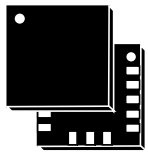
LSM6DS0

iNEMO inertial module: 3D accelerometer and 3D gyroscope

Datasheet - production data



LGA-16L (3x3x0.86 mm)

Features

- Analog supply voltage: 1.71 V to 3.6 V
- Independent IOs supply (1.71 V)
- “Always on” eco power mode down to 1.8 mA
- 3 independent acceleration channels and 3 angular rate channels
- ±2/±4/±8/±16 *g* full scale
- ±245/±500/±2000 dps full scale
- SPI/I^2C serial interface
- Embedded temperature sensor
- Embedded FIFO
- ECOPACK®, RoHS and “Green” compliant

Applications

- GPS navigation systems
- Impact recognition and logging
- Gaming and virtual reality input devices
- Motion-activated functions
- Intelligent power saving for handheld devices
- Vibration monitoring and compensation
- Free-fall detection
- 6D orientation detection

Description

The LSM6DS0 is a system-in-package featuring a 3D digital accelerometer and a 3D digital gyroscope. ST’s family of MEMS sensor modules leverages the robust and mature manufacturing processes already used for the production of micromachined accelerometers and gyroscopes.

The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the sensing element characteristics.

The LSM6DS0 has a full-scale acceleration range of ±2/±4/±8/±16 *g* and an angular rate range of ±245/±500/±2000 dps. The LSM6DS0 has two operating modes in that the accelerometer and gyroscope sensors can be either activated at the same ODR or the accelerometer can be enabled while the gyroscope is in power-down.

The LSM6DS0 is available in a plastic land grid array (LGA) package.

Table 1. Device summary

Part number	Temp. range [°C]	Package	Packing
LSM6DS0	-40 to +85	LGA-16L (3x3x0.86 mm)	Tray
LSM6DS0TR	-40 to +85		Tape and reel

Figure 1. Pin connections

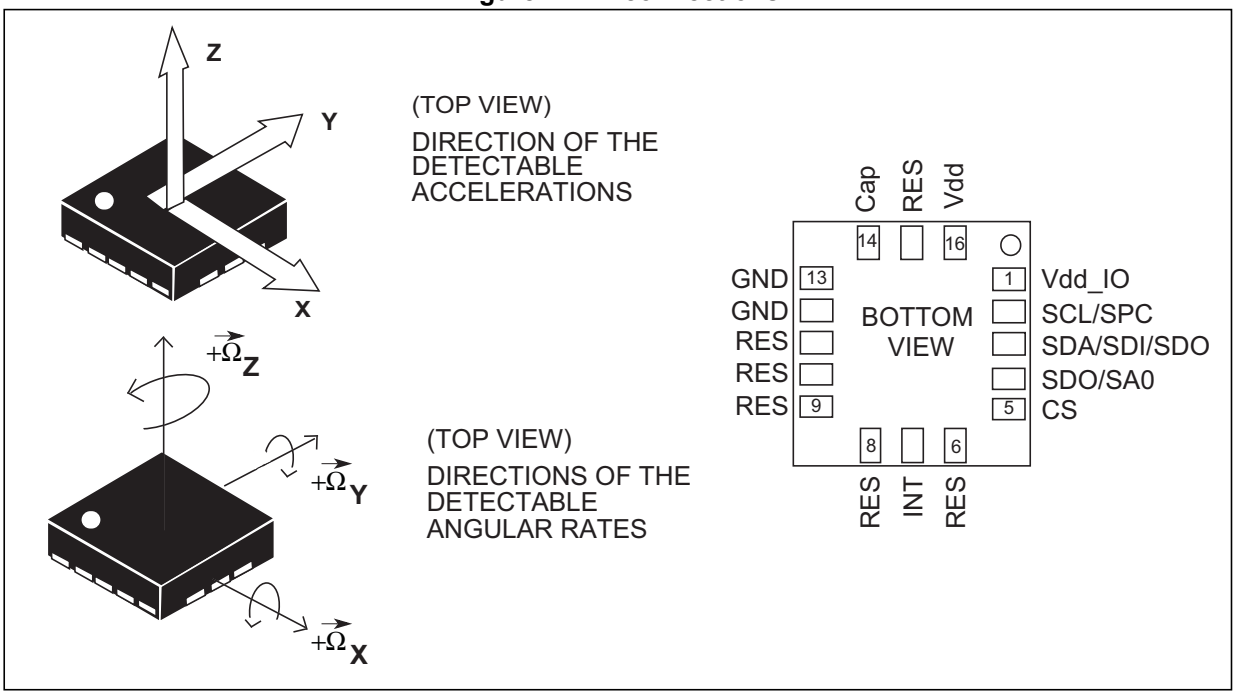

Table 2. Pin description

Pin#	Name	Function
1	Vdd_IO(1)	Power supply for I/O pins
2	SCL SPC	I²C serial clock (SCL) SPI serial port clock (SPC)
3	SDA SDI SDO	I²C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO)
4	SDO SA0	SPI serial data output (SDO) I²C least significant bit of the device address (SA0)
5	CS	SPI enable I²C/SPI mode selection (1: SPI idle mode / I²C communication enabled; 0: SPI communication mode / I²C disabled)
6	RES	Leave unconnected
7	INT	Programmable interrupt
8	RES	Connect to GND
9	RES	Connect to GND
10	RES	Connect to GND
11	RES	Connect to Vdd or GND
12	GND	0 V supply
13	GND	0 V supply
14	Cap	Connect to GND with ceramic capacitor(2)
15	RES	Connect to Vdd or GND
16	Vdd(3)	Power supply

1. Recommended 100 nF filter capacitor.
2. 10 nF (±10%), 16 V. 1 nF minimum value has to be guaranteed under 11 V bias condition.
3. Recommended 100 nF plus 10 µF capacitors.

2 Module specifications

2.1 Mechanical characteristics

@ Vdd = 2.2 V, T = 25 °C unless otherwise noted[a]

Table 3. Mechanical characteristics

Symbol	Parameter	Test conditions	Min.	Typ.[1]	Max.	Unit
LA_FS	Linear acceleration measurement range			±2		*g*
				±4		
				±8		
				±16		
G_FS	Angular rate measurement range			±245		dps
				±500		
				±2000		
LA_So	Linear acceleration sensitivity	FS = ±2 *g*		0.061		mg/LSb
		FS = ±4 *g*		0.122		
		FS = ±8 *g*		0.244		
		FS = ±16 *g*		0.732		
G_So	Angular rate sensitivity	FS = ±245 dps		8.75		mdps/LSb
		FS = ±500 dps		17.50		
		FS = ±2000 dps		70		
LA_TyOff	Linear acceleration typical zero-*g* level offset accuracy[2]	FS = ±8 *g*		±90		mg
G_TyOff	Angular rate typical zero-rate level[3]	FS = ±2000 dps		±30		dps
LA_ODR	Linear acceleration output data rate	Gyro ON		952 476 238 119 59.5 14.9		Hz
		Gyro OFF		952 476 238 119 50 10		Hz

a. The product is factory calibrated at 2.2 V. The operational power supply range is from 1.71 V to 3.6 V.

Table 3. Mechanical characteristics (continued)

Symbol	Parameter	Test conditions	Min.	Typ.(1)	Max.	Unit
G_ODR	Angular digital output data rate			952 476 238 119 59.5 14.9		Hz
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.
2. Typical zero-g level offset value after soldering.
3. Typical zero-rate level offset value after MSL3 preconditioning.

2.2 Electrical characteristics

@ Vdd = 2.2 V, T = 25 °C unless otherwise noted

Table 4. Electrical characteristics

Symbol	Parameter	Test conditions	Min.	Typ.(1)	Max.	Unit
Vdd	Supply voltage		1.71		3.6	V
Vdd_IO	Power supply for I/O		1.71		Vdd + 0.1	V
LA_Idd	Accelerometer current consumption in normal mode	ODR = 10 Hz		60		µA
		ODR = 50 Hz		160		
		ODR ≥ 119 Hz		330		
G_Idd	Gyroscope current consumption in normal mode			4.0		mA
Top	Operating temperature range		-40		+85	°C
Trise	Time for power supply rising(2)		0.01		100	ms
Twait	Time delay between Vdd_IO and Vdd (2)		0		10	ms

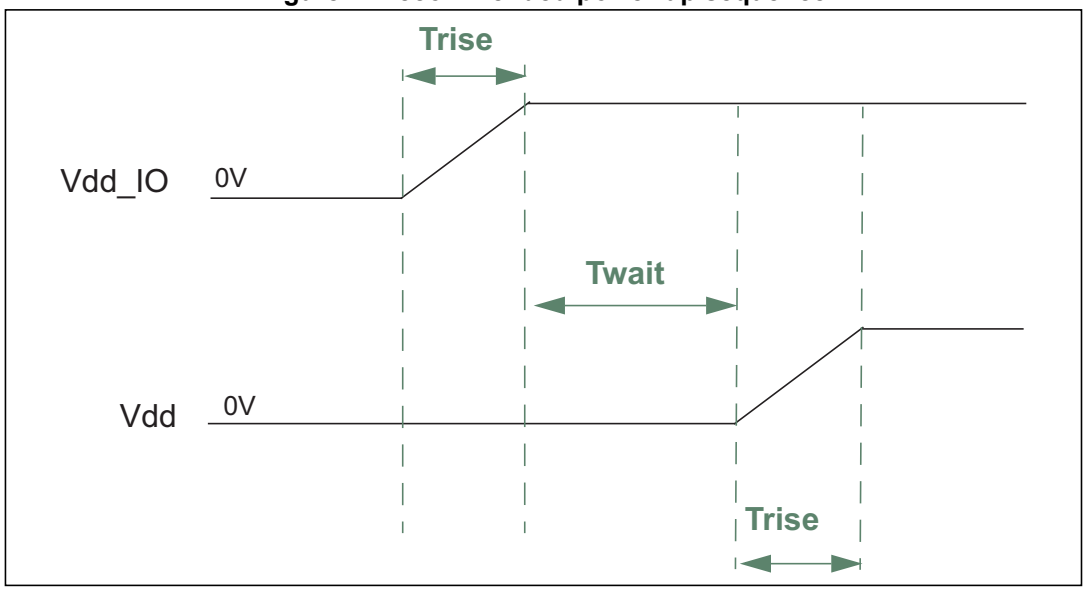
1. Typical specifications are not guaranteed.
2. Please refer to *Section 2.2.1: Recommended power-up sequence* for more details.

2.2.1 Recommended power-up sequence

For the power-up sequence please refer to the following figure, where:

- Trise is the time for the power supply to rise from 10% to 90% of its final value
- Twait is the time delay between the end of the Vdd_IO ramp (90% of its final value) and the start of the Vdd ramp

Figure 2. Recommended power-up sequence



2.3 Temperature sensor characteristics

@ Vdd = 2.2 V, T = 25 °C unless otherwise noted [b]

Table 5. Temperature sensor characteristics

Symbol	Parameter	Test condition	Min.	Typ.(1)	Max.	Unit
TODR	Temperature refresh rate	Gyro off(2)		50		Hz
		Gyro on		59.5		
TSen	Temperature sensitivity(3)			16		LSB/°C
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.
2. When the accelerometer ODR is set to 10 Hz and the gyroscope part is turned off, the TODR value is 10 Hz.
3. The output of the temperature sensor is 0 (typ.) at 25°C

b. The product is factory calibrated at 2.2 V.

