

## AM263x Sitara™ Microcontrollers

### 1 Features

#### Processor Cores:

- Single, dual, and quad-core Arm® Cortex®-R5F MCU with each core running up to 400 MHz
  - 16KB I-cache with 64-bit ECC per CPU core
  - 16KB D-cache with 32-bit ECC per CPU core
  - 64KB Tightly-Coupled Memory (TCM) with 32-bit ECC per CPU core
  - Lockstep or Dual-core capable clusters

#### Memory Subsystem:

- 2MB of On-Chip RAM (OCSRAM)
  - 4 Banks x 512KB
  - ECC error protection
  - Internal DMA engine support

#### System on Chip (SoC) Services and Architecture:

- 1x EDMA to support data movement functions
- Device Boot supported from the following interfaces:
  - UART (Primary/Backup)
  - QSPI NOR Flash (4S/1S) (Primary)
- Interprocessor communication modules
  - SPINLOCK module for synchronizing processes running on multiple cores
  - MAILBOX functionality implemented through CTRLMMR registers
- Central Platform Time Sync (CPTS) support with time-sync and compare-event interrupt routers

#### Media and Data Storage:

- 1x 4-bit Multi-Media Card/Secure Digital (MMC/SD) interface
- General-Purpose Memory Controller (GPMC)
  - 16-bit parallel data bus with 22-bit address bus
  - Up to 4MB addressable memory space
  - Integrated Error Location Module (ELM) support for error checking

#### General Connectivity:

- 6x Universal Asynchronous RX-TX (UART)
- 5x Serial Peripheral Interface (SPI) controllers
- 5x Local Interconnect Network (LIN) ports
- 4x Inter-Integrated Circuit (I2C) ports
- 4x Modular Controller Area Network (MCAN) modules with CAN-FD support
- 1x Quad Serial Peripheral Interface (QSPI)
- 4x Fast Serial Interface Transmitters (FSITX)
- 4x Fast Serial Interface Receivers (FSIRX)
- Up to 139 General-Purpose I/O (GPIO) pins

#### Sensing & Actuation:

- Real-time Control Subsystem (CONTROLSS)
- Flexible Input/Output Crossbars (XBAR)
- 5x 12-bit Analog-to-Digital Converters (ADC)
  - 6-input SAR ADC up to 4 MSPS
    - 6x Single-ended channels **OR**
    - 3x Differential channels
  - Highly Configurable ADC Digital Logic
    - XBAR Start of Conversion Triggers (SOC)
    - User-defined Sample and Hold (S+H)
    - Flexible Post-Processing Blocks (PPB)
- 10x Analog Comparators with Type-A programmable DAC reference (CMPSSA)
- 10x Analog Comparators with Type-B programmable DAC reference (CMPSSB)
- 1x 12-bit Digital-to-Analog Converter (DAC)
- 32x Pulse Width Modulation (EPWM) modules
  - Single or Dual PWM channels
  - Advanced PWM Configurations
  - Extended HRPWM time resolution
- 10x Enhanced Capture (ECAP) modules
- 3x Enhanced Quadrature Encoder Pulse (EQEP) modules
- 2x 4-Ch Sigma-Delta Filter Modules (SDFM)
- Additional Signal-multiplex Crossbars (XBAR)

#### Industrial Connectivity:

- Programmable Real-Time Unit (PRU-SS) and PRU-Industrial Communication Subsystem (PRU-ICSS)
  - Dual core Programmable Realtime Unit Subsystem (PRU0 / PRU1)
    - Deterministic Hardware
    - Dynamic Firmware
  - 20-channel enhanced input (eGPI) per PRU
  - 20-channel enhanced output (eGPO) per PRU
  - Embedded Peripherals and Memory
    - 1x UART, 1x ECAP
    - 1x MDIO, 1x IEP,
    - 1x 32KB Shared General Purpose RAM
    - 2x 8KB Shared Data RAM
    - 1x 16KB IRAM per PRU
    - ScratchPad (SPAD), MAC/CRC
  - Digital encoder and sigma-delta control loops
  - The PRU-ICSS enables advanced industrial protocols including:
    - EtherCAT®, Ethernet/IP™,
    - PROFINET®, IO-Link® for order
  - Dedicated Interrupt Controller (INTC)
  - Dynamic CONTROLSS XBAR Integration

- Integrated Ethernet switch supporting two external ports
  - RMI (10/100) or RGMII (10/100/1000)
  - IEEE 1588 (2008 Annex D, Annex E, Annex F) with 802.1AS PTP
  - Clause 45 MDIO PHY management
  - 512x ALE engine-based Packet Classifiers
  - Priority flow control with up to 2KB packet size
  - Four CPU hardware interrupt pacing
  - IP/UDP/TCP checksum offload in hardware

### Security:

- Hardware Security Module (HSM) with support for Auto SHE 1.1/EVITA
- Secure boot support
  - Device Take Over Protection
  - Hardware-enforced root-of-trust
  - Authenticated boot
  - SW Anti-rollback protection
- Debug security
  - Secure device debug only after proper authentication
  - Ability to disable device debug functionality
- Device ID and Key Management
  - Support for OTP Memory (FUSEROM)
    - Store root keys & other security fields
  - Separate EFUSE controllers and FUSE ROMs
  - Unique Public Device Identifiers (UIDs)
- Memory Protection Units (MPU)
  - Dedicated Arm® MPU per Cortex®-R5F core
  - System MPU - present at various interfaces in the SoC (MPU or Firewall)
  - 8-16 Programmable Regions
    - Enable/Privilege ID
    - Start/End Address
    - Read/Write/Cachable
    - Secure/Non-Secure
- Cryptographic Acceleration
  - Cryptographic cores with DMA Support
  - AES - 128/192/256-bit key sizes
  - SHA2 - 256/384/512-bit support
  - DRBG with pseudo and true random number generator
  - PKA (public key accelerator) to assist in RSA/ECC processing

### Functional Safety:

- Enables design of systems with functional safety requirements
  - Error Signaling Module (ESM) with designated SAFETY\_ERROR<sub>n</sub> pin
  - ECC or parity on calculation-critical memories
  - Built-In Self-Test (BIST) and fault-injection for CPU and on-chip RAM
  - Runtime internal diagnostic modules including voltage, temperature, and clock monitoring, windowed watchdog timers, CRC engines for memory integrity checks
- [Functional Safety-Compliant \[Industrial\]](#)
  - Developed for functional safety applications
  - Documentation to be made available to aid IEC 61508 functional safety system design
  - Systematic capability up to SIL-3
  - Hardware integrity up to SIL-3
  - Safety-related certification

  - Safety-related certification
    - [ISO 26262 certified up to ASIL-D by TUV SUD](#)

### Technology / Package:

- AEC-Q100 qualified for automotive applications
- 45-nm technology
- ZCZ Package
  - 324-pin NFBGA
  - 15.0 mm x 15.0 mm
  - 0.8 mm pitch

### 3 Description

The AM263x Sitara™ Arm® Microcontrollers are built to meet the complex real-time processing needs of next generation industrial and automotive embedded products. The AM263x MCU family consists of multiple pin-to-pin compatible devices with up to four 400 MHz Arm® Cortex®-R5F cores. As an option, the Arm® R5F subsystem can be programmed to run in lockstep or dual-core mode for a multiple functional safety configurations. The industrial communications subsystem (PRU-ICSS) enables integrated industrial Ethernet communication protocols such as PROFINET®, TSN, Ethernet/IP®, EtherCAT® (among many others), standard Ethernet connectivity, and even custom I/O interfaces. The family is designed for the future of motor control and digital power applications with advanced analog sensing and digital actuation modules.

