

## 13.56 MHz short-range contactless memory chip with 4096-bit EEPROM and anticollision functions

-Unsawn wafer  
-Bumped and sawn wafer

### Product status link

[ST25TB04K](#)

### Features

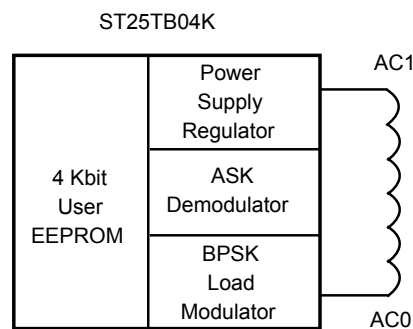

- ISO 14443-2 Type B air interface compliant
- ISO 14443-3 Type B frame format compliant
- 13.56 MHz carrier frequency
- 847 kHz subcarrier frequency
- 106 Kbit/second data transfer
- 8 bit Chip\_ID based anticollision system
- 2 count-down binary counters with automated anti-tearing protection
- 64-bit Unique Identifier
- 4096-bit EEPROM with write protect feature
- Read\_block and Write\_block (32 bits)
- Internal tuning capacitor: 68 pF
- 1 million erase/write cycles
- 40-year data retention
- Self-timed programming cycle
- 5 ms typical programming time

# 1 Description

The **ST25TB04K** is a contactless memory, powered by an externally transmitted radio wave. It contains a 4096-bit user EEPROM. The memory is organized as 16 blocks of 32 bits. The **ST25TB04K** is accessed via the 13.56 MHz carrier. Incoming data are demodulated and decoded from the received amplitude shift keying (ASK) modulation signal and outgoing data are generated by load variation using bit phase shift keying (BPSK) coding of a 847 kHz sub-carrier. The received ASK wave is 10% modulated. The data transfer rate between the **ST25TB04K** and the reader is 106 kbit/s in both reception and emission modes.

The **ST25TB04K** follows the ISO 14443 - 2 Type B recommendation for the radio-frequency power and signal interface.

**Figure 1. Logic diagram**

The **ST25TB04K** is specifically designed for short range applications that need re-usable products. The **ST25TB04K** includes an anticollision mechanism that allows it to detect and select tags present at the same time within range of the reader. The anticollision is based on a probabilistic scanning method using slot markers.

**Table 1. Signal names**

Signal names	Description
AC1	Antenna coil
AC0	Antenna coil

The **ST25TB04K** contact-less EEPROM can be randomly read and written in block mode (each block containing 32 bits). The instruction set includes the following nine commands:

- Read\_block
- Write\_block
- Initiate
- Pcall16
- Slot\_marker
- Select
- Completion
- Reset\_to\_inventory
- Get\_UID

The **ST25TB04K** memory is organized in three areas, as described in [Table 3. ST25TB04K memory mapping](#). The first area is a resettable OTP (one time programmable) area in which bits can only be switched from 1 to 0. Using a special command, it is possible to erase all bits of this area to 1. The second area provides two 32-bit binary counters which can only be decremented. The last area is the EEPROM memory. It is accessible by block of 32 bits and includes an auto-erase cycle during each Write\_block command.

Die floor plan and physical options related to the die assembly are described in [Figure 2](#).

**Figure 2. Die floor plan and assembly options**

For the option 1 of the die assembly, the CTUN (referenced in Table 2) can increase from 0.5pF to 1pF. The option 2 of the die assembly is showing a tripod which can be used for physical stability, having no impact on CTUN parameter.

## **2**      **Signal description**

---

### **2.1**      **AC1, AC0**

The pads for the Antenna Coil. AC1 and AC0 must be directly bonded to the antenna.

### 3 Data transfer

#### 3.1 Input data transfer from reader to ST25TB04K (request frame)

The reader must generate a 13.56 MHz sinusoidal carrier frequency at its antenna, with enough energy to “remote-power” the memory. The energy received at the ST25TB04K’s antenna is transformed into a supply voltage by a regulator, and into data bits by the ASK demodulator. For the ST25TB04K to decode correctly the information it receives, the reader must 10% amplitude-modulate the 13.56 MHz wave before sending it to the ST25TB04K. This is represented in Figure 3. The data transfer rate is 106 Kbits/s.

In some figures of this datasheet the ST25TBxxx refers to ST25TB04K.

**Figure 3. ST25TB04K 10% ASK modulation of the received wave**

##### 3.1.1 Character transmission format for request frame

The ST25TB04K transmits and receives data bytes as 10-bit characters, with the least significant bit ( $b_0$ ) transmitted first, as shown in Figure 4. Each bit duration, an ETU (elementary time unit), is equal to 9.44  $\mu$ s (1/106 kHz).

These characters, framed by a start of frame (SOF) and an end of frame (EOF), are put together to form a command frame as shown in Figure 10. A frame includes an SOF, commands, addresses, data, a CRC and an EOF as defined in the ISO 14443-3 Type B Standard. If an error is detected during data transfer, the ST25TB04K does not execute the command, but it does not generate an error frame.

**Figure 4. ST25TB04K request frame character format**

**Table 2. Bit description**

Bit	Description	Value
$b_0$	Start bit used to synchronize the transmission	$b_0 = 0$
$b_1$ to $b_8$	Information byte (command, address or data)	The information byte is sent with the least significant bit first
$b_9$	Stop bit used to indicate the end of a character	$b_9 = 1$

##### 3.1.2 Request start of frame

The SOF described in Figure 5 is composed of:

- one falling edge,

- followed by 10 ETUs at logic-0,
- followed by a single rising edge,
- followed by at least 2 ETUs (and at most 3) at logic-1.

