 Usage Notes

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

30.4.1 Specification

The following shows the specification.

Table 30.30 Specification

Item	Description
Limits on input video clock of Digital pin	The upper limit on frequency of the input video clock varies with the clock mode, capture interface and scaling ratio. The upper limits on frequency of the video clock for this module as a stand-alone unit are shown below. Usage of other modules may make reaching the upper limits impossible. Fully evaluate performance before deciding on the settings for the input video clock, particularly if you are using magnification. Upper limits on video-clock frequency is 100 MHz.
Limitation on size clipping	The upper limits on size clipping depends on the use case.
ITU-R BT.709 interface	When the ITU-R BT.709 interface is in use, the maximum frequency of the video clock of Digital pin is 100 MHz.
Capture in progressive mode	Use the internal field signal generation function in combination with an input interface in progressive mode. For details, see section 30.2.18.
Input from MIPI CSI-2 interface	In the input of progressive image through the MIPI CSI-2 interface, use this together with the VSYNC field toggle mode function. For detail, see section 30.2.18.
Limitation on register update	If a register is updated during capture, data captured immediately after the register update cannot be guaranteed. To update a register which supports the internal update mode as shown in Table 30.10 to Table 30.13, VIN Registers, specify an internal update for VIN registers by using the MC/VUP bit. To update other registers, stop capture operation and then update them.
Field capture mode image quality	Images of odd-numbered, odd/even-numbered and even-numbered fields, captured by VnMC/IM interlace mode bit settings, contain every other line from the input interlace images. Therefore, note that the horizontal resolution for video display is in units of fields.
Full interlace mode image quality	In full interlace composition mode, horizontal stripe noise (such as combing noise) is generated in composite images as fields based on different timelines are combined in memory due to the interlacing method.
Limitation on horizontal scaling	When scaling-up is used, horizontal size that can be input is up to 2048 pixel. When scaling-down is used, horizontal size that can be output is up to 2048 pixel.
Interrupt event timing	Interrupt event asserted by this module indicates the time when an interrupt event occurs in VIN, not the time when the transfer of capture data to memory is completed.
Pixel post-clip setting	Even if the output format is YCbCr-422, pixel post-clip is performed according VnUDS_CLIP_SIZE setting. For that reason, if the CL_HSIZE clipping size is an odd number, the Cr data of the rightmost two pixels is not output to memory. Therefore, if the output format is YCbCr-422, set the CL_HSIZE clipping size to even number. Note that the clipping size must not be set to a value larger than the size of the output image.
Coefficient settings for color space conversion	Specify appropriate values in the color space change coefficient 1 to 3 registers (VnCSCC1 to VnCSCC3) to keep the RGB image data within the range $0 \leq R', G', B' \leq 255$. After calculation for color space conversion, minus pixel data is normalized to 0 and pixel data more than or equal to 255 is normalized to 255.
Scaling up	When horizontal and vertical scaling up is specified, the amount of memory transfer becomes greater with an increase in traffic. Note the amount of traffic on the entire system when using the scaling-up function because the overall transfer efficiency of the system might degrade due to the increased use of the internal buses.

Item	Description
YC Restrictions on YC separation function	Set the offset register that stores UV data (VnUVAOF) such that the storage areas of Y and UV data are not the same. If the same storage area is set for both data, Y data will be overwritten.
RGB-888→RGB-565 conversion function	In the dithering process by cumulative addition, if the same color is captured as in blue back image, periodic noise may be generated by the cumulative addition process (carried by addition). In this case, set the DC[1:0] bits in VnMC to the ordered dithering.
Video display operation	This module performs capture control based on the external input synchronization signal. Note that it is not synchronous to the timing of frame update set in the Display Unit and thus video display in sync with the capture frame is disabled.

Item	Description
The maximum size that can be captured when the HSYNC signal is connected to the VIn_CLKENB pin (including the case where the CHS bit of the VnDMR2 register is set to 1).	
Hbp: Horizontal back porch period
Hw: Horizontal valid pixels
Vbp: Vertical back porch period
Vw: Vertical valid lines

Capture area when the HSYNC signal is connected to the VIn_CLKENB pin

When the ITU-R BT.601/709/1358 interface is in use, so the HSYNC signal is connected to the VIn_CLKENB pin (including the case where the CHS bit of the VnDMR2 register is set to 1), the VIN also captures data during the horizontal and vertical back porch periods (Hbp and Vbp). Thus, capturing only the valid data is required by setting the clipping registers as shown below.

- VnSLPrC (start line pre-clip register) = vertical back porch period (Vbp)
- VnELPrC (end line pre-clip register) = vertical back porch period (Vbp) + number of valid lines (Vw) – 1
- VnSPPrC (start pixel pre-clip register) = horizontal back porch period (Hbp)
- VnEPPrC (end pixel pre-clip register) = horizontal back porch period (Hbp) + number of valid pixels (Hw) – 1

The maximum number of lines and pixels that can be captured at this time is as shown below. When this size is exceeded, use the VIN with the data enable signal connected to the VIn_CLKENB pin.

- The maximum number of lines that can be captured = 4096 (the maximum value of the clipping register) – vertical back porch period (Vbp)
- The maximum number of pixels that can be captured = 4096 (the maximum value of the clipping register) – horizontal back porch period (Hbp)

Note: The horizontal back porch period unit shall be the followings.

Capture data	Horizontal back porch period unit
YCbCr-422 data	2 pixels
RGB data	2 pixels
RAW data	4 pixels

Item	Description
Limits on input format	When the two channels use the digital pins, there are limits on input format.

30.4.2 Limitations on Usage

The VIN does not operate correctly in some cases depending on the usage. The following shows cases that require attention.

Table 30.31 Limitations on Usage

Item	Description
Limitation on vertical scaling	For vertical scaling and full interlace composition, the capture lines are inverted in some cases depending on the scaling ratio because the scaling processing is applied before interlace composition in memory. Be sure to evaluate the image quality before practical application.
Image Stride setting	When outputting the NV16 format and NV12 format, set value of 32pixel unit to the image stride (IS) bit in the image stride register (VnIS).
Limitation of when YUV420 format is output	When YUV420 format is output, upper limits on the horizontal clip size is 2048 pixel.
Bus QoS setting [RZ/G2M V1.3]	When vertical scaling up is used, the bus QoS shall be set as the below according output format. RGB-888 : more than or equal to 1.6Gbyte/s YCbCr-422 8bit : more than or equal to 800Mbyte/s

31. Video Decoding Processor for inter-device video transfer (iVDP1C)

RZ/G2H RZ/G2M V1.3 RZ/G2M V3.0 RZ/G2N RZ/G2E

31.1 Overview

The iVDP1C is a low-latency video decoder which provides high definition, high fidelity capabilities of H.264/AVC and JPEG standards. Require software or the library to RENESAS for operating this module.

Figure 31.1 shows iVDP1C and related module for RZ/G2M V1.3. iVDP1C connects to FCPCI.

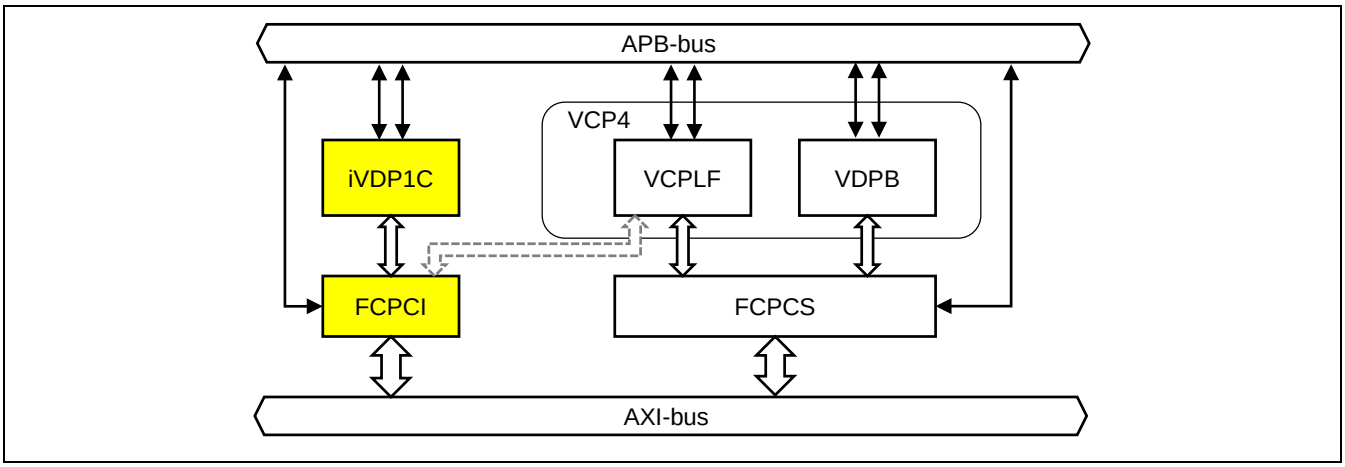

Figure 31.1 iVDP1C and related modules for RZ/G2M V1.3

Figure 31.2 and Figure 31.3 show iVDP1C and related modules (Figure 31.2 for RZ/G2H, and RZ/G2M V3.0, Figure 31.3 for RZ/G2N and RZ/G2E). iVDP1C connects FCPCS, and shares it with VCPLF and VDPB. All video codec modules, iVDP1C, VCPLF, and VDPB need to work exclusively. However, a pixel processing unit of all codec modules for RZ/G2H, RZ/G2M V3.0 and RZ/G2N have twice the performance as codec modules for RZ/G2M V1.3. So, the performance of iVDP1C for RZ/G2H, RZ/G2M V3.0, and RZ/G2N is same as iVDP1C for RZ/G2M V1.3. Note that a performance of variable length code processing unit for RZ/G2H, RZ/G2M V3.0, and RZ/G2N doesn't change from RZ/G2M V1.3. A performance beyond the RZ/G2M V1.3 cannot be realized with RZ/G2H, RZ/G2M V3.0, and RZ/G2N. For detail performance of each product, refer maximum pixel rate in section 31.1.1.

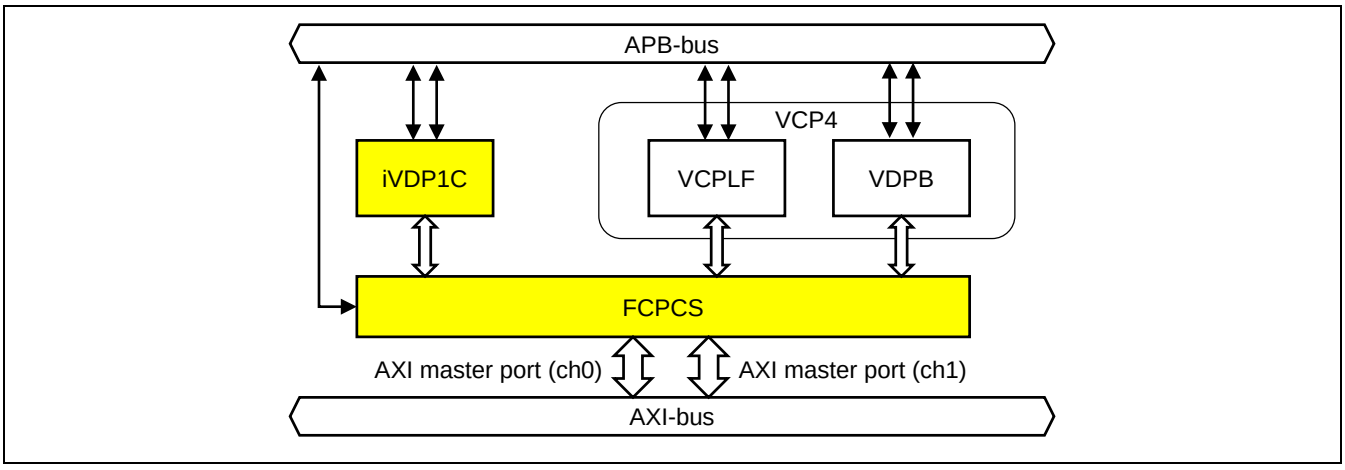

Figure 31.2 iVDP1C and related modules for RZ/G2H, and RZ/G2M V3.0

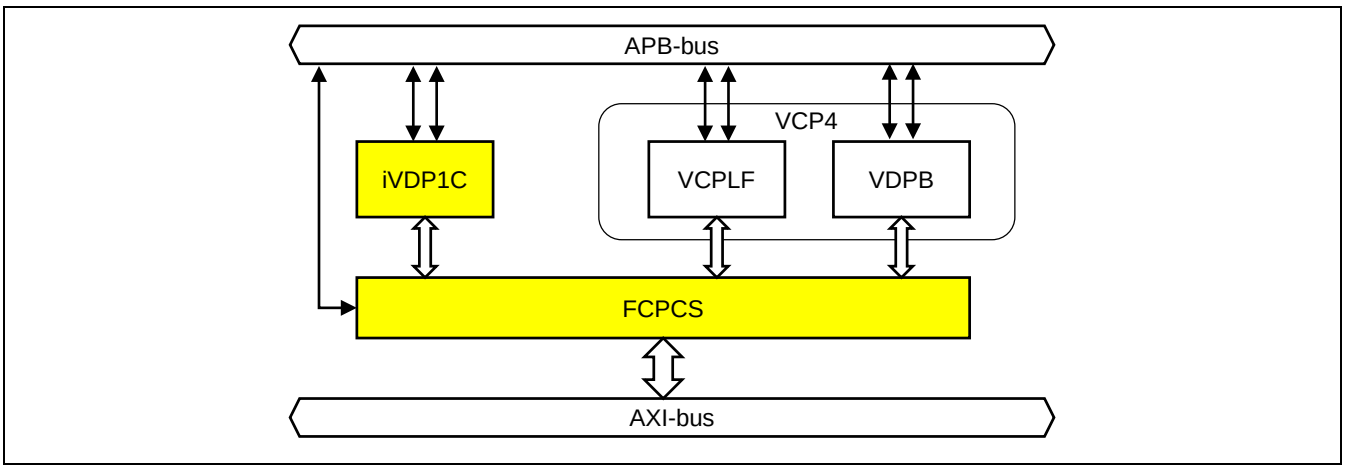

Figure 31.3 iVDP1C and related modules for RZ/G2N and RZ/G2E

The iVDP1C is connected memory bus via companion module FCPCI or FCPCS. For detail information, refer section 35. Note that lossless image compression for reference picture by FCPCI or FCPCS is supported if bit depth of image is 8 bits and color format is YCbCr 4:2:0.

Note that the VCPLF, multi-codec decoder and encoder module, for RZ/G2M V1.3 may connect to FCPCI. In this case, the iVDP1C isn't able to operate at all. For more information, refer to section 32.

31.1.1 Features

The iVDP1C has the following features.

- Support for H.264/AVC and JPEG with 8/10/12-bit depth
- Low-latency decoding
- Support 1920 × 1080 resolution
- Data handling on a picture-by-picture basis

Table 31.1 Main Function of the iVDP1C

Item	Description
Decoding standard supported	• H.264/AVC Baseline Profile@Level 5 (The arbitrary slice order, flexible macroblock order and redundant slice aren't supported), Constrained Baseline Profile@Level 5, High Profile@Level 5, Main Profile@Level 5, Constrained High Profile@Level 5, Progressive High Profile@Level 5, High 10 Profile@Level 5, High 10 Intra Profile @Level 5, High4:2:2 Profile@Level 5, High4:2:2 Intra Profile @Level 5, High4:4:4 Predictive Profile (*1), High4:4:4 Intra Profile (*1) MBAFF, PICAFF, B-Slice are supported in case of 8-bit depth and YCbCr 4:2:0 format. Note: 1. Only 12-bit depth samples is supported tool in this profile. • H.264/MVC Stereo High Profile@Level 4.1 • JPEG Baseline process (*2), Extended DCT-based processes (*3) Notes: 2. Supported function is limited as follows: DCT-based process, 8-bit depth samples, Sequential, Huffman coding (2 AC and 2 DC tables), 3 components, interleaved single scan, 4:2:0 and 4:2:2 color format. 3. Only 12-bit depth samples is supported tool in this profile.
Maximum pixel rate	**RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** 1280 × 960p × 120 fps, or 1920 × 1080p × 60 fps **RZ/G2E** 1280 × 960p × 30 fps (if VPC4 is used) 1280 × 960p × 60 fps, or 1920 × 1080p × 30 fps (if VPC4 is not used) This indicates the decoding performance including both display picture and non-display picture.
Maximum bit rate	**RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** 40 Mbps × 4 streams or 160 Mbps × 1 stream **RZ/G2E** 10 Mbps × 4 streams or 40 Mbps × 1 stream (if VCP4 is used) 20 Mbps × 4 streams or 80 Mbps × 1 stream (if VCP4 is not used) Note that these streams assume constant bit rate.
Picture size supported	Minimum size: Horizontal 80 pixels × Vertical 80 lines Maximum size: Horizontal 1920 pixels × Vertical 1088 lines Horizontal size is a multiple of 8 pixels, and vertical size is a multiple of 8 lines. 320 × 180 and 854 × 480 (WVGA+) are supported.
Color format	YCbCr 4:2:0 semi-planar (Y and C plan) and YCbCr 4:2:2 semi-planar Cb/Cr and Cr/Cb interleaving order is supported.
Bit stream format	Video elementary stream as shown in Table 31.2. Function to remove the emulation prevention byte in the H.264 bit stream is supported. Function to remove the zero byte which is inserted by byte stuffing in the JPEG bit stream is supported.
Picture structure	Frame structure and field structure

Table 31.2 Data Handled by the iVDP1C

Standard	Decoding Range
H.264	Slice header (other than the first slice header in picture) and subsequent data
JPEG	MCU data

31.1.2 Connected Module

Table 31.3 shows modules connected to the iVDP1C.

Table 31.3 Connected Module

Module	Connected Module	Description
iVDP1C	FCPCI	RZ/G2M V1.3 only has this module. Reference data read cache, lossless data compression and decompression
	FCPCS	Reference data read cache, lossless data compression and decompression For RZ/G2M V1.3, iVDP1C doesn't connect to FCPCS. For RZ/G2H, RZ/G2N, RZ/G2M V3.0, and RZ/G2E, FCPCS is shared by VDPB, VCPLF, and iVDP1C.

31.2 Usage Notes

31.2.1 Limitations on Software Reset, Module Standby and power-shutoff

Before executing following operations for iVDP1C, confirm that iVDP1C is not decoding a picture. If iVDP1C is decoding a picture, wait completion of decoding.

- Execute Software Reset by CPG
- Enter Module Standby (stop clock supply) by CPG
- Enter power-shutoff status (stop power supply) by SYSC

31.2.2 Note on input bitstream for decoding

In decoding process of iVDP1C, input bitstream not conformant to video codec standard might cause hang of iVDP1C.

32. Video Codec Processor (VCP4)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

32.1 Overview

The VCP4 is a multi-codec module set which provides encoding and decoding capabilities on the basis of multiple video coding schemes, e.g., H.265/HEVC, H.264/AVC. Require software or the library to RENESAS for operating this module.

The VCP4 consists of following two codec IP cores.

1. VDPB: H.265/HEVC decoder
2. VCPLF: Multi-codec decoder and encoder

Figure 32.1 and Figure 32.2 show VCP4 and related modules for RZ/G2M V1.3. There are two configurations when iVDP1C is used or not.

If iVDP1C is used, VCPLF can only connects to FCPCS. VDPB and VCPLF share FCPCS (Figure 32.1), and need to work exclusively.

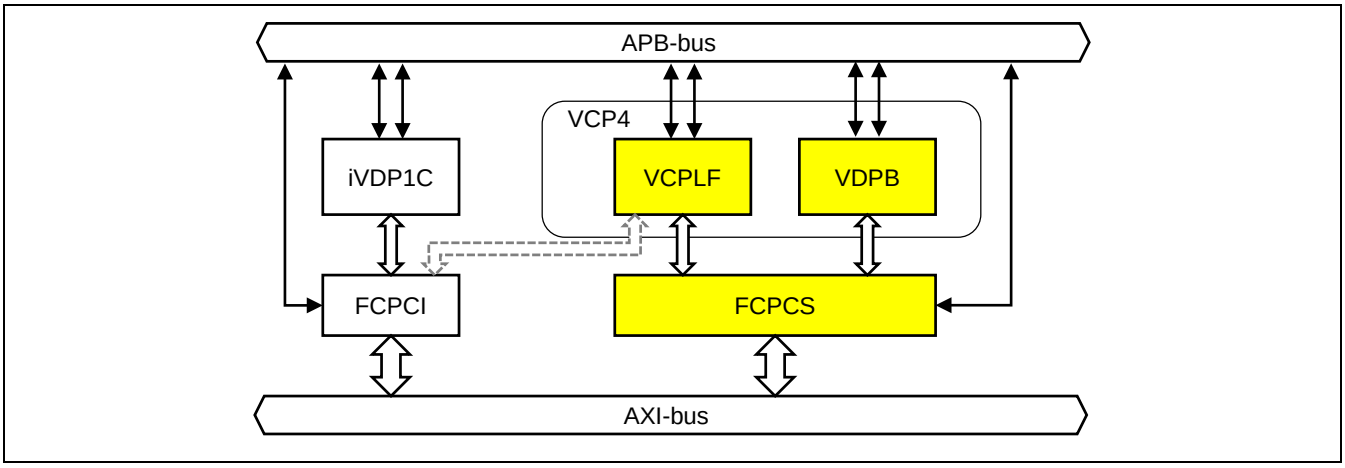

Figure 32.1 VCP4 and related modules for RZ/G2M V1.3, in Case that VCPLF Connects to FCPCS

On the other hand, if iVDP1C isn't used, VCPLF can connect to FCPCI. VDPB and VCPLF can operate simultaneously (Figure 32.2). Note that all related IPs shall stop the operation to switch the configuration.

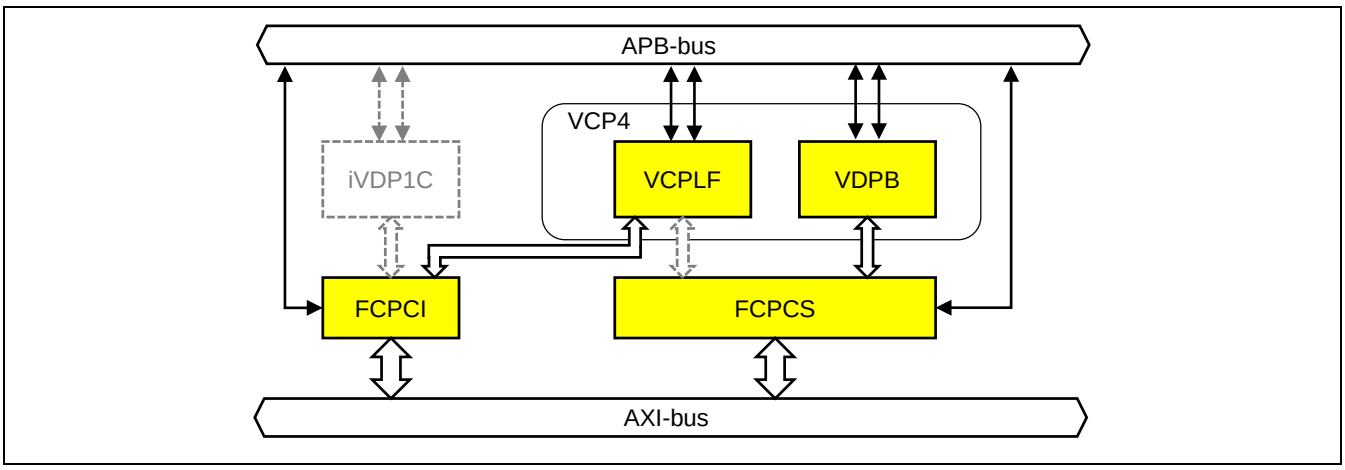

Figure 32.2 VCP4 and related modules for RZ/G2M V1.3, in Case that VCPLF Connects to FCPCI

Figure 32.3 and Figure 32.4 show VCP4 and related modules (Figure 32.3 for RZ/G2H and RZ/G2M V3.0, Figure 32.4 for RZ/G2N and RZ/G2E).All video codec modules, VDPB, VCPLF, and iVDP1C, share one FCPCS, and need to work exclusively. However, a pixel processing unit of all codec modules for RZ/G2H, RZ/G2M V3.0 and RZ/G2N have twice the performance as codec modules for RZ/G2M V1.3. So, the performance of VCP4 for RZ/G2H, RZ/G2M V3.0, and RZ/G2N is same as VCP4 for RZ/G2M V1.3. Note that a performance of variable length code processing unit for RZ/G2H, RZ/G2M V3.0 and RZ/G2N doesn't change from RZ/G2M V1.3. A performance beyond the RZ/G2M V1.3, such as H.265 3840 × 2160p × 60 fps decoding, cannot be realized with RZ/G2H, RZ/G2M V3.0 and RZ/G2N. For detail performance of each product, refer to summary of maximum pixel rate in section.32.1.1.