The multiple R5F cores are arranged in cluster subsystems with 256KB of shared tightly coupled memory (TCM) along with 2MB of shared SRAM, greatly reducing the need for external memory. Extensive ECC is included for on-chip memories, peripherals, and interconnects for enhanced reliability. Granular firewalls managed by the Hardware Security Manager (HSM) enable developers to implement stringent security-minded system design requirements. Cryptographic acceleration and secure boot are also available on AM263x devices.

TI provides a complete set of microcontroller software and development tools for the AM263x family of microcontrollers.

#### Package Information

PART NUMBER <sup>(1) (2)</sup>	PACKAGE	BODY SIZE
AM2634...ZCZ	nFBGA (324-pin)	15.0 mm × 15.0 mm

## 4 Revision History

### Changes from November 18, 2022 to July 21, 2023 (from Revision C (November 2022) to Revision D (July 2023))

	Page
• <b>Global:</b> Changed CPSW3G to CPSW.....	1
• (Features): Changed "Up to 140 GPIO" to "Up to 139 GPIO".....	1
• (Features): Changed PRU Memory from 12KB to 16KB.....	1
• (Features): Changed from Functional Safety "Targeted" to "Compliant".....	1
• (Device Comparison): Added footnote about TCM access to the core.....	7
• (Device Comparison): Add footnote about Functional Safety Compliance.....	7
• (Device Comparison): Changed "Up to 140" to "Up to 139".....	7
• (Pin Attributes): Updated/Changed all applicable Ball State After Reset values from "Off / Off / Off" from "Off / On / Down".....	13
• (Pin Attributes): Updated QSPI0_CLKLB ball Ball State After Reset values to "On / On / Down".....	13
• (Pin Attributes): Replaced RSVD_J16 with VDD.....	13
• (Pin Attributes): Replaced EQEP_S and EQEP_I with EQEP_STROBE and EQEP_INDEX.....	13
• (Digital and Analog IO Electrical Characteristics): Changed V_OH to VDDS33 - 0.45V and V_OL to 0.45V.....	68
• (Crystal Oscillator (XTAL) Parameters): Added Duty Cycle.....	82
• (Peripheral Timings ePWM): Added EPWM Characteristics table.....	91
• (SPI): Shanged SS2 and SS3 minimum values from "18.45 x P" to "0.45 x P".....	121
• (Decoupling Capacitor Requirements): Added C_VPP and C_ADC_VREF.....	148

• (Power Consumption Summary): Added <b>Power Consumption - Typical</b> and <b>Power Consumption - Traction Inverter</b> sections.....	67
• (Analog-to-Digital Converter (ADC)): Updated Input Conversion MAX Range from "33/18 x V <sub>REFHI</sub> V" to "32/18 x V <sub>REFHI</sub> V".....	68
• (Analog-to-Digital Converter (ADC)): Updated TYP V <sub>REFHI</sub> input current from "300 µA" to "400 µA".....	68
• (Analog-to-Digital Converter (ADC)): Added TYP Input Leakage value.....	68
• (Analog-to-Digital Converter (ADC)): Updated Power Consumption (VDDA18) TYP value from "500 µA" to "700 µA".....	68
• (Comparator Subsystem A (CMPSSA)): Removed first option for Comparator input range MAX parameter..	68
• (Comparator Subsystem A (CMPSSA)): Updated DAC static offset error MIN value from "-20 mV" to "-45 mV" and MAX value from "70 mV" to "45 mV".....	68
• (Comparator Subsystem A (CMPSSA)): Updated DAC_VREF loading TYP value from "6 kΩ" to "37 kΩ".....	68
• (Comparator Subsystem A (CMPSSA)): Updated Input Leakage TYP value "1 µA" to "0.1 µA" and added MAX value "5 µA".....	68
• (Comparator Subsystem B (CMPSSB)): Updated Comparator input range MIN value from "0 V" to "0.1 V" and MAX value from "1.8 x DAC_VREF" to "VDDA33 - 50mV".....	68
• (Comparator Subsystem B (CMPSSB)): Updated DAC output range MIN value from "0 V" to "0.1 V" and MAX value from "DAC_VREF" to "Minimum of 33/18 x DAC_VREF or VDDA33 - 50mV".....	68
• (Comparator Subsystem B (CMPSSB)): Updated DAC static offset error MIN value from "-20 mV" to "-45 mV" and max value from "70 mV" to "45 mV".....	68
• (Comparator Subsystem B (CMPSSB)): Updated DAC MAX settling time from "2 µs" to "1 µs".....	68
• (Comparator Subsystem B (CMPSSB)): Updated DAC_VREF loading TYP value from "6 kΩ" to "37 kΩ".....	68
• (Comparator Subsystem B (CMPSSB)): Updated Input Leakage TYP value "1 µA" to "0.1 µA" and added MAX value "5 µA".....	68
• (Digital-to-Analog Converter (DAC)): Updated Power-up time MAX value from "10 µs" to "1 µs".....	68
• (Power Management Unit (PMU)): Updated DC accuracy MIN value from "-2% V" to "1.764 V" and MAX value from "2% V" to "1.836 V".....	68
• (Hardware Design Guide): Added new section.....	151
• (Device Naming Convention): Changed "Device Speed and Memory Grades" to "Device Operating Performance Points".....	154
• (Device Naming Convention): Removed M OPP speed grade row.....	154
• (Documentation Support): Added AM263x TRM Register Addendum Link.....	156

- (1) Developed for Functional Safety applications, the device supports hardware integrity upto ASIL-D or SIL-3. Refer to the related documentation for more details.
- (2) "X:" letter refers to feature parameter and (Grade "X") refers to Grade in the Section 7.6, Operating Performance Points table.
- (3) For more details about the CTRLMMR\_WKUP\_JTAG\_DEVICE\_ID register and DEVICE\_ID bit field, see the device TRM.
- (4) Standard Analog configuration contains 3x ADC, 16x EHRPWM, 5x eCAP, 2x EQEP, 1x SDFM, 12x CMPSS
- (5) Enhanced Analog configuration contains 5x ADC, 32x EHRPWM, 10x eCAP, 3x EQEP, 2x SDFM, 20x CMPSS
- (6) Programmable Real-Time Unit Subsystem is available when selecting an orderable part number that includes a feature code of D, E, F, K, L, or M. Refer to the Nomenclature Description table for definition of feature codes.
- (7) Industrial Communication Subsystem Support is available when selecting an orderable part number that includes a feature code of D, E, F, K, L, or M. Refer to the Nomenclature Description table for definition of feature codes.