2.4 Communication interface characteristics

2.4.1 SPI - serial peripheral interface

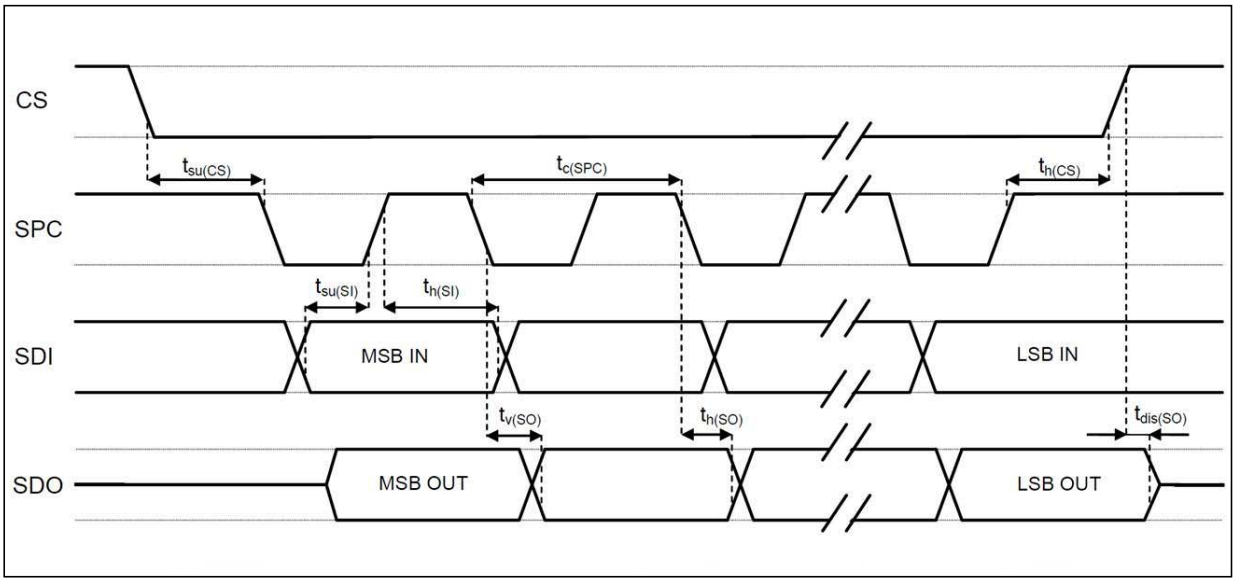
Subject to general operating conditions for Vdd and Top.

Table 6. SPI slave timing values

Symbol	Parameter	Value(1)		Unit
		Min	Max	
$t_{c(SPC)}$	SPI clock cycle	100		ns
$f_{c(SPC)}$	SPI clock frequency		10	MHz
$t_{su(CS)}$	CS setup time	5		ns
$t_{h(CS)}$	CS hold time	20		
$t_{su(SI)}$	SDI input setup time	5		
$t_{h(SI)}$	SDI input hold time	15		
$t_{v(SO)}$	SDO valid output time		50	
$t_{h(SO)}$	SDO output hold time	5		
$t_{dis(SO)}$	SDO output disable time		50	

1. Values are guaranteed at 10 MHz clock frequency for SPI with both 4 and 3 wires, based on characterization results, not tested in production

Figure 3. SPI slave timing diagram



Note: Measurement points are done at 0.2·Vdd_IO and 0.8·Vdd_IO, for both input and output ports.

2.4.2 I²C - inter-IC control interface

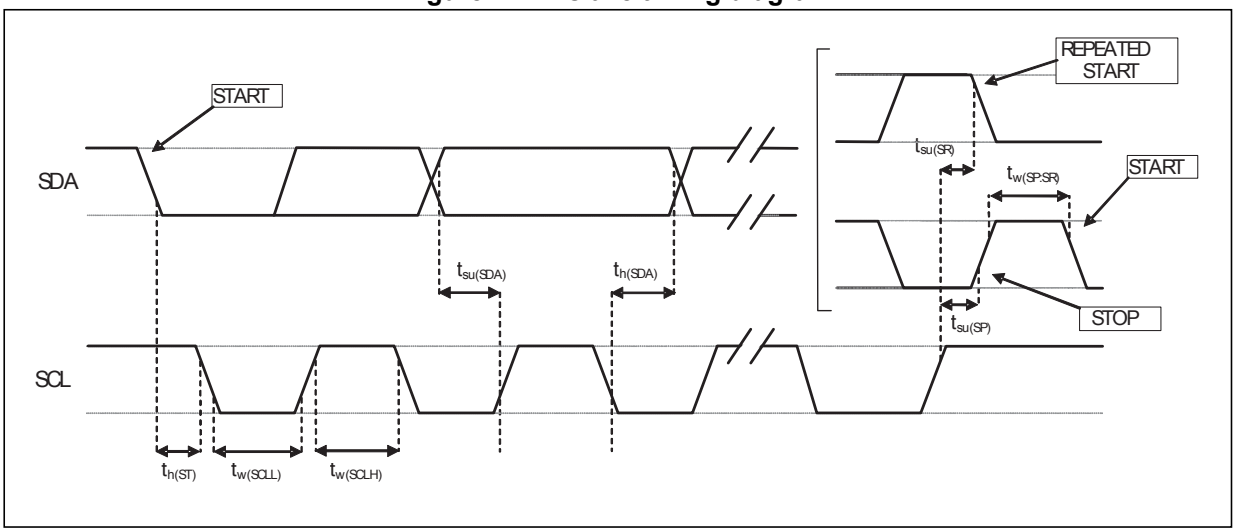
Subject to general operating conditions for Vdd and Top.

Table 7. I²C slave timing values

Symbol	Parameter	I²C Standard mode(1)		I²C Fast mode (1)		Unit
		Min	Max	Min	Max	
$f_{(SCL)}$	SCL clock frequency	0	100	0	400	kHz
$t_{w(SCLL)}$	SCL clock low time	4.7		1.3		µs
$t_{w(SCLH)}$	SCL clock high time	4.0		0.6		
$t_{su(SDA)}$	SDA setup time	250		100		ns
$t_{h(SDA)}$	SDA data hold time	0	3.45	0	0.9	µs
$t_{h(ST)}$	START condition hold time	4		0.6		µs
$t_{su(SR)}$	Repeated START condition setup time	4.7		0.6		
$t_{su(SP)}$	STOP condition setup time	4		0.6		
$t_{w(SP:SR)}$	Bus free time between STOP and START condition	4.7		1.3		

1. Data based on standard I²C protocol requirement, not tested in production.

Figure 4. I²C slave timing diagram



Note: Measurement points are done at 0.2·Vdd_IO and 0.8·Vdd_IO, for both ports.

2.5 Absolute maximum ratings

Stresses above those listed as “Absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 8. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
Vdd	Supply voltage	-0.3 to 4.8	V
T_{STG}	Storage temperature range	-40 to +125	°C
Sg	Acceleration *g* for 0.1 ms	10,000	*g*
ESD	Electrostatic discharge protection (HBM)	2	kV
Vin	Input voltage on any control pin (including CS, SCL/SPC, SDA/SDI/SDO, SDO/SA0)	0.3 to Vdd_IO +0.3	V

Note: Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

2.6 Terminology

2.6.1 Sensitivity

Linear acceleration sensitivity can be determined, for example, by applying 1 *g* acceleration to the device. Because the sensor can measure DC accelerations, this can be done easily by pointing the selected axis towards the ground, noting the output value, rotating the sensor 180 degrees (pointing towards the sky) and noting the output value again. By doing so, ±1 *g* acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and over time. The sensitivity tolerance describes the range of sensitivities of a large number of sensors.

An angular rate gyroscope is a device that produces a positive-going digital output for counterclockwise rotation around the considered axis. Sensitivity describes the gain of the sensor and can be determined by applying a defined angular velocity to it. This value changes very little over temperature and time.

2.6.2 Zero-*g* and zero rate level

Linear acceleration zero-*g* level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface will measure 0 *g* on both the X-axis and Y-axis, whereas the Z-axis will measure 1 *g*. Ideally, the output is in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called zero-*g* offset.

Offset is to some extent a result of stress to the MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Linear acceleration zero-*g* level change vs. temperature" in *Table 3*. The zero-*g* level tolerance (TyOff) describes the standard deviation of the range of zero-*g* levels of a group of sensors.

The zero-rate level describes the actual output signal if there is no angular rate present. The zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and therefore the zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little over temperature and time.

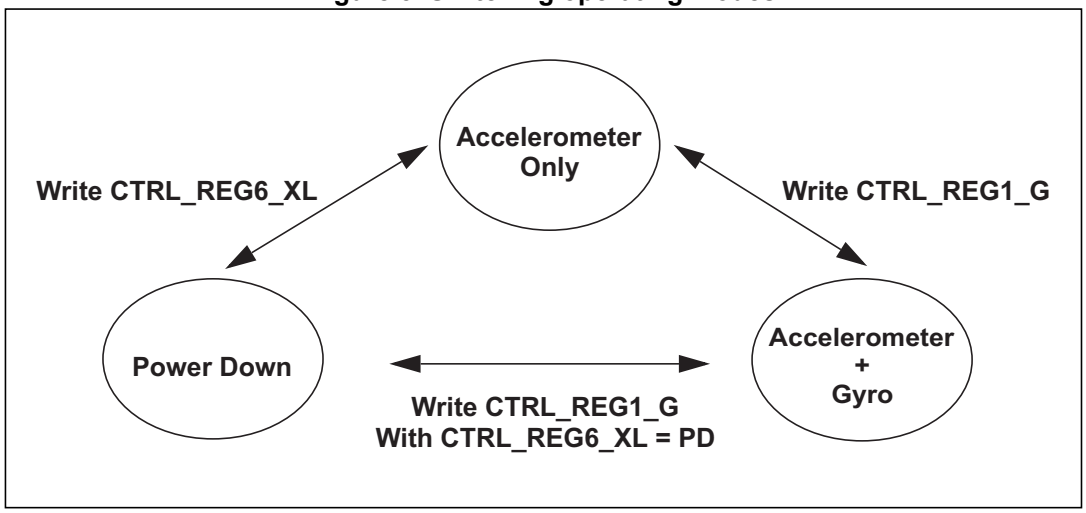
3 Functionality

3.1 Operating modes

The LSM6DS0 has two operating modes available: only accelerometer active and gyroscope in power-down or both accelerometer and gyroscope sensors active at the same ODR. Switching from one mode to the other requires one write operation: writing to *CTRL_REG6_XL (20h)*, the accelerometer operates in normal mode and the gyroscope is powered down, writing to *CTRL_REG1_G (10h)* both the accelerometer and gyroscope are activated at the same ODR.

Figure 5 depicts both modes of operation from power down.