**Figure 5. Request start of frame**

### 3.1.3 Request end of frame

The EOF shown in Figure 6 is composed of:

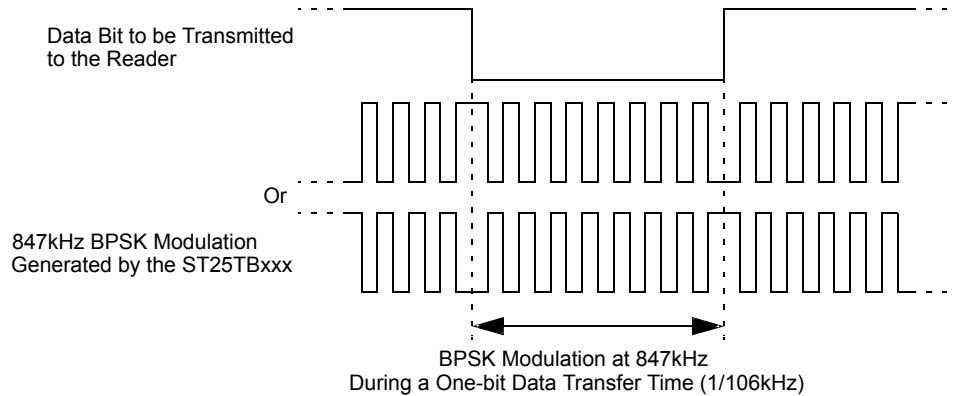

- one falling edge,
- followed by 10 ETUs at logic-0,
- followed by a single rising edge.

**Figure 6. Request end of frame**

### 3.2 Output data transfer from to reader ST25TB04K (answer frame)

The data bits issued by the ST25TB04K use back-scattering. Back-scattering is obtained by modifying the ST25TB04K current consumption at the antenna (load modulation). The load modulation causes a variation at the reader antenna by inductive coupling. With appropriate detector circuitry, the reader is able to pick up information from the ST25TB04K. To improve load-modulation detection, data is transmitted using a BPSK encoded, 847 kHz subcarrier frequency  $f_s$  as shown in Figure 7, and as specified in the ISO 14443-2 Type B standard.

**Figure 7. Wave transmitted using BPSK subcarrier modulation**

#### 3.2.1 Character transmission format for answer frame

The character format is the same as for input data transfer (Figure 4). The transmitted frames are made up of an SOF, data, a CRC and an EOF (Figure 10). As with an input data transfer, if an error occurs, the reader does not issue an error code to the ST25TB04K, but it should be able to detect it and manage the situation. The data transfer rate is 106 Kbits/second.

#### 3.2.2 Answer start of frame

The SOF described in Figure 8 is composed of:

- one falling edge,
- followed by 10 ETUs at logic-0,
- followed by 2 ETUs at logic-1.

**Figure 8. Answer start of frame**

### 3.2.3 Answer end of frame

The EOF shown in Figure 9 is composed of:

- one falling edge,
- followed by 10 ETUs at logic-0,
- followed by 2 ETUs at logic-1.

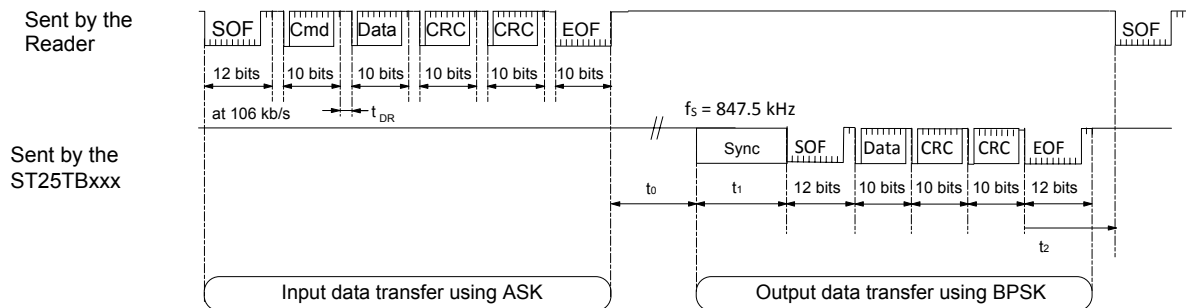

Figure 9. Answer end of frame

### 3.3 Trasmision frame

Between the request data transfer and the answer data transfer, all ASK and BPSK modulations are suspended for a minimum time of  $t_0 = 128/f_S$ . This delay allows the reader to switch from Transmission to Reception mode. It is repeated after each frame. After  $t_0$ , the 13.56 MHz carrier frequency is modulated by the ST25TB04K at 847 kHz for a period of  $t_1 = 128/f_S$  to allow the reader to synchronize. After  $t_1$ , the first phase transition generated by the ST25TB04K forms the start bit ('0') of the answer SOF. After the falling edge of the answer EOF, the reader waits a minimum time,  $t_2$ , before sending a new request frame to the ST25TB04K.

Figure 10. Example of a complete transmission frame

### 3.4 CRC

The 16-bit CRC used by the ST25TB04K is generated in compliance with the ISO14443 Type B recommendation. For further information, please see Appendix A [ISO-14443 Type B CRC calculation](#). The initial register contents are all 1s: FFFFh.

The two-byte CRC is present in every request and in every answer frame, before the EOF. The CRC is calculated on all the bytes between SOF (not included) and the CRC field.

Upon reception of a request from a reader, the ST25TB04K verifies that the CRC value is valid. If it is invalid, the ST25TB04K discards the frame and does not answer the reader.

Upon reception of an answer from the ST25TB04K, the reader should verify the validity of the CRC. In case of error, the actions to be taken are the reader designer's responsibility.

The CRC is transmitted with the least significant byte first and each byte is transmitted with the least significant bit first.

**Figure 11. CRC transmission rules**

## 4 Memory mapping

The ST25TB04K is organized as 128 blocks of 32 bits as shown in Table 3. ST25TB04K memory mapping. All blocks are accessible by the Read\_block command. Depending on the write access, they can be updated by the Write\_block command. A Write\_block updates all the 32 bits of the block.

**Table 3. ST25TB04K memory mapping**

Block Address	MSB	32-bit block					LSB	Description
	b31	b24 b23	b16	b15	b8 b7	b0		
0	32-bit Boolean area						Resettable OTP bit

127	User area							
255	OTP_Lock_Reg	Reserved						System OTP bits
UID0	64 bits UID area						ROM	
UID1								

## 4.1 EEPROM area

### 4.1.1 Block 0-4: resettable OTP area

This area contains five individual 32-bit Boolean words (see [Table 4](#) for a map of the area). A Write\_block command doesn't erase the previous contents of the block as the write cycle is not preceded by an auto-erase cycle. This feature can be used to reset selected bits from 1 to 0. All bits previously at 0 remain unchanged. When the 32 bits of a block are all at 0, the block is empty, and cannot be updated any more. See [Figure 12](#) and [Figure 13](#) for examples of the result of the Write\_block command in the resettable OTP area.