- (8) AEC-Q100 qualification is applicable to select part number variants as indicated by the Automotive Designator (Q1) identifier in the [Nomenclature Description](#) table.
- (9) Each R5FSS cluster supports 128-KB of Tightly-Coupled Memory (TCM). When configured as Single-Core or Lockstep operating mode, individual cores can utilize the entire 128-KB of TCM memory, while in Dual-Core mode, each core may only utilize its designated half (64-KB TCM).

## 6 Terminal Configuration and Functions

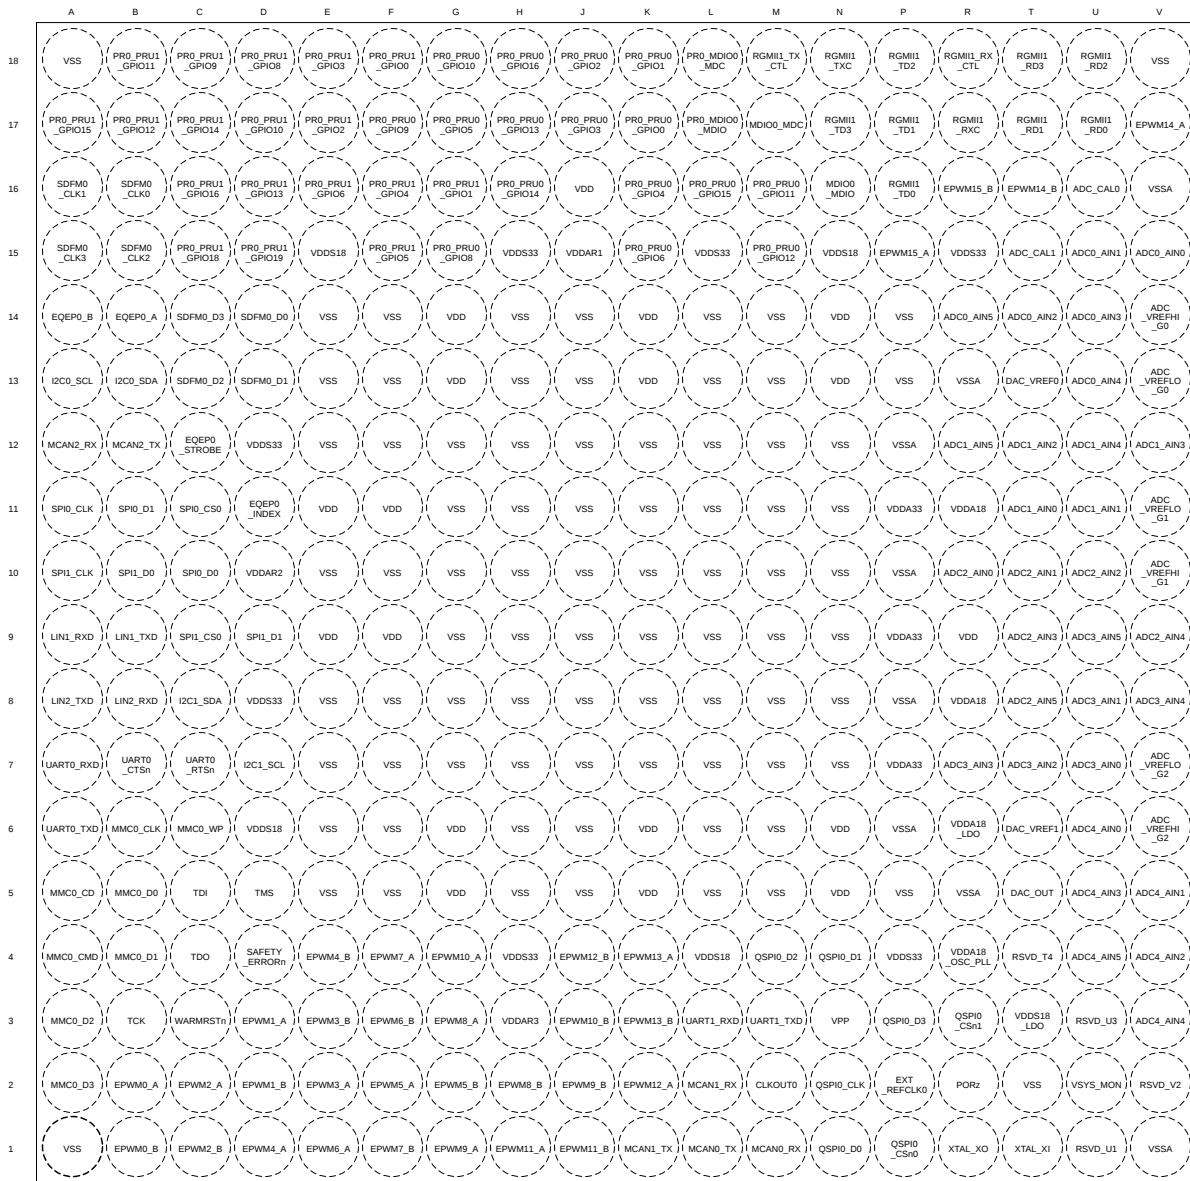

### 6.1 Pin Diagram

#### Note

The terms "ball", "pin", and "terminal" are used interchangeably throughout the document. An attempt is made to use "ball" only when referring to the physical package.

The diagrams in this section are used in conjunction with the other Terminal Configuration and Functions tables to locate signal names and ball grid numbers.

#### 6.1.1 ZCZ Pin Diagram

Not to scale

## 6.2 Pin Attributes

The following list describes the contents of each column in the *Pin Attributes* table:

1. **Ball Number:** Ball numbers assigned to each terminal of the Ball Grid Array package.
2. **Ball Name:** Ball name assigned to each terminal of the Ball Grid Array package (this name is typically taken from the primary MUXMODE 0 signal function).
3. **Signal Name:** Signal name of all dedicated and pin multiplexed signal functions associated with a ball.

---

### Note

The *Pin Attributes* table, defines the SoC pin multiplexed signal function implemented at the pin and **does not** define secondary multiplexing of signal functions implemented in device subsystems. Secondary multiplexing of signal functions are not described in this table. For more information on secondary multiplexed signal functions, see the respective peripheral chapter of the device TRM.