Figure 5. Switching operating modes



3.2 Gyroscope power modes

In the LSM6DS0, the gyroscope can be configured in three different operating modes: power-down, low-power and normal mode.

Low-power mode is available for lower ODR (14.9, 59.5, 119 Hz) while for greater ODR (238, 476, 952 Hz) the device is automatically in normal mode. *Table 9* summarizes the ODR configuration (ODR_G[2:0] bits set in *CTRL_REG1_G (10h)*) and the corresponding power modes.

To enable low-power mode, the LP_mode bit in *CTRL_REG3_G (12h)* has to be set to ‘1’.

Low-power mode allows reaching low-power consumption while maintaining the device always on, refer to *Table 10*.

Table 9. Gyroscope operating modes

ODR_G [2:0]	ODR [Hz]	Power mode(1)
000	Power-down	Power-down
001	14.9	Low-power/Normal mode
010	59.5	Low-power/Normal mode
011	119	Low-power/Normal mode
100	238	Normal mode
101	476	Normal mode
110	952	Normal mode

1. Gyroscope low-power mode is available for G_FS = ±2000 dps.

Table 10. Operating mode current consumption

ODR [Hz]	Power mode	Current consumption(1) [mA]
14.9	Low-power	1.8
59.5	Low-power	2.3
119	Low-power	2.9
238	Normal mode	4.3
476	Normal mode	4.3
952	Normal mode	4.3

1. Typical values of gyroscope and accelerometer current consumption are based on characterization data

Table 11. Accelerometer turn-on time

ODR [Hz]	BW = 400 Hz(1)	BW = 200 Hz(1)	BW = 100 Hz(1)	BW = 50 Hz(1)
14.9	0	0	0	0
59.5	0	0	0	0
119	1	1	1	2
238	1	1	2	4
476	1	2	4	7
952	2	4	7	14

1. The table contains the number of samples to be discarded after switching between power-down mode and normal mode.

Table 12. Gyroscope turn-on time

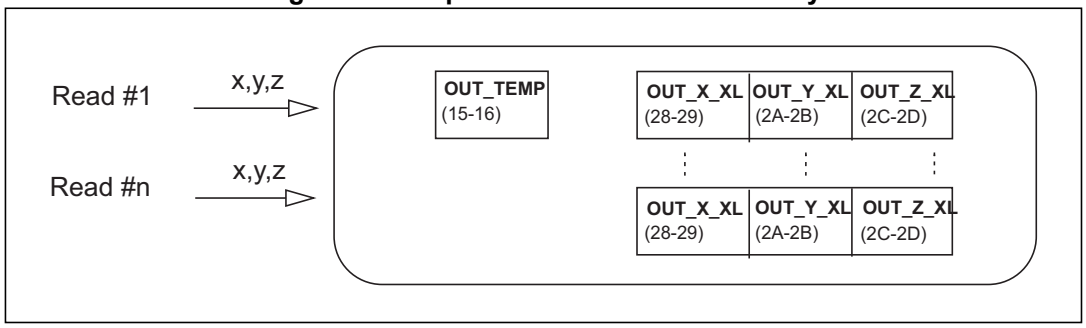
ODR [Hz]	LPF1 only(1)	LPF1 and LPF2(1)
14.9	2	LPF2 not available
59.5 or 119	3	13
238	4	14
476	5	15
952	8	18

1. The table contains the number of samples to be discarded after switching between low-power mode and normal mode.

3.3 Multiple reads (burst)

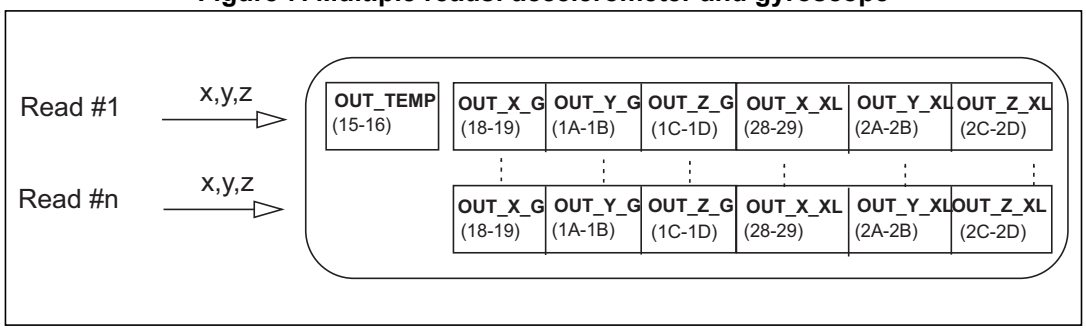
When only the accelerometer is activated and the gyroscope is in power down, starting from *OUT_X_XL (28h - 29h)* multiple reads can be performed. Once *OUT_Z_XL (2Ch - 2Dh)* is read, the system automatically restarts from *OUT_X_XL (28h - 29h)* (see *Figure 6*).

Figure 6. Multiple reads: accelerometer only



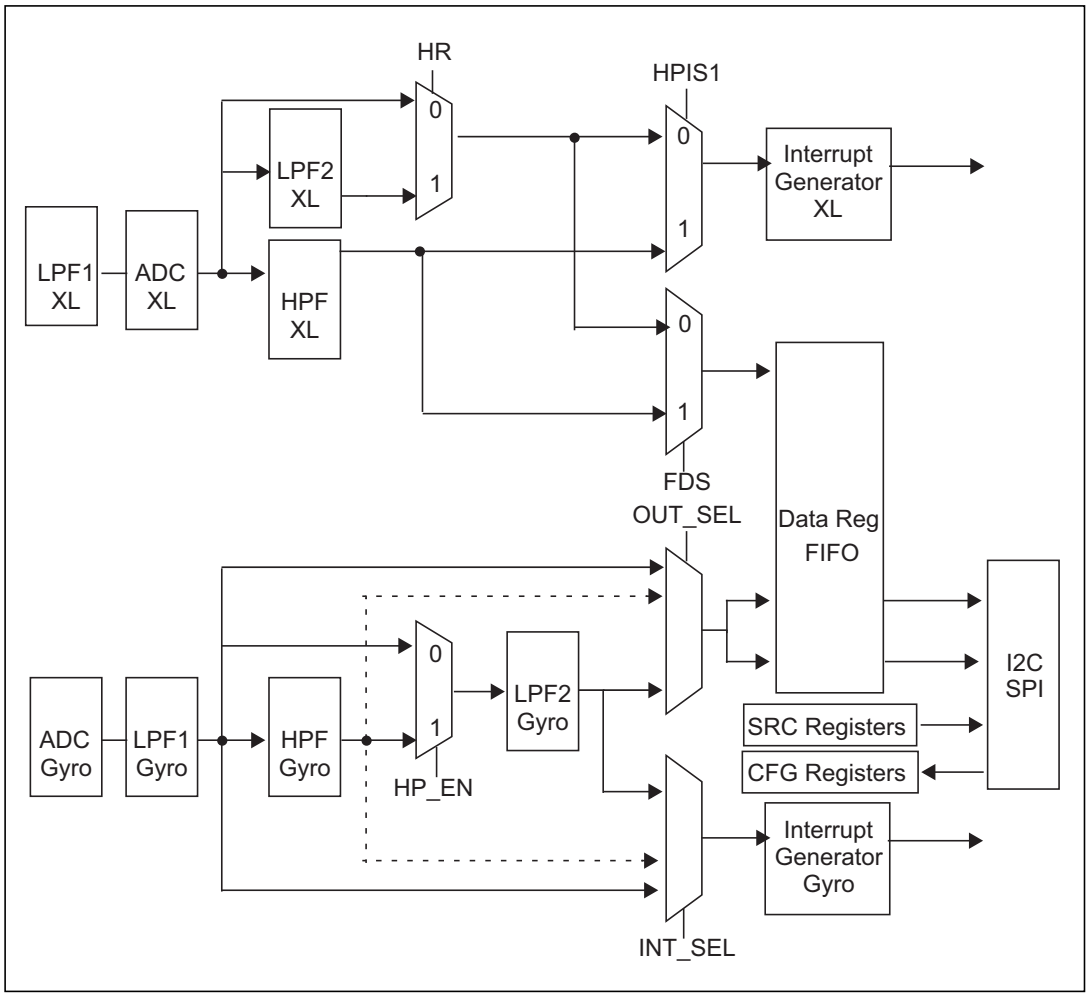
When both accelerometer and gyroscope sensors are activated at the same ODR, starting from *OUT_X_G (18h - 19h)* multiple reads can be performed. Once *OUT_Z_XL (2Ch - 2Dh)* is read, the system automatically restarts from *OUT_X_G (18h - 19h)* (see *Figure 7*).

Figure 7. Multiple reads: accelerometer and gyroscope



3.4 Digital block diagram

Figure 8. Digital block diagram



3.5 FIFO

The LSM6DS0 embeds 32 slots of 16-bit data FIFO for each of the gyroscope's three output channels, yaw, pitch and roll, and 16-bit data FIFO for each of the accelerometer's three output channels, X, Y and Z. This allows consistent power saving for the system, since the host processor does not need to continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO. This buffer can work accordingly to five different modes: Bypass mode, FIFO-mode, Continuous mode, Continuous-to-FIFO mode and Bypass-to-Continuous. Each mode is selected by the FMODE [2:0] bits in the *FIFO_CTRL (2Eh)* register. Programmable FIFO threshold status, FIFO overrun events and the number of unread samples stored are available in the *FIFO_SRC (2Fh)* register and can be set to generate dedicated interrupts on the INT pin using the *INT_CTRL (0Ch)* register.

FIFO_SRC (2Fh)(FTH) goes to '1' when the number of unread samples (*FIFO_SRC (2Fh)* (FSS5:0)) is greater than or equal to FTH [4:0] in *FIFO_CTRL (2Eh)*. If *FIFO_CTRL (2Eh)* (FTH[4:0]) is equal to 0, *FIFO_SRC (2Fh)*(FTH) goes to '0'.

FIFO_SRC (2Fh)(OVRN) is equal to '1' if a FIFO slot is overwritten.

FIFO_SRC (2Fh)(FSS [5:0]) contains stored data levels of unread samples. When FSS [5:0] is equal to '000000', FIFO is empty. When FSS [5:0] is equal to '100000', FIFO is full and the unread samples are 32.

The FIFO feature is enabled by writing '1' in *CTRL_REG9 (23h)* (FIFO_EN).

To guarantee the correct acquisition of data during the switching into and out of FIFO mode, the first sample acquired must be discarded.

