

BUH50G

Switch-mode NPN Silicon Planar Power Transistor

The BUH50G has an application specific state-of-art die designed for use in 50 W HALOGEN electronic transformers and switch-mode applications.

Features

- Improved Efficiency Due to Low Base Drive Requirements:
High and Flat DC Current Gain h_{FE}
Fast Switching
- ON Semiconductor Six Sigma Philosophy Provides Tight and Reproducible Parametric Distributions
- Specified Dynamic Saturation Data
- Full Characterization at 125°C
- These Devices are Pb-Free and are RoHS Compliant*

MAXIMUM RATINGS

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate I_C - V_{CE} limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate. The data of Figure 20 is based on $T_C = 25^\circ\text{C}$; $T_{J(pk)}$ is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be de-rated when $T_C > 25^\circ\text{C}$. Second breakdown limitations do not de-rate the same as thermal limitations. Allowable current at the voltages shown on Figure 20 may be found at any case temperature by using the appropriate curve on Figure 17.

$T_{J(pk)}$ may be calculated from the data in Figure 22. At any case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown. For inductive loads, high voltage and current must be sustained simultaneously during turn-off with the base to emitter junction reverse biased. The safe level is specified as a reverse biased safe operating area (Figure 21). This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode.