---

4. **Mux Mode:** The MUXMODE value associated with each pin multiplexed signal function:
  - MUXMODE 0 is the primary pin multiplexed signal function. However, the primary pin multiplexed signal function is not necessarily the default pin multiplexed signal function.
  - MUXMODE values 1 through 15 are possible for pin multiplexed signal functions. However, not all MUXMODE values have been implemented. The only valid MUXMODE values are those defined as pin multiplexed signal functions within the Pin Attributes table. Only defined valid values of MUXMODE can be used.
  - Bootstrap defines SOC configuration pins, where the logic state applied to each pin is latched on the rising edge of PORz. These input signal functions are fixed to their respective pins and are not programmable via MUXMODE.
  - An empty box or "-" means Not Applicable.

---

### Note

- The value found in the MUX MODE AFTER RESET column defines the default pin multiplexed signal function selected when PORz is deasserted.
  - Configuring two pins to the same pin multiplexed signal function can yield unexpected results and is not supported. This can be prevented with proper software configuration.
  - Configuring a pad to an undefined multiplexing mode results in undefined behavior and must be avoided.
- 

5. **Type:** Signal type and direction:
  - I = Input
  - O = Output
  - ID = Input, with open-drain output function
  - OD = Output, with open-drain output function
  - IO = Input, Output, or simultaneously Input and Output
  - IOD = Input, Output, or simultaneously Input and Output, with open-drain output function
  - IOZ = Input, Output, or simultaneously Input and Output, with three-state output function
  - OZ = Output with three-state output function
  - A = Analog
  - CAP = LDO capacitor
  - PWR = Power
  - GND = Ground
6. **DSIS:** The deselected input state (DSIS) indicates the state driven to the subsystem input (logic "0", logic "1", or "pad" level) when the pin multiplexed signal function is not selected by MUXMODE.
  - 0: **Logic 0** driven to the subsystem input.
  - 1: **Logic 1** driven to the subsystem input.

- pad: Logic state of the pad is driven to the subsystem input.
  - An empty box, NA, or "-" means Not Applicable.
7. **Ball State During Reset (RX/TX/PULL):** State of the terminal while PORz is asserted, where RX defines the state of the input buffer, TX defines the state of the output buffer, and PULL defines the state of internal pull resistors:
- RX (Input buffer)
    - Off: The input buffer is **disabled**.
    - On: The input buffer is **enabled**.
  - TX (Output buffer)
    - Off: The output buffer is **disabled**.
    - Low: The output buffer is **enabled** and drives  $V_{OL}$ .
  - PULL (Internal pull resistors)
    - Off: Internal pull resistors are turned **off**.
    - Up: Internal **pull-up** resistor is turned on.
    - Down: Internal **pull-down** resistor is turned on.
    - NA: No internal pull resistor.
  - An empty box, or "-" means Not Applicable.
8. **Ball State After Reset (RX/TX/PULL):** State of the terminal after PORz is deasserted, where RX defines the state of the input buffer, TX defines the state of the output buffer, and PULL defines the state of internal pull resistors:
- RX (Input buffer)
    - Off: The input buffer is **disabled**.
    - On: The input buffer is **enabled**.
  - TX (Output buffer)
    - Off: The output buffer is **disabled**.
    - SS: The subsystem selected with MUXMODE determines the output buffer state.
  - PULL (Internal pull resistors)
    - Off: Internal pull resistors are turned **off**.
    - Up: Internal **pull-up resistor** is turned on.
    - Down: Internal **pull-down resistor** is turned on.
    - NA: No internal pull resistor.
  - An empty box, NA, or "-" means Not Applicable.
9. **Mux Mode After Reset:** The value found in this column defines the **default** pin multiplexed signal function after PORz is deasserted.
- An empty box, NA, or "-" means Not Applicable.
10. **I/O Voltage:** This column describes I/O **operating voltage** options of the respective power supply, when applicable.
- An empty box, NA, or "-" means Not Applicable.
- For more information, see valid operating voltage range defined for each power supply in *Recommended Operating Conditions*.
11. **Power:** The power supply of the associated I/O, when applicable.
- An empty box, NA, or "-" means Not Applicable.
12. **Hys:** Indicates if the input buffer associated with this I/O has hysteresis:
- Yes: Hysteresis Support
  - No: **No** Hysteresis Support
  - An empty box, NA, or "-" means Not Applicable.
- For more information, see the hysteresis values in *Electrical Characteristics*.
13. **Pull Type:** Indicates the presence of an internal pull-up or pull-down resistor. Internal resistors can be enabled or disabled via software.

- PU: Internal pull-up Only
- PD: Internal pull-down Only
- PU/PD: Internal pull-up and pull-down
- An empty box, NA, or "-" means No internal pull.

---

#### Note

Configuring two pins to the same pin multiplexed signal function is not supported as this yields unexpected results. Issues can be easily prevented with the proper software configuration.

When a pad is set into a multiplexing mode which is not defined by pin multiplexing, that pad's behavior is undefined. This must be avoided.

---

14. **Buffer Type:** This column defines the buffer type associated with a terminal. This information can be used to determine the applicable Electrical Characteristics table.
- An empty box, NA, or "-" means Not Applicable.

For electrical characteristics, refer to the appropriate buffer type table in *Electrical Characteristics*.

15. **Pad Configuration Register Name:** This is the name of the device pad/pin configuration register.
16. **Pad Configuration Register Address:** This is the memory address of the device pad/pin configuration register.
17. **Pad Configuration Register Default Value:** This is the default value of the register device pad/pin configuration register after PORz is deasserted.

## 6.3 Signal Descriptions

Many signals are available on multiple pins, according to the software configuration of the pin multiplexing options.

The following list describes the column headers:

1. **SIGNAL NAME:** The name of the signal passing through the pin.

---

### Note

Signal names and descriptions provided in each Signal Descriptions table, represent the pin multiplexed signal function which is implemented at the pin and selected via IOMUX pad configuration registers. Some device subsystems provide secondary multiplexing of signal functions, which are not described in these tables. For more information on secondary multiplexed signal functions, see the respective peripheral chapter of the device TRM.

---

2. **PIN TYPE:** Signal direction and type:

- I = Input
- O = Output
- IO = Input, Output, or simultaneously Input and Output
- ID = Input with open-drain output function
- OD = Output, with open-drain output function
- IOD = Input, Output, or simultaneously Input and Output, with open-drain output function
- IOZ = Input, Output, or simultaneously Input and Output, with three-state output function
- OZ = Output with three-state output function
- A = Analog
- CAP = LDO capacitor
- PWR = Power
- GND = Ground

3. **DESCRIPTION:** Description of the signal

4. **BALL:** Associated ball number

For more information on the I/O cell configurations, see the *Pad Configuration Registers* section within the *Device Configuration* chapter of the device TRM.