**Table 4. Resettable OTP area (addresses 0 to 4)**

Block address	32-bit block					Description
	MSB b31	b24 b23	b16 b15	b8 b7	LSB b0	
0	32-bit Boolean area					Resettable OTP bit
1	32-bit Boolean area					
2	32-bit Boolean area					
3	32-bit Boolean area					
4	32-bit Boolean area					

**Figure 12. Write\_block update in Standard mode (binary format)**

The five 32-bit blocks making up the resettable OTP area can be erased in one go by adding an auto-erase cycle to the Write\_block command. An auto-erase cycle is added each time one reload mode is activated. The reload mode is implemented through a specific update of the 32-bit binary counter located at block address 6 (see [Section 4.2 32-bit binary counters](#) for details).

**Figure 13. Write\_block update in Reload mode (binary format)**

ai07659

### 4.1.2 block 7-127

The 127 blocks between addresses 7 and 127 are EEPROM blocks of 32 bits each (484 bytes in total). (See [Table 5](#) for a map of the area.) These blocks can be accessed using the Read\_block and Write\_block commands. The Write\_block command for the EEPROM area always includes an auto-erase cycle prior to the write cycle.

Blocks 7 to 15 can be write-protected. Write access is controlled by the 8 bits of the OTP\_Lock\_Reg located at block address 255 (see “Section 4.3.1 OTP\_Lock\_Reg” for details). Once protected, these blocks (7 to 15) cannot be unprotected.

**Table 5. EEPROM area (addresses 7 to 127)**

Block Address	32-bit block				LSB	Description
	MSB					
	b31	b24 b23	b16 b15	b8 b7	b0	
7			User area			Lockable EEPROM
8			User area			
9			User area			
10			User area			
11			User area			
12			User area			
13			User area			
14			User area			
15			User area			
16			User area			
...			User area			
127			User area			

## 4.2 32-bit binary counters

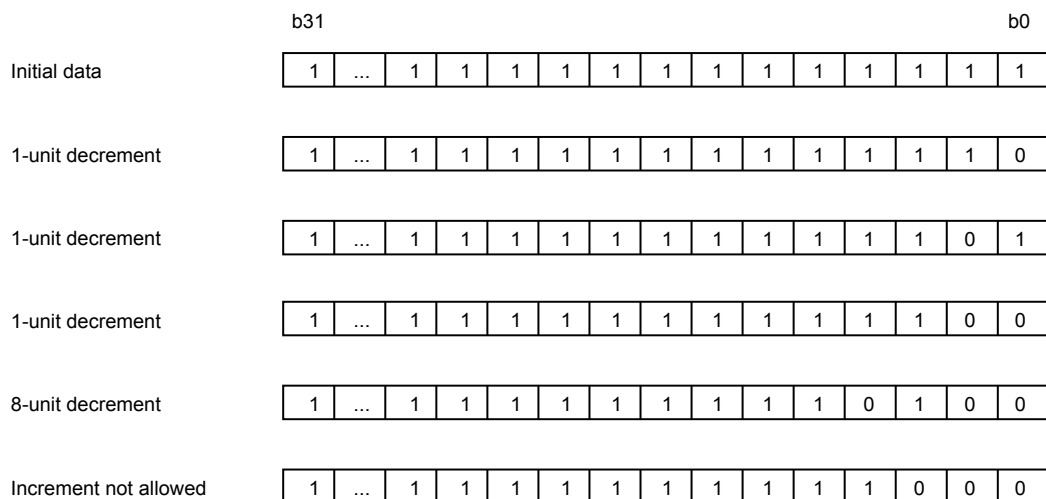

The two 32-bit binary counters are located at block addresses 5 and 6. The ST25TB04K uses dedicated logic that only allows the update of a counter if the new value is lower than the previous one. This feature allows the application to count down by steps of 1 or more. The initial value in Counter 5 is FFFF FFEh and is FFFF FFFFh in Counter 6. When the reached value is 0000 0000h, the counter is empty and cannot be reloaded. For each counter 5 and 6, the update is done by issuing the Write\_block command. The Write\_block command writes the new 32-bit value to the counter block address. Table 6 shows examples of how the counters operate.

The counter programming cycles are protected by automated antitearing logic. This function allows the counter value to be protected in case of power down within the programming cycle. In case of power down, the counter value is not updated and the previous value continues to be stored.

**Table 6. Binary counter (addresses 5 to 6)**

Block Address	MSB	32-bit block				LSB	Description
	b <sub>31</sub>	b <sub>24</sub> b <sub>23</sub>	b <sub>16</sub> b <sub>15</sub>	b <sub>8</sub> b <sub>7</sub>	b <sub>0</sub>		
5	32-bit Boolean area					Count down counter	
6	32-bit Boolean area						

**Figure 14. Countdown example (binary format)**

The counter with block address 6 controls the reload mode used to reset the resettable OTP area (addresses 0 to 4). Bits b<sub>31</sub> to b<sub>21</sub> act as an 11-bit Reload counter; whenever one of these 11 bits is updated, the ST25TB04K detects the change and adds an Erase cycle to the Write\_block command for locations 0 to 4 (see the Section 4.1.1 Block 0 - 4: resettable OTP area paragraph).

The Erase cycle remains active until a Power-off or a Select command is issued.

The ST25TB04K's resettable OTP area can be reloaded up to 2 047 times (2<sup>11</sup>-1).

### 4.3 System area

This area is used to modify the settings of the ST25TB04K. It contains 2 registers: OTP\_Lock\_Reg and ST Reserved. See Table 7. System area for a map of this area.

A Write\_block command in this area will not erase the previous contents. Selected bits can thus be set from 1 to 0. All bits previously at 0 remain unchanged. Once all the 32 bits of a block are at 0, the block is empty and cannot be updated any more.

**Table 7. System area**

Block Address	32-bit block								Description
	MSB							LSB	
	b31	b24	b23	b16	b15	b14	b7	b0	
255	OTP_Lock_Reg			0	ST reserved				OTP

#### 4.3.1 OTP\_Lock\_Reg

The 8 bits,  $b_{31}$  to  $b_{24}$ , of the System area (block address 255) are used as OTP\_Lock\_Reg bits in the ST25TB04K. They control the write access to the 9 EEPROM blocks with addresses 7 to 15 as follows:

- When  $b_{24}$  is at 0, blocks 7 and 8 are write-protected
- When  $b_{25}$  is at 0, block 9 is write-protected
- When  $b_{26}$  is at 0, block 10 is write-protected
- When  $b_{27}$  is at 0, block 11 is write-protected
- When  $b_{28}$  is at 0, block 12 is write-protected
- When  $b_{29}$  is at 0, block 13 is write-protected
- When  $b_{30}$  is at 0, block 14 is write-protected
- When  $b_{31}$  is at 0, block 15 is write-protected.