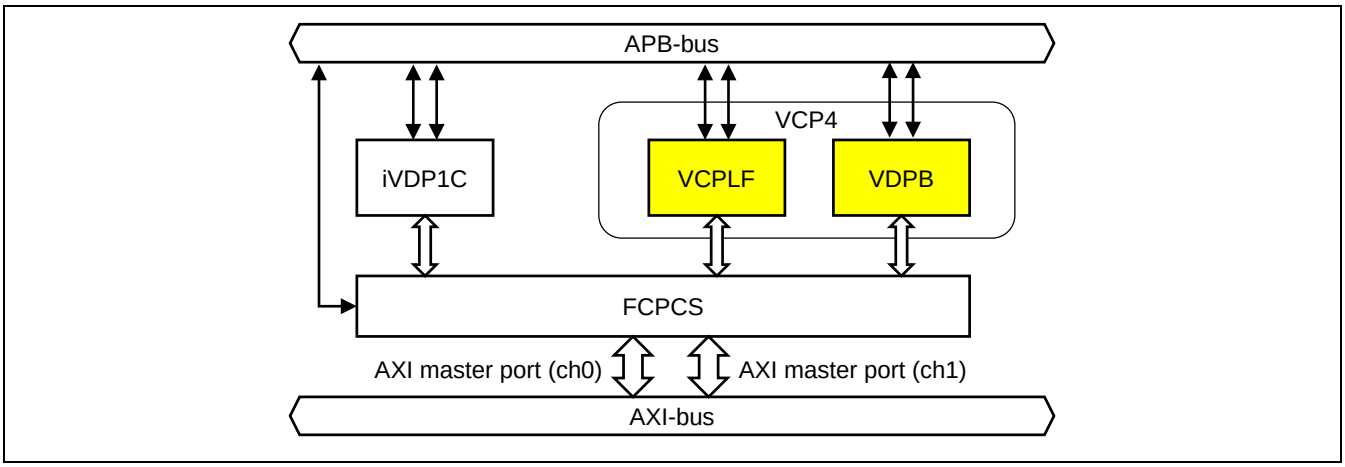

Figure 32.3 VCP4 and related modules for RZ/G2H and RZ/G2M V3.0

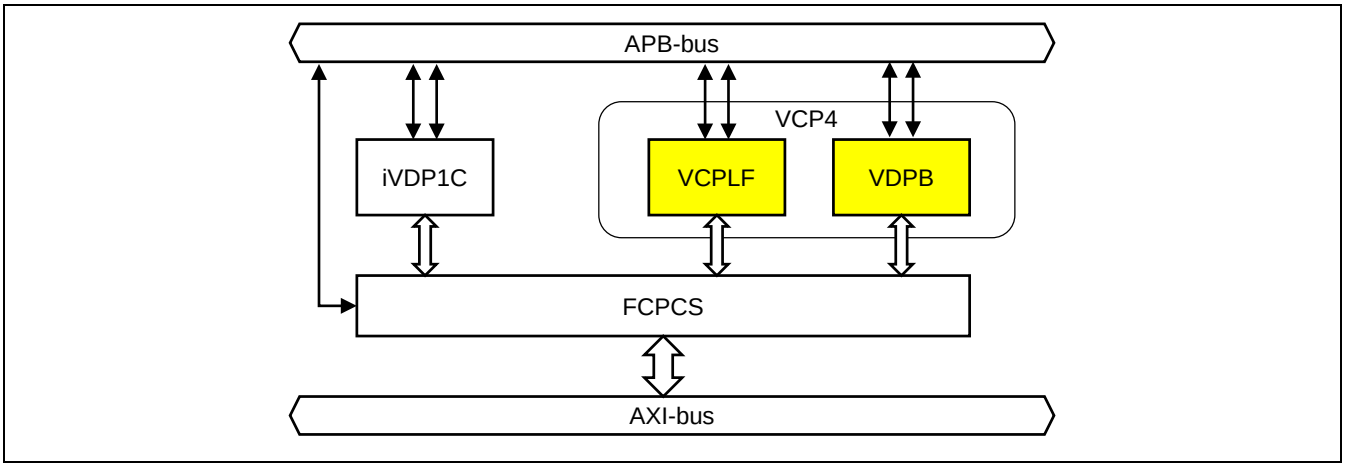

Figure 32.4 VCP4 and related modules for RZ/G2N and RZ/G2E

The VDPB and VCPLF are connected memory bus (AXI-bus) via companion modules, FCPCS or FCPCI. For detail information, refer to section 35.

The iVDP1C is a low-latency video decoder. For detail information, refer to section 31.

32.1.1 Features

(1) VDPB

The VDPB has the following features.

- Support H.265/HEVC MP (Main Profile) decoding
- Support 3840 x 2160 resolution
- Data handling on a picture-by-picture basis

Table 32.1 Main Function of the VDPB

Item	Description
Decoding standard supported	**RZ/G2H** **RZ/G2M** • H.265/HEVC Main Profile@Level 5 **RZ/G2M V3.0** **RZ/G2N** • H.265/HEVC Main Profile@Level 5 **RZ/G2E** • H.265/HEVC Main Profile@Level 4.1
Maximum pixel rate	• H.265/HEVC **RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** 1920 × 1080p × 120 fps, or 3840 × 2160p × 30 fps **RZ/G2E** 1920 × 1080p × 30 fps (if iVDP1C is used) 1920 × 1080p × 60 fps (if iVDP1C is not used) This indicates the decoding performance including both display picture and non-display picture

Item	Description
Maximum bit rate	• H.265/HEVC **RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** 30 Mbps × 4 streams, or 120 Mbps × 1 stream **RZ/G2E** 15 Mbps × 2 streams, or 30 Mbps × 1 stream (if iVDP1C is used) 30 Mbps × 2 streams, or 60 Mbps × 1 stream (if iVDP1C is not used)
Picture size supported	Minimum: H.265/HEVC If CtbSizeY is 16, Horizontal 64 pixels × Vertical 64 lines If CtbSizeY is 32, Horizontal 96 pixels × Vertical 96 lines Otherwise (CtbSizeY is 64), Horizontal 192 pixels × Vertical 192 lines Maximum: Horizontal 3840 pixels × Vertical 2160 lines 2160 × 3840 is supported.
	RZ/G2E Note: When picture size is 3840 × 2160, frame rate is smaller than 30 fps. For example, if iVDP1C isn't used and codec is H.265/HEVC, frame rate is 15 fps. H.265/HEVC Horizontal size is a multiple of 2 pixels, and vertical size is a multiple of 2 lines.
Color format	YCbCr 4:2:0 semi-planar (Y and C plane) Cb/Cr and Cr/Cb interleaving order is supported.
Bit stream format	Video elementary stream as shown in Table 32.2. Function to remove the emulation prevention byte in the HEVC VCL NAL unit is supported.
Picture structure	Frame structure

Table 32.2 Data Handled by the VDPB

Standard	Decoding Range
H.265/HEVC	VCL NAL units in byte stream format data

(2) VCPLF

The VCPLF has the following features.

- Support for multiple codecs
- Support 3840 × 2160 resolution (H.264 decode/encode only)
- Data handling on a picture-by-picture basis
  - Encode/decode data one picture (frame or field) at a time.
- High picture quality
  - Support the H.264 high-efficiency coding tools (CABAC, 8 × 8 frequency conversion, and quantization matrix).
  - High-efficiency motion vector detection by a combination of discrete search and trace search
  - Optimal-mode selection by Rate-Distortion (RD) cost evaluation
  - Picture quality control based on activity analysis results which match visual models

Table 32.3 Main Function of the VCPLF

Item	Description
Encoding standard supported	• H.264/AVC **RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** High Profile@Level 5.1, Progressive High Profile@Level 5.1, Constrained High Profile@Level 5.1, Main Profile@Level 5.1, Constrained Baseline Profile@Level 5.1 Baseline Profile@Level 5.1 (The arbitrary slice order, flexible macroblock order and redundant slice aren't supported) **RZ/G2E** High Profile@Level 4.2, Progressive High Profile@Level 4.2, Constrained High Profile@Level 4.2, Main Profile@Level 4.2, Constrained Baseline Profile@Level 4.2 Baseline Profile@Level 4.2 (The arbitrary slice order, flexible macroblock order and redundant slice aren't supported) • H.264/MVC **RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** Stereo High Profile@Level 4.2 **RZ/G2E** Stereo High Profile@Level 4

Item	Description
Decoding standard supported	• H.264/AVC **RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** High Profile@Level 5.1, Progressive High Profile@Level 5.1, Constrained High Profile@Level 5.1, Main Profile@Level 5.1, Constrained Baseline Profile@Level 5.1, Baseline Profile@Level 5.1 (The arbitrary slice order, flexible macroblock order and redundant slice aren't supported) **RZ/G2E** High Profile@Level 4.2, Progressive High Profile@Level 4.2, Constrained High Profile@Level 4.2, Main Profile@Level 4.2, Constrained Baseline Profile@Level 4.2, Baseline Profile@Level 4.2 (The arbitrary slice order, flexible macroblock order and redundant slice aren't supported) • H.264/MVC **RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** Stereo High Profile@Level 4.2 **RZ/G2E** Stereo High Profile@Level 4

Item	Description
Maximum pixel rate	One of following items: **RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** • (H.264 1920 × 1080p × 120 fps) **RZ/G2E** If iVDP1C is used: • (H.264 1920 × 1080p × 30 fps) Otherwise (If iVDP1C isn't used): • (H.264 1920 × 1080p × 60 fps) "1920 × 1080p × 120 fps" can be replaced as "3840 × 2160p × 30 fps" (H.264 only), "1920 × 1080p × 60 fps" can be replaced as "1280 × 720p × 120 fps" "1920 × 1080p × 30 fps" can be replaced as "1280 × 720p × 60 fps" In case of decoding, this indicates the processing performance including both display picture and non-display picture.
Maximum bit rate	One of the followings: **RZ/G2H** **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N** • H.264 (40 Mbps × 4ch, 80 Mbps × 2ch, or 160 Mbps × 1ch) **RZ/G2E** If iVDP1C is used: • H.264 (20 Mbps × 2ch, or 40 Mbps × 1ch) If iVDP1C isn't used: • H.264 (40 Mbps × 2ch, or 80 Mbps × 1ch)

Item	Description
Picture size supported in decoding	Minimum size: Horizontal 80 pixels × vertical 80 lines Maximum size: Horizontal 3840 pixels × vertical 2160 lines (H.264) (If horizontal size is larger than 1920, the VCPLF only supports a progressive sequence.) **RZ/G2E** Note: When picture size is 3840 × 2160, frame rate is smaller than 30 fps. For example, if iVDP1C isn't used and codec is H.264/AVC, frame rate is 15 fps. Horizontal size is a multiple of 2 pixels, and vertical size is a multiple of 2 lines. Additionally, 1080 × 1920, 1088 × 1920, and 2160 × 3840 (H.264 only) are supported.
Picture size supported in encoding	Minimum size: Horizontal 80 pixels × vertical 80 lines Maximum size: Horizontal 3840 pixels × vertical 2160 lines (H.264) Horizontal size is a multiple of 8 pixels, and vertical size is a multiple of 8 lines. Additionally, 320 × 180, 854 × 480 (WVGA+), 1080 × 1920, 1088 × 1920, and 2160 × 3840 (H.264 only) are supported.
Color format	YCbCr 4:2:0 planar (Y, Cb, and Cr plane) and semi-planar (Y and C plane) are supported as an input picture in encoding. YCbCr 4:2:0 semi-planar is supported as an output picture in decoding. Cb/Cr and Cr/Cb interleaving order is supported in YCbCr 4:2:0 semi-planar.
Bit stream format	Video elementary stream as shown in Table 32.4. Function to add or remove the emulation prevention byte in the H.264 bit stream is supported.
Picture structure	Frame structure and field structure

Table 32.4 Data Handled by the VCPLF

Standard	Encoding Range	Decoding Range
H.264	Slice header and subsequent data	Slice header (other than the first slice header in picture) and subsequent data

(3) Summary of Maximum Pixel Rate

The following combinations of maximum pixel rate shall be applied to RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N and RZ/G2E.

RZ/G2H **RZ/G2M V1.3, RZ/G2M V3.0** **RZ/G2N**

If iVDP1C is used, the maximum pixel rate is one of following items:

- (H.264/H.265 1920 × 1080p × 120 fps)

Otherwise (if iVDP1C isn't used), the maximum pixel rate is one of following items:

- (H.265 1920 × 1080p × 120 fps) + (H.264 1920 × 1080p × 120 fps)

RZ/G2E

If iVDP1C is used, the maximum pixel rate is one of following items:

- (H.264/H.265 1920 × 1080p × 30 fps)

Otherwise (if iVDP1C isn't used), the maximum pixel rate is one of following items:

- (H.264/H.265 1920 × 1080p × 60 fps)

Notes:

"1920 × 1080p × 120 fps" can be replaced as "3840 × 2160p × 30 fps" (H.264/H.265).
"1920 × 1080p × 60 fps" can be replaced as "1280 × 720p × 120 fps".
"1920 × 1080p × 30 fps" can be replaced as "1280 × 720p × 60 fps".

32.1.2 Connected Module

Table 32.5 shows modules connected to the VCP4.

Table 32.5 Connected Module

Module	Connected Module	Description
VDPB	FCPCS	Reference data read cache, lossless data compression and decompression For RZ/G2M V1.3, FCPCS is shared between VDPB and VCPLF. For RZ/G2H, RZ/G2M V3.0, RZ/G2N and RZ/G2E, FCPCS is shared among VDPB, VCPLF, and iVDP1C.
VCPLF	FCPCS	Reference data read cache, lossless data compression and decompression For RZ/G2M V1.3, FCPCS is shared between VDPB and VCPLF. For RZ/G2H, RZ/G2M V3.0, RZ/G2N and RZ/G2E, FCPCS is shared among VDPB, VCPLF, and iVDP1C.
	FCPCI	RZ/G2M V1.3 only has this module. Reference data read cache, lossless data compression and decompression FCPCI is dedicated for iVDP1C or VCPLF.

32.2 Usage Notes

32.2.1 Limitations on Software Reset, Module Standby and power-shutoff

Before executing following operations for VCP4, confirm that VCP4 is not encoding or decoding a picture. If VCP4 is encoding or decoding a picture, wait completion of encoding or decoding.

- Execute Software Reset by CPG
- Enter Module Standby (stop clock supply) by CPG
- Enter power-shutoff status (stop power supply) by SYSC

32.2.2 Note on input bitstream for decoding

In decoding process of VCP4, input bitstream not conformant to video codec standard might cause hang of VCP4.

33. Video Signal Processor (VSP2)

RZ/G2H
RZ/G2M V1.3 RZ/G2M V3.0
RZ/G2N RZ/G2E

33.1 Overview

The VSP2 is the successor IP of Renesas' VSP-IP series which supports image processing such as super resolution, sharpness, up/down scaling, 1D look-up tables, 3D look-up tables, histogram, image blending, rotation/flipping, interface to Display Unit (DU).

33.1.1 Features

This LSI incorporates different types of VSP2 modules (VSPI, VSPBS, VSPBC, VSPBD, VSPB, VSPD and VSPDL) as image processing systems. Table 33.1 shows the number of VSP for each product.

The VSPI supports image processing by memory to memory such as super resolution, sharpness, up/down scaling, look-up tables, histogram and rotation/flipping.

The VSPBC supports image processing by memory to memory such as look-up tables, 1D-histogram and image blending. [RZ/G2H].

The VSPBD supports image processing by memory to memory such as image blending [RZ/G2H].

The VSPB supports image processing by memory to memory such as look-up tables, 1D-histogram, image blending and vertical flipping, VSPB is composed by unifying VSPBC function with VSPBD.

The VSPD supports image processing such as image blending, interface to and output image data to Display Unit (DU) with or without writing back the image data to memory. The VSPD supports image processing by memory to memory also, but the VSPD cannot output image data to Display Unit (DU) in that case.

The VSPDL supports image processing such as image blending, and output image data to Display Unit (DU) with or without writing back the image data to memory. The VSPDL supports two interfaces with Display Unit (DU). The VSPDL supports image processing by memory to memory also, but the VSPDL cannot output image data to Display Unit (DU) in that case. [RZ/G2H, RZ/G2N]

Table 33.1 VSP2 configuration

	Number of channels			
Module Name	RZ/G2H	RZ/G2M V1.3 RZ/G2M V3.0	RZ/G2N	RZ/G2E
VSPI	2	1	1	1
VSPBC	1	0	0	0
VSPBD	1	0	0	0
VSPB (*)	0	1	1	1
VSPBS	0	0	0	0
VSPD	1	3	1	2
VSPDL	1	0	1	0

Note: * INTC, module standby for VSPB in RZ/G2M V1.3, RZ/G2M V3.0 are same with VSPBD in RZ/G2H.
Each VSPs features are shown in from section 33.1.1.1 to section 33.1.1.7.

33.1.1.1 Features of VSPI

- Supports various data formats and conversion
  - Supports YCbCr444/422/420, RGB, α RGB, α plane.
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Supports combination between pixel alpha and global alpha.
  - Supports generating pre multiplied alpha.
- Video processing
  - Supporting 4K (3840 pixels × 2160 lines) [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
  - Supporting Full HD (1920 pixels × 1080 lines) [RZ/G2E]
  - Up and down scaling with arbitrary scaling ratio
  - Super resolution processing
  - Sharpness filter
  - 1D look up table
  - 3D look up table
  - Supports Hue, brightness, and saturation format for look up table or/and histogram.
  - 1D histogram
  - 2D histogram
  - Image rotation with unit of 90-degree, vertical and horizontal flipping
- Performance of VSPI (*[1])
  - 500 Mpix/s process rate (processing rate (*[2])) × 2 sets [RZ/G2H]
  - 500 Mpix/s process rate (processing rate (*[2])) × 1 set [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
  - 125 Mpix/s process rate (processing rate (*[2])) × 1 set [RZ/G2E]

Notes: 1. This performance cannot be realized in some condition. Detail performance is shown in section 33.4.6.1.
2. When scale-down is applied to input image, processing rate is input rate. When scale-up is applied to input image, processing rate is output rate. When no-scaling is applied, processing rate is input rate.

33.1.1.2 Features of VSPBD [RZ/G2H]

- Supports various data formats and conversion
  - Supports YCbCr444/422/420, RGB, α RGB, α plane.
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Supports combination between pixel alpha and global alpha.
  - Supports generating pre multiplied alpha.
- Video processing.
  - Supporting 4K (3840 pixels × 2160 lines)
  - Blending of five picture layers and raster operations (ROPs)
  - Vertical flipping
- Performance of VSPBD (*)
  - 500 Mpix/s process rate (output rate) × 1 set

Note: * This performance cannot be realized in some condition. Detail performance is shown in section 33.4.7.2.

33.1.1.3 Features of VSPBC [RZ/G2H]

- Supports various data formats and conversion
  - Supports YCbCr444/422/420, RGB, α RGB, α plane.
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Supports combination between pixel alpha and global alpha.
  - Supports generating pre multiplied alpha.
- Video processing
  - Supporting 4K (3840 pixels × 2160 lines)
  - Blending of five picture layers and raster operations (ROPs)
  - 1D look up table
  - 3D look up table
  - 1D histogram
  - Vertical flipping
- Performance of VSPBC (*)
  - 500 Mpix/s process rate (output rate) × 1 set

Note: * This performance cannot be realized in some condition. Detail performance is shown in section 33.4.7.2.

33.1.1.4 Features of VSPB [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]

- Supports various data formats and conversion
  - Supports YCbCr444/422/420, RGB, α RGB, α plane.
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Supports combination between pixel alpha and global alpha.
  - Supports generating pre multiplied alpha.
- Video processing
  - Supporting 4K (3840 pixels × 2160 lines) [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
  - Supporting Full HD (1920 pixels × 1080 lines) [RZ/G2E]
  - Blending of five picture layers and raster operations (ROPs)
  - 1D look up table
  - 3D look up table
  - 1D histogram
  - Vertical flipping
- Performance of VSPB (*)
  - 500 Mpix/s process rate (output rate) × 1 set [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
  - 125 Mpix/s process rate (output rate) × 1 set [RZ/G2E]

Note: * This performance cannot be realized in some condition. Detail performance is shown in section 33.4.7.2.

33.1.1.5 Features of VSPD

- Supports various data formats and conversion
  - Supports YCbCr444/422/420, RGB, α RGB, α plane.
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Supports combination between pixel alpha and global alpha.
  - Supports generating pre multiplied alpha.
- Video processing
  - Blending of five picture layers and raster operations (ROPs)
  - Vertical flipping in case of output to memory.
- Direct connection to display module
  - Supporting 4096 pixels in horizontal direction [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
  - Supporting 2048 pixels in horizontal direction [RZ/G2E]
  - Writing back image data which is transferred to Display Unit (DU) to memory.

33.1.1.6 Features of VSPDL [RZ/G2H, RZ/G2N]

- Supports various data formats and conversion
  - Supports YCbCr444/422/420, RGB, α RGB, α plane.
  - Color space conversion and changes to the number of colors by dithering
  - Color keying
  - Supports combination between pixel alpha and global alpha.
  - Supports generating pre multiplied alpha.
- Video processing
  - Blending of five picture layers and raster operations (ROPs)
  - Vertical flipping in case of output to memory.
- Direct connection to display module
  - Supporting two display output interfaces
  - Supporting 2048 pixels in horizontal direction.
  - Writing back image data which is transferred to Display Unit (DU) to memory.

33.1.1.7 Common restrictions

When the data output from the VSP2 is written back to the same memory area where the input data for the VSP2 has been read, the VSP2 has the following restrictions.

1. The access order and format on the frame memory are the same between the input pixels and output pixels.
2. Specifying a larger output image size than the input image size, either vertically or horizontally or both vertically and horizontally, is prohibited.
3. When the YCbCr4:2:0 format is input, operation between color components is prohibited.

These restrictions are summarized in Table 33.2. Refer to the descriptions of the registers related to each restriction. In the table, RPF_m indicates the RPFn that inputs the master layer, and WPF_{wb} indicates the WPFn that writes back the output image to the source image area for the master layer.

Table 33.2 Restrictions on Use when Output Data is Written Back to Input Data Area

No.	Restriction	Related Registers
Restriction 1	The RPF_m input format and the WPF_{wb} output format should be the same.	VI6_RPFn_INFMT.RDFMT VI6_RPFn_INFMT.VIR
	The RPF_m source image storing address and the WPF_{wb} destination address should be the same.	VI6_RPFn_SRCM_ADDR_*
	The RPF_m source picture memory stride and the WPF_{wb} destination memory stride should be the same.	VI6_RPFn_SRCM_PSTRIDE VI6_RPFn_SRCM_ASTRIDE
	The RPF_m and WPF_{wb} data swapping settings should be the same.	VI6_WPFn_DSWAP
	The image rotation and flipping function cannot be used if WPF_{wb} is WPF0.	VI6_WPFn_OUTFMT.ROT
	Super resolution processing with double scale-up by the SRU is prohibited (super resolution processing of the same size is allowed).	VI6_SRU_CTRL0
Restriction 2	Scale-up and color filling by UDS is prohibited.	VI6_UDS_SCALE VI6_UDS_CLIP_SIZE
	The value of scaling filter horizontal and vertical phase registers should be zero in case of using UDS.	VI6_UDS_HPHASE VI6_UDS_VPHASE
	The RPF_m basic read size and extended read size should be the same.	VI6_RPFn_SRC_BSIZE VI6_RPFn_SRC_ESIZE
	Color space conversion is prohibited in RPF_m and WPF_{wb}.	VI6_RPFn_INFMT.CSC VI6_WPFn_OUTFMT.CSC
Restriction 3*	Use of the CLU is prohibited. Make sure that the CLU is not used in DPR routing.	VI6_DPR_CLU_ROUTE.RT
	NOP should be specified for IROP operation.	VI6_RPFn_ALPH_SEL.IROP
	Color keying is prohibited.	VI6_RPFn_CKEY_CTRL.CV

Note: * When the input format is not YCbCr4:2:0, restriction 3 in not applied.

33.1.2 Block diagram

33.1.2.1 Block diagram of each VSP

Figure 33.1 to Figure 33.6 shows the configuration of VSPI, VSPBC, VSPBD, VSPB, VSPBS, VSPD and VSPDL sub modules.

All the registers and functions which doesn't appears in the each VSP2 unit's block diagram should be treated as un-implemented functions in each VSP2 unit. Do not set any registers related to the un-implemented function without any statement.