I2C3_SCL <sup>(2)</sup>	IOD	I2C Clock	B15, H2
I2C3_SDA <sup>(1)</sup>	IOD	I2C Data	A16, G3

- (1) I2C3\_SDA is implemented with the typical LVCMOS voltage buffer and should be properly configured to operate as an Input/Output Open Drain signal type.
- (2) I2C3\_SCL is implemented with the typical LVCMOS voltage buffer and should be properly configured to operate as an Input/Output Open Drain signal type.

**Note**

I2C signals that are implemented on an LVCMOS voltage buffer pin can be configured to operate as open-drain outputs by configuring the I2C module to source a constant low output and toggle the output enable. The output buffer drives low when enabled and is high impedance when disabled.

The (I2C OD FS) are the only IO voltage buffers which are fail-safe. These are implemented for I2C0 pins only. Other IOs do not allow any potential greater than (VDD + 0.3V) to be applied. This means you can not source any potential to these pins when power is off. All attached devices that can source a potential to these IOs must be powered from the same power supply that is sourcing the respective IO power rail.

PORz	I	Device Power-On (PORz) cold reset	R2
SAFETY_ERRORn	OD	ESM Safety Error Signal	D4
WARMRSTn	IO	Warm Reset Request (Input) / Warm Reset Status (Output)	C3

#### Note

The SAFETY\_ERRORn signal is implemented on an LVCMOS voltage buffer pin can be configured to operate as open-drain outputs by configuring the ESM module to source a constant low output and toggle the output enable. The output buffer drives low when enabled and is high impedance when disabled.

The (I2C OD FS) are the only IO voltage buffers which are fail-safe. These are implemented for I2C0 pins only. Other IOs do not allow any potential greater than (VDD + 0.3V) to be applied. This means you cannot source any potential to these pins when power is off. All attached devices that can source a potential to these IOs must be powered from the same power supply that is sourcing the respective IO power rail.

## 6.4 Pin Connectivity Requirements

This section describes connectivity requirements for package balls that have specific connectivity requirements and package balls that may be unused.

### Note

All power balls must be supplied with the voltages specified in the *Recommended Operating Conditions* section, unless otherwise specified in *Signal Descriptions*.

For additional clarification, "leave unconnected" or "no connect" (NC) mean **no** signal traces should be connected to these device ball numbers.

**Table 6-107. Pin Connectivity Requirements**

BALL NUMBER	BALL NAME	PIN CONNECTIVITY REQUIREMENTS
D4	SAFETY_ERRORn	Each of these balls must be connected to ground (VSS) through separate external pull resistors to ensure they are held to a valid logic low level if a PCB signal trace is connected and not actively driven by an attached device. The internal pull-down may be used to hold a valid logic low level if no PCB signal trace is connected to the ball.
B3 C5 D5	TCK TDI TMS	Each of these balls must be connected to the corresponding power supply <sup>(1)</sup> through separate external pull resistors to ensure these balls are held to a valid logic high level if a PCB signal trace is connected and not actively driven by an attached device. The internal pull-up may be used to hold a valid logic high level if no PCB signal trace is connected to the ball.
A13 B13	I2C0_SCL I2C0_SDA	Each of these balls must be connected to the corresponding power supply <sup>(1)</sup> through separate external pull resistors to ensure these balls are held to a valid logic high level.
N1 N4 A11 C10	QSPIO_D0 (SOP0) QSPIO_D1 SPI0_CLK (SOP2) SPI0_D0 (SOP3)	Each of these balls must be connected to the corresponding power supply <sup>(1)</sup> or ground (VSS) through separate external pull resistors to ensure these balls are held to a valid logic high or low level as appropriate to select the desired device boot mode.
ADC ZCZ PIN	ADC[0:4]_AIN[0:5]	Any unused ADCx_AINy input ball for any ADC instance (ADC[0:4]_AIN[0:5]) must be connected (shorted) directly to ground (VSS).
U16 T15	ADC_CAL0 ADC_CAL1	If all ADCx_AINy inputs for all ADC instances (ADC[0:4]_AIN[0:5]) are not used, the ADC_CAL[0:1] analog ball must be connected (shorted) directly to ground (VSS).
U2	VSYS_MON	If VSYS_MON is not used, this ball may be connected (shorted) directly to ground (VSS).
LVC MOS ZCZ PIN	Any LVC MOS Voltage Buffer Pin	If a pin has an associated IOMUX Pad Configuration Registration then the ball may remain unconnected. After PORz, the LVC MOS voltage buffer is configured to a default state compatible with an unconnected ball.

(1) To determine which power supply is associated with any IO, see POWER column of the *Pin Attributes* table.

### Note

Internal pull resistors are weak and may not source enough current to maintain a valid logic level for some operating conditions. This may be the case when connected to components with leakage to the opposite logic level, or when external noise sources couple to signal traces attached to balls which are only pulled to a valid logic level by the internal resistor. Therefore, external pull resistors may be required to hold a valid logic level on balls with external connections.

If balls are allowed to float between valid logic levels, the input buffer may enter a high-current state which could damage the IO cell.

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) All voltage values are with respect to VSS, unless otherwise noted.
- (3) VDDS33 is the voltage on the corresponding power-supply pin(s) for the IC.
- (4) Long-term high-temperature storage or extended use at maximum temperature conditions may result in a reduction of overall device life. For additional information, see the [Semiconductor and IC Package Thermal Metrics Application Report](#).

## 7.2 Electrostatic Discharge (ESD) Extended Automotive Ratings

over recommended operating conditions (unless otherwise noted)

			VALUE	UNIT	
V <sub>(ESD)</sub>	Electrostatic Discharge (ESD)	Human body model (HBM), per AEC-Q100-002 <sup>(1)</sup>	±2000	V	
		Charged device model (CDM), per AEC-Q100-011	All pins		±500
			Corner balls (A1, A18, V1, V18)		±750

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification

## 7.3 Electrostatic Discharge (ESD) Industrial Ratings

over recommended operating conditions (unless otherwise noted)

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic Discharge (ESD)	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V
		Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup>	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

## 7.8 Electrical Characteristics

### Note

The interfaces or signals described in [Section 7.8.1 Digital and Analog IO Electrical Characteristics](#) through [Section 7.8.6 Power Management Unit \(PMU\)](#) correspond to the interfaces or signals available in multiplexing mode 0 (Primary Function).

All interfaces or signals multiplexed on the balls described in these tables have the same DC electrical characteristics, unless multiplexing involves a PHY and GPIO combination, in which case different DC electrical characteristics are specified for the different multiplexing modes (Functions).