The OTP\_Lock\_Reg bits cannot be erased. Once write-protected, EEPROM blocks behave like ROM blocks and cannot be unprotected.

After any modification of the OTP\_Lock\_Reg bits, it is necessary to send a Select command with a valid Chip\_ID to the ST25TB04K in order to load the block write protection into the logic.

---

## 5 ST25TB04K operation

---

All commands, data and CRC are transmitted to the **ST25TB04K** as 10-bit characters using ASK modulation. The start bit of the 10 bits,  $b_0$ , is sent first. The command frame received by the **ST25TB04K** at the antenna is demodulated by the 10% ASK demodulator, and decoded by the internal logic. Prior to any operation, the **ST25TB04K** must have been selected by a Select command. Each frame transmitted to the **ST25TB04K** must start with a start of frame, followed by one or more data characters, two CRC bytes and the final end of frame. When an invalid frame is decoded by the **ST25TB04K** (wrong command or CRC error), the memory does not return any error code.

When a valid frame is received, the **ST25TB04K** may have to return data to the reader. In this case, data is returned using BPSK encoding, in the form of 10-bit characters framed by an SOF and an EOF. The transfer is ended by the **ST25TB04K** sending the 2 CRC bytes and the EOF.

## 6 ST25TB04K states

The ST25TB04K can be switched into different states. Depending on the current state of the ST25TB04K, its logic will only answer to specific commands. These states are mainly used during the anticollision sequence, to identify and to access the ST25TB04K in a very short time. The ST25TB04K provides 6 different states, as described in the following paragraphs and in Figure 15.

### 6.1 Power-off state

The ST25TB04K is in Power-off state when the electromagnetic field around the tag is not strong enough. In this state, the ST25TB04K does not respond to any command.

### 6.2 Ready state

When the electromagnetic field is strong enough, the ST25TB04K enters the Ready state. After Power-up, the Chip\_ID is initialized with a random value. The whole logic is reset and remains in this state until an Initiate() command is issued. Any other command will be ignored by the ST25TB04K.

### 6.3 Inventory state

The ST25TB04K switches from the Ready to the Inventory state after an Initiate() command has been issued. In Inventory state, the ST25TB04K will respond to any anticollision commands: Initiate(), Pcall16() and Slot\_marker(), and then remain in the Inventory state. It will switch to the Selected state after a Select(Chip\_ID) command is issued, if the Chip\_ID in the command matches its own. If not, it will remain in Inventory state.

### 6.4 Selected state

In Selected state, the ST25TB04K is active and responds to all Read\_block(), Write\_block() and Get\_UID() commands. When an ST25TB04K has entered the Selected state, it no longer responds to anticollision commands. So that the reader can access another tag, the ST25TB04K can be switched to the Deselected state by sending a Select(Chip\_ID) with a Chip\_ID that does not match its own, or it can be placed in Deactivated state by issuing a Completion() command. Only one ST25TB04K can be in Selected state at a time.

### 6.5 Deselected state

Once the ST25TB04K is in Deselected state, only a Select(Chip\_ID) command with a Chip\_ID matching its own can switch it back to Selected state. All other commands are ignored.

## 6.6 Deactivated state

When in this state, the ST25TB04K can only be turned off. All commands are ignored.

Figure 15. State transition diagram

## 7 Anticollision

The **ST25TB04K** provides an anticollision mechanism that searches for the **Chip\_ID** of each device that is present in the reader field range. When known, the **Chip\_ID** is used to select an **ST25TB04K** individually, and access its memory. The anticollision sequence is managed by the reader through a set of commands described in [Section 8 ST25TB04K commands](#):

- **Initiate()**
- **Pcall16()**
- **Slot\_marker()**.

The reader is the master of the communication with one or more **ST25TB04K** device(s). It initiates the tag communication activity by issuing an **Initiate()**, **Pcall16()** or **Slot\_marker()** command to prompt the **ST25TB04K** to answer. During the anticollision sequence, it might happen that two or more **ST25TB04K** devices respond simultaneously, so causing a collision. The command set allows the reader to handle the sequence, to separate **ST25TB04K** transmissions into different time slots. Once the anticollision sequence has completed, **ST25TB04K** communication is fully under the control of the reader, allowing only one **ST25TB04K** to transmit at a time.

The Anticollision scheme is based on the definition of time slots during which the **ST25TB04K** devices are invited to answer with minimum identification data: the **Chip\_ID**. The number of slots is fixed at 16 for the **Pcall16()** command. For the **Initiate()** command, there is no slot and the **ST25TB04K** answers after the command is issued. **ST25TB04K** devices are allowed to answer only once during the anticollision sequence. Consequently, even if there are several **ST25TB04K** devices present in the reader field, there will probably be a slot in which only one **ST25TB04K** answers, allowing the reader to capture its **Chip\_ID**. Using the **Chip\_ID**, the reader can then establish a communication channel with the identified **ST25TB04K**. The purpose of the anticollision sequence is to allow the reader to select one **ST25TB04K** at a time.

The **ST25TB04K** is given an 8-bit **Chip\_ID** value used by the reader to select only one among up to 256 tags present within its field range. The **Chip\_ID** is initialized with a random value during the Ready state, or after an **Initiate()** command in the Inventory state.