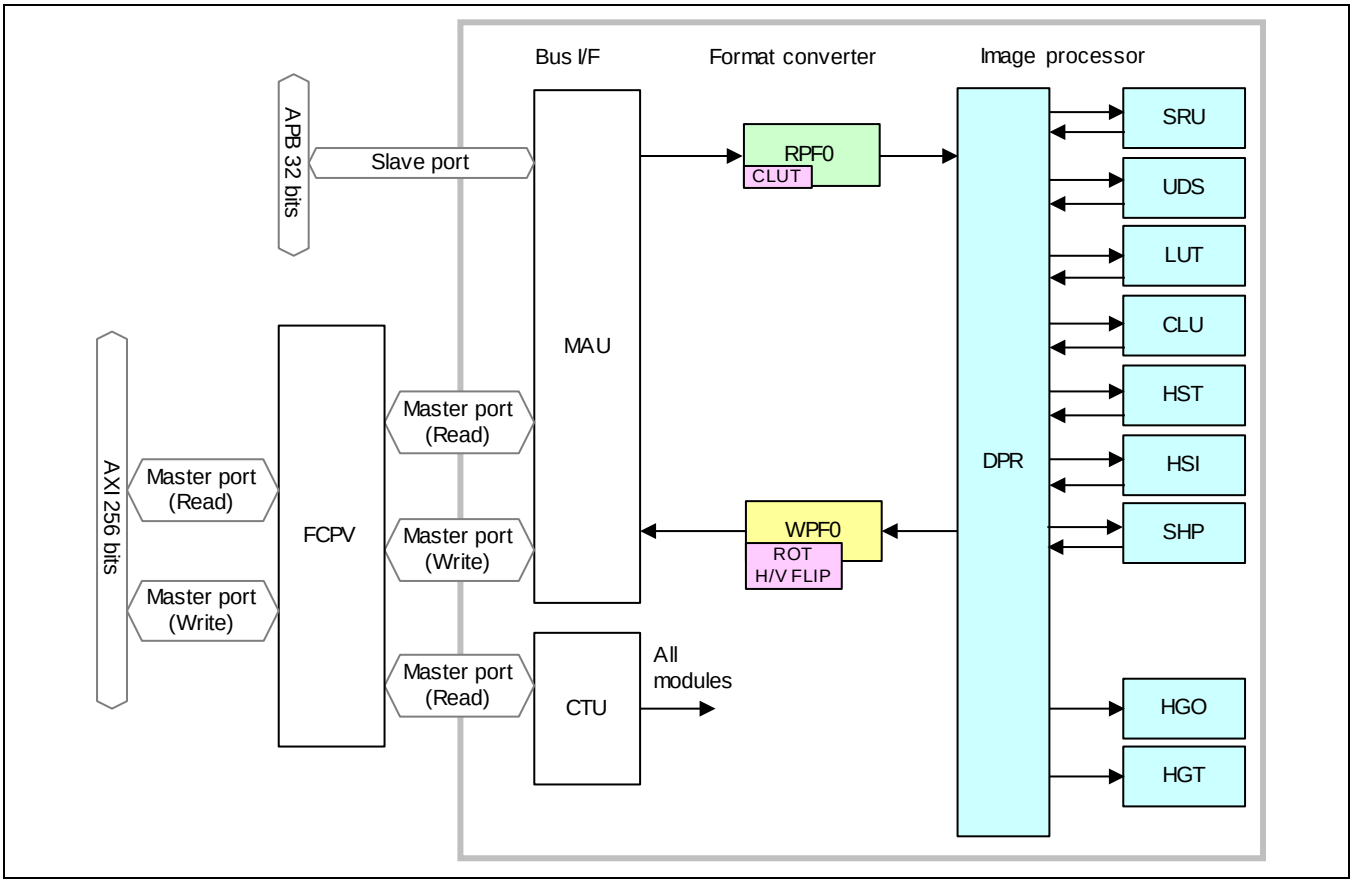

Figure 33.1 VSPI Module Configuration

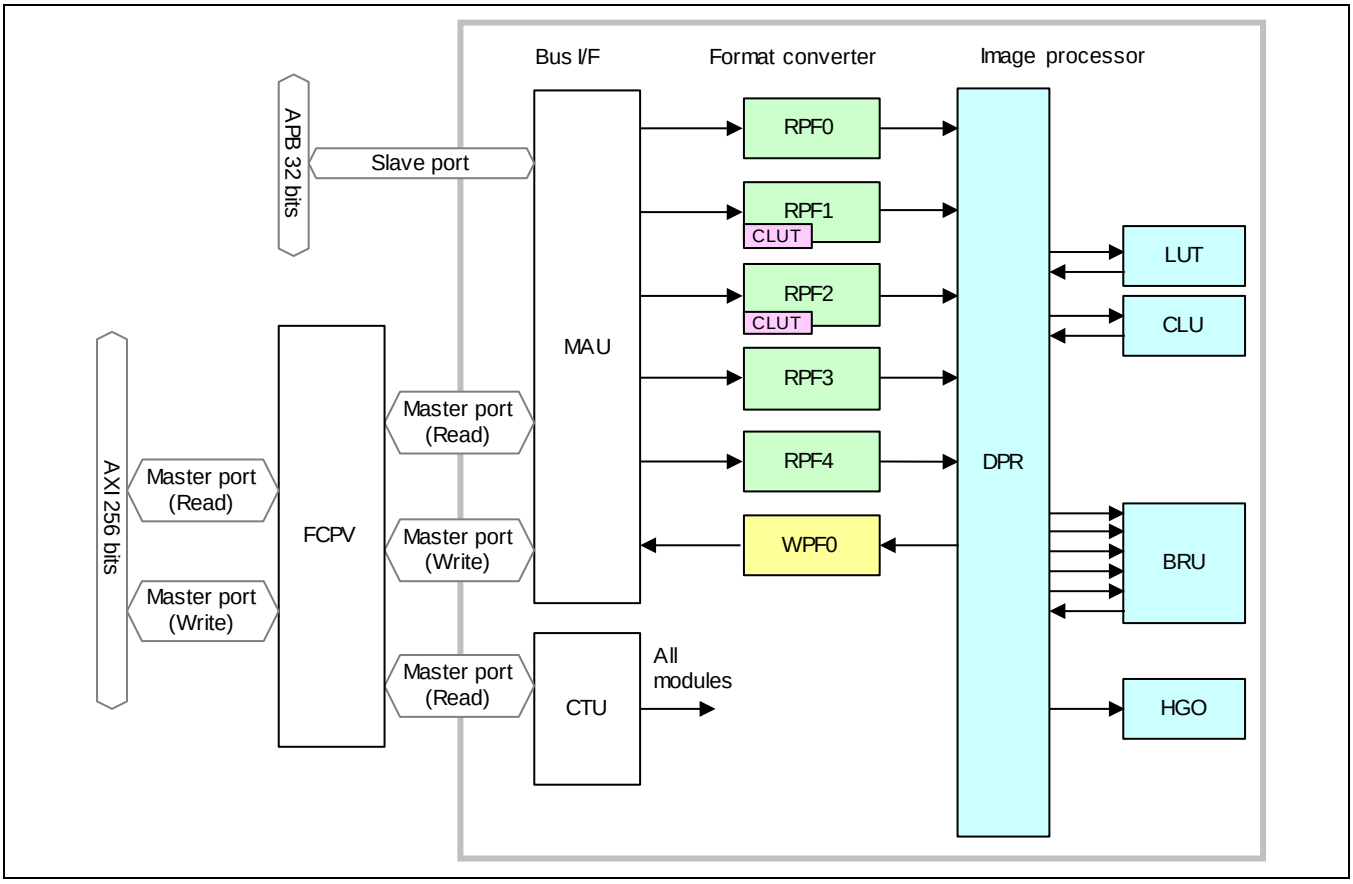

Figure 33.2 VSPBC Module Configuration [RZ/G2H]

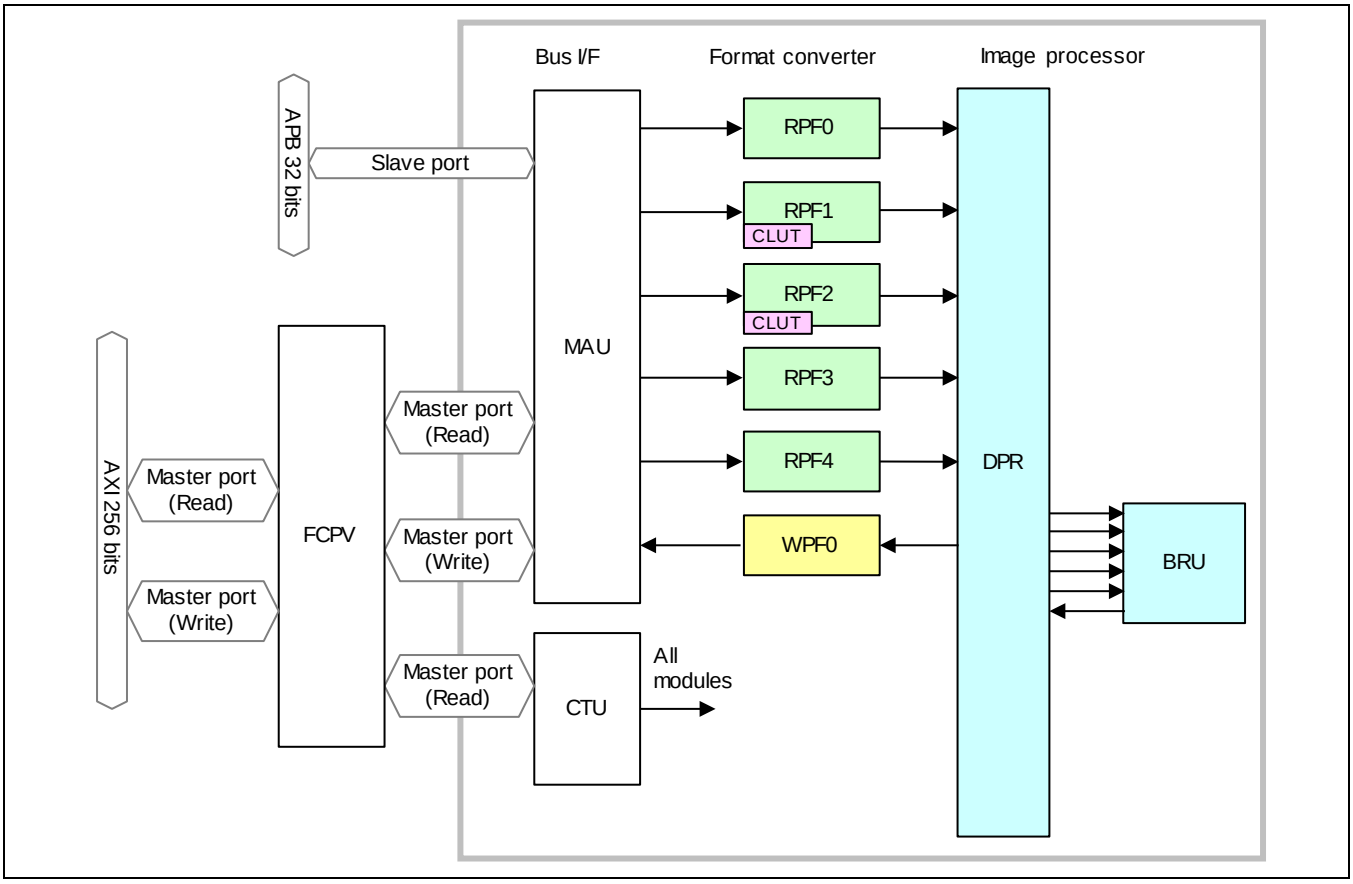

Figure 33.3 VSPBD Module Configuration [RZ/G2H]

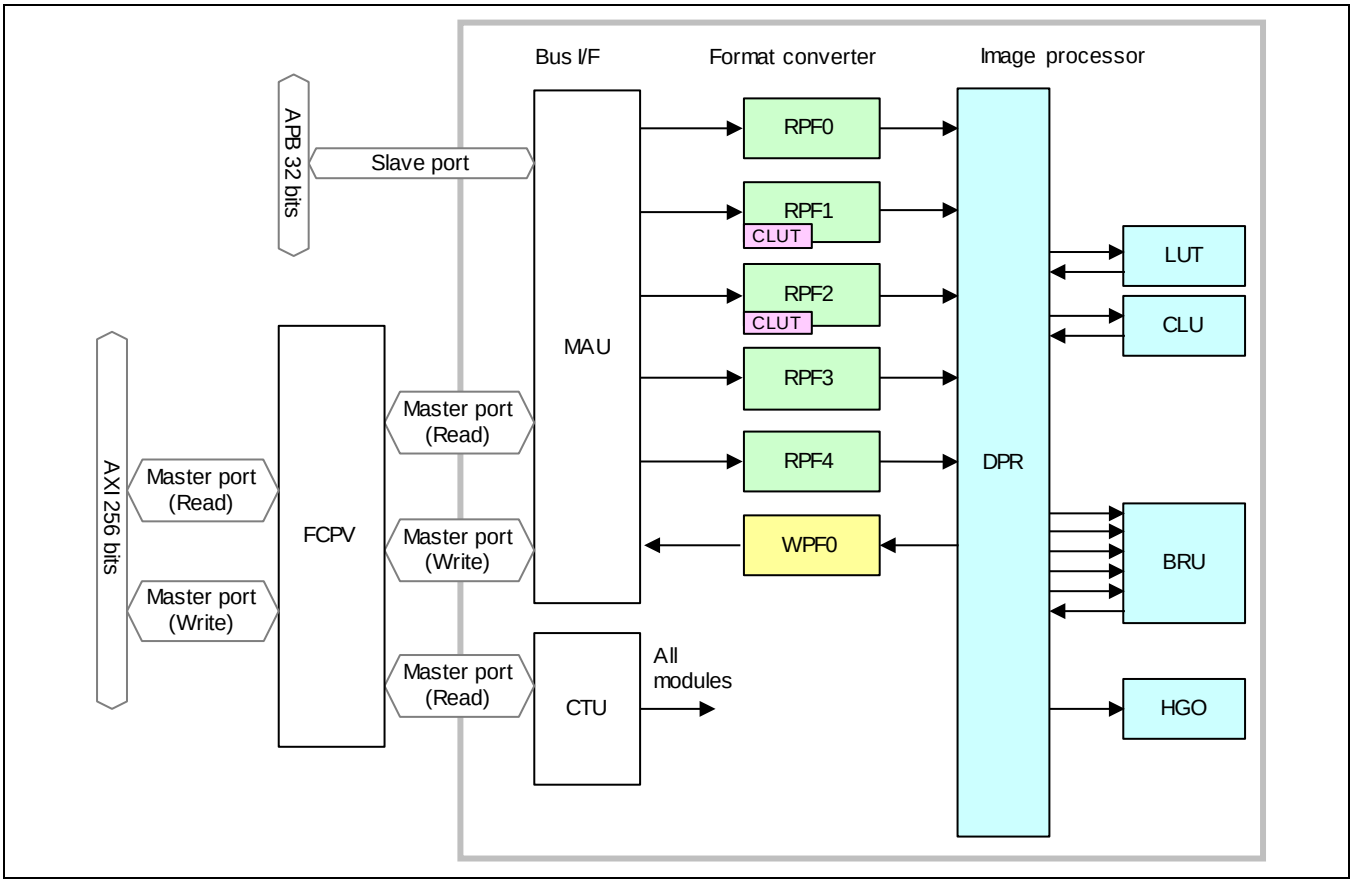

Figure 33.4 VSPB Module Configuration [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]

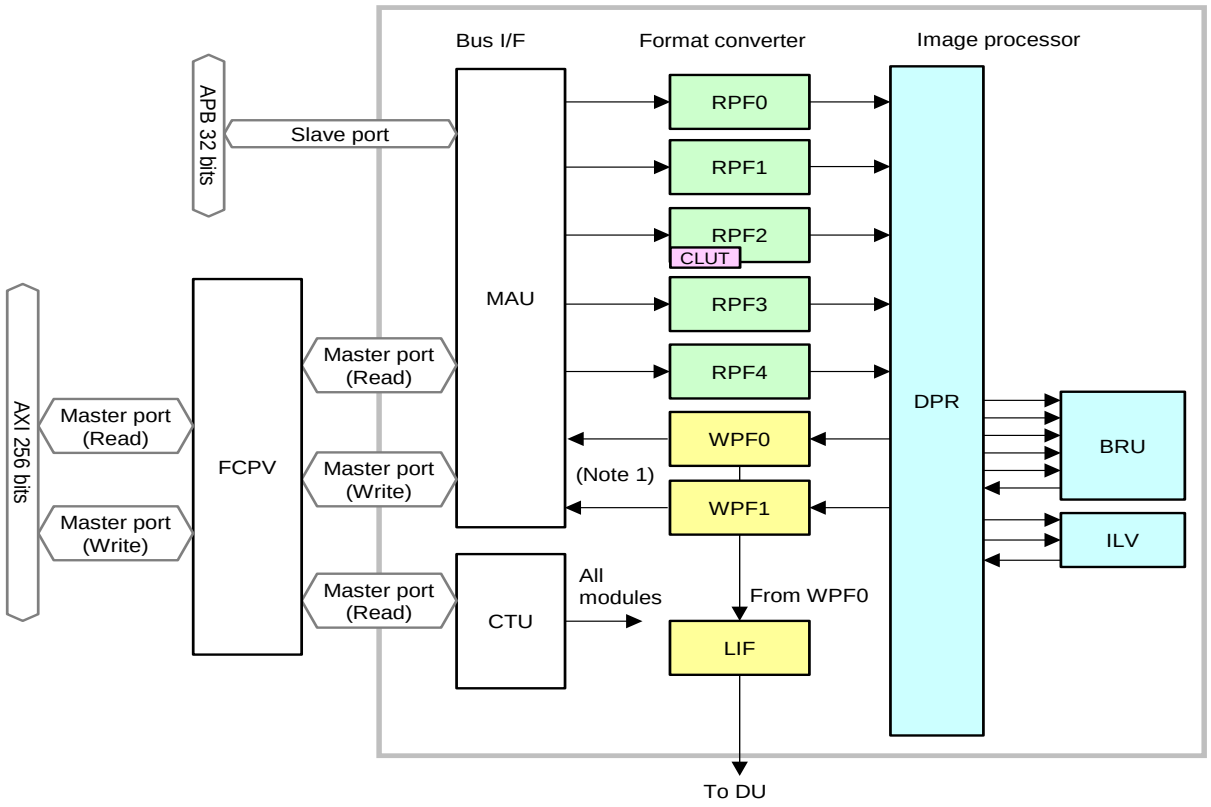

(Note1) WPF0 and WPF1 cannot be executed in parallel. Three following cases are available.

- Activating WPF0 for transferring image data to Display Unit (DU)
- Activating WPF0 for transferring image data to Display Unit (DU), and writing back the image data to memory.
- Activating WPF1 for memory to memory processing.

Figure 33.5 VSPD Module Configuration

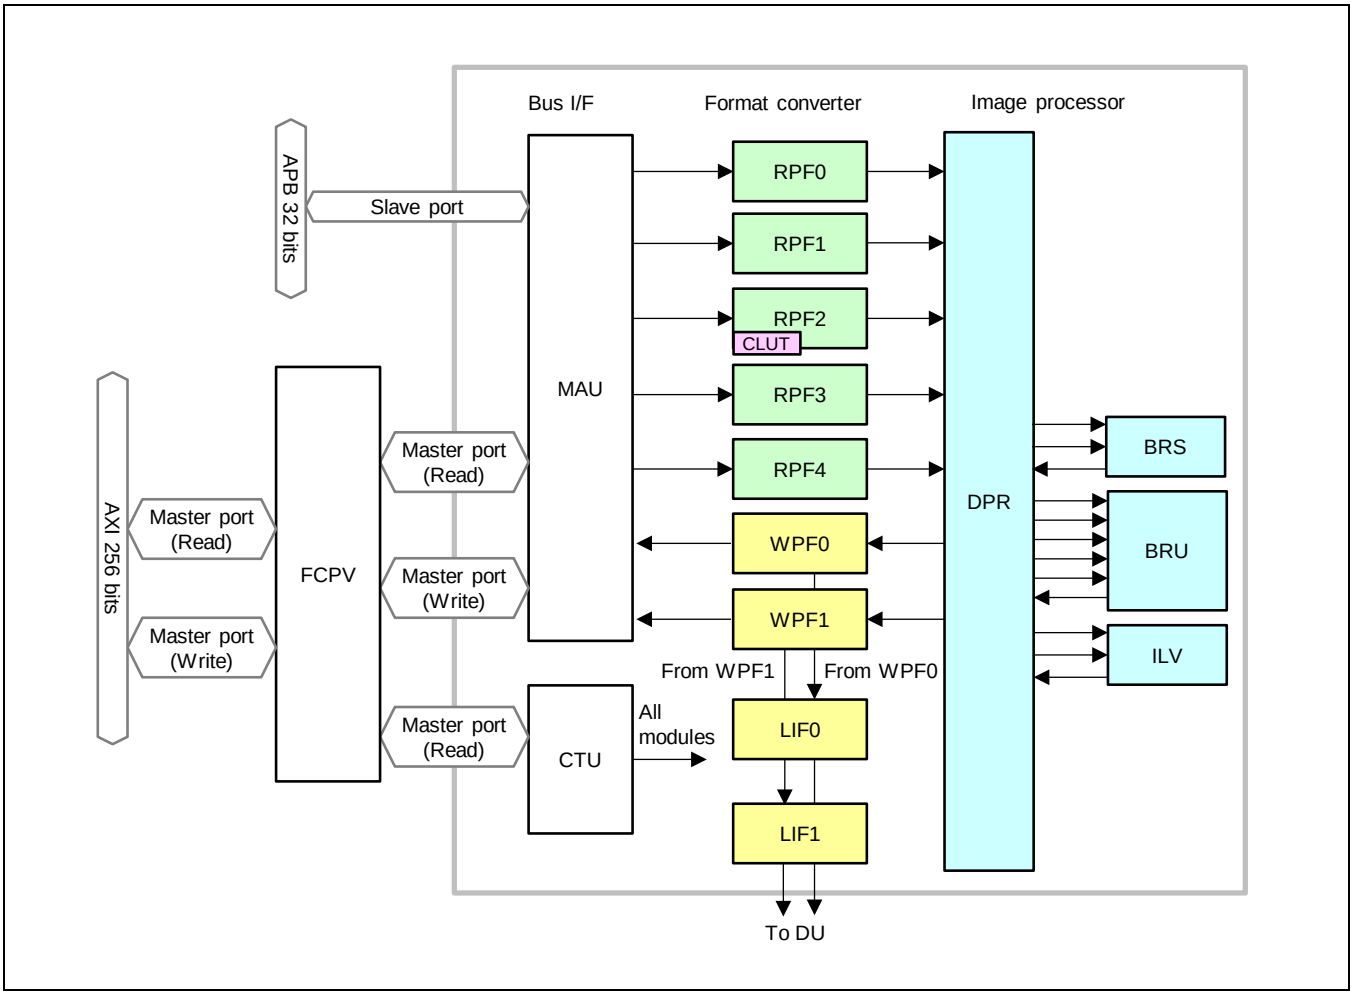

Figure 33.6 VSPDL Module Configuration [RZ/G2H, RZ/G2N]

Note: When neither WPF0 nor WPF1 is used to transfer image data to Display Unit (DU), WPF0 and/or WPF1 can be used as memory to memory processing.
Two following cases are available

- Activating WPF0 for transferring image data to Display Unit (DU) with or without writing back the image data to memory. Activating WPF1 for transferring image data to Display Unit (DU) with or without writing back the image data to memory.
- Activating WPF0 for memory to memory processing. Activating WPF1 for memory to memory processing.

The following gives an overview of each block function shown in Figure 33.1 to Figure 33.6.

The operation of these functions is determined by the register setting explained in section 33.2. Refer to section 33.2 for the relationship between the register setting and the functional behavior.

33.1.2.2 Memory Access Unit (MAU)

The VSP2 applies processing to the image data stored in the external memory and writes the resultant data back to the external memory. The data transfer between the external memory and VSP2 necessary for this operation is done by the MAU, which works as the bus master, according to the register settings. The MAU executes this data transfer between the external memory and VSP2.

33.1.2.3 Command Transfer Unit (CTU)

The VSP2 can directly read register parameters for image processing by display lists stored in external memory. The CTU module is a bus interface and controls display lists when the CTU reads display lists as a bus master.

33.1.2.4 Read Pixel Formatter (RPF)

The RPF reads image data from the external memory through the MAU, unpacks data according to the specified format, converts the color space, converts the number of colors, executes color keying, ROP operation, Multiply-alpha and OSD processing, and outputs the resultant data to the DPR. The RPF has an input format unpacking unit, an index color expanding unit (OSD-CLUT), a 1-bit mask generator, a raster operation unit (ROP unit), a color keying unit, a color space converter and multiply-alpha. Figure 33.7 shows the processing flow in the RPF.

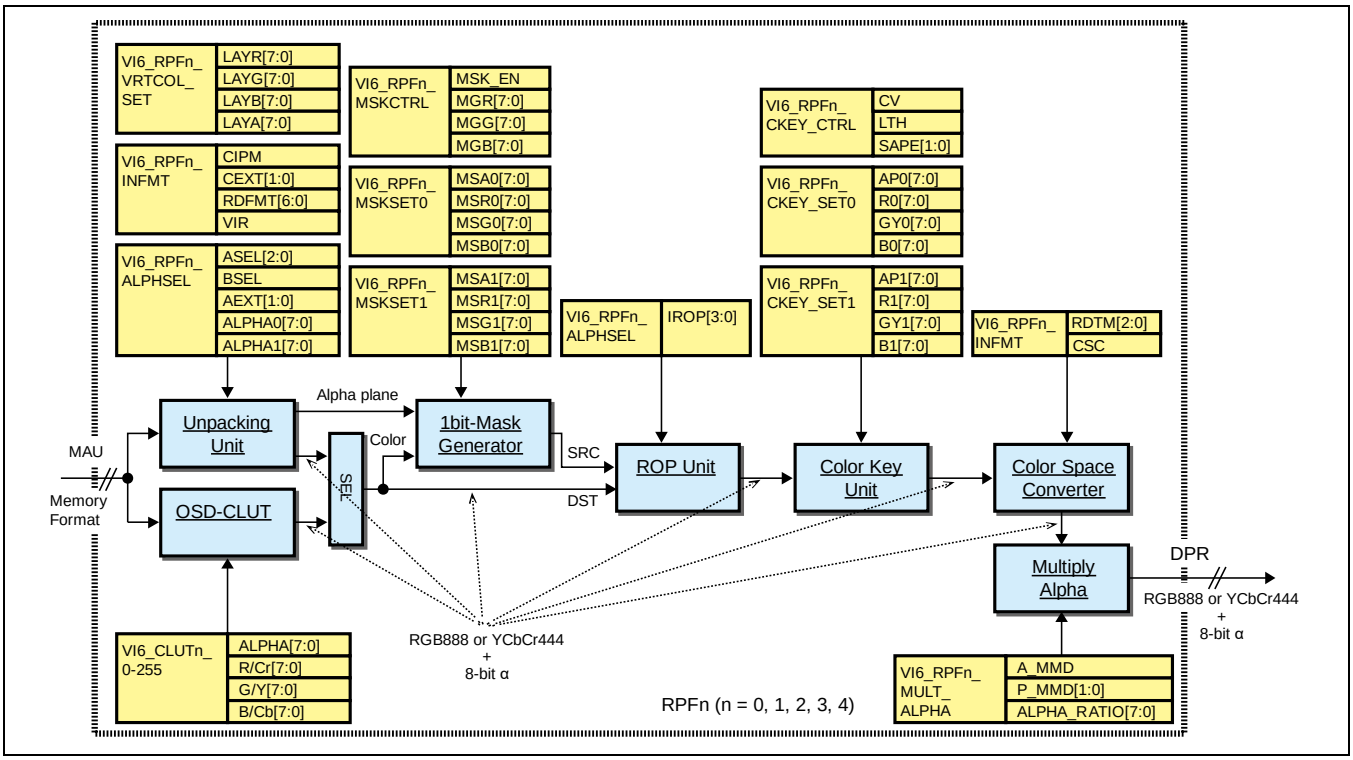

Figure 33.7 RPF Processing Flow

The input format unpacking unit and index color expanding unit (OSD-CLUT) expand the image data input from the MAU into the image format for internal processing (YCbCr444 or RGB888), and the 1-bit mask generator generates a 1-bit image mask from the image data expanded through the unpacking unit and OSD-CLUT. Alternately, a 1-bit image mask can be generated from the alpha plane that is different from the picture plane read through the MAU.