## 7.9 VPP Specifications for One-Time Programmable (OTP) eFuses

This section specifies the operating conditions required for programming the OTP eFuses.

### 7.9.1 VPP Specifications

over recommended operating conditions (unless otherwise noted)

PARAMETER	DESCRIPTION	TEST CONDITIONS	MIN	NOM	MAX	UNIT
VDD	Supply voltage range for the core domain during OTP operation	Normal Operation (OPP100)	1.140	1.200	1.260	V
VPP	Supply voltage range for the eFuse ROM domain	Normal Operation (OPP100)	No Connection			V
	Supply voltage range for the eFuse ROM domain during OTP programming	OTP Programming	1.65	1.7	1.75	V
$I_{(VPP)}$	VPP Current	$I_{(VPP)}$	100			mA
$T_A$	Ambient Temperature	Ambient Temperature	0	30	50	°C

### 7.9.2 Hardware Requirements

The following hardware requirements must be met when programming keys in the OTP eFuses:

- The VPP power supply must be disabled when not programming OTP registers.
- The VPP power supply must be ramped up after the proper device power-on sequence (for more details, see [Section 7.11.2.1, Power-On and Reset Sequencing](#)).

### 7.9.3 Programming Sequence

Programming sequence for OTP eFuses:

- Power on the board per the power-on sequencing. No voltage should be applied on the VPP terminal during power up and normal operation.
- Load the OTP write software required to program the eFuse (contact your local TI representative for the OTP software package).
- Apply the voltage on the VPP terminal according to the specification in [Section 7.9.1, VPP Specifications](#).
- Run the software that programs the OTP registers.
- After validating the content of the OTP registers, remove the voltage from the VPP terminal.

### 7.9.4 Impact to Your Hardware Warranty

You accept that e-Fusing the TI Devices with security keys permanently alters them. You acknowledge that the e-Fuse can fail, for example, due to incorrect or aborted program sequence or if you omit a sequence step. Further the TI Device may fail to secure boot if the error code correction check fails for the Production Keys or if the image is not signed and optionally encrypted with the current active Production Keys. These types of situations will render the TI Device inoperable and TI will be unable to confirm whether the TI Devices conformed to their specifications prior to the attempted e-Fuse.

CONSEQUENTLY, TI WILL HAVE NO LIABILITY (WARRANTY OR OTHERWISE) FOR ANY TI DEVICES THAT HAVE BEEN e-FUSED WITH SECURITY KEYS.

## 7.10 Thermal Resistance Characteristics

This section provides the thermal resistance characteristics used on this device.

For reliability and operability concerns, the maximum junction temperature of the device has to be at or below the  $T_J$  value identified in [Section 7.5, Recommended Operating Conditions](#).

### 7.10.1 Package Thermal Characteristics

It is recommended to perform thermal simulations at the system level with the worst-case device power consumption.

## 7.11 Timing and Switching Characteristics

### Note

The default SLEWRATE settings in each pad configuration register must be used to ensure timings, unless specific instructions are given otherwise.

### 7.11.1 Timing Parameters and Information

The timing parameter symbols used in *Timing and Switching Characteristics* sections are created in accordance with JEDEC Standard 100. To shorten the symbols, some pin names and other related terminologies have been abbreviated in [Table 7-1](#):

**Table 7-1. Timing Parameters Subscripts**

SYMBOL	PARAMETER
c	Cycle time (period)
d	Delay time
dis	Disable time
en	Enable time
h	Hold time
su	Setup time
START	Start bit
t	Transition time
v	Valid time
w	Pulse duration (width)
X	Unknown, changing, or don't care level
F	Fall time
H	High
L	Low
R	Rise time
V	Valid
IV	Invalid
AE	Active Edge
FE	First Edge
LE	Last Edge
Z	High impedance

## 7.11.2 Power Supply Sequencing

This section describes power supply sequencing required to ensure proper device operation.

### 7.11.2.1 Power-On and Reset Sequencing

AM263x attempts to simplify the power reset requirements from previous Sitara MCU devices. There is no sequencing requirement with respect to the primary core digital VDD 1.2-V and I/O power 3.3-V rails. A pair of on-die LDO are supplied through the VDDS33 power net. These on-die LDO generate the required VDDS1V8 and VDDA1V8 1.8-V digital and analog power. The AM263x does require the minimum ramp time be respected for 3.3-V power-on. Additional PORz and SOP boot mode latch timing must be respected by the EVM design as well. [Figure 7-1](#) describes the device power-on sequencing.

**Table 7-2. AM263x Power-On Sequencing**

PARAMETER		MIN	MAX	UNIT
t <sub>Startup</sub>	Time for 1.2-V and 3.3-V DC-DC converters to startup after being enabled. This is an arbitrary amount of time - no constraint imposed by the device.	–	–	ms
t <sub>PGood</sub>	Time for Power Good signals to be generated from DC-DC converters after rails are stable. This is an arbitrary amount of time - no constraint imposed by the device.	–	–	ms
t <sub>Ramp_3V3</sub>	Ramp time of the VDDS3V3 and VDDA3V3 supplies. This is a requirement imposed by the device.	0.1	–	ms
t <sub>SOP_Sampled</sub>	Time from PORz de-assertion until the SOP[3:0] pins are sampled. This is a device internal pentameter. Sampling happens when the internally generated supplies are stable. For information only. Refer to TSU_SOP and TH_SOP parameters for application usage.	0	–	ms
t <sub>SU_SOP</sub>	Setup time for SOP relative to PORz assertion.	10	–	μs
t <sub>H_SOP</sub>	Hold time for SOP relative to WARMRSTn deassertion.	0	–	μs
t <sub>WARMRSTn</sub>	Time from PORz de-assertion until the device de-asserts the WARMRESETn signal.	2.0	–	ms

**Figure 7-1. Power-On Sequencing**

#### 7.11.2.1.1 Power Reset Sequence Description

The following set of steps shall occur on the EVM and AM263x to boot the device from power-on reset.

1. PORz is held low by the external power supply monitor
2. VDD core digital 1.2V and VDDS3V3/VDDA3V3 3.3V supplies ramp to their nominal voltages
  - a. This requires a logical AND be applied to the power good signal generated from each supply
3. SOP[3:0] pins held in their boot latch state
4. After PCB supplied power nets are stable, the external supply monitor will de-assert PORz
5. Device will startup 1.8V on-die LDO
6. After internal supply monitors show externally and internally generated supplies are stable, the SOP[3:0] pin states are latched
7. R5F cores are unhalted and SOP selected boot ROM execution begins

### 7.11.2.2 Power-Down Sequencing

Figure 7-2 describes the device power-down sequencing. The order of AM263x 1.2V and 3.3V does not matter.

### 7.11.3.3 Safety Signal Timing

Tables and figures provided in this section define switching characteristics for SAFETY\_ERRORn.