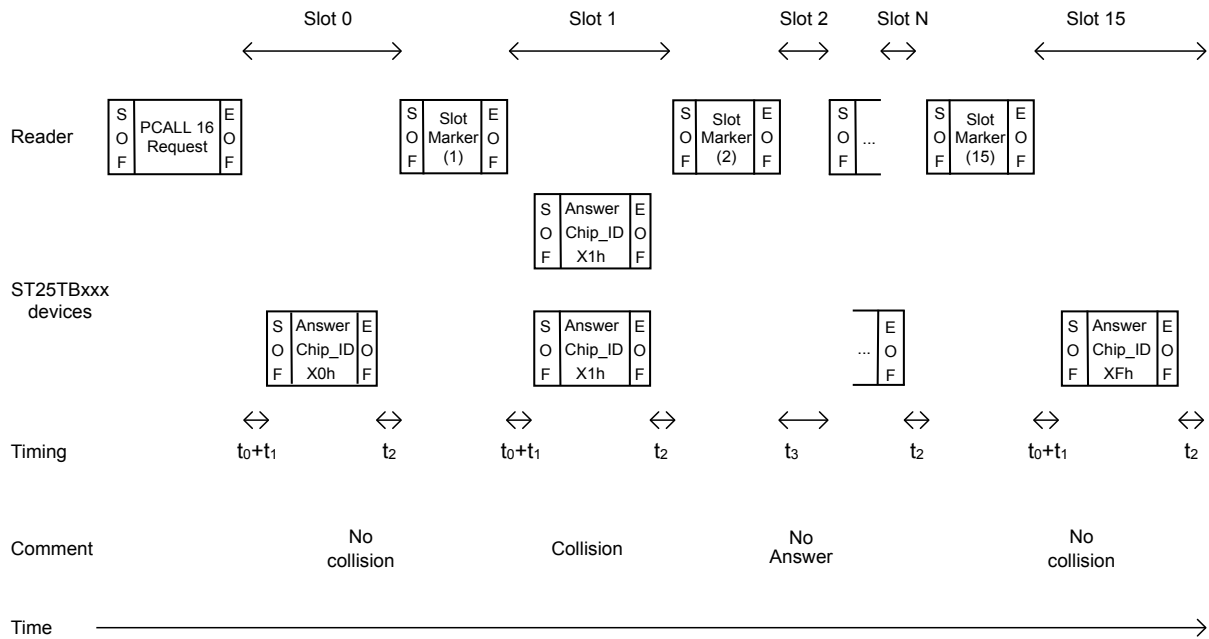

The four least significant bits ( $b_0$  to  $b_3$ ) of the **Chip\_ID** are also known as the **Chip\_slot\_number**. This 4-bit value is used by the **Pcall16()** and **Slot\_marker()** commands during the anticollision sequence in the Inventory state.

**Figure 16. ST25TB04K Chip\_ID description**

Each time the **ST25TB04K** receives a **Pcall16()** command, the **Chip\_slot\_number** is given a new 4-bit random value. If the new value is  $0000_b$ , the **ST25TB04K** returns its whole 8-bit **Chip\_ID** in its answer to the **Pcall16()** command. The **Pcall16()** command is also used to define the slot number 0 of the anticollision sequence. When the **ST25TB04K** receives the **Slot\_marker(SN)** command, it compares its **Chip\_slot\_number** with the **Slot\_number** parameter (SN). If they match, the **ST25TB04K** returns its **Chip\_ID** as a response to the command. If they do not, the **ST25TB04K** does not answer. The **Slot\_marker(SN)** command is used to define all the anticollision slot numbers from 1 to 15.

**Figure 17. Description of a possible anticollision sequence**

- The value X in the answer Chip\_ID means a random hexadecimal character from 0 to F.

## 7.1 Description of an anticollision sequence

The anticollision sequence is initiated by the Initiate() command which triggers all the ST25TB04K devices that are present in the reader field range, and that are in Inventory state. Only ST25TB04K devices in Inventory state will respond to the Pcall16() and Slot\_marker(SN) anticollision commands.

A new ST25TB04K introduced in the field range during the anticollision sequence will not be taken into account as it will not respond to the Pcall16() or Slot\_marker(SN) command (Ready state). To be considered during the anticollision sequence, it must have received the Initiate() command and entered the Inventory state.

Table 8 shows the elements of a standard anticollision sequence. (See Table 9 for an example.)

**Table 8. Standard anticollision sequence**

Step 1	Init:	Send Initiate(). <ul style="list-style-type: none"> <li>If no answer is detected, go to step1.</li> <li>If only 1 answer is detected, select and access the <a href="#">ST25TB04K</a>. After accessing the <a href="#">ST25TB04K</a>, deselect the tag and go to step1.</li> <li>If a collision (many answers) is detected, go to step2.</li> </ul>
Step 2	Slot 0	Send Pcall16(). <ul style="list-style-type: none"> <li>If no answer or collision is detected, go to step3.</li> <li>If 1 answer is detected, store the Chip_ID, Send Select() and go to step3.</li> </ul>
Step 3	Slot 1	Send Slot_marker(1). <ul style="list-style-type: none"> <li>If no answer or collision is detected, go to step4.</li> <li>If 1 answer is detected, store the Chip_ID, Send Select() and go to step4.</li> </ul>
Step 4	Slot 2	Send Slot_marker(2). <ul style="list-style-type: none"> <li>If no answer or collision is detected, go to step5.</li> <li>If 1 answer is detected, store the Chip_ID, Send Select() and go to step5.</li> </ul>
Step N	Slot N	Send Slot_marker(3 up to 14) ... <ul style="list-style-type: none"> <li>If no answer or collision is detected, go to stepN+1.</li> <li>If 1 answer is detected, store the Chip_ID, Send Select() and go to stepN+1.</li> </ul>
Step 17	Slot 15	Send Slot_marker(15). <ul style="list-style-type: none"> <li>If no answer or collision is detected, go to step18.</li> <li>If 1 answer is detected, store the Chip_ID, Send Select() and go to step18.</li> </ul>
Step 18	-	All the slots have been generated and the Chip_ID values should be stored into the reader memory. Issue the Select(Chip_ID) command and access each identified <a href="#">ST25TB04K</a> one by one. After accessing each <a href="#">ST25TB04K</a> , switch them into Deselected or Deactivated state, depending on the application needs. <ul style="list-style-type: none"> <li>If collisions were detected between Step2 and Step17, go to Step2.</li> <li>If no collision was detected between Step2 and Step17, go to Step1.</li> </ul>

After each Slot\_marker() command, there may be no answer, one or several answers from the [ST25TB04K](#) devices. The reader must handle all the cases and store all the Chip\_IDs, correctly decoded. At the end of the anticollision sequence, after Slot\_marker(15), the reader can start working with one [ST25TB04K](#) by issuing a Select() command containing the desired Chip\_ID. If a collision is detected, the reader has to generate a new sequence in order to identify all unidentified [ST25TB04K](#) devices in the field. The anticollision sequence can stop when all [ST25TB04K](#) devices have been identified.