The raster operation unit (ROP unit) executes raster operation between the data from the 1-bit mask generator and the image data expanded from the input format, and the color keying unit applies color replacement and specifies the transparent color for the image data input from the ROP unit. The color space converter converts the color space (RGB-YCbCr) of the image data input from the color keying unit as necessary. The multiply-alpha unit multiplies pixel-alpha by specified alpha or/and multiplies image data by pixel-alpha or/and specified alpha.

The VSP2 provides maximum five RPF modules (RPF0 to RPF4). The implementation of OSD-CLUT depends on the configuration of each LSI.

33.1.2.5 Data Path Router (DPR)

The DPR controls the data paths among RPFs, function modules, and WPFs. The DPR selects one of the images input from RPFs, outputs it to a function module (BRU, BRS, SRU, UDS, LUT, CLU, HST, HSI, HGO, HGT, SHP or ILV), and selects one of WPFs as the destination where the image data processed in the function module will be output. Before output to the WPF, the output from each function module can be input to another function module, which enables multiple image processing functions to be executed continuously without involving the external memory.

33.1.2.6 Super Resolution Unit (SRU)

The SRU is a module connected to the DPR, which executes the super resolution processing.

33.1.2.7 Up Down Scalar (UDS)

The UDS is a module connected to the DPR, which upscales or downscales the image size. It can also upscale or downscale the alpha value.

33.1.2.8 Look Up Table (LUT)

This is a 1D-LUT that converts each of three color components by using a lookup table. The LUT is connected to the DPR and can be used for gamma correction, negative-positive conversion, posterization, and binarization through desired tone curve settings.

33.1.2.9 Blend ROP Unit (BRU)

The BRU is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRU has five blend/ROP operation units (blend/ROP unit m, m = A to E), an ROP operation unit, a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

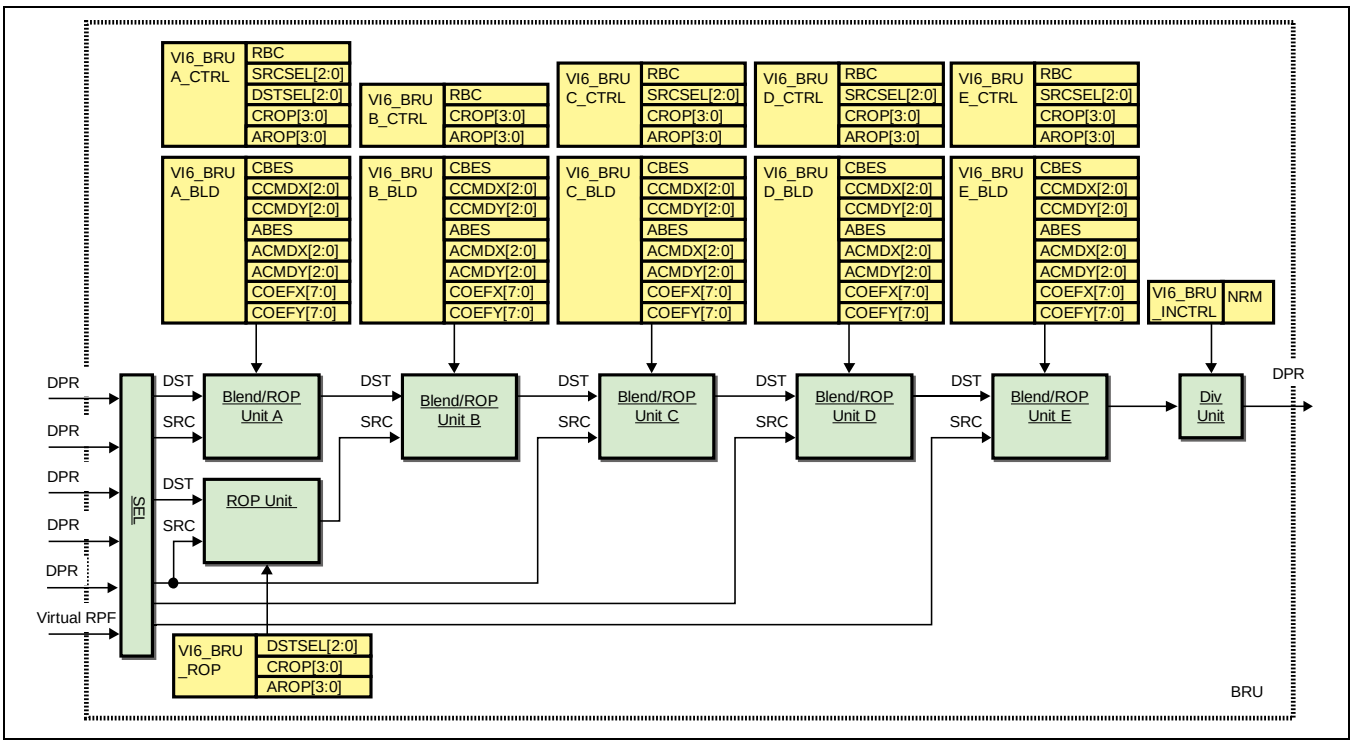

Figure 33.8 BRU Processing Flow

Each of the five blend-ROP operation units (blend/ROP unit m) receives the output from the SEL, blend/ROP Unit m, or ROP unit, and executes blending or raster operation (ROP) of images. The ROP unit receives the output from the SEL and executes 2-input raster operation (ROP2). By combining the ROP operation in the blend/ROP unit m and ROP2 operation in the ROP unit, 256-type 3-input raster operation (ROP3) can be implemented.

The divider for normalization (div unit) divides the pixel value by the α value.

33.1.2.10 Blend ROP Sub Unit (BRS)

The BRS is a module connected to the DPR, which executes the image blending processing and ROP operation. The BRS has two blend/ROP operation units (blend/ROP unit m, m = A to B), a blend/ROP input switch (SEL) for selecting the input to these operation units, and a divider for normalization (div unit).

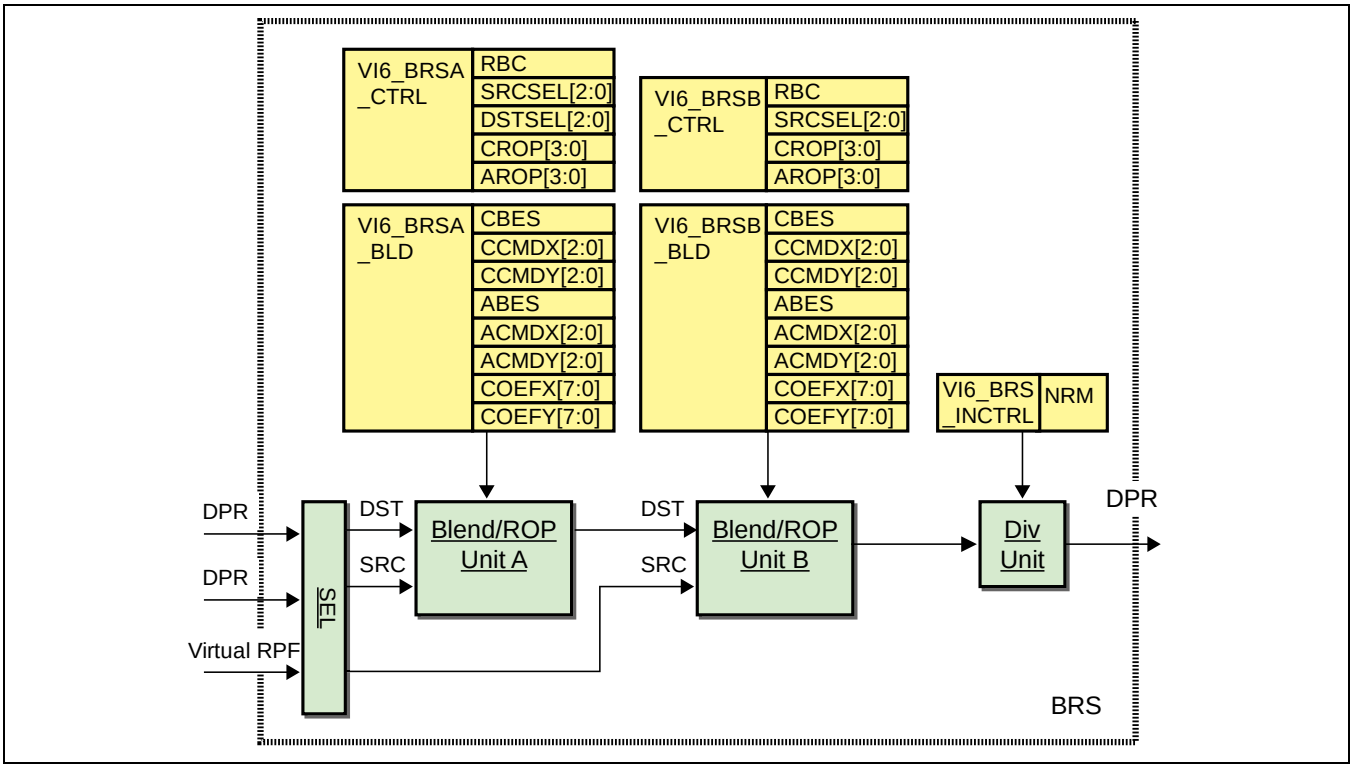

Figure 33.9 BRS Processing Flow

Each of the two blend-ROP operation units (blend/ROP unit m) receives the output from the SEL or blend/ROP Unit m, and executes blending or raster operation (ROP) of images.

The divider for normalization (div unit) divides the pixel value by the α value.

33.1.2.11 Write Pixel Formatter (WPF)

The WPF is an output module that receives 32bits image data (YCbCr444 or RGB888 + 8bit- α) from the DPR, converts the color space, number of colors, and format of the data, and outputs the results of VSP2 image processing to external memory through the MAU. The WPF is mainly configured from a color space converter and an output format converter (the packing unit).

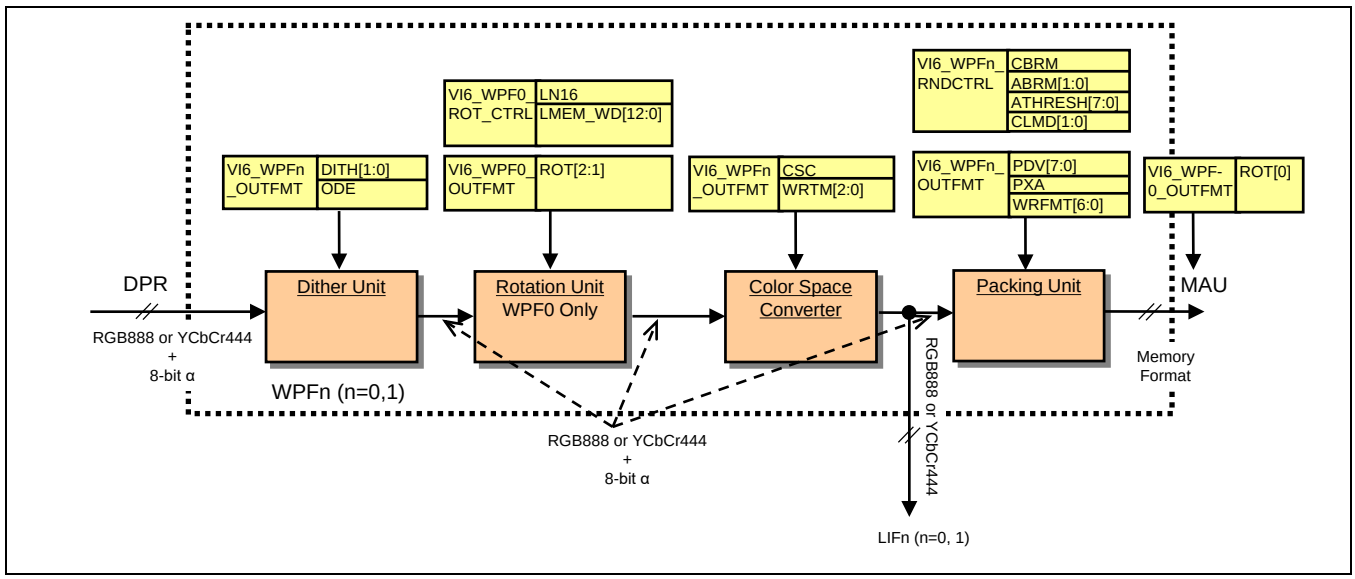

Figure 33.10 WPF Processing Flow

The color space converter converts the color space between RGB and YCbCr, and the packing unit converts the format into the picture plane storing format. The VSP2 provides two WPFs (WPF0 to WPF1). The WPF has the output to LIF module after the color space conversion for transferring the video data to the display module. Image data to LIF is 24bits (YCbCr444 or RGB888) format, and its' color space is after color space conversion.

33.1.2.12 Cubic Look Up table (CLU)

This is a three-dimensional LUT (3D-LUT) that converts the input three-color-component data into desired three color components by using a lookup table. The 1D-LUT can only control each of three color components separately, but the 3D-LUT can convert a specified color into a different color. The CLU is connected to the DPR and can be used for specific color adjustment, such as correction to memorable color.

33.1.2.13 Hue Saturation value Transform (HST)

The HST is a module connected to the DPR, which converts the RGB color space into the HSV color space. The HSV color space can represent a color with the hue, saturation, and value (brightness), and it makes color control through the LUT easier than in the RGB color space.

33.1.2.14 Hue Saturation value Inverse transform (HSI)

The HSI is a module connected to the DPR, which converts the HSV color space into the RGB color space. It executes conversion in the direction opposite to that of the HST.

33.1.2.15 Histogram Generator -One dimension (HGO)

The HGO is a module connected to the DPR and generates the one-dimensional histogram for the dynamic gamma correction. There is no output port of the image data.

33.1.2.16 Histogram Generator-Two dimension (HGT)

The HGT is a module connected to the DPR and generates the two-dimensional histogram for the dynamic color correction. There is no output port of the image data.

33.1.2.17 Display Unit InterFace (LIF)

The LIF module is used for transferring image data to the display module. The input port of the LIFn (n = 0, 1) module is connected to WPFn (n = 0, 1), and the output port of the LIF module is connected to DU (Display Unit). Data flow in LIF is shown in Figure 33.56.

33.1.2.18 SHarPness (SHP)

The SHP is a module connected to the DPR, which sharpen or un-sharpen the image.

33.1.2.19 InterLeaVer (ILV)

The ILV module is used for converting image data to the various 3D display formats. The ILV module has 2 input ports and 1 output port. Each port is connected to the DPR module.

33.1.2.20 Detail Function

Table 33.3 Detail Function of VSP2

Image Data Transfer Function

Bus interface	Protocol		AXI 256 bits through FCPV
	Data alignment	Conversion method	Byte, Word, LW, or LLW data swapping
		Channel	Data alignment can be specified separately for each input/output channel
Image memory	Input	Address setting	1-byte units
	Output	Address setting	1-byte units
		Memory area	Images can be written to the same memory area where the master layer is stored. Note the restrictions shown in Table 33.2.
Tile transfer mode			Supported by RPF0 to RPF4
YCbCr memory storage format			Interleaved, planar, or semi-planar

Display list/Extended Display List Transfer Function

Bus interface	Protocol		AXI 256 bits through FCPV
	Data alignment	Conversion method	Byte, Word, LW data swapping
			Data alignment can be specified separately for display list and each entry of extended display list
Data memory	Load	Address setting	8-byte units
	Store	—	Not available

Read Pixel Formatter (RPF)

Number of channels			Five channels (RPF0 to RPF4)
Image format	Input	RGB	RGB888, RGB565, RGB666, αRGB8888, αRGB4444, αRGB1555, α plane (8 bpp, 1 bpp)
		YCbCr	YCbCr4:4:4/YCbCr4:2:2/YCbCr4:2:0 α plane (8 bpp, 1 bpp)
		Maximum size	8190 × 8190 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to section 33.4.3
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to section 33.4.3.
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.
Color keying	Color replacement	Compared data	RGB888 or Y
		Replaced data	αRGB8888 or αYCbCr
		Comparison Mode	Matched color mode
		Input source	RRPF0 to RPF4
	Transparent color	Compared data	RGB888 or Y
		Replaced data	α
		Comparison Mode	Matched color mode, Luma threshold mode
		Input source	RPF0 to RPF4
OSD/CLUT	Format	Memory storage format	8 bpp
		Image format	α RGB32 or α YCbCr32
	Input channel		RPF0 to RPF2
Raster operation	ROP2 (within input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	ROP2 operation between the 1-bpp α plane and RGB/YCbCr data in RPF0 to RPF4. Note that 1-bpp α is converted to αRGB888 or αYCbCr4:4:4.
Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT601 (16, 235/240) RGB (0, 255) to BT709 (16, 235/240) RGB (0, 255) to BT601 (0, 255) RGB (16, 235) to BT709 (16, 235/240)
		Target of conversion	RPF0 to RPF4
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	RPF0 to RPF4

Read Pixel Formatter (RPF)

Changing number of colors	Reducing RGB color depth	Target format	RGB666, RGB565, RGB555, RGB444, or RGB332
		Target of conversion	RPF0 to RPF4
	Increasing RGB color depth		Padded with 0. Copied from the most significant bits.
	YCbCr444 generation		CbCr copying or CbCr vertical copying and horizontal interpolation.
Multiply-alpha function	Fade-alpha		RPF0 to RPF4
			Available for straight pixel and pre-multiplied pixel.
	Generate pre-multiplied alpha		RPF0 to RPF4
Virtual display	RPF0 to RPF4	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Same as the size of the input channel
	Virtual RPF	Color format	αRGB8888 or αYCbCr4:4:4 single-color
		Display size	Maximum: 8190 × 8190 pixels Minimum: 4 × 4 pixels
α bit count conversion	Input	Bit increase	Padded with 0. Copied from the most significant bits.

Write Pixel Formatter (WPF)

Number of channels			Two channels (WPF0 to WPF1)
Image format	Output	RGB	RGB332, RGB444, RGB565, RGB666, RGB888, αRGB8666, αRGB8888, αRGB4444, αRGB1555
		YCbCr	YCbCr4:4:4, YCbCr4:2:2, YCbCr4:2:0
		Maximum size	8190 × 8190 pixels The internal data path modules have separate restrictions on the maximum image size. For details, refer to section 33.4.4
		Minimum size	1 × 1 pixel The internal data path modules have separate restrictions on the minimum image size. For details, refer to section 33.4.4
		Size setting unit	YCbCr420: 2-pixel units both horizontally and vertically. YCbCr422: 2-pixel units horizontally and 1-pixel units vertically. In other formats, the size can be set in 1-pixel units.

Write Pixel Formatter (WPF)

Color space conversion	RGB to YCbCr	Conversion expression	RGB (0, 255) to BT.601 (16, 235/240) RGB (0, 255) to BT.709 (16, 235/240) RGB (0, 255) to BT.601 (0, 255) RGB (16, 235) to BT.709 (16, 235/240)
		Target of conversion	WPF0 to WPF1
	YCbCr to RGB	Conversion expression	BT.601 (16, 235/240) to RGB (0, 255) BT.709 (16, 235/240) to RGB (0, 255) BT.601 (0, 255) to RGB (0, 255) BT.709 (16, 235/240) to RGB (16, 235)
		Target of conversion	WPF0 to WPF1
Changing number of colors	Output	Reducing RGB color depth	Dithering, lower-order bit truncation, or rounding
		YCbCr422/420	CbCr skipping or CbCr vertical skipping and horizontal skipping
α bit count conversion	Output	Bit reduction	Truncation, rounding, or comparison with threshold (for 1 bpp)

Image Compositing

α blending	Input α value selection	RGB	Pixel α, fixed α value, α plane, or 1-bit α converted from the color specified for pixels
		YCbCr	α plane, fixed α value, or 1-bit α converted from the color specified for pixels
	α blending expression	Plane A: Upper plane	xA + yB, xA – yB Coefficients x and y should be selected from the following.
		Plane B: Lower plane	Fixed α value, (α for plane A), (1 – α for plane A), (α for plane B), (1 – α for plane B)
	Output α value selection	RGB	Fixed α value, x (α for plane A) + y (α for plane B), x (α for plane A) – y (α for plane B) Coefficients x and y should be selected from the following.
			Fixed α value, (α for plane A), (1 – α for plane A), (α for plane B), (1 – α for plane B)
	Blending planes	Number of planes	Five planes selected from RPF0 to RPF4 and video processing function output, and virtual RPF; six planes in total
		Order of planes	The order of six planes selected from RPF0 to RPF4, virtual RPF, and video processing function output can be changed as desired.
	α plane	Format	8 bpp or 1 bpp (α value can be specified through register)
		Input source	RPF0 to RPF4
	Fixed α value	Format	8 bpp
		Input source	RPF0 to RPF4, virtual RPF, or video processing function output
Raster operation	ROP2 (between input channels)	Operator	16 types (OpenGL2.0 is supported)
		Sources of operation	RPF0 to RPF4, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.
	ROP3 (between input channels)	Operator	256-type ROP3 is available by combining ROP2 operations
		Sources of operation	RPF0 to RPF4, virtual RPF, and video processing function output
		Operation control	RGB/YCbCr and α are operated separately.

Video Processing Functions

Super resolution	Processing method		Processing within one frame
	Scaling ratio		× 1 (same size) or × 2
	Arbitrary scaling ratio		Super resolution processing can be combined with the arbitrary ratio scaling function.
	α processing		Fixed α output
Scalar with Arbitrary scaling ratio	Scaling factor		1/16 < scaling factor =<16
	Scaling ratio setting	Expression	1 / [Mant.Frac]
		Precision	Mant = 4 bits, Frac = 12 bits
	α processing		Supported (for 1/4 < scaling factor =<16)
Sharpness processing	Method		Sharpness or blur is applied in horizontal direction
Rotation/flipping	Rotation function		90, 180 and 270 degree
	Flipping function		Vertical flipping, horizontal flipping
	Combination of rotation and flipping		Supported
	α processing		Supported
Simultaneous processing			All video processing functions and color adjustment functions can be processed simultaneously (the order of function execution is limited).

Color Adjustment Function

1D-LUT	LUT configuration	Independent R/Y, G/Cb, and B/Cr. 256 entries each
3D-LUT	Number of grid points	17 × 17 × 17
HSV color space conversion	RGB to HSV	8 bits each for H/S/V
	HSV to RGB	8 bits each for H/S/V
1D Histogram	Number of bins	64 for each color component 256 for Y component or Max-RGB
2D Histogram	Number of hue areas	6
	Number of bins	32 for each hue area

33.1.3 External Pins

VSP2 doesn't have external pins.

33.1.4 Register Configuration

(1) Base Address

Below are the base addresses of each VSP unit. VSPBC, VSPBD, VSPB, VSPBS and VSPI0~1 has 32Kbyte address space. VSPD0~2 has 28Kbyte address space.

VSPBC: H'FE92_0000 [RZ/G2H]
VSPBD: H'FE96_0000 [RZ/G2H]
VSPB: H'FE96_0000 [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]
VSPI0: H'FE9A_0000
VSPI1: H'FE9B_0000 [RZ/G2H]
VSPD0 (*) H'FEA2_0000
VSPD1 H'FEA2_8000
VSPD2 H'FEA3_0000 [RZ/G2M V1.3, RZ/G2M V3.0]

Note: * For RZ/G2H, RZ/G2N, instance of VSPD0 is VSPDL.

(2) Register/Table Address

Table 33.4 shows the VSP2 register configuration (represents in relative address).

Table 33.4 VSP2 Register Configuration

						Second Generation RZ/G Series Products			
Register Name	**Abbr.**	**R/W**	**Offset Address**	**Initial value**	**Access Size**	**RZ/G2H**	**RZ/G2M V1.3 RZ/G2M V3.0**	**RZ/G2N**	**RZ/G2E**
VSP2 Start Registers 0	VI6_CMD0	R/W *1	H'0000	H'0000_0000	32	√	√	√	√

Notes: 1. Read only bits or write only bits or read/write bits are mixed in the registers.
2. Initial value of IP version registers depends on product and Modules. See section 33.2.22.1 for more detail.

33.1.5 Connected Module

Table 33.5 shows modules connected to the VSP2. Table 33.6 shows channel number of DU which each VSPD/LIF is connected.