#### 7.11.3.3.1 SAFETY\_ERRORn Switching Characteristics

NO.	PARAMETER	DESCRIPTION	MIN	MAX	UNIT
SFTY1	$t_{c(SAFETY\_ERRORn)}$	Cycle time minimum, SAFETY_ERRORn (PWM mode enabled)	$(P^{(1)} \times H^{(3)}) + (P^{(1)} \times L)^{(4)}$		ns
SFTY2	$t_{w(SAFETY\_ERRORn)}$	Pulse width minimum, SAFETY_ERRORn active (PWM mode disabled) <sup>(5)</sup>	$P^{(1)} \times R^{(2)}$		ns
SFTY3	$t_{d(ERROR\_CONDITION-SAFETY\_ERRORnL)}$	Delay time, ERROR_CONDITION to SAFETY_ERRORn active <sup>(5)</sup>	$50 \times P^{(1)}$		ns

- (1) P = ESM functional clock  
(2) R = Error Pin Counter Pre-Load Register count value  
(3) H = Error Pin PWM High Pre-Load Register count value  
(4) L = Error Pin PWM Low Pre-Load Register count value  
(5) When PWM mode is enabled, SAFETY\_ERRORn stops toggling after RST22 and will maintain its value (either high or low) until the error is cleared. When PWM mode is disabled, SAFETY\_ERRORn is active low

- A. RGMII[x]\_RXC must be externally delayed relative to the data and control pins.  
 B. Data and control information is received using both edges of the clocks. RGMII[x]\_RD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]\_RXC and data bits 7-4 on the falling edge of RGMII[x]\_RXC. Similarly, RGMII[x]\_RX\_CTL carries RXDV on rising edge of RGMII[x]\_RXC and RXERR on falling edge of RGMII[x]\_RXC.

- A. TxC is delayed internally before being driven to the RGMII[x]\_TxC pin. This internal delay is always enabled.
- B. Data and control information is received using both edges of the clocks. RGMII[x]\_TD[3:0] carries data bits 3-0 on the rising edge of RGMII[x]\_TxC and data bits 7-4 on the falling edge of RGMII[x]\_TxC. Similarly, RGMII[x]\_TX\_CTL carries TXEN on rising edge of RGMII[x]\_TxC and TXERR on falling edge of RGMII[x]\_TxC.

PARAMETER	MIN	TYP	MAX	UNIT
Micro Edge Positioning (MEP) step size <sup>(1)</sup>		115	310	ps

(1) The MEP step size will be largest at high temperature and minimum voltage on VDD. MEP step size will increase with higher temperature and lower voltage and decrease with lower temperature and higher voltage. Applications that use the HRPWM feature should use MEP Scale Factor Optimizer (SFO) estimation software functions. See the TI software libraries for details of using SFO functions in end applications. SFO functions help to estimate the number of MEP steps per SYSCLK period dynamically while the HRPWM is in operation.

#### 7.11.5.8 Inter-Integrated Circuit (I<sup>2</sup>C)

For more details about features and additional description information on the device Inter-Integrated Circuit, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

For more information, see the *Inter-Integrated Circuit (I2C)* section in the device TRM.

#### 7.11.5.8.1 I2C

The device contains four multicontroller Inter-Integrated Circuit (I2C) controllers. Each I2C controller was designed to be compliant to the Philips I<sup>2</sup>C-bus™ specification version 2.1. However, the device IOs are not fully compliant to the I2C electrical specification. The speeds supported and exceptions are described per port below:

- I2C1, I2C2, and I2C3
  - Speeds:
    - Standard-mode (up to 100 Kbits/s)
      - 3.3 V
    - Fast-mode (up to 400 Kbits/s)
      - 3.3 V
  - Exceptions:
    - The IOs associated with these ports are not compliant to the fall time requirements defined in the I2C specification because they are implemented with higher performance LVCMOS push-pull IOs that were designed to support other signal functions that could not be implemented with I2C compatible IOs. The LVCMOS IOs being used on these ports are connected such they emulate open-drain outputs. This emulation is achieved by forcing a constant low output and disabling the output buffer to enter the Hi-Z state.
    - The I2C specification defines a maximum input voltage  $V_{IH}$  of  $(V_{DD_{max}} + 0.5 V)$ , which exceeds the absolute maximum ratings for the device IOs. The system must be designed to ensure the I2C signals never exceed the limits defined in the *Absolute Maximum Ratings* section of this datasheet.
- I2C0
  - Speeds:
    - Standard-mode (up to 100 Kbits/s)
      - 3.3 V
    - Fast-mode (up to 400 Kbits/s)
      - 3.3 V
  - Exceptions:
    - The IOs associated with this port were not design to support Hs-mode.
    - The rise and fall times of the I2C signals connected to these ports must not exceed a slew rate of 0.8 V/ns (or 8E+7 V/s). This limit is more restrictive than the minimum fall time limits defined in the I2C specification. Therefore, it may be necessary to add additional capacitance to the I2C signals to slow the rise and fall times such that they do not exceed a slew rate of 0.8 V/ns.
    - The I2C specification defines a maximum input voltage  $V_{IH}$  of  $(V_{DD_{max}} + 0.5 V)$ , which exceeds the absolute maximum ratings for the device IOs. The system must be designed to ensure the I2C signals never exceed the limits defined in the *Absolute Maximum Ratings* section of this datasheet.

Refer to the Philips I2C-bus specification version 2.1 for timing details.

### 7.11.5.12 Multi-Media Card/Secure Digital (MMCSD)

The MMCSD Host Controller provides an interface to embedded Multi-Media Card (MMC) and Secure Digital (SD) devices. The MMCSD Host Controller deals with MMC/SD protocol at transmission level, data packing, adding cyclic redundancy checks (CRCs), start/end bit insertion, and checking for syntactical correctness.

For more details about MMCSD interfaces, see the corresponding MMC subsection within *Signal Descriptions* and *Detailed Description* sections.

For more information, see *Multi-Media Card/Secure Digital (MMCSD) Interface* section in *Peripherals* chapter in the device TRM.

### 7.11.5.14 Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS)

The device has integrated a single Programmable Real-Time Unit and Industrial Communication Subsystem (PRU-ICSS0). The programmable nature of the PRU cores, along with their access to pins, events and all device resources, provides flexibility in implementing fast real-time responses, specialized data handling operations, custom peripheral interfaces, and in offloading tasks from the other processor cores in the device.

For more details about features and additional description information on the device PRU-ICSS, see the corresponding subsections within *Signal Descriptions* and *Detailed Description* sections.

#### Note

The PRU-ICSS0 supports an internal wrapper multiplexing that expands the device top-level multiplexing.

