

Programmable USB Type-C Controller w/PD

FUSB302T

Description

The FUSB302T targets system designers looking to implement USB Type-C wall charger or Travel adaptor. In addition to the default SRC function, the device supports DRP/ SRC/ SNK with low amount of programmability.

The FUSB302T enables the USB Type-C detection including attach/detach, and orientation. The FUSB302T integrates the physical layer of the USB BMC power delivery protocol to allow up to 100 W of power and role swap. The BMC PD block enables full support for alternative interfaces of the Type-C specification.

Features

- Dual-role Functionality with Autonomous DRP Toggle
- Ability to Connect as Either a Host or a Device Based on What Has Been Attached
- Software Configurable Either as a Dedicated Host, Dedicated Device, or Dual Role
 - ◆ Dedicated Devices can Operate both on a Type-C Receptacle or a Type-C Plug with a Fixed CC and VCONN Channel
- Full Type-C 1.2 Support. Integrates the Following Functionality of the CC Pin:
 - ◆ Attach/Detach Detection as Host
 - ◆ Current Capability Indication as Host
 - ◆ Current Capability Detection as Device
 - ◆ Audio Adapter Accessory Mode
 - ◆ Debug Accessory Mode
 - ◆ Active Cable Detection
- Integrates CCx to VCONN Switch with Over-current Limiting for Powering USB3.1 Full Featured Cables
- USB Power Delivery (PD) 2.0 Support:
 - ◆ Automatic GoodCRC Packet Response
 - ◆ Automatic Retries of Sending a Packet if a GoodCRC is Not Received
 - ◆ Automatic Soft Reset Packet Sent with Retries if Needed
 - ◆ Automatic Hard Reset Ordered Set Sent
- Default CC Open for SRC Application
- Low Power Operation: $I_{CC} = 25 \mu A$ (Typical)
- AEC-Q100 Qualified and PPAP Capable
- Packaged in:
 - ◆ 14-lead WQFN (2.5 mm × 2.5 mm, 0.5 mm Pitch)

Applications

- Charging/Wall Adaptors
- Automotive Cigarette Adaptors
- Laptops, Notebooks
- Power Adaptors
- Automotive

Table 2. PIN DESCRIPTION

| Name | Type | Description |
|---------------------------------------|-------------------|--|
| USB TYPE-C CONNECTOR INTERFACE | | |
| CC1/CC2 | I/O | Type-C connector Configuration Channel (CC) pins. Initially used to determine when an attach has occurred and what the orientation of the insertion is. Functionality after attach depends on mode of operation detected. Operating as a host: <ol style="list-style-type: none"> 1. Sets the allowable charging current for VBUS to be sensed by the attached device 2. Used to communicate with devices using USB BMC Power Delivery 3. Used to detect when a detach has occurred Operating as a device: <ol style="list-style-type: none"> 1. Indicates what the allowable sink current is from the attached host. Used to communicate with devices using USB BMC Power Delivery |
| GND | Ground | Ground |
| VBUS | Input | VBUS input pin for attach and detach detection when operating as an upstream facing port (Device). Expected to be an OVP protected input. |
| POWER INTERFACE | | |
| VDD | Power | Input supply voltage. |
| VCONN | Power Switch | Regulated input to be switched to correct CC pin as VCONN to power USB3.1 full-featured cables and other accessories. |
| SIGNAL INTERFACE | | |
| SCL | Input | I ² C serial clock signal to be connected to the phone-based I ² C master. |
| SDA | Open-Drain I/O | I ² C serial data signal to be connected to the phone-based I ² C master |
| INT_N | Open-Drain Output | Active LOW open drain interrupt output used to prompt the processor to read the I ² C register bits |

FUSB302T

CONFIGURATION CHANNEL SWITCH

The FUSB302T integrates the control and detection functionality required to implement a USB Type-C host, device or dual-role port including:

- Device Port Pull-Down (R_D)
- Host Port Pull-Up (I_P)
- VCONN Power Switch with OCP for Full-Featured USB3.1 Cables

- USB BMC Power Delivery Physical Layer
- Configuration Channel (CC) Threshold Comparators

Each CC pin contains a flexible switch matrix that allows the host software to control what type of Type-C port is implemented. The switches are shown in Figure 5.

Figure 5. Configuration Channel Switch Functionality

TYPE-C DETECTION

The FUSB302T implements multiple comparators and a programmable DAC that can be used by software to determine the state of the CC and VBUS pins. This status information provides the processor all of the information required to determine attach, detach and charging current configuration of the Type-C port connection.

The FUSB302T has three fixed threshold comparators that match the USB Type-C specification for the three charging current levels that can be detected by a Type-C device. These comparators automatically cause BC_LVL and COMP interrupts to occur when there is a change of state. In addition to the fixed threshold comparators, the host software can use the 6-bit DAC to determine the state of the CC lines more accurately.

The FUSB302T also has a fixed comparator that monitors if VBUS has reached a valid threshold or not. The DAC can be used to measure VBUS up to 20 V which allows the software to confirm that changes to the VBUS line have

occurred as expected based on PD or other communication methods to change the charging level.

Default Float on CC

With or without VDD, The default CC status of FUSB302T is float/open. The FUSB302T is suitable for charger (wall) adaptor application which needs source only mode and shouldn't be seen as sink mode even with no power on the device. The FUSB302T, however, can be set to sink mode, which has R_D (pull-down) on CCx by software program.