Table 33.5 Connected Module

Module	Connected Module	Description
VSPI [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]	FCPVI	FCPV for VSPI
VSPBD [RZ/G2H]	FCPVB	FCPV for VSPBD
VSPBC [RZ/G2H]	FCPVB	FCPV for VSPBC
VSPB [RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]	FCPVB	FCPV for VSPB
VSPD	FCPVD	FCPV for VSPD
	DU	Display Unit
VSPDL [RZ/G2H, RZ/G2N]	FCPVD	FCPV for VSPDL
	DU	Display Unit

Table 33.6 Correspondence between ch number of VSPD/LIF and ch number of DU

Product	VSPD ch	LIF ch	DU ch
RZ/G2H	VSPD0	LIF0	DU0
		LIF1	DU3
	VSPD1	LIF0	DU1
RZ/G2M V1.3 RZ/G2M V3.0	VSPD0	LIF0	DU0
	VSPD1	LIF0	DU1
	VSPD2	LIF0	DU2
RZ/G2N	VSPD0	LIF0	DU0
		LIF1	DU3
	VSPD1	LIF0	DU1
RZ/G2E	VSPD0	LIF0	DU0
	VSPD1	LIF0	DU1

Bus access of VSP2 is carried out through FCPV (Frame Compression IP for VSP) module in RZ/G Gen2 system. So, refer to also section 35 FCP User's Manual in the system.

FCP_CFG0.FCPVSEL described in section 35 FCP User's Manual is configuration register. Set following value for FCPVI, FCPVB and FCPVD respectively. Otherwise VSP may not work properly.

- Set 1 to FCP_CFG0.FCPVSEL to enable configuration of FCPVI.
- Set 0 to FCP_CFG0.FCPVSEL to enable configuration of FCPVB or FCPVD.

Frame compression for write is carried out in FCPV, but enable or disable frame compression should be set in VSP register (VI6_WPFn_OUTFMT.FCNL).

33.2 Register Description

33.2.1 Notational Conventions for Registers and Bit Fields

This document uses the following notational conventions for the VSP2 registers and bit fields.

1. The names of registers and bits are written in uppercase.
2. A bit or bit field in a register is indicated as [register name.bit name]. For example, the STRCMD bit in the VI6_CMD0 register is indicated as VI6_CMD0.STRCMD.
3. Lowercase "n" in a register name or a bit name indicates an integer and the range of value n is defined when necessary. For example, VI6_CMDn.STRCMD (n = 0, 1) indicates the STRCMD bit in two registers VI6_CMD0.STRCMD and VI6_CMD1.STRCMD. For RPFn, WPFn, and UDS, when the range of value n is not defined, RPFn (n = 0, 1, 2, 3, 4), WPFn (n = 0, 1), and UDS are assumed.
4. In each subsection for register description in section 33.2, when only a bit name is written without showing its register name, the bit is in the register described in that subsection.
5. A wildcard (*) indicates any characters in a name and represents all registers or bits that match the specified first part of a name. For example, when there are two registers VI6_RPF_SRC_BSIZE and VI6_RPF_SRC_ESIZE, VI6_RPF_SRC_* indicates both registers.

33.2.2 Register Classification

The VSP2 registers are arranged in the following order; the general control registers to display list control registers control operation of the entire VSP2, and the other registers control each image processing and specify parameters for the processing. The functions of the registers are described in this order starting from section 33.2.4.

1. General control registers
2. Display list control registers
3. RPF control registers (RPF0, RPF1, RPF2, RPF3 and RPF4)
4. WPF control registers (WPF0 and WPF1)
5. DPR control registers
6. SRU control registers
7. UDS control registers
8. LUT control register
9. CLU control register
10. HST control register
11. HSI control register
12. BRU control registers
13. HGO control registers
14. HGT control registers
15. ILV control register
16. BRS control registers
17. LIF control registers (LIF0 and LIF1)
18. SHP control registers
19. VSP internal registers

The VSP2 has five RPF channels and the register configuration is the same for all of RPF0 to RPF4. However, some bit fields have restrictions in certain RPFs. These restrictions are included in the description of the corresponding bit fields and registers. Likewise, the register configuration is the same for all Two WPF channels (WPF0 to WPF1), but some bit fields have restrictions in certain WPFs; the restrictions are included in the description of the corresponding bit fields and registers. For each register address, refer to section 33.1.4

33.2.3 Restrictions on Access to Registers and Lookup Tables

The VSP2 has control registers and lookup tables. All VSP2 registers are writable and readable by only 32 bits unit. To write partial bits in each register, read-modify-write is needed. When accessing the addresses where these registers and lookup tables are allocated, the following restrictions should be satisfied. If any restriction is violated, the VSP2 will not operate correctly.

1. For the read-only bits and reserved bits in all VSP2 registers, writing 1 is prohibited unless otherwise specified.
2. Addresses undefined in section 33.1.4 are reserved areas and write access is prohibited in these areas.
3. For all registers and lookup tables, except VI6_CMDn, VI6_SRESET, VI6_*IRQ* and two plane registers such as VI6_DL_HDR_ADDRn, VI6_DL_BODY_SIZE0, VI6_HGO_WBUFS and VI6_HGT_WBUFS, modifying register values during operation of the module is prohibited. Modify registers while the corresponding module is stopped. For the operating status of the target module, refer to section 33.3.2.
4. There are three types about General control registers (Section 33.2.4) and Display List Control Registers (Section 33.2.5) as below.
   Controlling WPF0 (ex. VI6_CMD0, VI6_SRESET.SRST0)
   Controlling WPF1 (ex. VI6_CMD1, VI6_SRESET.SRST1)
   Common setting of WPF0 and WPF1 (ex. VI6_DL_CTRL.AR_WAIT [15:0])
   VSPB, VSPBC, VSPBD, VSPBS, and VSPI, doesn't have WPF1.
   Therefore, don't write any values except default value to registers related to controlling WPF1 for VSPB, VSPBC, VSPBD, VSPBS, VSPI.

Table 33.7 Correspondence between Modules and Register Names

Module Name	Register Name
RPFn (n = 0 to 4)	VI6_RPFn_*
WPFn (n = 0, 1)	VI6_WPFn_*
DPR	VI6_DPR_*
SRU	VI6_SRU_*
SHP	VI6_SHP_*
UDS	VI6_UDS_*
LUT	VI6_LUT_CTRL
CLU	VI6_CLU_CTRL
HST	VI6_HST_CTRL
HSI	VI6_HSI_CTRL
BRU	VI6_BRU_*
HGO	VI6_HGO_*
HGT	VI6_HGT_*
ILV	VI6_ILV_*
BRS	VI6_BRS_*
LIFn (n = 0, 1)	VI6_LIFn_*

33.2.4 General Control Registers

33.2.4.1 VSP2 Start Registers n (VI6_CMDn: n = 0, 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	UPD HDR	—	—	—	STR CMD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5, 3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	UPDHDR	B'0	R/W	Reserved state of updating DLH address. UPDHDR can be negated by software reset (VI6_SRESET.SRSTn). [Write] 0: NOP 1: Don't set 1 to this bit [Read] 0: Not reserved to update DLHeader address and VI6_HGO/HGT_WBUFS. 1: Reserved to update DLHeader address and VI6_HGO/HGT_WBUFS. Set 0 to this bit when STRCMD bit is set to 1.
0	STRCMD	B'0	R/W	Start reservation of each WPF VSP2 has two output channels (WPFs). Two WPFs can be started at the same time. VI6_CMDn.STRCMD controls WPFn. Writing 1 to this bit starts WPFn in VSP2. Set this bit for activation only after all register settings in each output channel have been completed. If WPFn is idle, WPFn starts right after this bit is set to 1. If WPFn is active, writing 1 to this bit reserves starting WPFn operation. Wait to set 1 to VI6_CMDn.STRCMD until this bit is read as 0. VI6_CMDn.STRCMD can be negated by software reset (VI6_SRESET.SRSTn). [Write] 0: Start reservation of WPFn is canceled. 1: Start reservation of WPFn is set. [Read] 0: Starting VSP is not reserved. 1: Starting VSP is reserved.

The basic concept of image processing operation started by activating the VSP2 is shown in Figure 33.11. The actual data input/output is executed by the MAU, which is the bus interface module, as described in section 33.1.2, but conceptually

the RPF works as the data entry point to the VSP2 and the WPF works as the data exit point. To process images through the VSP2, the RPF (entrance) and WPF (exit) should be connected and a data path from the RPF to the WPF should be formed.

To connect RPFn to WPFn, specify RPFn as the source RPF for WPFn in VI6_WPFn_SRCRPF, which is a register for WPFn (refer to section 33.2.7.1). This setting determines that RPFn will be started when WPFn is started through VI6_CMDn.

A data path to execute desired image processing should then be formed between the RPF (entrance) and WPF (exit). To form a data path, connect the necessary function modules in the VSP2 between RPF and WPF. This function is provided by the DPR; specify the information for each module connection in data path routing registers VI6_DPR_*_ROUTE (refer to section 33.2.8).

After a data path is formed (RPFn → WPFn) as described above, starting output module WPFn in the VSP2 through VI6_CMDn starts all function modules connected to WPFn and the desired image processing is executed. According to this design concept, starting a WPF module means starting the VSP2.

There are two types of data path configuration in the VSP2; one is "a single input module to a single output module" as shown in Figure 33.11 (A), and the other is "multiple input modules to a single output module" as shown in Figure 33.11 (B).

Figure 33.11 (A) shows an example of a configuration where modules with single input and single output are implemented through the DPR.

Figure 33.11 (B) shows another configuration example where the module with multiple input and single output is implemented through the DPR.

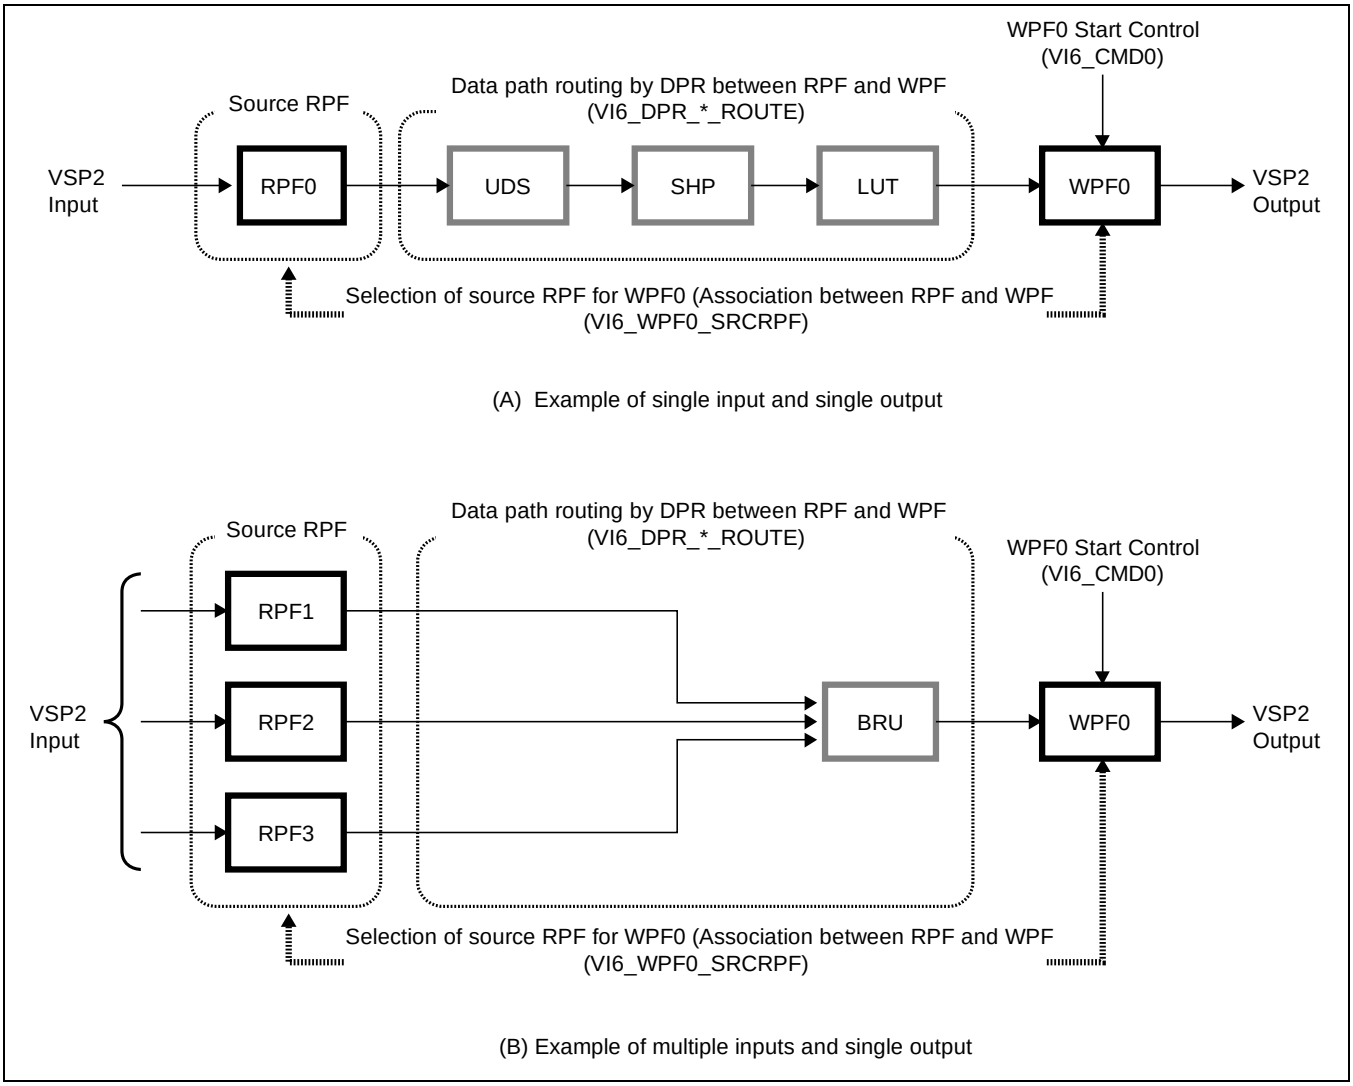

Figure 33.11 Basic Concept of VSP2 Startup

33.2.4.2 Clock Control Register 0 (VI6_CLK_CTRL0)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E

11 to 8	GCS2	H’0	R/W	Clock Control Setting2
4 to 0	GCS3	All 0	R/W	Clock Control Setting3

VSP2 can stop its operating clock for reducing power consumption.

To enable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H’0000_0000
- VI6_CLK_CTRL1 = H’0000_0000
- VI6_CLK_DCSWT = H’0000_0808
- VI6_CLK_DCSM0 = H’0000_0000
- VI6_CLK_DCSM1 = H’0000_0000

To disable clock stop function, set following registers:

- VI6_CLK_CTRL0 = H’1001_0F1F
- VI6_CLK_CTRL1 = H’FF10_FFFF
- VI6_CLK_DCSWT = H’0033_0808
- VI6_CLK_DCSM0 = H’1FFF_0F1F
- VI6_CLK_DCSM1 = H’FF10_FFFF

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRST1	SRST0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SRST1	B'0	R/W	WPFn Software Reset (SRSTn, n = 0 to 1) Writing 1 to this bit aborts the current processing in WPFn (the partially-completed image undergoing processing is output). The period until this software reset processing is completed depends on the bus state. When this reset processing is completed, the VI6_WPFn_IRQ_STA.FRE interrupt source bit is set to 1; when the FRE interrupt is enabled, the FRE end interrupt is output to notify the end of the reset processing. This bit is always read as 0. 0: NOP 1: WPFn software reset (*)
0	SRST0	B'0	R/W	

Note: * Applying a software reset to each WPF has the following restrictions.

Notes:
1. A software reset can be applied to only one of WPF0 to WPF1 through single write access to VI6_SRESET.
2. After a software reset is issued, no more software reset can be issued to another WPF until the issued software reset processing is completed
3. The end of software reset processing is notified through the FRE bit in VI6_WPFn_IRQ_STA, but the software reset issued while WPF is stopped is ignored as NOP. As it takes a while until the reset is actually issued after the reset bit is set, the VSP2 may complete operation before the reset is actually issued. In this case, no interrupt is output for the software reset that is issued after the VSP2 completes operation.
4. If a software reset is issued during downloading of a display list, the downloading processing is not aborted. After the end of downloading that is in progress when a software reset is issued, a frame end interrupt is output.
5. When software reset is issued to VSP, issue software reset to also FCPV except VSPDL. See Figure 33.66 for VSPD software reset sequence. See section 35 FCP User's Manual for VSPI/VSPBD/VSPBC/VSPBS software reset sequence.

Bit	Bit Name	Initial Value	R/W	Description
31 to 30, 27 to 10, 7 to 0	—	All 0	R	Reserved These bits are read as 0 or 1. Do not care about this value. Write access is prohibited.
29	FLDST1	B'0	R	Field status of previous frame of WPF1 [RZ/G2H, RZ/G2N]. 0: Previous finished frame is TOP field. 1: Previous finished frame is BOT field. This bit can be referred in case of AUTO-FLD or AUTO-DISP. This bit is changed at the timing of VI6_WPF1_IRQ_STA.FRE.
28	FLDST0	B'0	R	Field status of previous frame of WPF0. 0: Previous finished frame is TOP field. 1: Previous finished frame is BOT field. This bit can be referred in case of AUTO-FLD or AUTO-DISP. This bit is changed at the timing of VI6_WPF0_IRQ_STA.FRE.
9	SYS1_ACT	B'0	R	WPFn Operating Status (SYSn_ACT, n = 0 to 1) Each bit indicates the operating or stopped state of control channel n (WPFn). 0: WPFn is stopped. 1: WPFn is operating.
8	SYS0_ACT	B'0	R	

33.2.4.12 WPFn Interrupt Enable Registers (VI6_WPFn_IRQ_ENB: n = 0, 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UNDE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFEE	FREE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Each bit controls the interrupt enable of the corresponding interrupt source.

0: Interrupt Disabled

1: Interrupt Enabled

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	UNDE	B'0	R/W	Interrupt Enable for WPFn (n = 0 to 1) Underrun in case of DU connection.
1	DFEE	B'0	R/W	Interrupt Enable for WPFn (n = 0 to 1) Display List Frame End
0	FREE	B'0	R/W	Interrupt Enable for WPFn (n = 0 to 1) Frame End

Each bit in VI6_WPFn_IRQ_STA is set to 1 when the corresponding interrupt source is generated. VI6_WPFn_IRQ_ENB specifies whether to output an interrupt signal for the generated source. When an interrupt is disabled in this register, no interrupt signal is generated even when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1. When an interrupt is enabled in this register, an interrupt signal is output when the corresponding bit in VI6_WPFn_IRQ_STA is set to 1.

33.2.4.13 WPFn Interrupt Status Registers (VI6_WPFn_IRQ_STA: n = 0, 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	UND
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DFE	FRE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

The read value from each bit is the status of the interrupt source, and the write access to each bit controls the interrupt status.

[Read Access] Interrupt Status

0: No interrupt

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

Bit	Bit Name	Initial Value	R/W	Description
31 to 17, 15 to 2	—	All 0	R	Reserved These bits are read as 0 or 1. Do not care about this value. The write value should always be 0.
16	UND	B'0	R/W	Interrupt Status and Clear for WPFn (n = 0 to 1) Underrun in case of DU connection. This interrupt source bit is set to 1 when data underrun occurs in case of DU connection. Timing that this bit is set to 1 is at end of 1 frame.
1	DFE	B'0	R/W	Interrupt Status and Clear for WPFn (n = 0 to 1) Display List Frame End This interrupt source bit is set to 1 when VSP2 completes one-frame processing while the current frame in enable value stored in the display list header is 1 (refer to section 33.3.3.2). When display lists are not used, this bit is not used. In this case, clear VI6_WPFn_IRQ_ENB.DFEE to 0 to mask the interrupt generation by this interrupt source. This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared.

Bit	Bit Name	Initial Value	R/W	Description
0	FRE	B'0	R/W	Interrupt Status and Clear for WPFn (n = 0 to 1) Frame End This interrupt source bit is set to 1 when VSP2 completes one-frame processing. This bit is also set to 1 when one-frame processing using a display list is completed. The interrupt status is set to 1 by any of the following conditions. a) Processing one frame is finished normally b) Software reset is issued during VSP is processing. c) One frame's data from DU is displayed while VSP couldn't transfer one frame data to DU. (in case of Linked with DU) This bit can hold the most recent of two times of interrupt status at the maximum. When writing 0 to this bit, the oldest interrupt status is cleared. And the status bit becomes 0 after all interrupt statuses are cleared.

VI6_WPFn_IRQ_STA indicates the state of the interrupt sources generated in the VSP2. Whether to output a VSP2 interrupt when an interrupt source is generated and the corresponding bit is set to 1 is determined by the corresponding bit setting in VI6_WPFn_IRQ_ENB. While an interrupt is disabled in VI6_WPFn_IRQ_ENB, the VSP2 does not output an interrupt signal even when an interrupt source is generated, but the source flag in this register is set to 1.

Note that the interrupt source bits in this register cannot be cleared by write access using a display list.

33.2.4.14 Display-n Interrupt Enable Register (VI6_DISPn_IRQ_ENB: n = 0, 1)

1: Interrupt activated

[Write Access] Interrupt Clear

0: The interrupt status is cleared to 0

1: Hold the interrupt status value

Bit	Bit Name	Initial Value	R/W	Description
31 to 9, 7, 6, 4 to 0	—	All 0	R	Reserved These bits are always read as 0 or 1. Do not care about this value. The write value should always be 0.
8	DST	B'0	R/W	Interrupt Status and Clear for Display Start This bit is set to 1 when LIF module transfers the first data to the display module at the beginning of each frame. The timing depends on the output buffer status of LIF module.
5	MAE	B'0	R/W	Interrupt Status and Clear for Display Read Data End This bit is set to 1 when all RPFs transfer the last data of the frame to LIF module. The RPF module which is not used by LIF module does not affect this bit.

33.2.5 Display List Control Registers

33.2.5.1 Display List Control Register (VI6_DL_CTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	AR_WAIT [15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

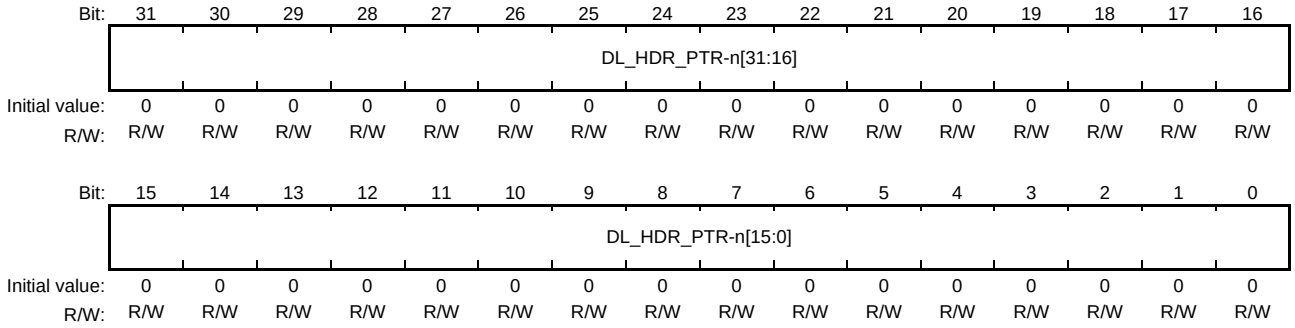
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	DC2	—	—	—	DC1	—	—	—	DLE 1	RLM 0	CFM 0	NH0	DLE 0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	AR_WAIT [15:0]	All 0	R/W	Display List Control Setting Always specify 256.
15 to 13, 11 to 9, 7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DC2	B’0	R/W	This bit doesn’t affect anything to VSP (NOP)
8	DC1	B’0	R/W	This bit doesn’t affect anything to VSP (NOP)
4	DLE1	B’0	R/W	Display List Enable/Disable for WPF1 Enables or disables the WPF1 display list function. When using display lists, note the restrictions in section 33.2.3. 0: The display list function is disabled 1: The display list function is enabled
3	RLM0	B’0	R/W	Loading two plane Registers Mode for WPF0. 0: Reserved status (VI6_CMD0.UPDHDR) is accepted by next frame auto start. Two plane registers are downloaded by next_frame_start also. 1: Reserved status (VI6_CMD0.UPDHDR) is not accepted by next frame auto start. pNextHeader in previous frame's DLH is used for loading DisplayList. Two plane registers are not downloaded by next_frame_start also.

Bit	Bit Name	Initial Value	R/W	Description
2	CFM0	B'0	R/W	Continuous Frame Mode for Header-less Display List for WPF0 This bit determines whether the next frame is automatically started or not. When the updated flag of the display list, VI6_DL_BODY_SIZE0.UPD0, is not updated, the display list of the next frame is not transferred and the same register values are used for the next frame. When the value of VI6_DL_BODY_SIZE0.UPD0 is updated, the new display list is transferred. 0: Stopped at the end of every frame 1: The next frame is automatically started
1	NH0	B'0	R/W	Header-less Display List Mode This bit is used for specifying the header-less display list mode. In case of header-less mode, the number of the display lists is 1. The address of the display body is set in VI6_DL_HDR_ADDR0 register, and the body size is set in VI6_DL_BODY_SIZE0 register. When this bit is changed, make sure that VSP2 is stopped. And also make sure the following before starting VSP2. - Header Address (VI6_DL_HDR_ADDR0) - Body Size (VI6_DL_BODY_SIZE0) in case of header-less mode 0: Use Display List Header (Normal DL Mode) 1: Don't use Display List Header (Header-less Mode) Notes: 1. Only WPF0 supports header-less display list. WPF1 work as the normal display list mode even if the WPF0 is set to header-less display list mode. 2. When DLE0 bit is 0, set 0 to NH0 bit.
0	DLE0	B'0	R/W	Display List Enable/Disable for WPF0 Enables or disables the WPF0 display list function. When the display list function is enabled through this bit, all WPF processing channels work in display list mode. When using display lists, note the restrictions in section 33.2.3. 0: The display list function is disabled 1: The display list function is enabled

33.2.5.2 Display List-n Header Address Register (VI6_DL_HDR_ADDRn: n = 0, 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_PTR-n [31:0]	All 0	R/W	Display List-n Header Address These bits specify the address of the display list header to be read for display list-n in 16-byte units (the lower-order four bits are read-only). When WPFn is first started in display list mode, the display list header is loaded from the address specified in this register. After loading of the header is completed, the register value of the display list address is updated to the next header address stored in the loaded header to prepare for loading of the next display list header. After that, this header address updating is repeated. When VI6_DL_CTRL.NHn is 0, writing header address to this register reserves updating two plane registers for the next frame. Two plane registers are VI6_HGO_WBUFS, VI6_HGT_WBUFS and VI6_DL_HDR_ADDRn. Set VI6_HGO_WBUFS and VI6_HGT_WBUFS before setting this register. A value from H'0000_0000 to H'FFFF_FFF0 can be specified.