[Table 9](#) gives an example of anticollision sequence, the cells containing (\*) highlight the fact that the related tags are not yet identified. When the tag is identified, in the table the (\*) changes to bold character.

**Table 9. Example of an anticollision sequence**

Command	Tag1	Tag2	Tag3	Tag4	Tag5	Tag6	Tag7	Tag8	Comment
	Chip_ID	Chip_ID	Chip_ID	Chip_ID	Chip_ID	Chip_ID	Chip_ID	Chip_ID	
READY state	28h(*)	75h(*)	40h(*)	01h(*)	02h(*)	FEh(*)	A9h(*)	7Ch(*)	Each tag gets a random Chip_ID

## 8 ST25TB04K commands

See the paragraphs below for a detailed description of the commands available on the ST25TB04K. The commands and their hexadecimal codes are summarized in [Table 10](#). A brief is given in [Appendix B ST25TB04K command brief](#).

**Table 10. Command code**

Hexadecimal code	Command
06h-00h	Initiate()
06h-04h	Pcall16()
x6h	Slot_marker (SN)
08h	Read_block(Addr)
09h	Write_block(Addr, Data)
0Bh	Get_UID()
0Ch	Reset_to_inventory
0Eh	Select(Chip_ID)
0Fh	Completion()

## 8.1 Initiate() command

Command code = 06h - 00h

Initiate() is used to initiate the anticollision sequence of the ST25TB04K. On receiving the Initiate() command, all ST25TB04K devices in Ready state switch to Inventory state, set a new 8-bit Chip\_ID random value, and return their Chip\_ID value. This command is useful when only one ST25TB04K in Ready state is present in the reader field range. It speeds up the Chip\_ID search process. The Chip\_slot\_number is not used during Initiate() command access.

**Figure 18. Initiate request format**

SOF	Initiate		CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	06h	00h	8 bits	8 bits	

Request parameter:

- No parameter

**Figure 19. Initiate response format**

SOF	Chip_ID	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	8 bits	8 bits	8 bits	

Response parameter:

- Chip\_ID of the ST25TB04K

**Figure 20. Initiate frame exchange between reader and ST25TB04K**

## 8.2 Pcall16() command

Command code = 06h - 04h

The **ST25TB04K** must be in Inventory state to interpret the Pcall16() command.

On receiving the Pcall16() command, the **ST25TB04K** first generates a new random Chip\_slot\_number value (in the 4 least significant bits of the Chip\_ID). Chip\_slot\_number can take on a value between 0 and 15 (1111<sub>b</sub>). The value is retained until a new Pcall16() or Initiate() command is issued, or until the **ST25TB04K** is powered off. The new Chip\_slot\_number value is then compared with the value 0000<sub>b</sub>. If they match, the **ST25TB04K** returns its Chip\_ID value. If not, the **ST25TB04K** does not send any response.

The Pcall16() command, used together with the Slot\_marker() command, allows the reader to search for all the Chip\_IDs when there are more than one **ST25TB04K** device in Inventory state present in the reader field range.

**Figure 21. Pcall16 request format**

SOF	PCALL16		CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	06h	04h	8 bits	8 bits	

Request parameter:

- No parameter

**Figure 22. Pcall16 response format**

SOF	Chip_ID	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	8 bits	8 bits	8 bits	

Response parameter:

- Chip\_ID of the **ST25TB04K**

**Figure 23. Pcall16 frame exchange between reader and ST25TB04K**

### 8.3 Slot\_marker(SN) command

Command code = x6h

The **ST25TB04K** must be in Inventory state to interpret the Slot\_marker(SN) command.

The Slot\_marker byte code is divided into two parts:

- b<sub>3</sub> to b<sub>0</sub>: 4-bit command code with fixed value 6.
- b<sub>7</sub> to b<sub>4</sub>: 4 bits known as the Slot\_number (SN). They assume a value between 1 and 15. The value 0 is reserved by the Pcall16() command.

On receiving the Slot\_marker() command, the **ST25TB04K** compares its Chip\_slot\_number value with the Slot\_number value given in the command code. If they match, the **ST25TB04K** returns its Chip\_ID value. If not, the **ST25TB04K** does not send any response.

The Slot\_marker() command, used together with the Pcall16() command, allows the reader to search for all the Chip\_IDs when there are more than one **ST25TB04K** device in Inventory state present in the reader field range.

**Figure 24. Slot\_marker request format**

SOF	Slot_marker	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	X6h	8 bits	8 bits	

Request parameter:

- x: Slot number

**Figure 25. Slot\_marker response format**

SOF	Chip_ID	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	8 bits	8 bits	8 bits	

Response parameters:

- Chip\_ID of the **ST25TB04K**

**Figure 26. Slot\_marker frame exchange between reader and ST25TB04K**

## 8.4 Select(Chip\_ID) command

Command code = 0Eh

The Select() command allows the ST25TB04K to enter the Selected state. Until this command is issued, the ST25TB04K will not accept any other command, except for Initiate(), Pcall16() and Slot\_marker(). The Select() command returns the 8 bits of the Chip\_ID value. An ST25TB04K in Selected state, that receives a Select() command with a Chip\_ID that does not match its own is automatically switched to Deselected state.

**Figure 27. Select request format**

SOF	Select	Chip_ID	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	0Eh	8 bits	8 bits	8 bits	

Request parameter:

- 8-bit Chip\_ID stored during the anticollision sequence

**Figure 28. Select response format**

SOF	Chip_ID	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	8 bits	8 bits	8 bits	

Response parameters:

- Chip\_ID of the selected tag. Must be equal to the transmitted Chip\_ID

**Figure 29. Select frame exchange between reader and ST25TB04K**

## 8.5 Completion() command

Command code = 0Fh

On receiving the Completion() command, an ST25TB04K in Selected state switches to Deactivated state and stops decoding any new commands. The ST25TB04K is then locked in this state until a complete reset (tag out of the field range). A new ST25TB04K can thus be accessed through a Select() command without having to remove the previous one from the field. The Completion() command does not generate a response.

All ST25TB04K devices not in Selected state ignore the Completion() command.