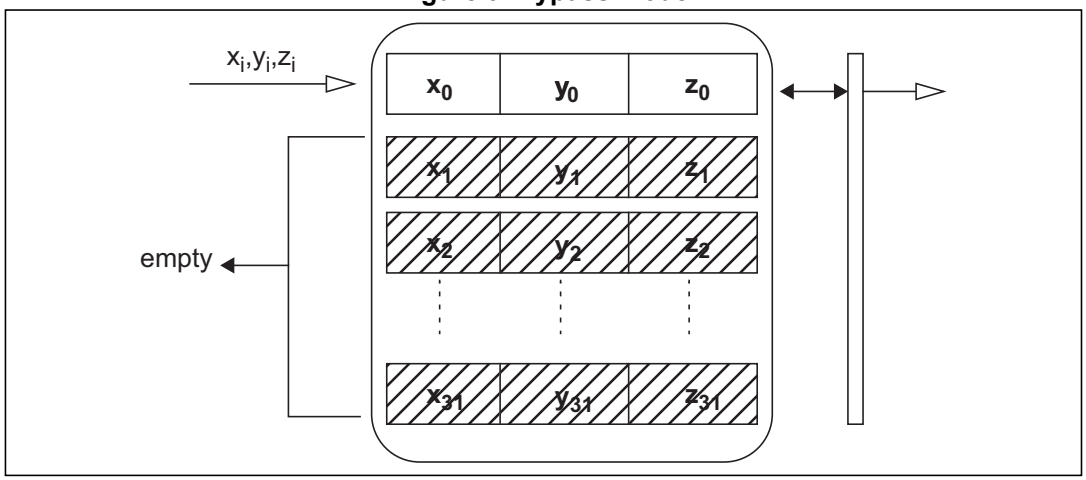
3.5.1 Bypass mode

In Bypass mode (*FIFO_CTRL (2Eh)*(FMODE [2:0]= 000), the FIFO is not operational and it remains empty.

Bypass mode is also used to reset the FIFO when in FIFO mode.

As described in *Figure 9*, for each channel only the first address is used. When new data is available the old data is overwritten.

Figure 9. Bypass mode



3.5.2 FIFO mode

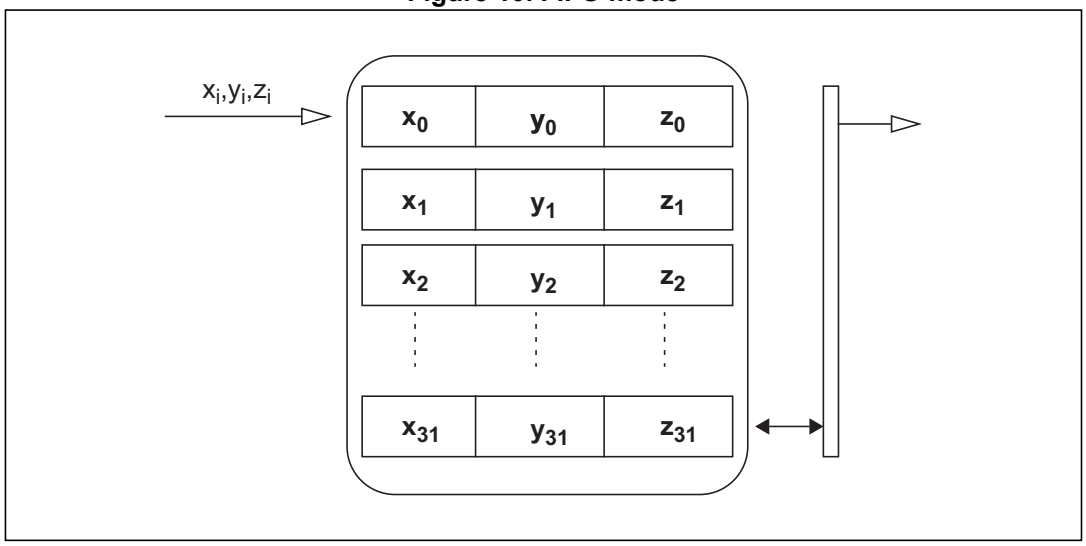
In FIFO mode (*FIFO_CTRL (2Eh)* (FMODE [2:0] = 001) data from the output channels are stored in the FIFO until it is overwritten.

To reset FIFO content, Bypass mode should be selected by writing *FIFO_CTRL (2Eh)* (FMODE [2:0]) to '000'. After this reset command, it is possible to restart FIFO mode, writing *FIFO_CTRL (2Eh)* (FMODE [2:0]) to '001'.

The FIFO buffer memorizes 32 levels of data, but the depth of the FIFO can be resized by setting the STOP_ON_FTH bit in *CTRL_REG9 (23h)*. If the STOP_ON_FTH bit is set to '1', FIFO depth is limited to *FIFO_CTRL (2Eh)*(FTH [4:0]) + 1 data.

A FIFO threshold interrupt can be enabled (INT_OVR bit in *INT_CTRL (0Ch)*) in order to be raised when the FIFO is filled to the level specified by the FTH[4:0] bits of *FIFO_CTRL (2Eh)*. When a FIFO threshold interrupt occurs, the first data has been overwritten and the FIFO stops collecting data from the input channels.

Figure 10. FIFO mode



3.5.3 Continuous mode

Continuous mode (*FIFO_CTRL (2Eh)* (FMODE[2:0] = 110) provides a continuous FIFO update: as new data arrives the older is discarded.

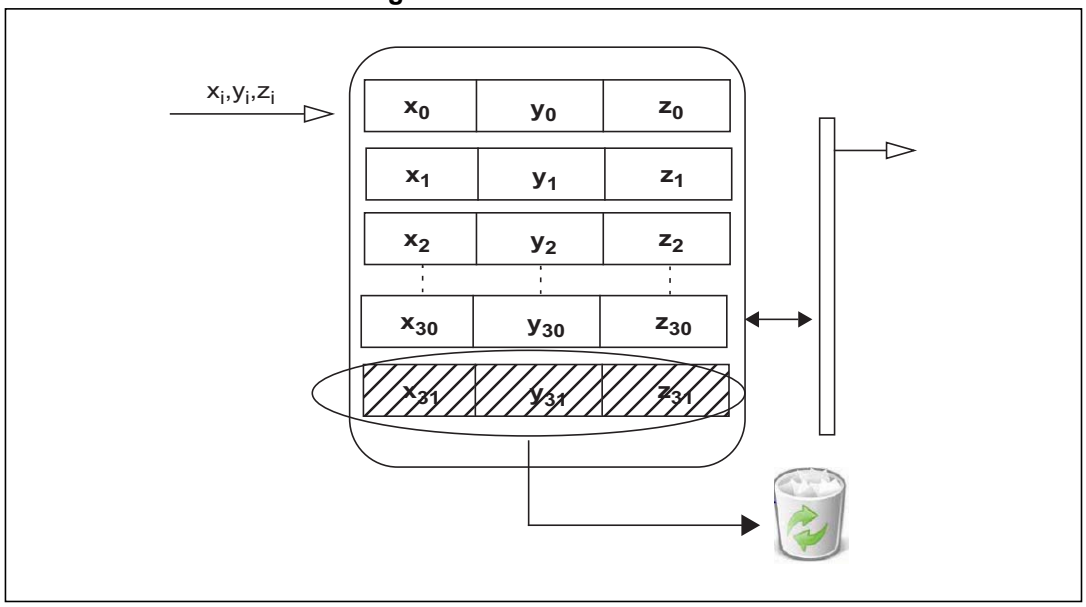
A FIFO threshold flag *FIFO_SRC (2Fh)*(FTH) is asserted when the number of unread samples in FIFO is greater than or equal to *FIFO_CTRL (2Eh)*(FTH4:0).

It is possible to route *FIFO_SRC (2Fh)*(FTH) to the INT pin by writing the INT_FTH bit to ‘1’ in register *INT_CTRL (0Ch)*.

A full-flag interrupt can be enabled (*INT_CTRL (0Ch)* (INT_ FSS5)= '1') when the FIFO becomes saturated and in order to read the contents all at once. If an overrun occurs, the oldest sample in FIFO is overwritten and the OVRN flag in *FIFO_SRC (2Fh)* is asserted.

In order to empty the FIFO before it is full, it is also possible to pull from FIFO the number of unread samples available in *FIFO_SRC (2Fh)* (FSS[5:0]).

Figure 11. Continuous mode



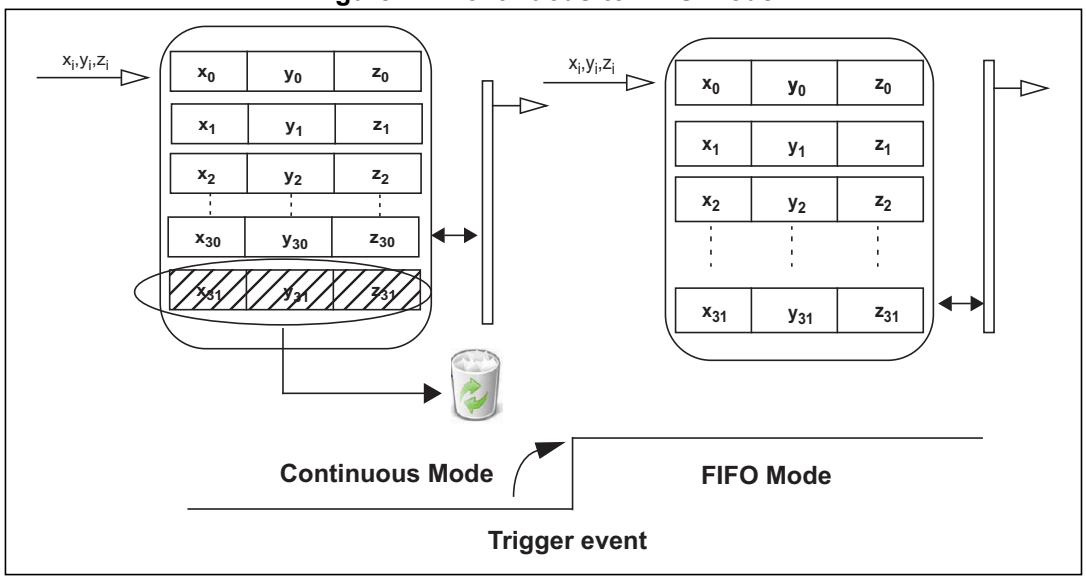
3.5.4 Continuous-to-FIFO mode

In Continuous-to-FIFO mode (*FIFO_CTRL (2Eh)*(FMODE [2:0] = 011), FIFO behavior changes according to the *INT_GEN_SRC_XL (26h)*(IA_XL) bit. When the *INT_GEN_SRC_XL (26h)*(IA_XL) bit is equal to '1', FIFO operates in FIFO mode. When the *INT_GEN_SRC_XL (26h)*(IA_XL) bit is equal to '0', FIFO operates in Continuous mode.

The interrupt generator should be set to the desired configuration by means of *INT_GEN_CFG_XL (06h)*, *INT_GEN_THS_X_XL (07h)*, *INT_GEN_THS_Y_XL (08h)* and *INT_GEN_THS_Z_XL (09h)*.

The *CTRL_REG4 (1Eh)*(LIR_XL) bit should be set to '1' in order to have latched interrupt.