33.2.5.3 Display List-n Data Swapping Register (VI6_DL_SWAPn: n = 0, 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IND	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DL_HDR_REF_PTR-n[31:0]	All 0	R	Display List-n reference Header Address Following value is read out from the VI6_DL_HDR_REF_ADDRn for each period. (1) When H/W is reading display list from external memory, header address of the display list referred by VSP2-H/W is read out. (2) When H/W is not reading display list from external memory, the value of VI6_DL_HDR_ADDRn is read out. For details, refer to section 33.3.6.1.

33.2.6 RPF Control Registers

33.2.6.1 RPFn Basic Read Size Registers (VI6_RPFn_SRC_BSIZE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	BHSIZE[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	BVSIZE[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	BHSIZE [12:0]	All 0	R/W	Horizontal Size of RPF Basic Read Area These bits specify the horizontal size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EHSIZE).
12 to 0	BVSIZE [12:0]	All 0	R/W	Vertical Size of RPF Basic Read Area These bits specify the vertical size of the basic area to be read from the external RAM by the RPFn. When the input format is YCbCr4:2:0, specify the size in 2-pixel units. A value from 1 to 8190 can be specified. Specify a value equal to or smaller than the extended read size (VI6_RPFn_SRC_ESIZE.EVSIZE).

Figure 33.12 shows the relationship between the basic read size and extended read size. The RPF reads data from the source memory area specified by the basic read size. The RPF repeats reading the basic read area in the horizontal and vertical directions up to the extended read size and sends the read data to the processing modules in the VSP2.

For basic read size reading, the reading start address, called the RPFn source image storing address, should be specified in VI6_RPFn_SRCM_ADDR_*. In the memory area where the basic read area image is stored, the distance (number of bytes) between addresses for lines n and n + 1 of two-dimensional image data, called the memory stride, should be specified in VI6_RPFn_SRCM_PSTRIDE.

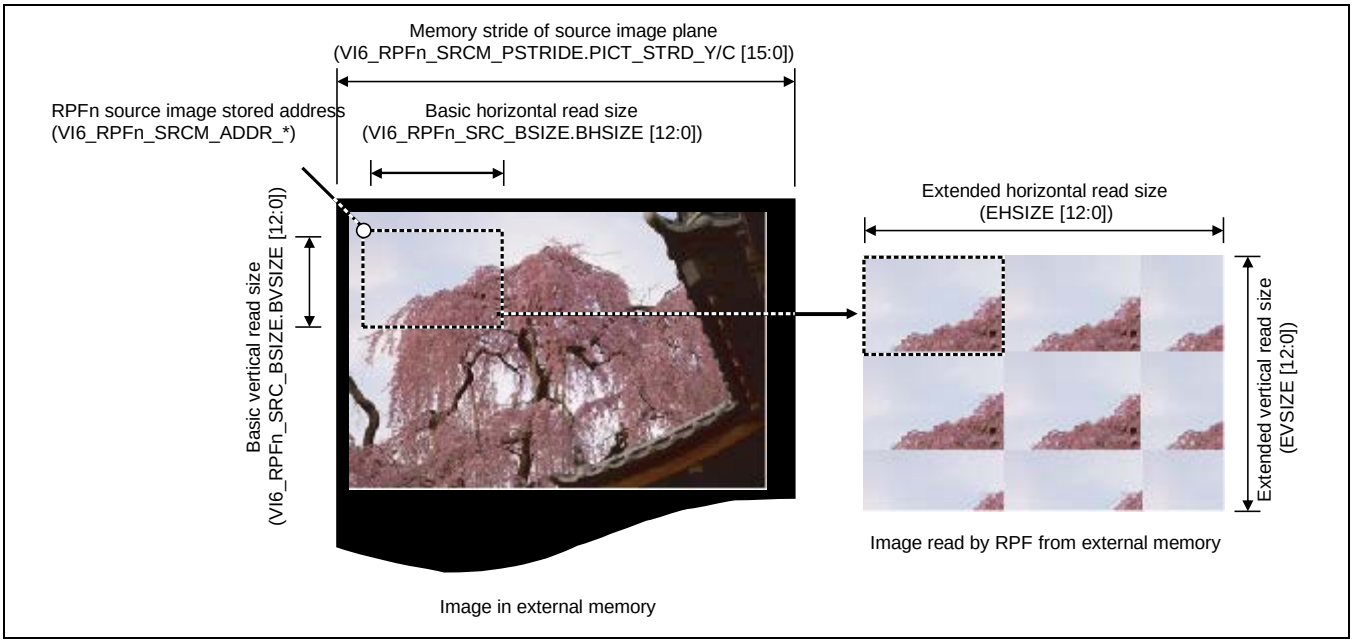

Figure 33.12 Relationship between Basic Read Size and Extended Read Size

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	EVSIZE[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	EHSIZE [12:0]	All 0	R/W	RPF Extended Horizontal Read Size These bits specify the horizontal size of the extended read area to which the RPFn reads data from the external RAM. As shown in Figure 33.12, the basic read area image is repeatedly placed in the extended read area; in the EHSIZE bits, specify a value not smaller than the horizontal size of the basic read area. When the input format is YCbCr4:2:2 or YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8190 can be specified.
12 to 0	EVSIZE [12:0]	All 0	R/W	RPF Extended Vertical Read Size These bits specify the vertical size of the extended read area to which the RPFn reads data from the external RAM. As shown in Figure 33.12, the basic read area image is repeatedly placed in the extended read area; in the EVSIZE bits, specify a value not smaller than the vertical size of the basic read area. When the input format is YCbCr4:2:0, specify the size in 2-pixel units (an even value). A value from 1 to 8190 can be specified.

VI6_RPFn_SRC_ESIZE specifies the extended size for RPFn. The extended horizontal and vertical sizes should be equal to or greater than the basic sizes specified in VI6_RPFn_SRC_BSIZE. The RPF internal data processing described later and image processing described in section 33.2.8 and later sections are all applied to the image in the extended read size shown on the right side in Figure 33.12.

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 27 to 17, 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	VIR	B'0	R/W	Virtual Input Enable Enables or disables the virtual input function of the RPFn. The image to be processed by the RPFn is usually read from the external memory by the MAU. Instead of this input, the virtual input function generates a single-color image within the RPFn and sends it to the modules in VSP2. When the virtual input function is enabled, the fixed value specified in VI6_RPFn_VRTCOL_SET is used as the input to the RPFn. While the virtual input function is enabled, data is not read from the external memory; that is, the α plane is not read and the IROP calculation thus cannot be executed. In this case, set VI6_RPFn_ALPH_SEL.ASEL to 4. Neither the color space conversion through CSC nor the color keying described in section 33.2.6.11 can be used. 0: RPFn uses general input. 1: RPFn uses virtual input.
16	CIPM	B'0	R/W	Horizontal Chrominance Interpolation Method Setting Image data is processed in the YCbCr444 format inside VSP2 in case of YCbCr color space. When the chrominance format of the input image is YCbCr422 or YCbCr420, data is up-sampled as shown in Figure 33.13 for internal processing. This bit specifies the method of up-sampling for this purpose. 0: The nearest-neighbor method is used for horizontal chrominance interpolation. 1: The bilinear method is used for horizontal chrominance interpolation.
15	SPYCS	B'0	R/W	RPF Input Mode Setting 1 When the input format is YUY2, set this bit to 1 and set the RDFMT bits to 71 (H'47). When the input format is YVYU, set this bit and the SPUVS bit to 1 and set the RDFMT bits to 71 (H'47). In other cases, set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
14	SPUVS	B’0	R/W	RPF Input Mode Setting 2 When the input format is NV61, set this bit to 1 and set the RDFMT bits to 65 (H’41). When the input format is NV21, set this bit to 1 and set the RDFMT bits to 66 (H’42). When the input format is YVYU, set this bit and the SPYCS bit to 1 and set the RDFMT bits to 71 (H’47). In other cases, set this bit to 0.
13, 12	CEXT [1:0]	B’00	R/W	Lower-Bit Color Data Extension Method Setting When an RGB input format where each color component is expressed in less than 8 bits are selected from Table 33.10 through the RDFMT bits, VSP2 internally extends each color component to 8 bits before using the data. These bits select this extension method. B'00: Lower-order bits of color data are extended with 0. B'01: Upper-order bits of color data are copied to the lower -order bits. B'10: Lower-order bits of color data are extended with 0. The maximum value is limited to H’FF. B'11: Setting prohibited
11 to 9	RDTM [2:0]	B’000	R/W	CSC Conversion Expression Setting These bits select the expression used for color space conversion. The conversion direction is RGB → YCbCr when RGB is selected through the RDFMT bits; the direction is YCbCr → RGB when YCbCr is selected. B'000: BT.601 YCbCr [16,235/240] ↔ RGB [0,255] B'001: BT.601 YCbCr [0,255] ↔ RGB [0,255] B'010: BT.709 YCbCr [16,235/240] ↔ RGB [0,255] B'011: BT.709 YCbCr [16,235/240] ↔ RGB [16,235] B'100 to B’111: Setting prohibited
8	CSC	B’0	R/W	Color Space Conversion Enable Enables or disables color space conversion between YCbCr and RGB to be executed in RPFn. The characteristics of color space conversion are determined by the RDTM bit setting. (*1) When using the virtual input (VIR = 1), specify 0. 0: Color space conversion is disabled. 1: Color space conversion is enabled.

Bit	Bit Name	Initial Value	R/W	Description
6 to 0	RDFMT [6:0]	All 0	R/W	RPF Input Image Format Setting These bits select the format of the image input from the external RAM to the RPFn. Select a value corresponding to the desired format from those shown in Table 33.10 and Table 33.11. When the virtual input function is used (VIR = 1), the color information for the virtual input should be specified in VI6_RPFn_VRTCOL_SET. If this color information is in the RGB format, set the RDFMT bits to 19. If the color information is in the YCbCr format, set these bits to 64. [Note 1] Number of input pixels When YCbCr4:2:2 is selected through the RDFMT bits, the horizontal size of the input image should be specified in 2-pixel units. When YCbCr4:2:0 is selected, the vertical and horizontal sizes should be specified in 2-pixel units. Observe these restrictions when specifying the image size in VI6_RPFn_SRC_BSIZE and VI6_RPFn_SRC_ESIZE. [Note 2] OSD-CLUT Setting When the RDFMT bits are set to H'3F, RGB color data should be stored in the OSD-CLUT. When these bits are set to H'7F, YCbCr color data should be stored in the OSD-CLUT. Note that while the target WPF is operating, the RPF is also operating and the OSD-CLUT cannot be read or written to.

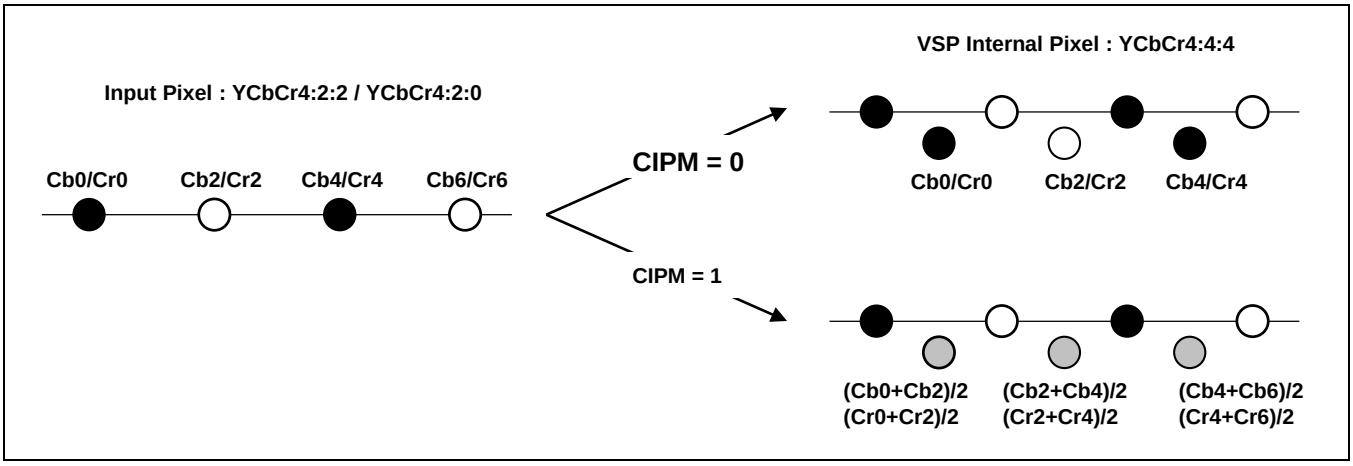

Figure 33.13 Chrominance Interpolation Methods Selectable through CIPM Setting

Note: * Note on color space settings

The color space for the image output from the RPF to VSP2 internal modules is determined by the combination of the color space for the image input to the RPF, which is selected through the VI6_RPFn_INFMT.RDFMT setting, and the enabled or disabled state of the color space conversion function, which is selected through the VI6_RPFn_INFMT.CSC setting (Table 33.9). For example, when the image input to the RPF is in the YCbCr format, the RPF outputs data to VSP2 internal modules in the YCbCr format if color space conversion is disabled through the CSC bit, and the RPF outputs data in the RGB format if color space conversion is enabled. When the image input to the RPF is in the RGB format, the relationship between the output format and the color space conversion setting is the opposite of the YCbCr case. For some VSP2 internal modules, the YCbCr format is recommended for image processing because of the characteristics of the processing, or the same color space needs to be specified between multiple RPF outputs. In these cases, set VI6_RPFn_INFMT.RDFMT and VI6_RPFn_INFMT.CSC appropriately so that the RPFs can output the required color space according to the color space conditions described above.

Table 33.9 RPFn Input Color Space and Output Color Space

RPFn Input Color Space (VI6_RPFn_INFMT. RDFMT)		Color Space Conversion Setting (VI6_RPFn_INFMT.CSC)		RPFn Output Color Space
RGB	(H'00 to H'3F)*	Disabled	(0) *	RGB
		Enabled	(1) *	YCbCr
YCbCr	(H'40 to H'7F)*	Disabled	(0) *	YCbCr
		Enabled	(1) *	RGB

Note: * Value specified in the register

A color space conversion function equivalent to that in the RPFn is also provided by the WPF. As shown in Table 33.9, the color space (YCbCr or RGB) output from the RPF becomes the input format for the WPF. Here, the color space of the output image obtained by the color space conversion function of the WPF must match the color space of the format specified through VI6_WPFn_OUTFMT.WRFMT.

Figure 33.14 shows the relationship between the input/output format and color space. The input color space for the RPF is determined when the input image format for the RPF is specified through the RDFMT bits. The color space for the image output from the RPF to subsequent VSP2 internal modules depends on the combination of the RPF input format and CSC (color space conversion function) enabled or disabled state in the RPF as shown in Table 33.9 and Figure 33.14. The user should first determine whether the image processing in the VSP2 is done in YCbCr or RGB, and then specify the RPF input format and CSC enabled or disabled state to obtain the desired color space. The color space of the RPF output image is also that of the WPF input image; the color space of the data output from the WPF to the outside of VSP2 depends on the combination of the WPF input color space and the enabled or disabled state of the CSC implemented in the WPF as shown in Figure 33.14. The color space of the WPF output image must match that of the WPF output format (determined by VI6_WPFn_OUTFMT.WRFMT). For example, in the flow shown in Figure 33.14, YCbCr should not be specified as the WPF output format regardless of the fact that the color space of the WPF output image is in RGB format.

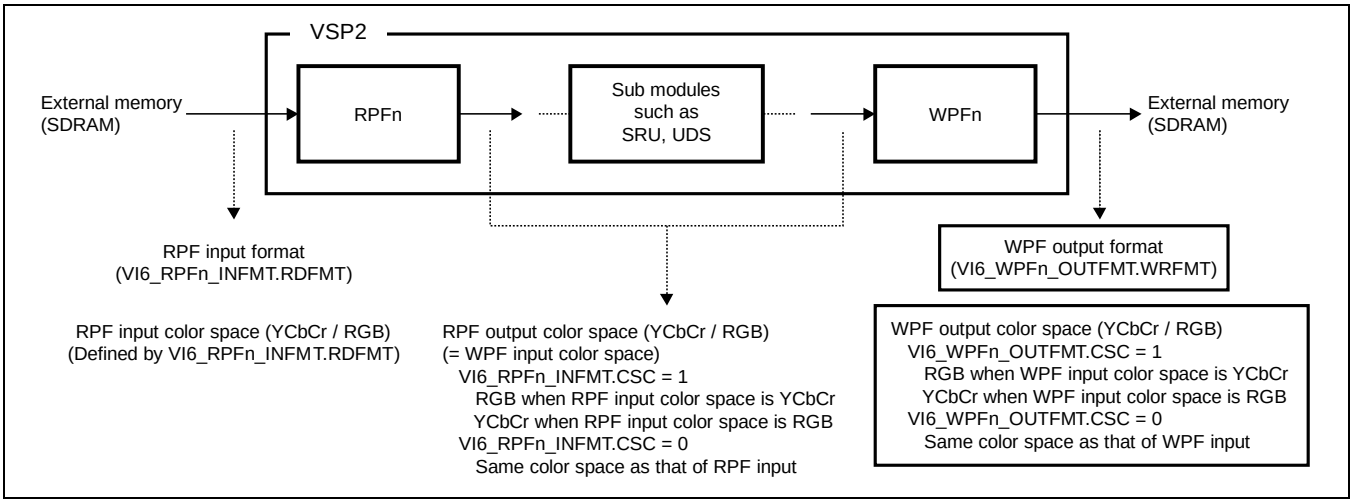

Figure 33.14 Relationship between Input/output Format and Color Space

When the RDFMT [6:0] bits are set to H'3F, it is necessary to set up the OSD-CLUT in the RGB color space.

Table 33.11 Packed YCbCr Formats for RPF Input

RDFMT [6:0]	Packed YCbCr Input Format	Reference
H'40	YCbCr4:4:4 semi-planar	Figure 33.15*6
H'41	YCbCr4:2:2 semi-planar (NV16, NV61*1)	
H'42	YCbCr4:2:0 semi-planar (NV12, NV21*1) *7	
H'43 to H'45	Reserved	—
H'46	YCbCr4:4:4 interleaved	Figure 33.16*6
H'47	YCbCr4:2:2 interleaved type 0 (UYVY, YUY2*2, YVYU*3)	
H'48	YCbCr4:2:2 interleaved type 1	
H'49	YCbCr4:2:0 interleaved*8	
H'4A	YCbCr4:4:4 planar	Figure 33.17*6
H'4B	YCbCr4:2:2 planar (YV16)	
H'4C	YCbCr4:2:0 planar (YV12, I420) *7	
H'4D to H'7E	Reserved	—
H'7F	YCBCR_CLUT_DATA*4 *5	—

Notes: 1. When the input format is NV61 or NV21, set the SPUVS bit to 1.
2. When the input format is YUY2, set the SPYCS bit to 1.
3. When the input format is YVYU, set the SPUVS bit to 1 and SPYCS bit to 1.
4. When the RDFMT [6:0] bits are set to H'7F, it is necessary to set up the OSD-CLUT in the YCbCr color space.
5. The Monochrome format can be implemented through the OSD-CLUT.
6. Figure 33.18 shows the definition of memory address for each pixel in Figure 33.15 to Figure 33.17.
7. Each line of C plane is read twice, so byte/pixel of YCbCr420 is 2 byte/pixel (same as YCbCr422).
8. Each line of plane is read twice, so byte/pixel of YCbCr420ITL is 3 byte/pixel (same as YCbCr444ITL).

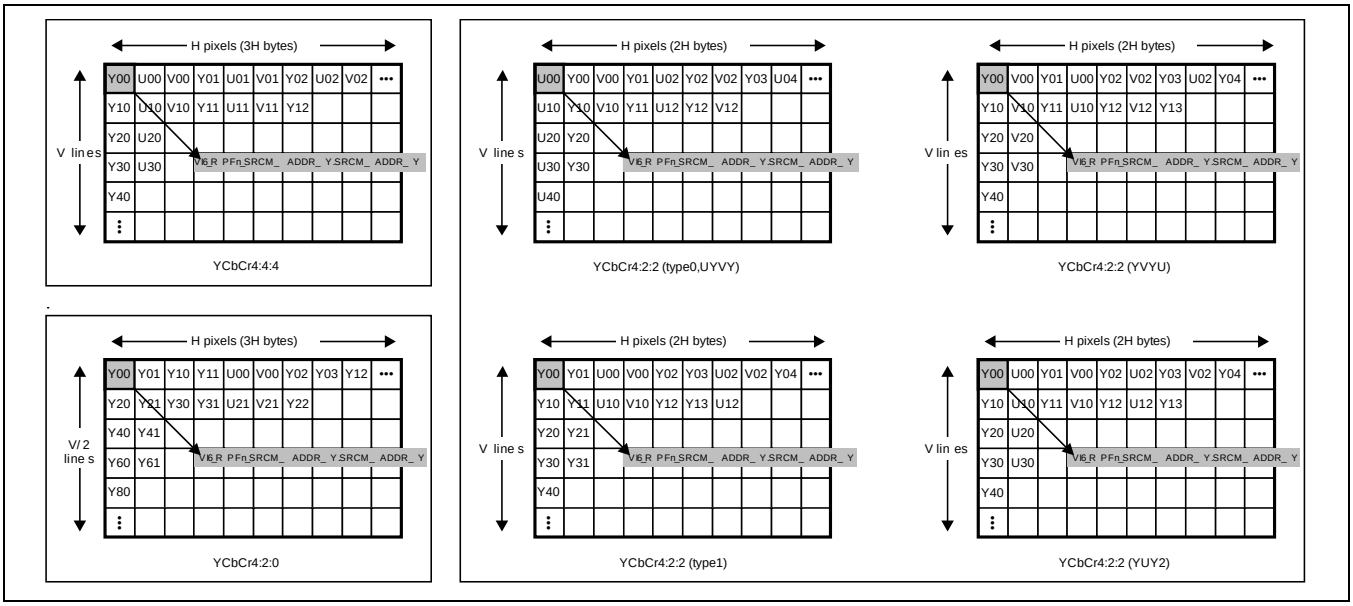

Figure 33.16 YCbCr Interleaved Formats

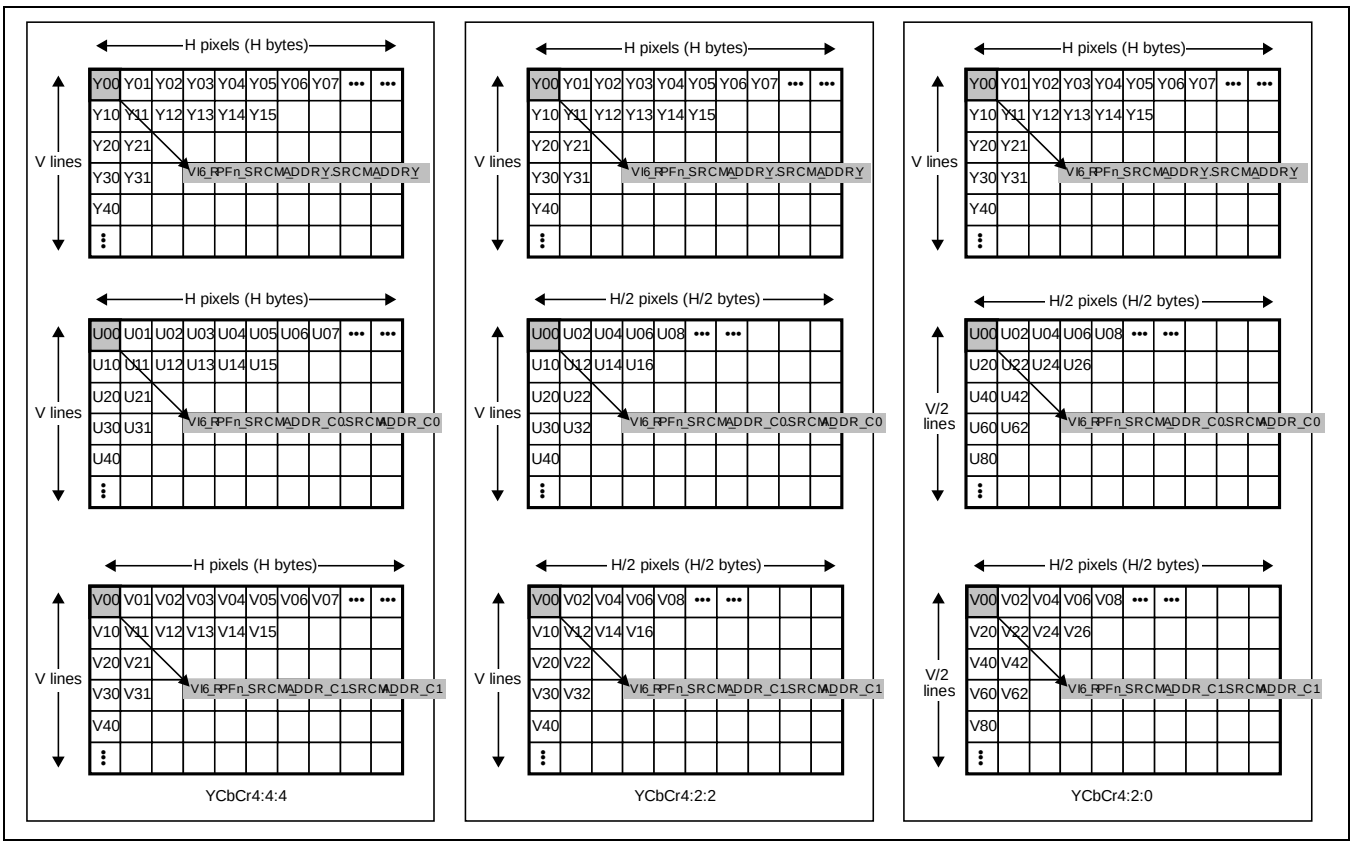

Figure 33.17 YCbCr Planar Formats

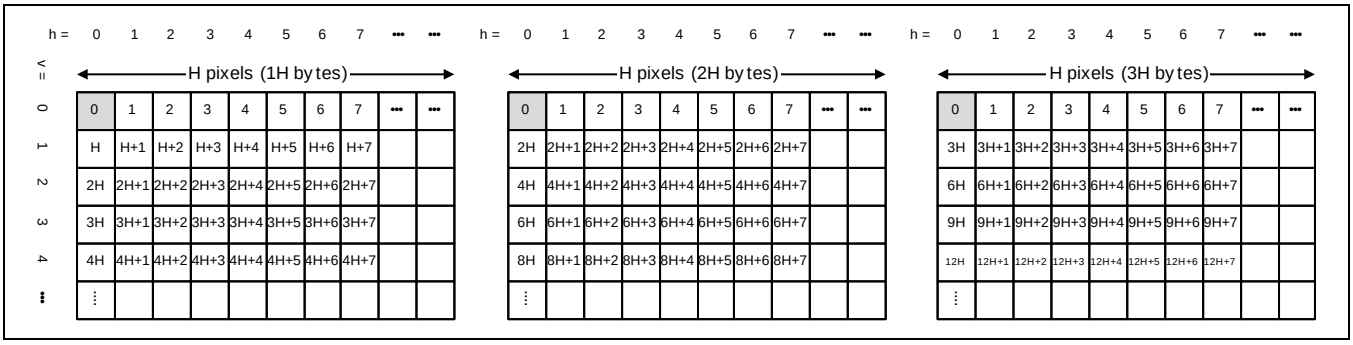

Figure 33.18 Memory address for the corresponding pixel's position

Legend of Figure 33.18

— H is horizontal image size in pixel unit.