**Figure 30. Completion request format**

SOF	Completion	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	0Fh	8 bits	8 bits	

Request parameters:

- No parameter

**Figure 31. Completion response format**

No Response

**Figure 32. Completion frame exchange between reader and ST25TB04K**

## 8.6 Reset\_to\_inventory() command

Command code = 0Ch

On receiving the Reset\_to\_inventory() command, all ST25TB04K devices in Selected state revert to Inventory state. The concerned ST25TB04K devices are thus resubmitted to the anticollision sequence. This command is useful when two ST25TB04K devices with the same 8-bit Chip\_ID happen to be in Selected state at the same time. Forcing them to go through the anticollision sequence again allows the reader to generate new Pcall16() commands and so, to set new random Chip\_IDs.

The Reset\_to\_inventory() command does not generate a response.

All ST25TB04K devices that are not in Selected state ignore the Reset\_to\_inventory() command.

**Figure 33. Reset\_to\_inventory request format**

SOF	RESET_TO_INVENTORY	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	0Ch	8 bits	8 bits	

Request parameter:

- No parameter

**Figure 34. Reset\_to\_inventory response format**

No Response

**Figure 35. Reset\_to\_inventory frame exchange between reader and ST25TB04K**

## 8.7 Read\_block(Addr) command

Command code = 08h

On receiving the Read\_block command, the ST25TB04K reads the desired block and returns the 4 data bytes contained in the block. Data bytes are transmitted with the least significant byte first and each byte is transmitted with the least significant bit first.

The address byte gives access to the 128 blocks of the ST25TB04K (addresses 0 to 127). Read\_block commands issued with a block address above 127 will not be interpreted and the ST25TB04K will not return any response, except for the System area located at address 255.

The ST25TB04K must have received a Select() command and be switched to Selected state before any Read\_block() command can be accepted. All Read\_block() commands sent to the ST25TB04K before a Select() command is issued are ignored.

**Figure 36. Read\_block request format**

SOF	Read_block	Address	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	08h	8 bits	8 bits	8 bits	

Request parameter:

- Address: block addresses from 0 to 127, or 255

**Figure 37. Read\_block response format**

SOF	Data 1	Data 2	Data 3	Data 4	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	8 bits	8 bits	8 bits	8 bits	8 bits	8 bits	

Response parameters:

- Data 1: Less significant data byte
- Data 2: Data byte
- Data 3: Data byte
- Data 4: Most significant data byte

**Figure 38. Read\_block frame exchange between reader and ST25TB04K**

## 8.8 Write\_block (Addr, Data) command

Command code = 09h

On receiving the Write\_block command, the ST25TB04K writes the 4 bytes contained in the command to the addressed block, provided that the block is available and not write-protected. Data bytes are transmitted with the least significant byte first, and each byte is transmitted with the least significant bit first.

The address byte gives access to the 128 blocks of the ST25TB04K (addresses 0 to 127). Write\_block commands issued with a block address above 127 aren't interpreted and the ST25TB04K don't return any response, except for the System area located at address 255.

The result of the Write\_block command is submitted to the addressed block. See the following tables for a complete description of the Write\_block command:

- Table 4. Resettable OTP area (addresses 0 to 4)
- Table 6. Binary counter (addresses 5 to 6)
- Table 5. EEPROM area (addresses 7 to 127)

The Write\_block command does not give rise to a response from the ST25TB04K. The reader must check after the programming time,  $t_w$ , that the data was correctly programmed. The ST25TB04K must have received a Select() command and be switched to Selected state before any Write\_block command can be accepted. All Write\_block commands sent to the ST25TB04K before a Select() command is issued, are ignored.

**Figure 39. Write\_block request format**

SOF	Write_block	Address	Data 1	Data 2	Data 3	Data 4	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	09h	8 bits	8 bits	8 bits	8 bits	8 bits	8 bits	8 bits	

- Request parameters:
- Address: block addresses from 0 to 127, or 255
- Data 1: Less significant data byte
- Data 2: Data byte
- Data 3: Data byte
- Data 4: Most significant data byte.

**Figure 40. Write\_block response format**

No Response

**Figure 41. Write\_block frame exchange between reader and ST25TB04K**

## 8.9 Get\_UID() command

Command code = 0Bh

On receiving the Get\_UID command, the ST25TB04K returns its 8 UID bytes. UID bytes are transmitted with the least significant byte first, and each byte is transmitted with the least significant bit first.

The ST25TB04K must have received a Select() command and be switched to Selected state before any Get\_UID() command can be accepted. All Get\_UID() commands sent to the ST25TB04K before a Select() command is issued, are ignored.

**Figure 42. Get\_UID request format**

SOF	Get_IUD	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	0Bh	8 bits	8 bits	

Request parameter:

- No parameter

**Figure 43. Get\_UID response format**

SOF	UID 0	UID 1	UID 2	UID 3	UID 4	UID 5	UID 6	UID 7	CRC <sub>L</sub>	CRC <sub>H</sub>	EOF
	8 bits	8 bits	8 bits	8 bits	8 bits	8 bits	8 bits	8 bits	8 bits	8 bits	

Response parameters:

- UID 0: Less significant UID byte
- UID 1 to UID 6: UID bytes
- UID 7: Most significant UID byte.

### Unique identifier (UID)

Members of the ST25TB04K family are uniquely identified by a 64-bit unique identifier (UID). This is used for addressing each ST25TB04K device uniquely after the anticollision loop. The UID complies with ISO/IEC 15963 and ISO/IEC 7816-6. It is a read-only code, and comprises (as summarized in Figure 44. 64-bit unique identifier of the ST25TB04K):

- an 8-bit prefix, with the most significant bits set to D0h
- an 8-bit IC manufacturer code (ISO/IEC 7816-6/AM1) set to 02h (for STMicroelectronics)
- a 8-bit product ref code set to 1Fh for ST25TB04K
- a 40-bit unique serial number

**Figure 44. 64-bit unique identifier of the ST25TB04K**

**Figure 45. Get\_UID frame exchange between reader and ST25TB04K**

## 8.10 Power-on state

After power-on, the ST25TB04K is in the following state:

- It is in the low-power state.
- It is in Ready state.
- It shows highest impedance with respect to the reader antenna field.
- It will not respond to any command except Initiate().