Figure 12. Continuous-to-FIFO mode



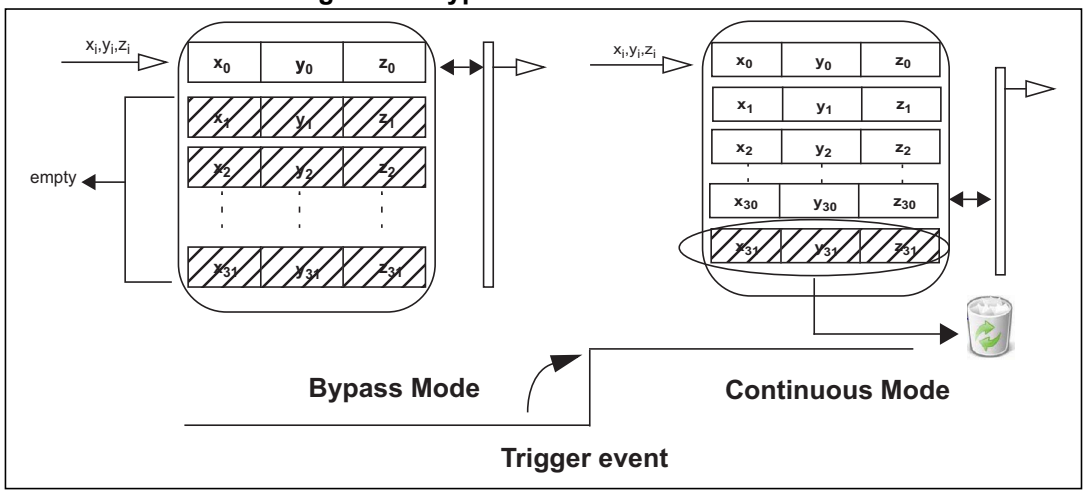
3.5.5 Bypass-to-Continuous mode

In Bypass-to-Continuous mode (*FIFO_CTRL (2Eh)*(FMODE[2:0] = '100'), data measurement storage inside FIFO operates in Continuous mode when *INT_GEN_SRC_XL (26h)*(IA_XL) is equal to '1', otherwise FIFO content is reset (Bypass mode).

The interrupt generator should be set to the desired configuration by means of *INT_GEN_CFG_XL (06h)*, *INT_GEN_THS_X_XL (07h)*, *INT_GEN_THS_Y_XL (08h)* and *INT_GEN_THS_Z_XL (09h)*.

The *CTRL_REG4 (1Eh)*(LIR_XL) bit should be set to '1' in order to have latched interrupt.

Figure 13. Bypass-to-Continuous mode



4 Digital interfaces

The registers embedded inside the LSM6DS0 may be accessed through both the I^2C and SPI serial interfaces. The latter may be SW configured to operate either in 3-wire or 4-wire interface mode.

The serial interfaces are mapped onto the same pins. To select/exploit the I^2C interface, the CS line must be tied high (i.e connected to Vdd_IO).

Table 13. Serial interface pin description

Pin name	Pin description
CS	SPI enable I^2C/SPI mode selection (1: SPI idle mode / I^2C communication enabled; 0: SPI communication mode / I^2C disabled)
SCL/SPC	I^2C Serial Clock (SCL) SPI Serial Port Clock (SPC)
SDA/SDI/SDO	I^2C Serial Data (SDA) SPI Serial Data Input (SDI) 3-wire Interface Serial Data Output (SDO)
SDO/SA0	SPI Serial Data Output (SDO) I^2C less significant bit of the device address

4.1 I^2C serial interface

The LSM6DS0 I^2C is a bus slave. The I^2C is employed to write the data to the registers whose content can also be read back.

The relevant I^2C terminology is provided in the table below.

Table 14. I^2C terminology

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I^2C bus: the serial clock line (SCL) and the Serial DAta line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines must be connected to Vdd_IO through an external pull-up resistor. When the bus is free, both the lines are high.

The I^2C interface is implemeted with fast mode (400 kHz) I^2C standards as well as with the standard mode.

In order to disable the I^2C block, the I2C_disable bit must be written to ‘1’ in *CTRL_REG9 (23h)*.

4.1.1 I²C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a high-to-low transition on the data line while the SCL line is held high. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The Slave ADdress (SAD) associated to the LSM6DS0 is 110101xb. The SDO/SA0 pin can be used to modify the less significant bit of the device address. If the SDO/SA0 pin is connected to a voltage supply, LSb is '1' (address 1101011b), else if the SDO/SA0 pin is connected to ground, the LSb value is '0' (address 1101010b). This solution permits to connect and address two different inertial modules to the same I²C bus.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line low so that it remains stable low during the high period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the LSM6DS0 behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, an 8-bit sub-address (SUB) is transmitted. The increment of the address is configured by the *CTRL_REG8 (22h)* (IF_ADD_INC).

The slave address is completed with a Read/Write bit. If the bit was '1' (Read), a repeated START (SR) condition must be issued after the two sub-address bytes. If the bit is '0' (Write) the master will transmit to the slave with direction unchanged. *Table 15* explains how the SAD+Read/Write bit pattern is composed, listing all the possible configurations.

Table 15. SAD+Read/Write patterns

Command	SAD[6:1]	SAD[0] = SA0	R/W	SAD+R/W
Read	110101	0	1	11010101 (D5h)
Write	110101	0	0	11010100 (D4h)
Read	110101	1	1	11010111 (D7h)
Write	110101	1	0	11010110 (D6h)

Table 16. Transfer when master is writing one byte to slave

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

Table 17. Transfer when master is writing multiple bytes to slave

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

Table 18. Transfer when master is receiving (reading) one byte of data from slave

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

Table 19. Transfer when master is receiving (reading) multiple bytes of data from slave

Master	ST	SAD+W		SUB		SR	SAD+R			MAK		MAK		NMAK	SP
Slave			SAK		SAK			SAK	DATA		DATA		DATA		

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the Most Significant bit (MSb) first. If a receiver can't receive another complete byte of data until it has performed some other function, it can hold the clock line, SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver doesn't acknowledge the slave address (i.e. it is not able to receive because it is performing some real-time function) the data line must be left high by the slave. The master can then abort the transfer. A low-to-high transition on the SDA line while the SCL line is high is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

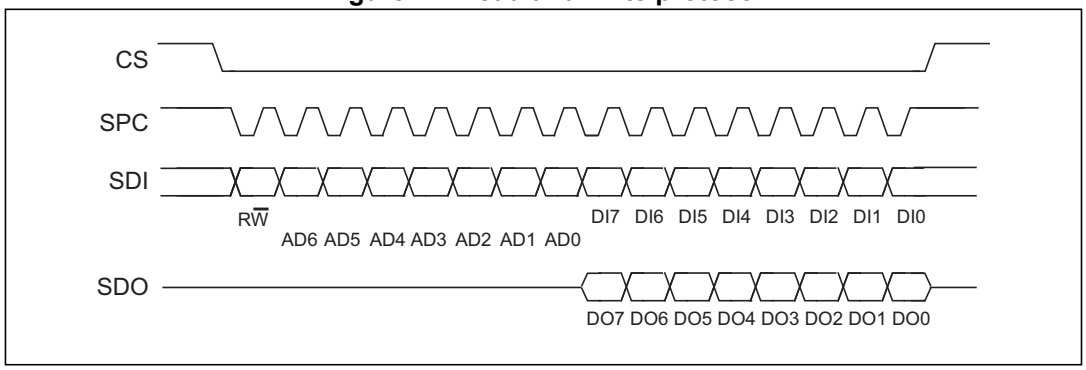
In the presented communication format MAK is Master acknowledge and NMAK is No Master Acknowledge.

4.2 SPI bus interface

The LSM6DS0 SPI is a bus slave. The SPI allows to write and read the registers of the device.

The serial interface connects to applications using 4 wires: **CS**, **SPC**, **SDI** and **SDO**.

Figure 14. Read and write protocol



CS is the serial port enable and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are respectively the serial port data input and output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of SPC just before the rising edge of **CS**.

bit 0: R$\overline{W}$ bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In latter case, the chip will drive **SDO** at the start of bit 8.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

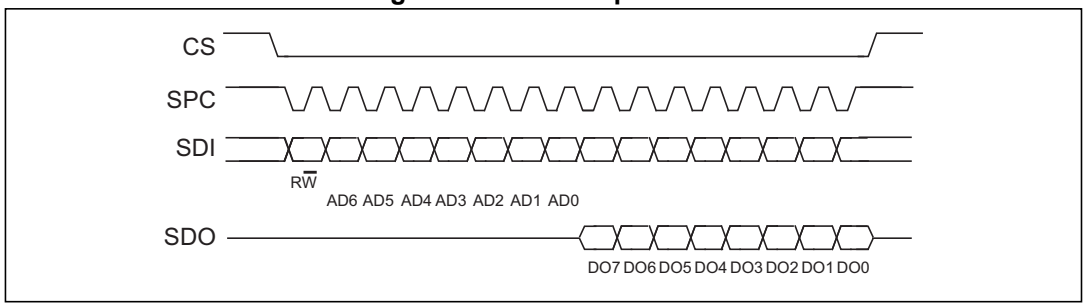
bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods will be added. When the *CTRL_REG8 (22h)* (IF_ADD_INC) bit is '0', the address used to read/write data remains the same for every block. When the *CTRL_REG8 (22h)*(IF_ADD_INC) bit is '1', the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

4.2.1 SPI read

Figure 15. SPI read protocol



The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

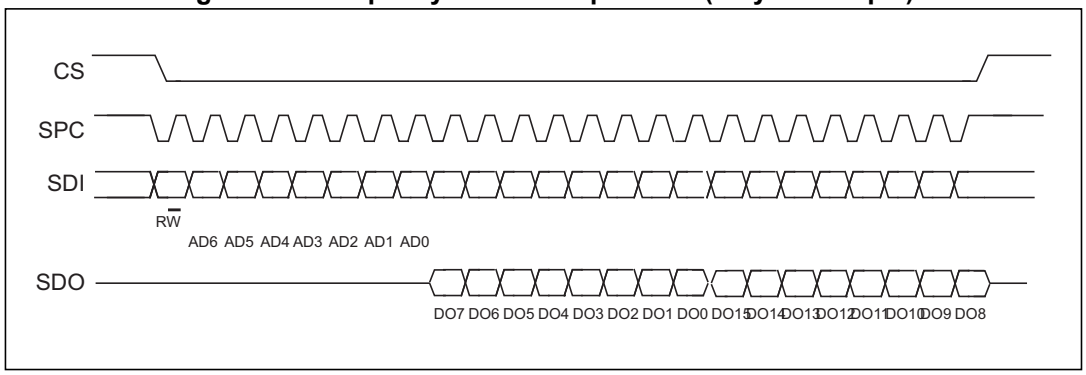
bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that will be read from the device (MSb first).

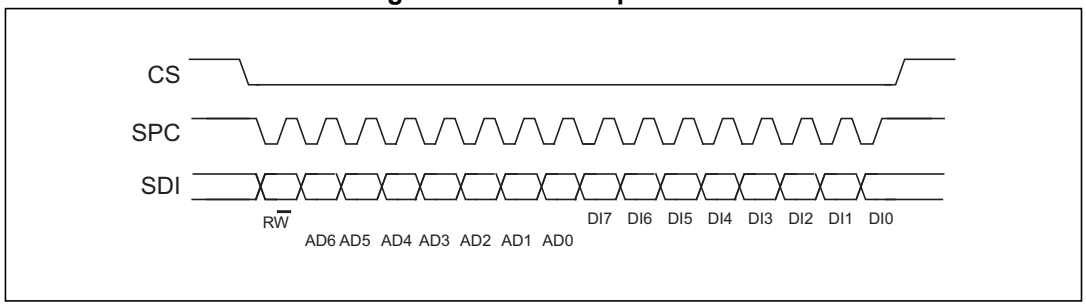
bit 16-... : data DO(...-8). Further data in multiple byte reads.