#### 7.11.5.14.1 PRU-ICSS Programmable Real-Time Unit (PRU)

#### Note

The PRU-ICSS PRU signals have different functionality depending on the mode of operation. The signal naming in this section matches the naming used in the *PRU Module Interface* section in the device TRM.

## 8 Detailed Description

### 8.1 Overview

The AM263x Sitara Arm® Microcontrollers are built to meet the complex real-time processing and control needs of next generation industrial and automotive embedded projects. AM263x uniquely combines advanced compute with industry leading real-time control peripherals to meet the growing performance needs of applications such as HEV/EV (traction inverters, on-board chargers, and DC-DC converters), motor drives, renewable energy, energy storage, and other general real-time constrained systems. AM263x combines up to four Cortex-R5F MCUs, a real-time control subsystem (CONTROLSS), a Hardware Security Module (HSM), and one instance of Sitara's TSN-enabled PRU-ICSS, making AM263x designed for advanced motor control and digital power control applications.

The multiple R5F cores are arranged in cluster with 256KB of shared tightly coupled memory (TCM) along with 2MB of shared SRAM. The multiple Arm® cores can be optionally programmed to run in lock-step option for different functional safety configurations. Extensive ECC is included on on-chip memory, peripherals, and interconnect for enhanced reliability. Cryptographic acceleration and secure boot are also available on AM263x devices in addition to granular firewalls managed by the HSM for developers to design the most secure systems.

The Real-Time Control Subsystem (CONTROLSS) is a revolutionary subsystem integrated into the device. CONTROLSS contains multiple digital and analog control peripherals including: ADC, CMPSS, EPWM, ECAP, and EQEP, among others to enable efficient execution of critical sense/process/actuate real-time signal chain control loops. The integrated crossbar (XBAR) infrastructure enables flexible configuration and routing of external signals to internal ports and internal signals to external pins.

The PRU-ICSS in AM263x provides the flexible industrial communications capability necessary to run TSN, EtherCAT®, PROFINET®, Ethernet/IP™, or for standard Ethernet connectivity and custom I/O interfacing. The PRU also enables additional interfaces in the SoC including sigma delta decimation filters and absolute encoder interfaces. The CPSW interface also provides two standard Ethernet ports.

TI provides a complete set of microcontroller software and development tools for the AM263x family of microcontrollers in addition to multiple pin-to-pin compatible devices for scalability and ease of use.

## 8.2 Processor Subsystems

### 8.2.1 Arm Cortex-R5F Subsystem

The R5FSS is a dual-core implementation of the Arm® Cortex®-R5F processor configured for dual-core (split) or lockstep modes of operation. It also includes accompanying memories (L1 caches and tightly-coupled memories), standard Arm® CoreSight™ debug and trace architecture, integrated Vectored Interrupt Manager (VIM), ECC Aggregators, and various wrappers for protocol conversion and address translation for easy integration into the SoC. The device supports up to two R5FSS modules for a total possible 4x functional cores (dual-core mode) or 2x functional cores (lockstep mode).

---

#### Note

The Arm® Cortex®-R5F processor is a Cortex-R5 processor that includes the optional Floating-point Unit (FPU) extension.

#### 9.1.2 JTAG, EMU, and TRACE

Texas Instruments supports a variety of eXtended Development System (XDS) JTAG controllers with various debug capabilities beyond only JTAG support. A summary of this information is available in the [XDS Target Connection Guide](#).

For recommendations on JTAG, EMU, and TRACE routing, see the [Emulation and Trace Headers Technical Reference Manual](#)

#### 9.1.3 Hardware Design Guide

For details regarding creating PCB systems based on the AM263x family of MCU devices, please see the [AM263x Hardware Design Guide](#).

## 10 Device and Documentation Support

### 10.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microcontrollers (MCUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, XAM2634AOLFGMZCZQ). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- TMDS** Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

For orderable part numbers of AM263x devices in the ZCZ package type, see the Package Option Addendum of this document, the TI website ([ti.com](http://ti.com)), or contact your TI sales representative.

### 10.1.1 Standard Package Symbolization

#### Note

Some devices may have a cosmetic circular marking visible on the top of the device package which results from the production test process. In addition, some devices may also show a color variation in the package substrate which results from the substrate manufacturer. These differences are cosmetic only with no reliability impact.

- (1) BLANK in the symbol or part number is collapsed so there are no gaps between characters.
- (2) To designate the stages in the product development cycle, TI assigns prefixes to the part numbers. These prefixes represent evolutionary stages of product development from engineering prototypes through fully qualified production devices. Prototype devices are shipped against the following disclaimer:  
 "This product is still in development and is intended for internal evaluation purposes."  
 Notwithstanding any provision to the contrary, TI makes no warranty expressed, implied, or statutory, including any implied warranty of merchantability of fitness for a specific purpose, of this device.
- (3) Applies to device max junction temperature.

## 10.2 Tools and Software

The following products support development for AM263x platforms:

### Development Tools

**Code Composer Studio™ Integrated Development Environment** Code Composer Studio (CCS) Integrated Development Environment (IDE) is a development environment that supports TI's Microcontroller and Embedded Processors portfolio. Code Composer Studio comprises a suite of tools used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar tools and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

**SysConfig-PinMux Tool** The SysConfig-PinMux Utility is a software tool which provides a Graphical User Interface for configuring pin multiplexing settings, resolving conflicts and specifying I/O cell characteristics for TI Embedded Processor devices. The tool can be used to automatically calculate the optimal pinmux configuration to satisfy entered system requirements. The tool will generate output C header/code files that can be imported into software development kits (SDKs) and used to configure customer's software to meet custom hardware requirements.

For a complete listing of development-support tools for the processor platform, visit the Texas Instruments website at [ti.com](http://ti.com). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

### 10.3 Documentation Support

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

The following documents are provided to describe the AM263x device.

**AM263x Silicon Errata** Describes the known exceptions to the functional specifications for the device.

**AM263x Technical Reference Manual** Details the integration, the environment, the functional description, and the programming models for each peripheral and subsystem in the AM263x family of devices.

**AM263x TRM Register Addendum** Details the memory mapped register information for each peripheral and subsystem in the AM263x family of devices.

### 10.4 Support Resources

**TI E2E™ support forums** are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 10.5 Trademarks

Ethernet/IP™ is a trademark of ODVA, INC..

Sitara™, Code Composer Studio™, and TI E2E™ are trademarks of Texas Instruments.

CoreSight™ is a trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

Arm® and Cortex® are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

EtherCAT® is a registered trademark of Beckhoff Automation GmbH.

PROFINET® is a registered trademark of PROFINET International.

IO-Link® is a registered trademark of PROFIBUS Nutzerorganisation e.V. eingetragener Verein (e.v.) FED REP GERMANY.

All trademarks are the property of their respective owners.

## 10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