— 1H, 2H and 3H is corresponding to the case 1 pixel has 1byte, 2bytes, 3bytes of data respectively.

[OSD-CLUT Setting]

To set up the OSD-CLUT, store the values to replace each of R (Cr), G (Y), and B (Cb) components in the OSD-CLUT allocated as shown in Table 33.12. The OSD-CLUT space has 256 32-bit entries, which should be accessed in 32 bits in the same way as for register access. The address for each entry is obtained from the start address of each space (Table 33.12) + entry number × 4. For example, the OSD-CLUT address of entry 7 for RPF2 is (offset address) + H'481C. Figure 33.19 shows the OSD-CLUT format.

Table 33.12 OSD-CLUT Space for Each RPF

RPF	Address Area for CLUT Space
RPF0	(offset address) + H'4000 to (offset address) + H'43FF
RPF1	(offset address) + H'4400 to (offset address) + H'47FF
RPF2	(offset address) + H'4800 to (offset address) + H'4BFF

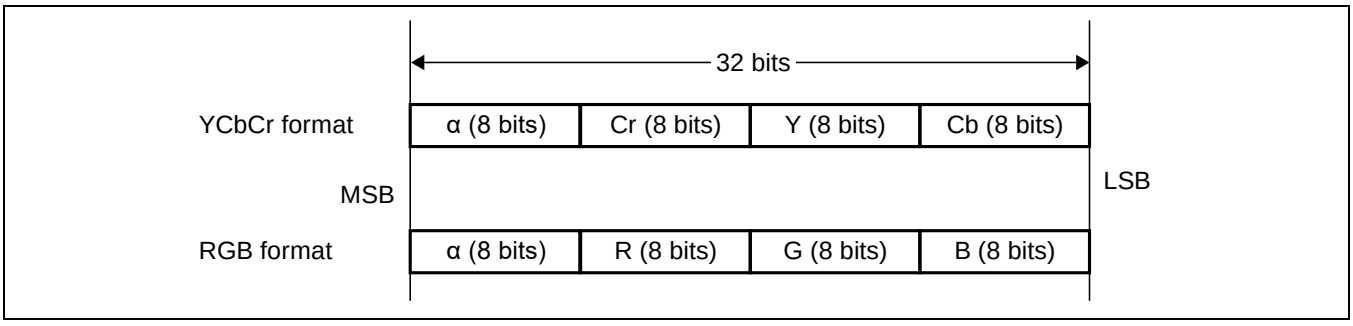

Figure 33.19 OSD-CLUT Format

According to the specified 256-entry replacement table (OSD-CLUT), input data is replaced as shown in Figure 33.20. Input data is 8 bits but output data is 32 bits including α and RGB or YCbCr components.

When writing to an entry in the OSD-CLUT, the host CPU writes all components at the same time. Therefore, specify replacement data for all components in the OSD-CLUT at the same time as shown in Figure 33.19.

Note that write access to the OSD-CLUT space is prohibited while the RPF is operating.

Bit	Bit Name	Initial Value	R/W	Description
0	P_BTS	B'0	R/W	Picture Plane Data Swapping in Byte Units The effect of this bit setting is defined in Table 33.13. 0: Data swapping in byte (8-bit) units is disabled 1: Data swapping in byte (8-bit) units is enabled

When the virtual input function of the RPFn is used (VI6_RPFn_INFMT.VIR = 1), this register setting is ignored. Swapping of RPF input data can be specified separately for the α plane and picture plane.

Table 33.13 shows the data order before and after swapping according to the long long word, long word, word, and byte swapping settings.

When data order in memory for each format is the same as Table 33.10 for RGB format and Figure 33.15 to Figure 33.17 for YCbCr format, set 4'b1111 to {*_LLS, *_LWS, *_WDS, *_BTS}. If data order is not the same as the definition, change data order within 16byte unit by these bits as shown in Table 33.13.

Table 33.13 Changing data order according to swap register

Bit	Bit Name	Initial Value	R/W	Description
31 to 29, 15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 16	HCOORD [12:0]	All 0	R/W	Horizontal Coordinate of Sublayer Display Location on Master Layer These bits specify the left-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the horizontal coordinate of the location in pixel units with the left-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0. If the sublayer extends beyond the master layer according to the HCOORD setting, the extended section is cut off at the right end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the right end of the master layer. A value from 0 to 8189 can be specified.
12 to 0	VCOORD [12:0]	All 0	R/W	Vertical Coordinate of Sublayer Display Location on Master Layer These bits specify the top-end location of the sublayer displayed by the RPFn and the subsequent module connected through the DPR. Specify the vertical coordinate of the location in pixel units with the top-end pixel of the master layer set at coordinate 0. When the RPFn is the master layer, set these bits to 0. If the sublayer extends beyond the master layer according to the VCOORD setting, the extended section is cut off at the bottom end of the master layer. Even in this case, however, a bus transfer that is unnecessary for output image generation is executed since the whole sublayer data is read from the external memory. Appropriate coordinate setting is required so that the sublayer does not extend beyond the bottom end of the master layer. A value from 0 to 8189 can be specified.

Figure 33.21 shows an example of RPF1 and RPF2 offsets with respect to master layer RPF0. Although this figure only shows sublayers RPF1 and RPF2, specify offsets for all RPFs other than the master layer in the same way as shown in this example.

Whether an RPFn is the master layer or a sublayer is determined through the selection of the source RPF for WPFn (the VI6_WPFn_SRCRPF setting). For details, refer to section 33.2.7.1.

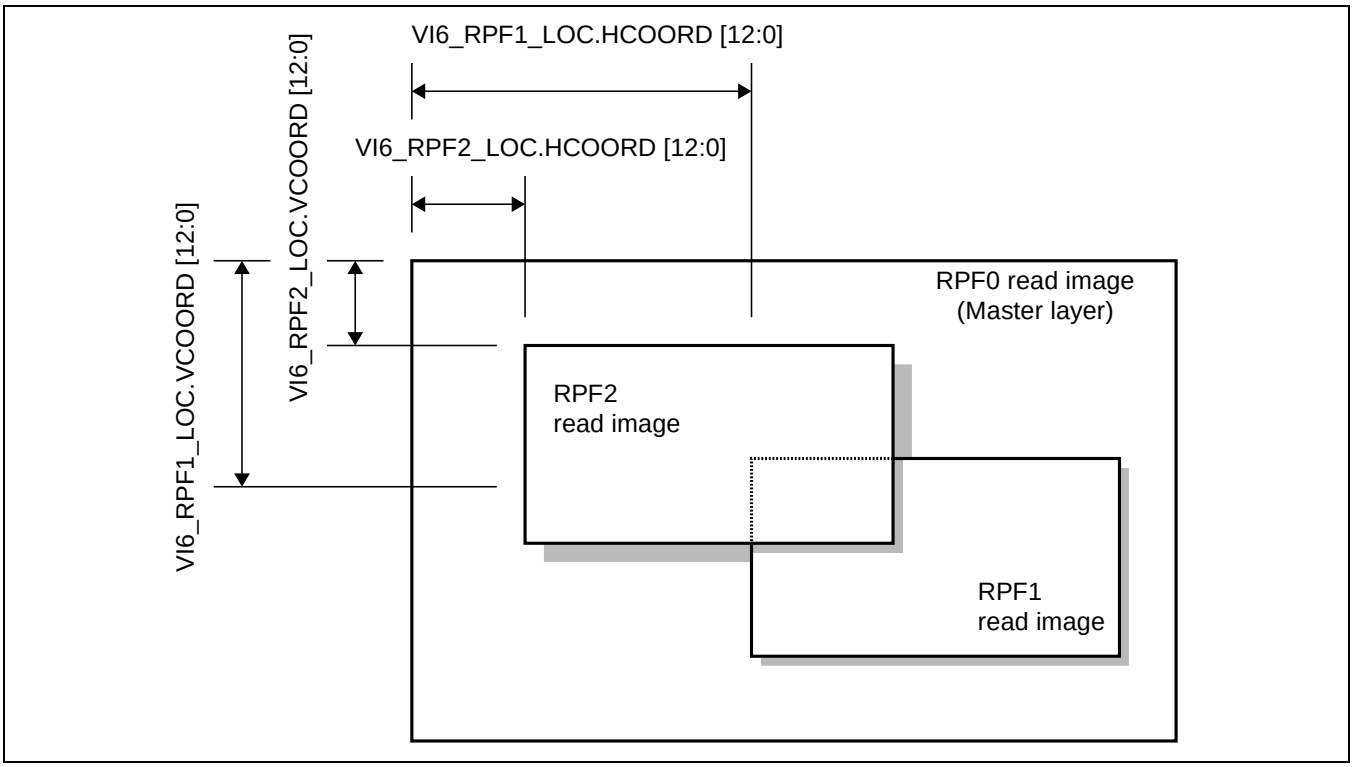

Figure 33.21 RPF1 and RPF2 Offsets from Master Layer

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 22 to 20, 17, 16	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	ASEL[2:0]	B'000	R/W	α Format and Processing Method Select These bits select how to handle the α value to be used. The RPF handles two types of α value; 8-bit and 1-bit values. When a 1-bit α value is used, VSP2 assumes that the 1-bpp α value for each pixel is stored in the order from MSB to LSB in each byte (big endian). The α value is used as either transparency information or mask information. Transparency information is included in the α plane read from external memory when the ASEL bits are set to 1 or 3 and in the α value stored in the packed RGB bit field when these bits are set to 0 or 2. The α value as transparency information is sent as the destination value to the IROP as shown in Figure 33.22 and then output to the subsequent modules. The output α value is used, for example, for blending in the BRU. The α value as mask information is used for IROP operation in the RPF. The mask information is included in the α plane read from external RAM when the ASEL bits are set to 0 or 2 and the source value is used in IROP operation (IROP setting other than 0, 5, 10, or 15). This α value is sent as the source value to the IROP as shown in Figure 33.22. Note that the α value selected through the ASEL bits has a lower priority than the VI6_RPFn_CKEY_SET*.AP* value replaced through the color keying function. When the color keying function is used, the α value may be replaced with the VI6_RPFn_CKEY_SET*.AP* value regardless of the ASEL bit setting. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), specify 4. 0: 1, 4, or 8-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The α bit field in 1, 4, or 8-bit packed α is handled as transparency information. Be sure to specify the packed format that includes α through VI6_RPFn_INFMT.RDFMT. When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP bit value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read.

Bit	Bit Name	Initial Value	R/W	Description
30 to 28	ASEL[2:0]	B’000	R/W	B’001: 8-bit plane α The 8-bit α plane is read from external RAM as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. The α value goes through the 8-bit transparent α generator shown in Figure 33.22 without change. When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed. B’010: 1-bit packed α + plane α (IROP ! = 0, 5, 10, 15) The 1-bit packed α input is converted by the 8-bit transparent α generator shown in Figure 33.22 according to the ALPHA0/1 setting into the 8-bit α value as transparency information. Select the packed input format that includes a 1-bit α field. When VI6_RPFn_MSKCTRL.MSK_EN is 0 and the IROP value is not 0, 5, 10, or 15, the α plane should be read as mask information. Specify the number of α data bits (BSEL) stored in the α plane and the α plane read start address (VI6_RPFn_SRCM_ADDR_AI). When the IROP bits are set to 0, 5, 10, or 15, the α plane is not read. B’011: 1-bit plane α The 1-bit α plane is read from external RAM and converted by the 8-bit transparent α generator shown in Figure 33.22 according to the ALPHA0/1 setting into the 8-bit α value as transparency information. When the packed RGB format has a bit field for α, the information in the α bit field is discarded. The α plane read start address (VI6_RPFn_SRCM_ADDR_AI) should be specified. When VI6_RPFn_MSKCTRL.MSK_EN is 0, IROP operation cannot be executed; set the IROP bits to 0 in this case. When VI6_RPFn_MSKCTRL.MSK_EN is 1. IROP operation can be executed. B’100: Fixed α The fixed α value (VI6_RPFn_VRTCOL_SET.LAYA value) is output from the RPF. IROP operation cannot be executed; set the IROP bits to 0 in this case. B’101 to B’111: Setting prohibited.

Bit	Bit Name	Initial Value	R/W	Description
27 to 24	IROP[3:0]	H'0	R/W	IROP Operation Setting These bits specify the operator to be executed in the IROP operation unit shown in Figure 33.22. The source (S) for the IROP operation is the pixel data and α data specified in the VI6_RPFn_MSKSET0 or VI6_RPFn_MSKSET1 IROP input value register, which is selected according to the value (0 or 1) generated by the 1-bit mask generator. The destination (D) is the image data (RGB/YCbCr) and 8-bit α data output from the unpack/OSD processor. IROP operation is applied both for the image data and α data between the source and destination data. If these bits are set to the operation that involves the source (S) (IROP setting other than 0, 5, 10, or 15) while VI6_RPFn_MSKCTRL.MSK_EN is 0, the α plane is read from the external RAM to be used for the α value for IROP operation; specify the α plane read start address (VI6_RPFn_SRCM_ADDR_A). When the virtual input function is used (VI6_RPFn_INFMT.VIR = 1), IROP operation is not available; set these bits to B'0000. B'0000: NOP(D) B'0001: AND(S & D) B'0010: AND_REVERSE(S & ~D) B'0011: COPY(S) B'0100: AND_INVERTED(~S & D) B'0101: CLEAR(0) B'0110: XOR(S ^ D) B'0111: OR(S | D) B'1000: NOR(~(S | D)) B'1001: EQUIV(~(S ^ D)) B'1010: INVERT(~D) B'1011: OR_REVERSE(S | ~D) B'1100: COPY_INVERTED(~S) B'1101: OR_INVERTED(~S | D) B'1110: NAND(~(S & D)) B'1111: SET(all 1)
23	BSEL	B'0	R/W	α Bit Count Conversion Selection for 1-Bit Mask Generator Specifies the number of bits in the α plane to be read as mask information from the external RAM. The α value in mask information is used for the source (S) in IROP. When α plane data is 8 bits, it is converted to one bit through the 1-bit mask generator shown in Figure 33.22. Note that this bit setting is valid when the ASEL bits are set to 0 or 2 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0. In other cases, this bit setting has no effect. 0: 8-bit α is converted to 1-bit α through the 1-bit mask generator. When the 8-bit α value input to the RPF is not 0, it is converted to B'1; when the value is 0, it is converted to B'0. 1: α value goes through the 1-bit mask generator. The 1-bit α value input to the RPF is output through the 1-bit mask generator without change.

Bit	Bit Name	Initial Value	R/W	Description
19, 18	AEXT[1:0]	B'00	R/W	Lower-Bit α Value Extension Method Set These bits specify the method for extending the input α data to 8 bits through the unpack processing. B'00: The lower-order bits of α value are extended with 0. B'01: The upper-order bits of α value are copied to the lower-order bits. B'10: The lower-order bits of α value are extended with 0. The maximum value is limited to H'FF. B'11: Setting prohibited
15 to 8	ALPHA1[7:0]	All 0	R/W	8-Bit α Value Output when 1-Bit α Value is 1 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in Figure 33.22 is B'1. This setting is valid when the ASEL bits are set to B'010 or B'011. A value from 0 to 255 can be specified.
7 to 0	ALPHA0 [7:0]	All 0	R/W	8-Bit α Value Output when 1-Bit α Value is 0 These bits specify the 8-bit α value to be output when 1-bit α data is input and the α value input to the 8-bit transparent α generator shown in Figure 33.22 is B'0. This setting is valid when the ASEL bits are set to B'010 or B'011. A value from 0 to 255 can be specified.

Figure 33.22 shows the relationship between the α selector, IROP operation unit, color keying unit, and related registers. The IROP operation unit receives two inputs, source and destination. The image data input from the external memory is processed through the unpack processor and 8-bit transparent α generator and then input to the IROP operation unit as destination data. The α plane data input from the external memory is sent to the 8-bit transparent α generator when the ASEL bits are set to 1 or 3, or sent to the 1-bit mask α generator when the ASEL bits are set to 0 or 2. For the pixel data and 8-bit α value on the source side of the IROP operation unit, either the VI6_RPFn_MSKSET0 value or VI6_RPFn_MSKSET1 values will be selected according to the 1-bit α value output by the 1-bit mask α generator.

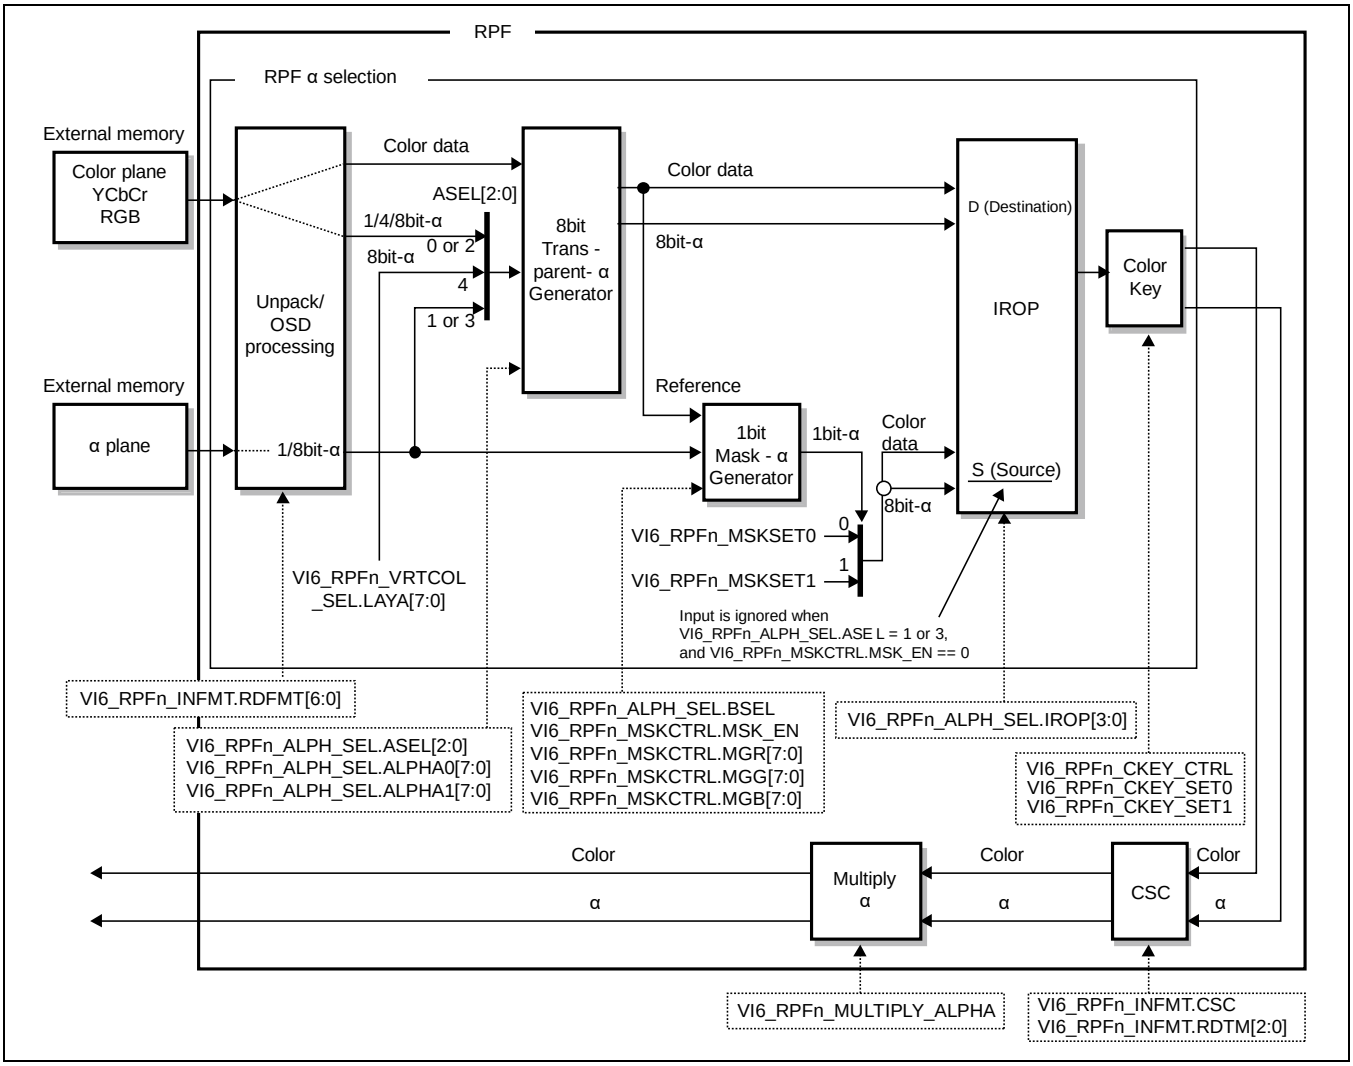

Figure 33.22 Configuration of alpha Selector and IROP Operation Unit in RPF

The following describes the function of each block shown in Figure 33.22. Read the following while referring to the figure as necessary.

Unpack/OSD processor:

Unpacks each component and α value of the image data according to the packed format specified in VI6_RPFn_INFMT.RDFMT.

8-bit transparent α generator:

Converts the input α value into 8-bit α when the input α is four bits or one bit.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α), this generator outputs the input α value without change if the α bit field in the packed α data is 8 bits; if the α bit field is less than 8 bits, it is converted to an 8-bit α value by extending the LSB side according to the VI6_RPFn_ALPH_SEL.AEXT setting.

When VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 4 (fixed α), this generator outputs the input 8-bit plane α without change. If a packed α value is included in RGB data, it is discarded.

When VI6_RPFn_ALPH_SEL.ASEL are set to 2 (1-bit packed α) or 3 (8-bit α generated from 1-bit plane α), an 8-bit α value is generated by using the VI6_RPFn_ALPH_SEL.ALPHA0 [7:0] value when the input 1-bit α value is 0 or by using the VI6_RPFn_ALPH_SEL.ALPHA1 [7:0] value when the input 1-bit α value is 1. When VI6_RPFn_ALPH_SEL.ASEL is set to 3, a packed α value that is included in RGB data is discarded.

1-bit mask α generator:

Generates 1-bit α data from the input 8-bit α data or pixel data. When the input α data is one bit, this generator outputs it without change.

When VI6_RPFn_ALPH_SEL.ASEL are set to 0 (8-, 4-, or 1-bit packed α) or 2 (plane α) and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the α plane read from the external memory to be used in IROP is converted to 1-bit α data when necessary. When the α plane data read from the external RAM is 8 bits (BSEL = 0), if the value is 0, a 1-bit α value of B'0 is generated; if the value is not 0, a 1-bit α value of B'1 is generated. When the α plane data is one bit (BSEL = 1), this generator outputs it without change.

When the value of the 1-bit α generated by the 1-bit mask α generator is B'0, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET0 are output as the source. When the generated 1-bit α value is B'1, the 8-bit α and pixel data specified in VI6_RPFn_MSKSET1 are output as the source.