Figure 16. Multiple byte SPI read protocol (2-byte example)



4.2.2 SPI write

Figure 17. SPI write protocol



The SPI write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

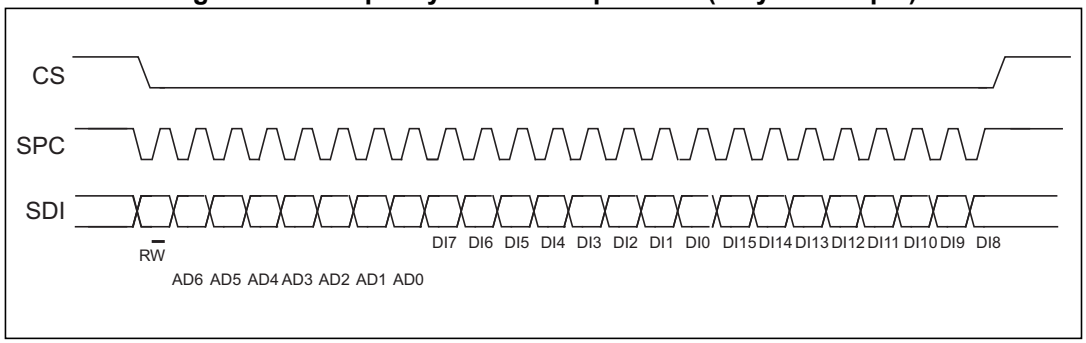
bit 0: WRITE bit. The value is 0.

bit 1 -7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

bit 16-... : data DI(...-8). Further data in multiple byte writes.

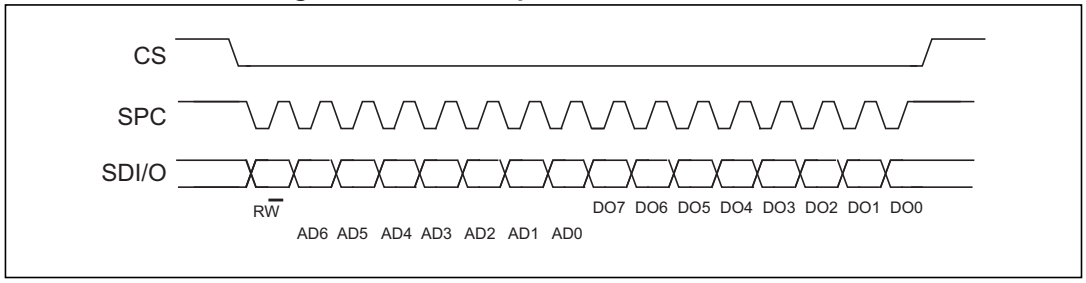
Figure 18. Multiple byte SPI write protocol (2-byte example)



4.2.3 SPI read in 3-wire mode

3-wire mode is entered by setting the *CTRL_REG8 (22h)*(SIM) bit equal to '1' (SPI serial interface mode selection).

Figure 19. SPI read protocol in 3-wire mode



The SPI read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

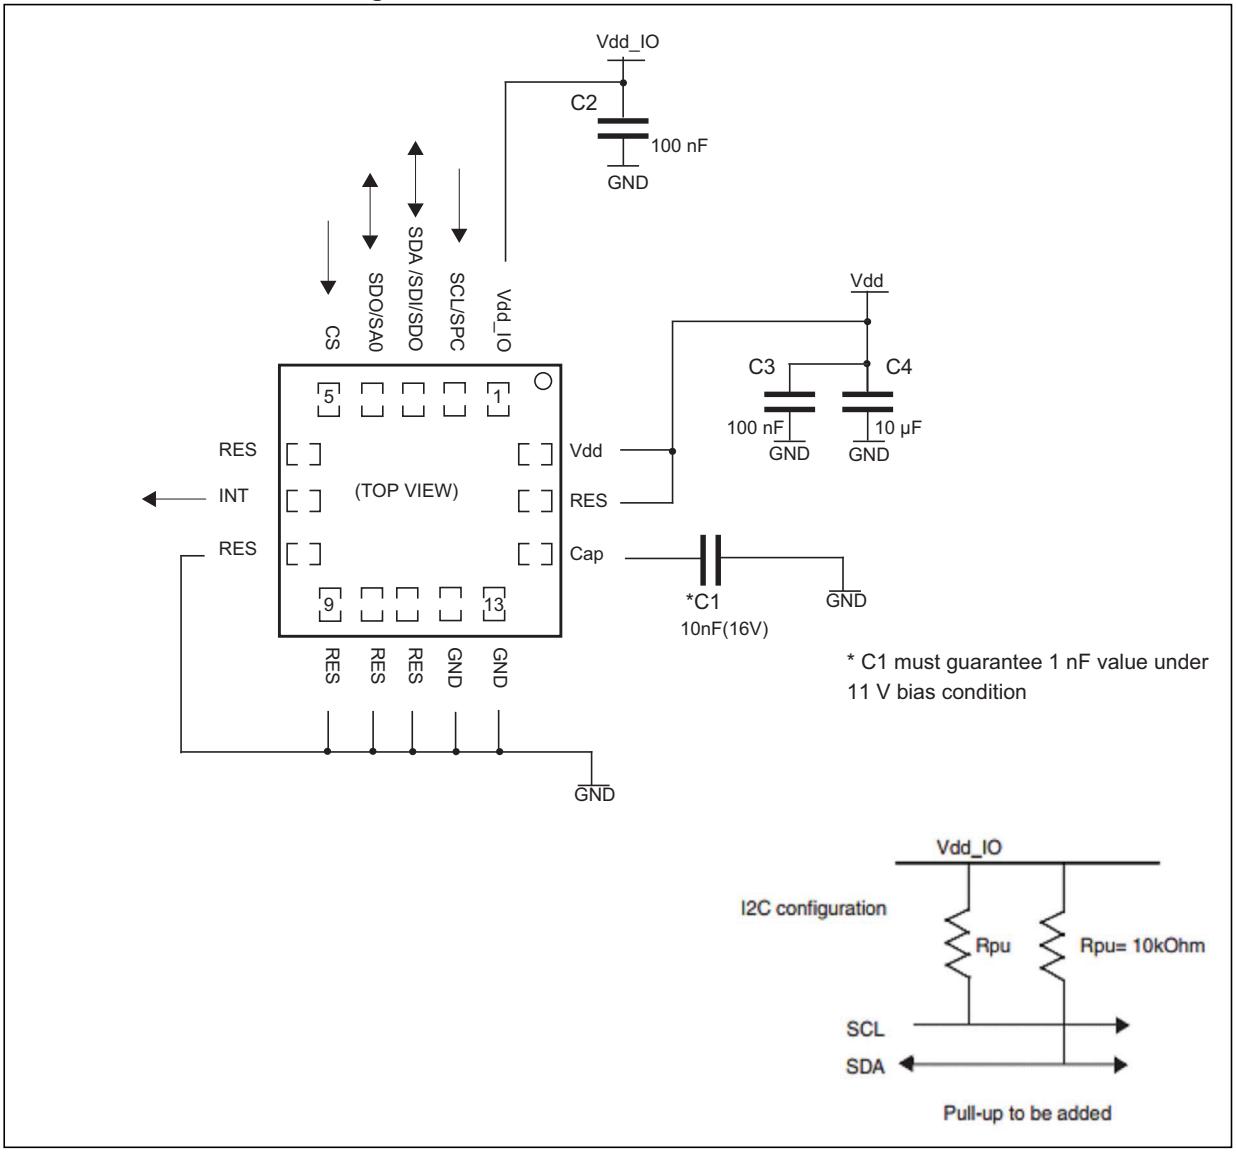
bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

A multiple read command is also available in 3-wire mode.

5 Application hints

Figure 20. LSM6DS0 electrical connections



5.1 External capacitors

The device core is supplied through the Vdd line. Power supply decoupling capacitors (C2, C3 = 100 *nF* ceramic, C4 = 10 *µF* Al) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I^2C interface.

6 Register mapping

The table given below provides a list of the 8/16 bit registers embedded in the device and the corresponding addresses.

Table 20. Register mapping

Reserved	r	38-7F	--	--	Reserved

Registers marked as *Reserved* must not be changed. Writing to those registers may cause permanent damage to the device.

To guarantee proper behavior of the device, all register addresses not listed in the above table must not be accessed and the content stored on those registers must not be changed.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

7 Register description

The device contains a set of registers which are used to control its behavior and to retrieve linear acceleration, angular rate and temperature data. The register addresses, consisting of 7 bits, are used to identify them and to write the data through the serial interface.

7.1 ACT_THS (04h)

Activity threshold register.

Table 21. ACT_THS register

INACT	Inactivity interrupt output signal. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupt events have been generated)
BOOT_ STATUS	Boot running flag signal. Default value: 0 (0: no boot running; 1: boot running)
TDA	Temperature sensor new data available. Default value: 0 (0: new data is not yet available; 1: new data is available)
GDA	Gyroscope new data available. Default value: 0 (0: a new set of data is not yet available; 1: a new set of data is available)
XLDA	Accelerometer new data available. Default value: 0 (0: a new set of data is not yet available; 1: a new set of data is available)

7.18 OUT_X_G (18h - 19h)

Angular rate sensor pitch axis (X) angular rate output register. The value is expressed as a 16-bit word in two’s complement.

7.19 OUT_Y_G (1Ah - 1Bh)

Angular rate sensor roll axis (Y) angular rate output register. The value is expressed as a 16-bit word in two’s complement.

7.20 OUT_Z_G (1Ch - 1Dh)

Angular rate sensor yaw axis (Z) angular rate output register. The value is expressed as a 16-bit word in two’s complement.

7.21 CTRL_REG4 (1Eh)

Control register 4.

Table 58. CTRL_REG4 register

0(1)	0(1)	Zen_G	Yen_G	Xen_G	0(1)	LIR_XL1	4D_XL1

1. These bits must be set to '0' for the correct operation of the device

Table 59. CTRL_REG4 register description

Zen_G	Gyroscope's yaw axis (Z) output enable. Default value: 1 (0: Z-axis output disabled; 1: Z-axis output enabled)
Yen_G	Gyroscope's roll axis (Y) output enable. Default value: 1 (0: Y-axis output disabled; 1: Y-axis output enabled)
Xen_G	Gyroscope's pitch axis (X) output enable. Default value: 1 (0: X-axis output disabled; 1: X-axis output enabled)
LIR_XL1	Latched interrupt. Default value: 0 (0: interrupt request not latched; 1: interrupt request latched)
4D_XL1	4D option enabled on interrupt. Default value: 0 (0: interrupt generator uses 6D for position recognition; 1: interrupt generator uses 4D for position recognition)

7.22 CTRL_REG5_XL (1Fh)

Linear acceleration sensor Control Register 5.