## 9 Maximum ratings

Stressing the device above the ratings listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 11. Absolute maximum ratings**

Symbol	Parameter	Min.	Max.	Unit	
T <sub>STG</sub> , t <sub>STG</sub>	Storage conditions	Sawn wafer	15	25	°C
		(kept in its original packing form)	-	9 <sup>(1)</sup>	months
		Unsawn wafer	19	25	°C
		(kept in its antistatic bag)	-	23	months
I <sub>CC</sub>	Supply current on AC0 / AC1	-	40	mA	
V <sub>MAX</sub> <sup>(2)</sup>	RF input voltage amplitude between AC0 and AC1, GND pad left floating	-	10	V	
V <sub>ESD</sub>	Electrostatic discharge voltage	-	2000	V	
				Human Body Model <sup>(3)</sup>	

1. Counted from ST shipment date.

2. Based on characterization, not tested in production.

3. Positive and negative pulses applied on different combinations of pin connections, according to AEC-Q100-002 (compliant with ANSI/ESDA/JEDEC JS-001-2012, C1=100 pF, R1=1500 Ω, R2=500 Ω).

## 10 RF electrical parameters

**Table 12. Operating conditions**

Symbol	Parameter	Min.	Max.	Unit
T <sub>A</sub>	Ambient operating temperature	-40	85	°C

**Table 13. Electrical characteristics**

Symbol	Parameter	Condition	Min	Typ	Max	Unit
H_ISO	Operating field according to ISO	T <sub>A</sub> = 0 °C to 50 °C	1500	-	7500	mA/m
H_extended	Operating field in extended temperature range	T <sub>A</sub> = -40 °C to 85 °C	1500	-	7500	
V <sub>RET</sub>	Back-scattering induced voltage	ISO 10373-6	20	-	-	mV
C <sub>TUN</sub>	Internal tuning capacitor	13.56 MHz <sup>(1)</sup>	62	68	74	pF

1. The tuning capacitance value is evaluated by characterization with equipment at chip power on reset and ambient temperature. This value is to be used as reference for antenna design. Min and max value are deduced from correlation at ambient temperature with industrial tester limits.

Note:

For inlay implementation, the antenna design applied for SRI4K can be re-used as-is for ST25TB04K: typical 68pF value for the ST25TB04K is equivalent to what was specified in the SRI4K data-sheet as 64pF. This change is related to a different measurement methodology between SRI4K and ST25TB04K.

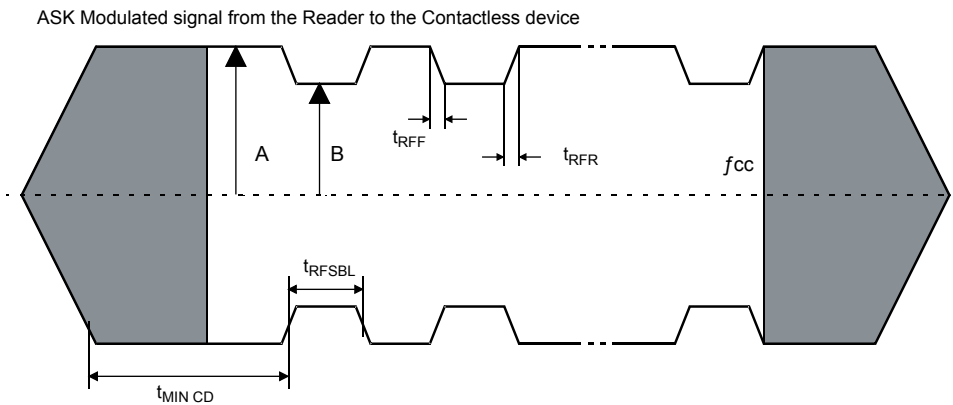

**Table 14. RF characteristics**

Symbol	Parameter	Condition	Min	Typ	Max	Unit
f <sub>CC</sub>	RFcarrier frequency	-	13.553	-	13.567	MHz
MI <sub>CARRIER</sub>	Carrier modulation index	MI=(A-B)/(A+B)	8	11	14	%
t <sub>RFR</sub> , t <sub>RFF</sub>	10% Rise and Fall times	-	0.1	-	1.25	µs
t <sub>RFSBL</sub>	Minimum pulse width for Start bit	ETU = 128/f <sub>CC</sub>	-	9.44	-	µs
t <sub>JIT</sub>	ASK modulation data jitter	Coupler to ST25TB04K	-2	-	+2	µs
t <sub>MIN CD</sub>	Minimum timefrom carrier generation to first data	-	5	-	-	ms
f <sub>S</sub>	Subcarrier frequency	f <sub>CC</sub> /16	-	847.5	-	kHz
t <sub>0</sub>	Antenna reversal delay	-	-	159	-	µs
t <sub>1</sub>	Synchronization delay	-	-	151	-	µs
t <sub>2</sub>	Answer to new request delay	14 ETU	132	-	-	µs
t <sub>DR</sub>	Time between request characters	Coupler to ST25TB04K	0	-	57	µs
t <sub>DA</sub>	Time between answer characters	ST25TB04K to coupler	-	0	-	µs
t <sub>W</sub>	Programming time for write	With no auto-erase cycle (OTP)	-	-	3	ms
		With auto-erase cycle (EEPROM)	-	-	5	ms
		Binarycounter decrement with tearing condition	-	-	7	ms

Note: All timing measurements were performed on a reference antenna with the following characteristics:

- External size: 76 mm x 46 mm
- Number of turns: 4
- Width of conductor: 0.9 mm
- Space between 2 conductors: 0.9 mm
- Tuning Frequency: 13.58 MHz

**Figure 46. ST25TB04K synchronous timing, transmit and receive**

Data jitter on FRAME Transmitted by the reader in ASK

## 11 Ordering information

**Table 15. Ordering information scheme**

Example:	ST25	T	B	04K	-A	C	6	G	6
<b>Device type</b>									
ST25 = RF memory									
<b>Product type</b>									
T = Tags + RFID									
<b>Protocol</b>									
B = ISO14443-B									
<b>Memory density</b>									
04K (binary)									
<b>Interface</b>									
A = None									
<b>Features</b>									
C = Counter as option									
<b>Device grade</b>									
6 = - 40 to 85 °C									
<b>Package/Packaging</b>									
G = Bumped 120 µm									
U = Unseen 725 µm									
<b>Capacitor value</b>									
6 = 68 pF									

**Note:** *Devices are shipped from the factory with the memory content bits erased to 1.*

Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering samples to run qualification activity.

## Appendix A ISO-14443 Type B CRC calculation

```

#include <stdio.h>