As shown in Figure 33.22, when VI6_RPFn_ALPH_SEL.ASEL are set to 1 (8-bit plane α) or 3 (1-bit plane α), the α plane read from the external RAM is sent to the 8-bit transparent α generator as transparency information. When VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the 1-bit α for masking is generated according to the input α plane (refer to section 33.2.6.8), but the 1-bit mask α generator does not refer to the input α plane because it is input to the 8-bit transparent α generator as transparency information. Accordingly, the 1-bit mask α generator does not generate a 1-bit α for masking and the data on the source side becomes invalid; that is, IROP operation cannot be executed. Set the IROP bits to 0 in this case. In contrast, when VI6_RPFn_MSKCTRL.MSK_EN is set to 1, the 1-bit mask α generator creates α data for masking according to the pixel data instead of the input α plane data, and IROP operation can be executed in this case.

IROP operation unit

Executes ROP operation according to the opcode specified in VI6_RPFn_ALPH_SEL.IROP. For ROP operation (other than NOP), valid values should be input both for the source and destination. As described in the above (description of the 1-bit mask α generator), when VI6_RPFn_ALPH_SEL.ASEL are set to 1 or 3 and VI6_RPFn_MSKCTRL.MSK_EN is set to 0, the source data for the IROP operation unit is treated as invalid; set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP). When VI6_RPFn_ALPH_SEL.ASEL are set to 4, a fixed α value is output from the RPF and IROP operation is not available. In the same way as the above case, set VI6_RPFn_ALPH_SEL.IROP to 0 (NOP).

To specify a valid source value for the IROP operation unit and execute IROP operation (specify an opcode other than NOP in the IROP bits), specify register values as shown in Table 33.14. Where the source input state is indicated as "Valid" in the table, IROP operation can be executed. In the cases where IROP operation is not available, set the IROP bits to 0 (NOP).

Table 33.14 Source Input State in IROP Operation Unit

		VI6_RPFn_MSKCTRL.MSK_EN		
VI6_RPFn_ALPH_SEL.ASEL [2:0]		0 (Source data is generated according to input α plane)		1 (Source data is generated according to the destination-side pixel data)
B'000	(1-, 4-, or 8-bit packed α + plane α)	Valid	(α plane input)	Valid
B'001	(8-bit α plane)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
B'010	(8-bit α generated from 1-bit packed α + plane α)	Valid	(α plane input)	Valid
B'011	(8-bit α generated from 1-bit plane α)	Invalid	(IROP operation is not available; α plane is output to the subsequent modules behind RPF)	Valid
B'100	(Fixed α)	Invalid (IROP operation is not available; fixed α is output to the subsequent modules behind RPF)		

For the handling of the α values shown in Figure 33.22 and Table 33.14, the relationship between the RPF input format and RPF output α value is shown in Table 33.15. Where only bit names are shown in the table, the bits are in VI6_RPFn_ALPH_SEL described in this section.

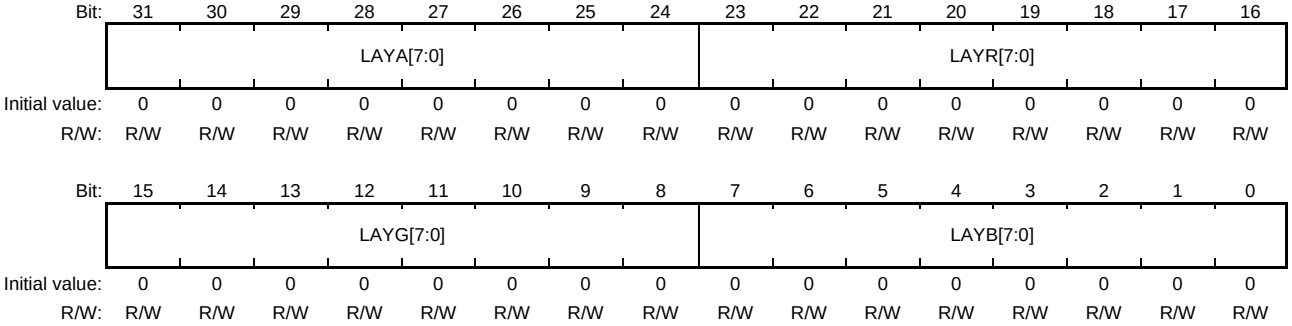
Table 33.15 α Value Selected and Output according to ASEL Bits in Each Input Format

*Fixed value H'FF is output because packed α is not included in YCbCr.

		α Value Output for Each Input Format		
ASEL Setting		RGB	YCbCr	OSD-CLUT
B'000	(8-, 4-, or 1-bit packed α is input)	1- ,4-, or 8-bit pixel α	H'FF*	α value in CLUT
B'001	(8-bit plane α is input)	8-bit α plane	8-bit α plane	8-bit α plane
B'010	(8-bit α is generated from the 1-bit packed α input)	ALPHA0 or ALPHA1 setting	H'FF*	H'FF
B'011	(8-bit α is generated from the 1-bit plane α input)	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting	ALPHA0 or ALPHA1 setting
B'100	(Fixed α is output)	VI6_RPFn_VRTCOL_SET.LAYA setting		

33.2.6.7 RPFn Virtual Plane Color Information Registers (VI6_RPFn_VRTCOL_SET)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	LAYA [7:0]	All 0	R/W	Virtual-Input Fixed α Value These bits specify the fixed α value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When the virtual input function is disabled (VI6_RPFn_INFMT.VIR = 0), these bits are used to specify the fixed α value to be output from the RPF while VI6_RPFn_ALPH_SEL.ASEL are set to 4. A value from 0 to 255 can be specified.
23 to 16	LAYR [7:0]	All 0	R/W	Virtual-Input Fixed R/Cr Component Value These bits specify the fixed R or Cr value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the R value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cr value. A value from 0 to 255 can be specified.
15 to 8	LAYG [7:0]	All 0	R/W	Virtual-Input Fixed G/Y Component Value These bits specify the fixed G or Y value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the G value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Y value. A value from 0 to 255 can be specified.
7 to 0	LAYB [7:0]	All 0	R/W	Virtual-Input Fixed B/Cb Component Value These bits specify the fixed B or Cb value generated in the RPFn when the virtual input function is enabled through the VI6_RPFn_INFMT.VIR setting. When VI6_RPFn_INFMT.RDFMT is set to 19, the value specified in these bits is used as the B value. When VI6_RPFn_INFMT.RDFMT is set to 64, the value specified in these bits is used as the Cb value. A value from 0 to 255 can be specified.

33.2.6.8 RPFn Mask Control Registers (VI6_RPFn_MSKCTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

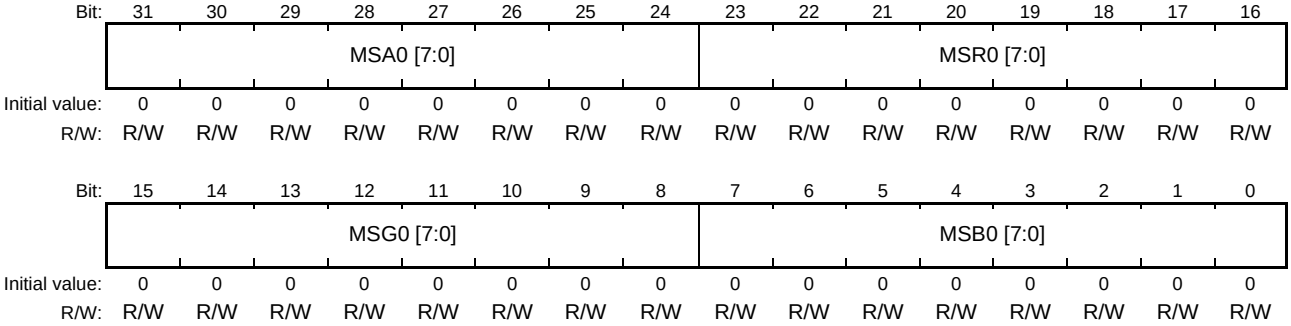
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MGG [7:0]								MGB [7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	MSK_EN	B'0	R/W	Mask Generation Specification Specifies the method of α value generation in the 1-bit mask α generator shown in Figure 33.22. 0: A 1-bit mask value is generated according to the input α plane value. When the input α is in the 1-bit format (VI6_RPFn_ALPH_SEL.BSEL = 1), the 1-bit mask value is output without change. When the input α is in the 8-bit format (VI6_RPFn_ALPH_SEL.BSEL = 0), the 1-bit mask value is 0 if the α value is H'00; otherwise, the 1-bit mask value is 1. 1: The R/Cr, G/Y, and B/Cb components of the image input to the destination side of the IROP operation unit are compared with the values specified in the MGR, MGG, and MGB bits, respectively. When all values match, 1 is output as the 1-bit mask value, and in other cases, 0 is output. When the generated 1-bit mask data is not used, set VI6_RPFn_ALPH_SEL.IROP to 0.
23 to 16	MGR [7:0]	All 0	R/W	R/Cr Comparison Value for 1-Bit α Generation These bits specify the R/Cr value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R value for comparison. When YCbCr is specified, specify a Cr value for comparison. This setting is ignored when the MSK_EN bit is set 0. A value from 0 to 255 can be specified.
15 to 8	MGG [7:0]	All 0	R/W	G/Y Comparison Value for 1-Bit α Generation These bits specify the G/Y value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G value for comparison. When YCbCr is specified, specify a Y value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	MGB [7:0]	All 0	R/W	B/Cb Comparison Value for 1-Bit α Generation These bits specify the B/Cb value to be compared for 1-bit α generation by using the pixel data on the destination side. When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B value for comparison. When YCbCr is specified, specify a Cb value for comparison. This setting is ignored when MSK_EN is set to 0. A value from 0 to 255 can be specified.

33.2.6.9 RPFn IROP-SRC Input Value Registers 0 (VI6_RPFn_MSKSET0)

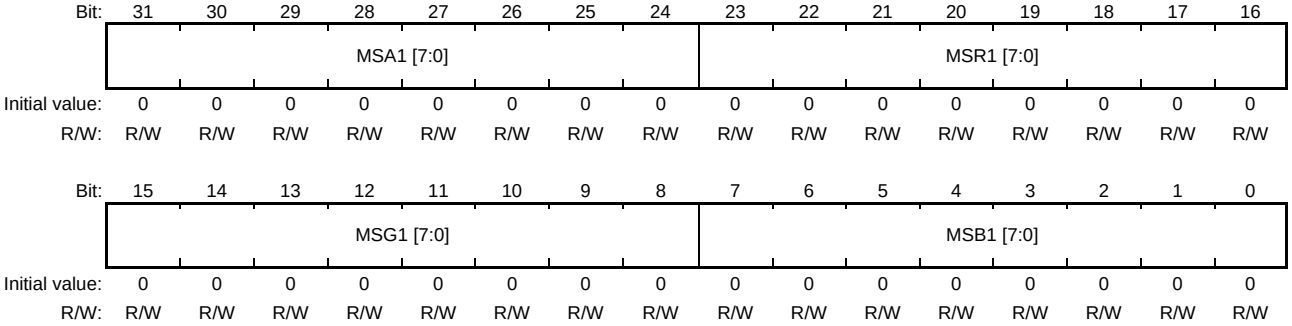
RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA0 [7:0]	All 0	R/W	IROP-Source Input α Value when 1-Bit α is 0 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 33.22). A value from 0 to 255 can be specified.
23 to 16	MSR0 [7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 0 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 33.22). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG0 [7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit α is 0 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 33.22). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB0 [7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 0 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 0 (Figure 33.22). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

33.2.6.10 RPFn IROP-SRC Input Value Registers 1 (VI6_RPFn_MSKSET1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	MSA1 [7:0]	All 0	R/W	IROP-Source Input α Value when 1-Bit α is 1 These bits specify the 8-bit α value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1. A value from 0 to 255 can be specified (Figure 33.22).
23 to 16	MSR1 [7:0]	All 0	R/W	IROP-Source Input R/Cr Value when 1-Bit α is 1 These bits specify the R/Cr value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 33.22). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify an R component value. When YCbCr is specified, specify a Cr component value. A value from 0 to 255 can be specified.
15 to 8	MSG1 [7:0]	All 0	R/W	IROP-Source Input G/Y Value when 1-Bit α is 1 These bits specify the G/Y value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 33.22). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a G component value. When YCbCr is specified, specify a Y component value. A value from 0 to 255 can be specified.
7 to 0	MSB1 [7:0]	All 0	R/W	IROP-Source Input B/Cb Value when 1-Bit α is 1 These bits specify the B/Cb value to be input as the source to the IROP operation unit when the internal 1-bit α value generated through the 1-bit mask generator is 1 (Figure 33.22). When RGB is specified as the RPFn input format through VI6_RPFn_INFMT.RDFMT, specify a B component value. When YCbCr is specified, specify a Cb component value. A value from 0 to 255 can be specified.

33.2.6.11 RPFn Color Keying Control Registers (VI6_RPFn_CKEY_CTRL)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

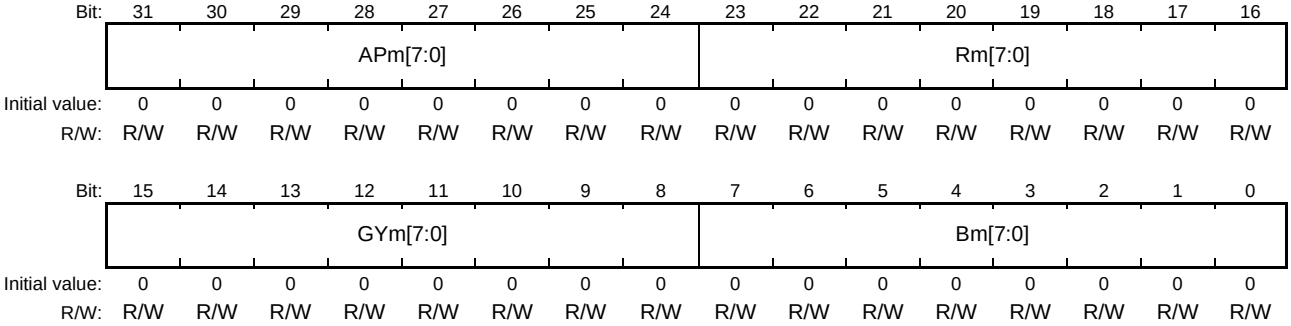
	—	—	—	—	—	—	—	LTH	—	—	—	CV	—	—	SAPE1	SAPE0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9, 7 to 5, 3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	LTH	B'0	R/W	Transparent color-luma Threshold Mode Enable/Disable This bit enables or disables transparent color-luma threshold mode for the color keying module. In transparent color-luma threshold mode, color information 0 (GY0) specified in VI6_RPFn_CKEY_SET0 register is compared with the input luma values. When the input data is in YCbCr format, and if input Y value is equal to or smaller than specified color information (VI6_RPFn_CKEY_SET0.GY0), the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP0. This bit is available only when the input data is in YCbCr format. When the input data is in an RGB format, set this bit to 0. This bit setting is valid only when the CV bit is set to 0; it is ignored when the CV bit is set to 1. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Luma threshold mode is disabled (Matched color mode) 1: Luma threshold mode is enabled

Bit	Bit Name	Initial Value	R/W	Description
4	CV	B'0	R/W	Color Replacement Control This bit controls the color replacement function in the color keying module shown in Figure 33.7. When an RGB format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, and if all components of an input pixel match the color components specified in VI6_RPFn_CKEY_SET0, the color replacement function replaces the values of the input α and all RGB components with the α and color components specified in VI6_RPFn_CKEY_SET1. When a YCbCr format is specified as the color space of the RPFn input data through VI6_RPFn_INFMT.RDFMT, only the Y data is compared; if the luminance component of an input pixel matches the value specified in VI6_RPFn_CKEY_SET0.GY0, the color replacement function replaces the values of the input α and all YCbCr components with the α and color components specified in VI6_RPFn_CKEY_SET1. When the CV bit is set to 1, the color replacement function is enabled. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Color replacement function is disabled (transparent color mode). 1: Color replacement function is enabled.
1	SAPE1	B'0	R/W	Comparison Color Data Setting 1 Enable/Disable This bit enables or disables comparison color data setting 1 in the transparent color mode for the color keying module. This bit setting is valid when the CV bit and the LTH bit are set to 0; it is ignored when the CV bit or the LTH bit is set to 1. In transparent color mode, color information 1 (VI6_RPFn_CKEY_SET1.R1/GY1/B1) specified in VI6_RPFn_CKEY_SET1 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET1.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), set this bit to 0. 0: Comparison color data setting 1 is disabled. 1: Comparison color data setting 1 is enabled.
0	SAPE0	B'0	R/W	Comparison Color Data Setting 0 Enable/Disable This bit enables or disables comparison color data setting 0 in the transparent color mode for the color keying module. This bit setting is valid when the CV bit and the LTH bit are set to 0; it is ignored when the CV bit or the LTH bit is set to 1. In transparent color mode, color information 0 (VI6_RPFn_CKEY_SET0.R0/GY0/B0) specified in VI6_RPFn_CKEY_SET0 is compared with the input component values. When the input data is in an RGB format, and if all input values match the specified color information, the input α value is replaced with the value specified in VI6_RPFn_CKEY_SET0.AP. When the input data is in YCbCr format, only the Y data is compared. When using the virtual input function (VI6_RPFn_INFMT.VIR = 1), clear this bit to 0. 0: Comparison color data setting 0 is disabled. 1: Comparison color data setting 0 is enabled.

33.2.6.12 RPFn Color Keying Color Setting Registers-m (VI6_RPFn_CKEY_SETm: m = 0, 1)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



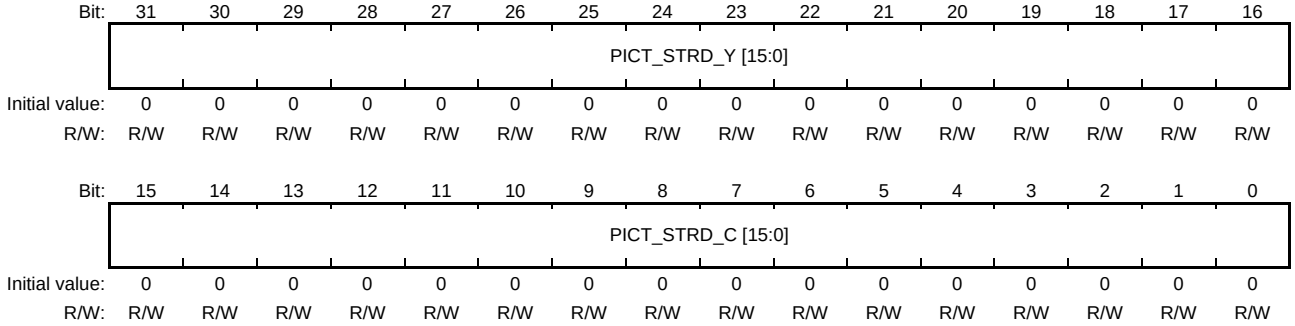
Bit	Bit Name	Initial Value	R/W	Description
31 to 24	APm [7:0]	All 0	R/W	α Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying When the input data matches color setting-m (Rm, GYm, and Bm) for transparent color comparison in the color keying module, the input α value is replaced with the value specified in these bits. Specify the α value to replace the input value. • In transparent color-luma threshold mode for color keying When the input data is in YCbCr format, and if input Y value is equal to or smaller than GY0, the input α value is replaced with the value specified in this bit field (AP0). Specify the α value in this bit field (AP0) to replace the input value. AP1 is not used in this mode. Set AP1 to 0 value. • In color replacement mode for color keying These bits are not used in this mode. Clear them to 0. α value replacement through these bits in transparent color mode for color keying takes priority over the α value selected through the VI6_RPFn_ALPH_SEL.ASEL setting. A value from 0 to 255 can be specified.
23 to 16	Rm [7:0]	All 0	R/W	R*/Cr Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the R component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cr component, and the setting of these bits is ignored. • In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. • In color replacement mode for color keying Specify the R component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	GYm [7:0]	All 0	R/W	G*/Y Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the G/Y component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. • In transparent color-luma threshold mode for color keying Specify the Y component value in the GY0 to be compared. • In color replacement mode for color keying Specify the G/Y component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.
7 to 0	Bm [7:0]	All 0	R/W	B*/Cb Component Data in Color Keying Color Information-m • In transparent color-matched color mode for color keying Specify the B component value for comparison enabled through the VI6_RPFn_CKEY_CTRL.SAPEm setting. When the RPFn input is in YCbCr format, the color keying module does not compare the Cb component, and the setting of these bits is ignored. • In transparent color-luma threshold mode for color keying The color keying module does not refer this bit field, and the setting of these bits is ignored. • In color replacement mode for color keying Specify the B component value to be compared with the input data in the color replacement function of the color keying module. A value from 0 to 255 can be specified.

Note: * When comparison data is specified in an RGB format, if a packed format is selected for RGB input and each of the RGB components is not 8 bits, the lower-order bits of input data are extended as specified through VI6_RPFn_INFMT.CEXT before comparison. The RGB components to be compared with the input should also be extended in the same way and the extended values should be specified in this register.

33.2.6.13 RPFn Source Picture Memory Stride Setting Registers (VI6_RPFn_SRCM_PSTRIDE)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	PICT_STRD_Y [15:0]	All 0	R/W	Memory Stride of Source Picture Y/RGB Plane These bits specify in 1-byte units the memory stride of the source picture Y/RGB plane read by the RPFn. A value from 0 to 65535 can be specified. Refer to Figure 33.23 for settings.
15 to 0	PICT_STRD_C [15:0]	All 0	R/W	Memory Stride of Source Picture C Plane These bits specify in 1-byte units the memory stride of the source picture C plane read by the RPFn. When an RGB-format picture is read, these bits do not need to be set. A value from 0 to 65535 can be specified. Refer to Figure 33.23 for settings. In the YCbCr planar format, this setting is used as the memory stride of the Cb and Cr planes.

This register specifies the memory stride of the picture planes in the source area as shown in Figure 33.23. The memory stride of the α plane should be specified through VI6_RPFn_SRCM_ASTRIDE.ALPH_STRD. When the RPF input is in an RGB format, only the RGB plane is read; when the input is in YCbCr format, the Y and C planes are read as shown in Figure 33.23. When the α plane is used, the α plane is also read. According to the image format and the necessity of the α plane, specify the necessary addresses where the source image is stored (VI6_RPFn_SRCM_ADDR_Y, VI6_RPFn_SRCM_ADDR_C, and VI6_RPFn_SRCM_ADDR_AI).

Whether the α plane needs to be read is determined according to the α plane selection method and IROP operation type. For details, refer to section 33.2.6.6.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_C0 [31:0]	All 0	R/W	Source Image C Plane Storing Address 0 These bits specify in 1-byte units the start address of the source image C plane read by the RPFn. Here, the C plane indicates the combined CbCr plane when a semi-planar format is selected from the packed YCbCr formats shown in Table 33.11 or the Cb plane when a planar format is selected. When an interleaved format is selected or the RPF input is in an RGB format, this setting is not used. A value from H'0000_0000 to H'FFFF_FFFF can be specified. Refer to Figure 33.23 in section 33.2.6.13 for settings.

33.2.6.17 RPFn Source Chroma Address Registers 1 (VI6_RPFn_SRCM_ADDR_C1)

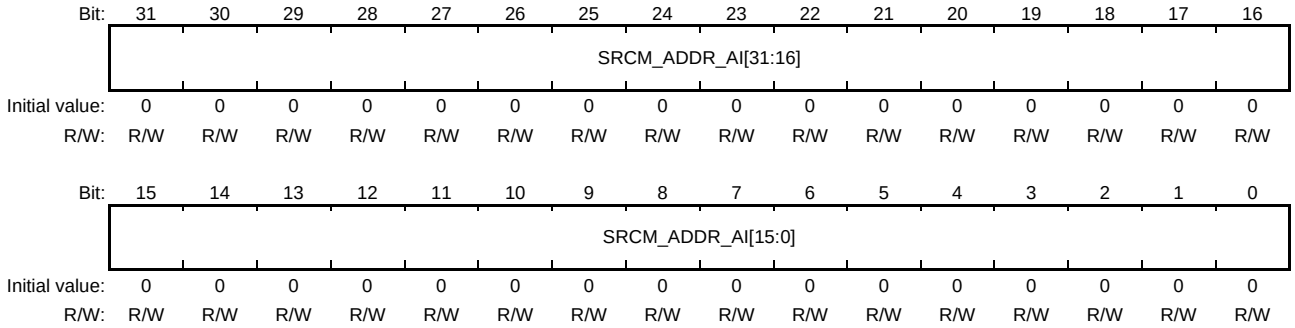
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_C1 [31:0]	All 0	R/W	Source Image C Plane Storing Address 1 These bits specify in 1-byte units the start address of the Cr plane when a planar YCbCr format shown in Table 33.11 is read by the RPFn. This setting is not used when the RPF input is in YCbCr format that is not a planar format or in an RGB format. A value from H'0000_0000 to H'FFFF_FFFF can be specified. Refer to Figure 33.23 in section 33.2.6.13 for settings.

33.2.6.18 RPFn Source α Address Registers (VI6_RPFn_SRCM_ADDR_AI)

RZ/G2H	RZ/G2M V1.3, RZ/G2M V3.0	RZ/G2N	RZ/G2E
√	√	√	√



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SRCM_ ADDR_AI [31:0]	All 0	R/W	Source Image α Plane Storing Address These bits specify in 1-byte units the start address of the α plane of the source image read by the RPFn. Specify in the same way as the start address of the picture plane. When the α plane is not read from the source area, these bits do not need to be set. A value from H'0000_0000 to H'FFFF_FFFF can be specified. Refer to Figure 33.23 in section 33.2.6.13 for settings.

33.2.6.19 RPFn Bus Access Control Registers (VI6_RPFn_BAC)