Table 60. CTRL_REG5_XL register

DEC_1	DEC_0	Zen_XL	Yen_XL	Xen_XL	0(1)	0(1)	0(1)

1. These bits must be set to '0' for the correct operation of the device

Table 61. CTRL_REG5_XL register description

DEC_ [0:1]	Decimation of acceleration data on OUT REG and FIFO. Default value: 00 (00: no decimation; 01: update every 2 samples; 10: update every 4 samples; 11: update every 8 samples)
Zen_XL	Accelerometer's Z-axis output enable. Default value: 1 (0: Z-axis output disabled; 1: Z-axis output enabled)
Yen_XL	Accelerometer's Y-axis output enable. Default value: 1 (0: Y-axis output disabled; 1: Y-axis output enabled)
Xen_XL	Accelerometer's X-axis output enable. Default value: 1 (0: X-axis output disabled; 1: X-axis output enabled)

7.23 CTRL_REG6_XL (20h)

Linear acceleration sensor control register 6.

Table 62. CTRL_REG6_XL register

ODR_XL2	ODR_XL1	ODR_XL0	FS1_XL	FS0_XL	BW_SCAL_ODR	BW_XL1	BW_XL0

Table 63. CTRL_REG6_XL register description

ODR_XL [2:0]	Output data rate and power mode selection. Default value: 000 (see *Table 67*)
FS_XL [1:0]	Accelerometer full-scale selection. Default value: 00 (00: ±2*g*; 01: ±16*g*; 10: ±4*g*; 11: ±8*g*)
BW_SCAL_ODR	Bandwidth selection. Default value: 0 (0: bandwidth determined by ODR selection: - BW = 408 Hz when ODR = 952 Hz, 50 Hz, 10 Hz; - BW = 211 Hz when ODR = 476 Hz; - BW = 105 Hz when ODR = 238 Hz; - BW = 50 Hz when ODR = 119 Hz; 1: bandwidth selected according to BW_XL [2:1] selection)
BW_XL [1:0]	Anti-aliasing filter bandwidth selection. Default value: 00 (00: 408 Hz; 01: 211 Hz; 10: 105 Hz; 11: 50 Hz)

ODR_XL [2:0] is used to set the power mode and ODR selection. *Table 64* summarizes all available frequencies when only the accelerometer is activated.

Table 64. ODR register setting (accelerometer only mode)

ODR_XL2	ODR_XL1	ODR_XL0	ODR selection [Hz]
0	0	0	Power-down
0	0	1	10 Hz
0	1	0	50 Hz
0	1	1	119 Hz
1	0	0	238 Hz
1	0	1	476 Hz
1	1	0	952 Hz
1	1	1	n.a.

7.24 CTRL_REG7_XL (21h)

Linear acceleration sensor control register 7.

Table 65. CTRL_REG7_XL register

HR	DCF1	DCF0	0(1)	0(1)	FDS	0(1)	HPIS1

1. These bits must be set to '0' for the correct operation of the device

Table 66. CTRL_REG7_XL register description

HR	High resolution mode for accelerometer enable. Default value: 0 (0: disabled; 1: enabled). Refer to *Table 67*.
DCF[1:0]	Accelerometer digital filter (high-pass and low-pass) cutoff frequency selection: the band-width of the high-pass filter depends on the selected ODR. Refer to *Table 67*.
FDS	Filtered data selection. Default value: 0 (0: internal filter bypassed; 1: data from internal filter sent to output register and FIFO)
HPIS1	High-pass filter enabled for acceleration sensor interrupt function on interrupt. Default value: 0 (0: filter bypassed; 1: filter enabled)

Table 67. Low pass cut-off frequency in high resolution mode (HR = 1)

HR	CTRL_REG7 (DCF [1:0])	LP cutoff freq. [Hz]
1	00	ODR/50
1	01	ODR/100
1	10	ODR/9
1	11	ODR/400

7.25 CTRL_REG8 (22h)

Control register 8.

Table 68. CTRL_REG8 register

BOOT	BDU	H_LACTIVE	PP_OD	SIM	IF_ADD_INC	BLE	SW_RESET

Table 69. CTRL_REG8 register description

BOOT	Reboot memory content. Default value: 0 (0: normal mode; 1: reboot memory content(1))
BDU	Block Data Update. Default value: 0 (0: continuous update; 1: output registers not updated until MSB and LSB read)
H_LACTIVE	Interrupt activation level. Default value: 0 (0: interrupt output pins active high; 1: interrupt output pins active low)
PP_OD	Push-pull/Open Drain selection on INT pin. Default value: 0 (0: push-pull mode; 1: open drain mode)
SIM	SPI Serial Interface Mode selection. Default value: 0 (0: 4-wire interface; 1: 3-wire interface).
IF_ADD_INC	Register address automatically incremented during a multiple byte access with a serial interface (I^2C or SPI). Default value: 1 (0: disabled; 1: enabled)
BLE	Big/Little Endian Data Selection. Default value 0 (0: data LSB @ lower address; 1: data MSB @ lower address)
SW_RESET	Software reset. Default value: 0 (0: normal mode; 1: reset device)

1. Boot request is executed as soon as the internal oscillator is turned-on. It is possible to set the bit while in power-down mode, in this case it will be served at the next normal mode or sleep mode.

7.26 CTRL_REG9 (23h)

Control register 9.

Table 70. CTRL_REG9 register

0(1)	SLEEP_G	0(1)	FIFO_ TEMP_EN	DRDY_ mask_bit	I2C_disable	FIFO_EN	STOP_ON _FTH

1. These bits must be set to ‘0’ for the correct operation of the device

Table 71. CTRL_REG9 register description

SLEEP_G	Gyroscope sleep mode enable. Default value: 0 (0: disabled; 1: enabled)
FIFO_TEMP_EN	Temperature data storage in FIFO enable. Default value: 0 (0: temperature data not stored in FIFO; 1: temperature data stored in FIFO)
DRDY_mask_bit	Data available enable bit. Default value: 0 (0: DA timer disabled; 1: DA timer enabled)
I2C_disable	Disable I^2C interface. Default value: 0. (0: both I^2C and SPI enabled; 1: I^2C disabled, SPI only)
FIFO_EN	FIFO memory enable. Default value: 0 (0: disabled; 1: enabled)
STOP_ON_FTH	Enable FIFO threshold level use. Default value: 0. (0: FIFO depth is not limited; 1: FIFO depth is limited to threshold level)

7.27 CTRL_REG10 (24h)

Control register 10.

Table 72. CTRL_REG10 register

0(1)	0(1)	0(1)	0(1)	0(1)	ST_G	0(1)	ST_XL

1. These bits must be set to '0' for the correct operation of the device

Table 73. CTRL_REG10 register description

ST_G	Angular rate sensor self-test enable. Default value: 0 (0: Self-test disabled; 1: Self-test enabled)
ST_XL	Linear acceleration sensor self-test enable. Default value: 0 (0: Self-test disabled; 1: Self-test enabled)

7.28 INT_GEN_SRC_XL (26h)

Linear acceleration sensor interrupt source register.

Table 74. INT_GEN_SRC_XL register

0	IA_XL	ZH_XL	ZL_XL	YH_XL	YL_XL	XH_XL	XL_XL

Table 75. INT_GEN_SRC_XL register description

IA_XL	Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated)
ZH_XL	Accelerometer's Z high event. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
ZL_XL	Accelerometer's Z low event. Default value: 0 (0: no interrupt; 1: Z low event has occurred)
YH_XL	Accelerometer's Y high event. Default value: 0 (0: no interrupt, 1: Y high event has occurred)
YL_XL	Accelerometer's Y low event. Default value: 0 (0: no interrupt, 1: Y low event has occurred)
XH_XL	Accelerometer's X high event. Default value: 0 (0: no interrupt, 1: X high event has occurred)
XL_XL	Accelerometer's X low event. Default value: 0 (0: no interrupt, 1: X low event has occurred)

7.29 STATUS_REG (27h)

Status register.

Table 76. STATUS_REG register

0	IG_XL	IG_G	INACT	BOOT_ STATUS	TDA	GDA	XLDA

Table 77. STATUS_REG register description

IG_XL	Accelerometer interrupt output signal. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupt events have been generated)
IG_G	Gyroscope interrupt output signal. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupt events have been generated)
INACT	Inactivity interrupt output signal. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupt events have been generated)
BOOT_ STATUS	Boot running flag signal. Default value: 0 (0: no boot running; 1: boot running)
TDA	Temperature sensor new data available. Default value: 0 (0: new data is not yet available; 1: new data is available)
GDA	Gyroscope new data available. Default value: 0 (0: a new set of data is not yet available; 1: a new set of data is available)
XLDA	Accelerometer new data available. Default value: 0 (0: a new set of data is not yet available; 1: a new set of data is available)

7.30 OUT_X_XL (28h - 29h)

Linear acceleration sensor X-axis output register. The value is expressed as a 16-bit word in two’s complement.

7.31 OUT_Y_XL (2Ah - 2Bh)

Linear acceleration sensor Y-axis output register. The value is expressed as a 16-bit word in two’s complement.

7.32 OUT_Z_XL (2Ch - 2Dh)

Linear acceleration sensor Z-axis output register. The value is expressed as a 16-bit word in two’s complement.

7.33 FIFO_CTRL (2Eh)

FIFO control register.

Table 78. FIFO_CTRL register

FMODE2	FMODE1	FMODE0	FTH4	FTH3	FTH2	FTH1	FTH0

Table 79. FIFO_CTRL register description

FMODE [2:0]	FIFO mode selection bits. Default value: 000 For further details refer to *Table 80*.
FTH [4:0]	FIFO threshold level setting. Default value: 0 0000

Table 80. FIFO mode selection

FMODE2	FMODE1	FMODE0	Mode
0	0	0	Bypass mode. FIFO turned off
0	0	1	FIFO mode. Stop collecting data when FIFO is full.
0	1	0	Reserved
0	1	1	Continuous mode until trigger is deasserted, then FIFO mode.
1	0	0	Bypass mode until trigger is deasserted, then Continuous mode.
1	1	0	Continuous mode. If the FIFO is full, the new sample over-writes the older sample.

7.34 FIFO_SRC (2Fh)

FIFO status control register.

Table 81. FIFO_SRC register

FTH	OVRN	FSS5	FSS4	FSS3	FSS2	FSS1	FSS0

Table 82. FIFO_SRC register description

FTH	FIFO threshold status. (0: FIFO filling is lower than threshold level; 1: FIFO filling is equal to or higher than the threshold level
OVRN	FIFO overrun status. (0: FIFO is not completely filled; 1: FIFO is completely filled and at least one sample has been overwritten) For further details refer to *Table 83*.
FSS [5:0]	Number of unread samples stored in FIFO. (000000: FIFO empty; 100000: FIFO full, 32 unread samples) For further details refer to *Table 83*.

Table 83. FIFO_SRC example: OVR/FSS details

FTH	OVRN	FSS5	FSS4	FSS3	FSS2	FSS1	FSS0	Description
0	0	0	0	0	0	0	0	FIFO empty
--(1)	0	0	0	0	0	0	1	1 unread sample
...								
--(1)	0	1	0	0	0	0	0	32 unread sample
1	1	1	0	0	0	0	0	At least one sample has been overwritten

1. When the number of unread samples in FIFO is greater than the threshold level set in register *FIFO_CTRL (2Eh)*, the FTH value is '1'.

7.35 INT_GEN_CFG_G (30h)

Angular rate sensor interrupt generator configuration register.

Table 84. INT_GEN_CFG_G register

AOI_G	LIR_G	ZHIE_G	ZLIE_G	YHIE_G	YLIE_G	XHIE_G	XLIE_G

Table 85. INT_GEN_CFG_G register description

AOI_G	AND/OR combination of gyroscope's interrupt events. Default value: 0 (0: OR combination; 1: AND combination)
LIR_G	Latch gyroscope interrupt request. Default value: 0 (0: interrupt request not latched; 1: interrupt request latched)
ZHIE_G	Enable interrupt generation on gyroscope's yaw (Z) axis high event. Default value: 0 (0: disable interrupt request; 1: interrupt request on measured angular rate value higher than preset threshold)
ZLIE_G	Enable interrupt generation on gyroscope's yaw (Z) axis low event. Default value: 0 (0: disable interrupt request; 1: interrupt request on measured angular rate value lower than preset threshold)
YHIE_G	Enable interrupt generation on gyroscope's roll (Y) axis high event. Default value: 0 (0: disable interrupt request; 1: interrupt request on measured angular rate value higher than preset threshold)
YLIE_G	Enable interrupt generation on gyroscope's roll (Y) axis low event. Default value: 0 (0: disable interrupt request; 1: interrupt request on measured angular rate value lower than preset threshold)
XHIE_G	Enable interrupt generation on gyroscope's pitch (X) axis high event. Default value: 0 (0: disable interrupt request; 1: interrupt request on measured angular rate value higher than preset threshold)
XLIE_G	Enable interrupt generation on gyroscope's pitch (X) axis low event. Default value: 0 (0: disable interrupt request; 1: interrupt request on measured angular rate value lower than preset threshold)

7.36 INT_GEN_THS_X_G (31h - 32h)

Angular rate sensor interrupt generator threshold registers. The value is expressed as a 15-bit word in two's complement.

Table 86. INT_GEN_THS_XH_G register

DCRM_G	THS_G_X14	THS_G_X13	THS_G_X12	THS_G_X11	THS_G_X10	THS_G_X9	THS_G_X8

Table 87. INT_GEN_THS_XL_G register

THS_G_X7	THS_G_X6	THS_G_X5	THS_G_X4	THS_G_X3	THS_G_X2	THS_G_X1	THS_G_X0

Table 88. INT_GEN_THS_X_G register description

DCRM_G	Decrement or reset counter mode selection. Default value: 0 (0: Reset; 1: Decrement, as per counter behavior in *Figure 22* and *Figure 23*)
THS_G_X [14:0]	Angular rate sensor interrupt threshold on pitch (X) axis. Default value: 0000000 00000000

7.37 INT_GEN_THS_Y_G (33h - 34h)

Angular rate sensor interrupt generator threshold registers. The value is expressed as a 15-bit word in two's complement.

Table 89. INT_GEN_THS_YH_G register

0(1)	THS_G_Y14	THS_G_Y13	THS_G_Y12	THS_G_Y11	THS_G_Y10	THS_G_Y9	THS_G_Y8

1. This bit must be set to '0' for the correct operation of the device

Table 90. INT_GEN_THS_YL_G register

THS_G_Y7	THS_G_Y6	THS_G_Y5	THS_G_Y4	THS_G_Y3	THS_G_Y2	THS_G_Y1	THS_G_Y0

Table 91. INT_GEN_THS_Y_G register description

THS_G_Y [14:0]	Angular rate sensor interrupt threshold on roll (Y) axis. Default value: 0000000 00000000

7.38 INT_GEN_THS_Z_G (35h - 36h)

Angular rate sensor interrupt generator threshold registers. The value is expressed as 15bit word in two's complement.

Table 92. INT_GEN_THS_ZH_G register

0(1)	THS_G_ Z14	THS_G_ Z13	THS_G_ Z12	THS_G_ Z11	THS_G_ Z10	THS_G_ Z9	THS_G_ Z8

1. This bit must be set to '0' for the correct operation of the device

Table 93. INT_GEN_THS_ZL_G register

THS_G_ Z7	THS_G_ Z6	THS_G_ Z5	THS_G_ Z4	THS_G_ Z3	THS_G_ Z2	THS_G_ Z1	THS_G_ Z0

Table 94. INT_GEN_THS_Z_G register description

THS_G_Z [14:0]	Angular rate sensor interrupt thresholds on yaw (Z) axis. Default value: 0000000 00000000

7.39 INT_GEN_DUR_G (37h)

Angular rate sensor interrupt generator duration register.

Table 95. INT_GEN_DUR_G register

WAIT_G	DUR_G6	DUR_G5	DUR_G4	DUR_G3	DUR_G2	DUR_G1	DUR_G0

Table 96. INT_GEN_DUR_G register description

WAIT_G	Exit from Interrupt Wait function enable. Default value: 0 (0: wait function off; 1: wait for DUR_G [6:0] samples before exiting interrupt)
DUR_G [6:0]	Enter/exit interrupt duration value. Default value: 000 0000

The **DUR_G [6:0]** bits set the minimum duration of the interrupt event to be recognized. Duration steps and maximum values depend on the ODR chosen.

The **WAIT_G** bit has the following meaning:

'0': the interrupt falls immediately if the signal crosses the selected threshold

'1': if the signal crosses the selected threshold, the interrupt falls after a number of samples equal to the value of the duration counter register.

For further details refer to *Figure 22* and *Figure 23*.

Figure 22. Wait bit disabled

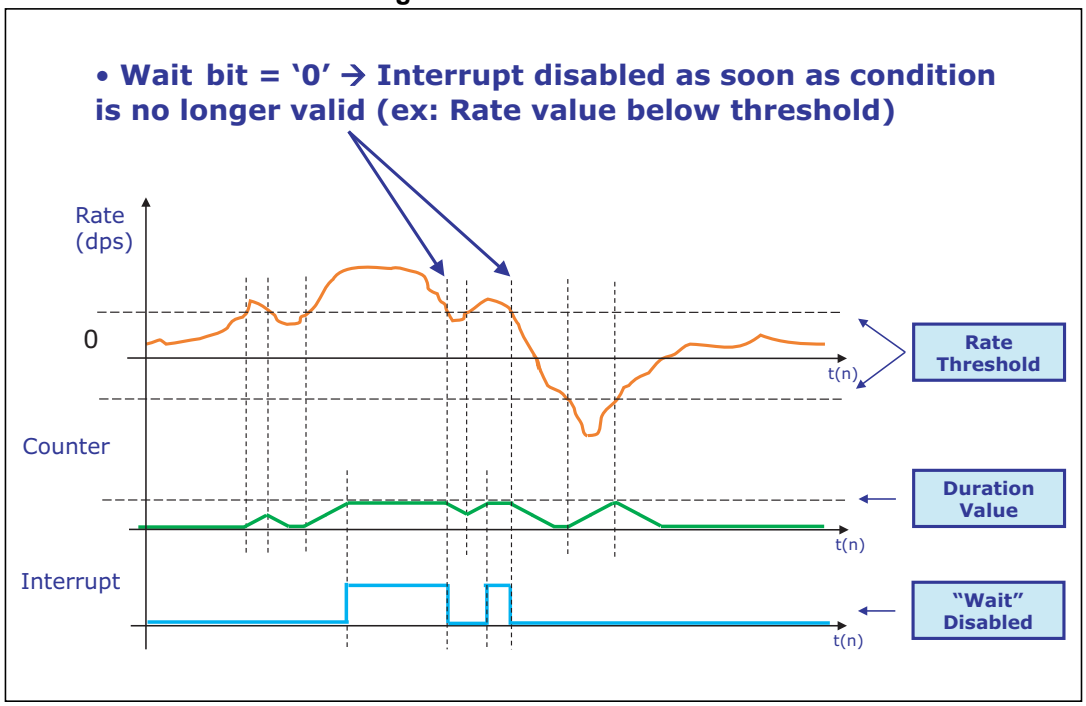

Figure 23. Wait bit enabled

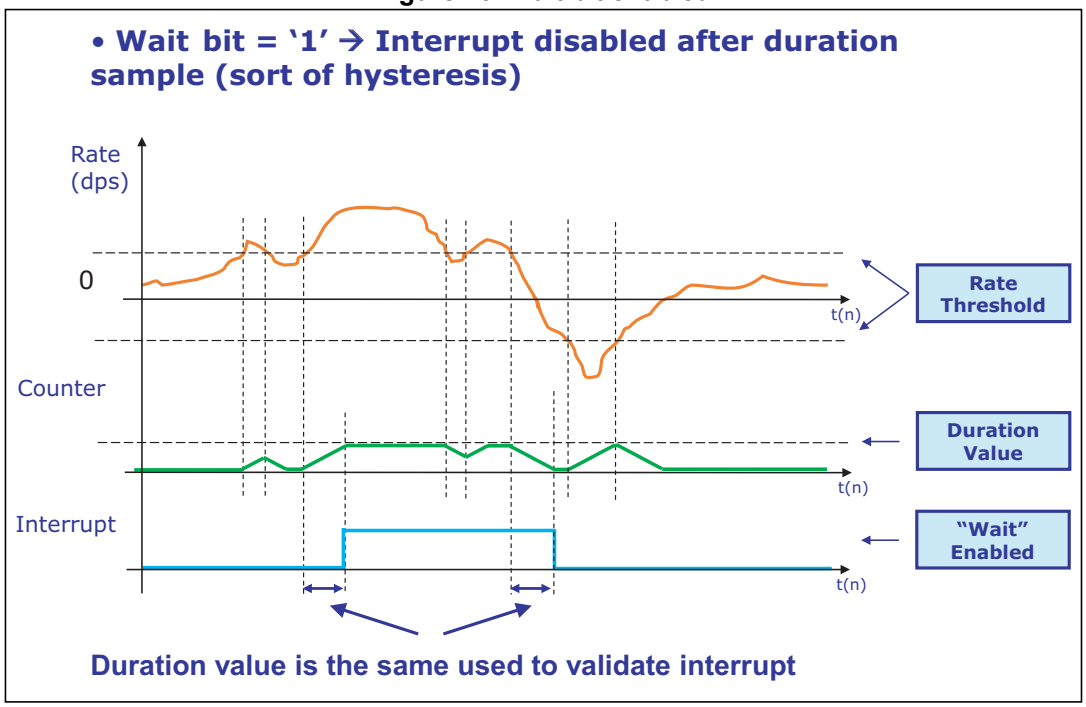

8 Soldering information

The LGA package is compliant with the ECOPACK®, RoHS and “Green” standard.
It is qualified for soldering heat resistance according to JEDEC J-STD-020.

Leave “Pin 1 Indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at www.st.com/mems.

9 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.