Detection through Autonomous Device Toggle

The FUSB302T has the capability to do autonomous DRP toggle. In autonomous toggle the FUSB302T internally controls the PDWN1, PDWN2, PU_EN1 and PU_EN2, MEAS_CC1 and MEAS_CC2 and implements a fixed DRP toggle between presenting as a SRC and presenting as a SNK. Alternately, it can present as a SRC or SNK only and poll CC1 and CC2 continuously.

FUSB302T

Table 3. PROCESSOR CONFIGURES THE FUSB302T THROUGH I²C

| I ² C Registers/Bits | Value |
|---|-------|
| TOGGLE | 1 |
| PWR | 07H |
| HOST_CUR0 | 1 |
| HOST_CUR1 | 0 |
| MEAS_VBUS | 0 |
| VCONN_CC1 | 0 |
| VCONN_CC2 | 0 |
| Mask Register | 0xFE |
| Maska Register | 0xBF |
| Maskb Register (Except I_TOGDONE and I_BC_LVL Interrupt) | 0x01 |
| PWR[3:0] | 0x07 |

1. Once it has been determined what the role is of the FUSB302T, it returns I_TOGDONE and TOGSS1/2.
2. Processor then can perform a final manual check through I²C.

Manual Device Toggle

The FUSB302T has the capability to do manual DRP toggle. In manual toggle the FUSB302T is configurable by the processor software by I²C and setting TOGGLE = 0.

Table 4. DEVICE INTERRUPT SUMMARY

| Status Type | Interrupt Status | | | | Meaning |
|--------------|------------------|------|------------------------|--------|-----------------------------|
| | BC_LVL[1:0] | COMP | COMP Setting | VBUSOK | |
| CC Detection | 2'b00 | NA | NA | 1 | vRA |
| | 2'b01 | NA | NA | 1 | vRd-Connect and vRd-USB |
| | 2'b10 | NA | NA | 1 | vRd-Connect and vRd-1.5 |
| | 2'b11 | 0 | 6'b11_0100 (2.05 V) | 1 | vRd-Connect and vRd-3.0 |
| Attach | NA | NA | NA | 1 | Host Attached, VBUS Valid |
| Detach | NA | NA | NA | 0 | Host Detached, VBUS Invalid |

Manual Host Detection and Configuration

When the FUSB302T is configured as a Type-C host, the software can use the status of the comparators and DAC to determine when a Type-C device has been attached or detached and what termination type has been attached to each CC pin.

The FUSB302T allows the host software to change the charging current capabilities of the port through the

Manual Device Detection and Configuration

A Type-C device must monitor VBUS to determine if it is attached or detached. The FUSB302T provides this information through the VBUSOK interrupt. After the Type-C device knows that a Type-C host/device has been attached, it needs to determine what type of termination is applied to each CC pin. The software determines if an Ra or Rd termination is present based on the BC_LVL and COMP interrupt and status bits.

Additionally, for Rd terminations, the software can further determine what charging current is allowed by the Type-C host by reading the BC_LVL status bits. This is summarized in Table 4.

Toggle Functionality

When TOGGLE bit (Control2 register) is set the FUSB302T implements a fixed DRP toggle between presenting as a SRC and as a SNK. It can also be configured to present as a SRC only or SNK only and poll CC1 and CC2 continuously. This operation is turned on with TOGGLE = 1 and the processor should initially write HOST_CUR1 = 0, HOST_CUR0 = 1 (for default current), VCONN_CC1 = VCONN_CC2 = 0, Mask Register = 0xFE, Maska register = 0xBF, and Maskb register = 0x01, and PWR = 0x01. The processor should also read the interrupt register to clear them prior to setting the TOGGLE bit.

HOST_CUR control bits. If the HOST_CUR bits are changed prior to attach, the FUSB302T automatically indicates the programmed current capability when a device is attached. If the current capabilities are changed after a device is attached, the FUSB302T immediately changes the CC line to the programmed capability.

FUSB302T

Figure 6. HOST_CUR Changed After Attach

Figure 7. HOST_CUR Changed Prior to Attach

The Type-C specification outlines different attach and detach thresholds for a Type-C host that are based on how much current is supplied to each CC pin. Based on the programmed HOST_CUR setting, the software adjusts the

DAC comparator threshold to match the Type-C specification requirements. The BC_LVL comparators can also be used as part of the Ra detection flow. This is summarized in Table 5.

Table 5. HOST INTERRUPT SUMMARY

| Termination | HOST_CUR[1:0] | Interrupt Status | | | Attach/Detach |
|-------------|---------------|------------------|------|---------------------|---------------|
| | | BC_LVL[1:0] | COMP | COMP Setting | |
| Ra | 2'b01 | 2'b00 | NA | NA | NA |
| | 2'b10 | 2'b01 | 0 | 6'b00_1010 (0.42 V) | |
| | 2'b11 | 2'b10 | 0 | 6'b01_0011 (0.8 V) | |
| Rd | 2'b01, 2'b10 | NA | 0 | 6'b10_0110 (1.6 V) | Attach |
| | | NA | 1 | 6'b10_0110 (1.6 V) | Detach |
| | 2'b11 | NA | 0 | 6'b11_1110 (2.6 V) | Attach |
| | | NA | 1 | 6'b11_1110 (2.6 V) | Detach |

The high level software flow diagram for a Type-C Host (SRC) is shown below in Figure 8.

FUSB302T

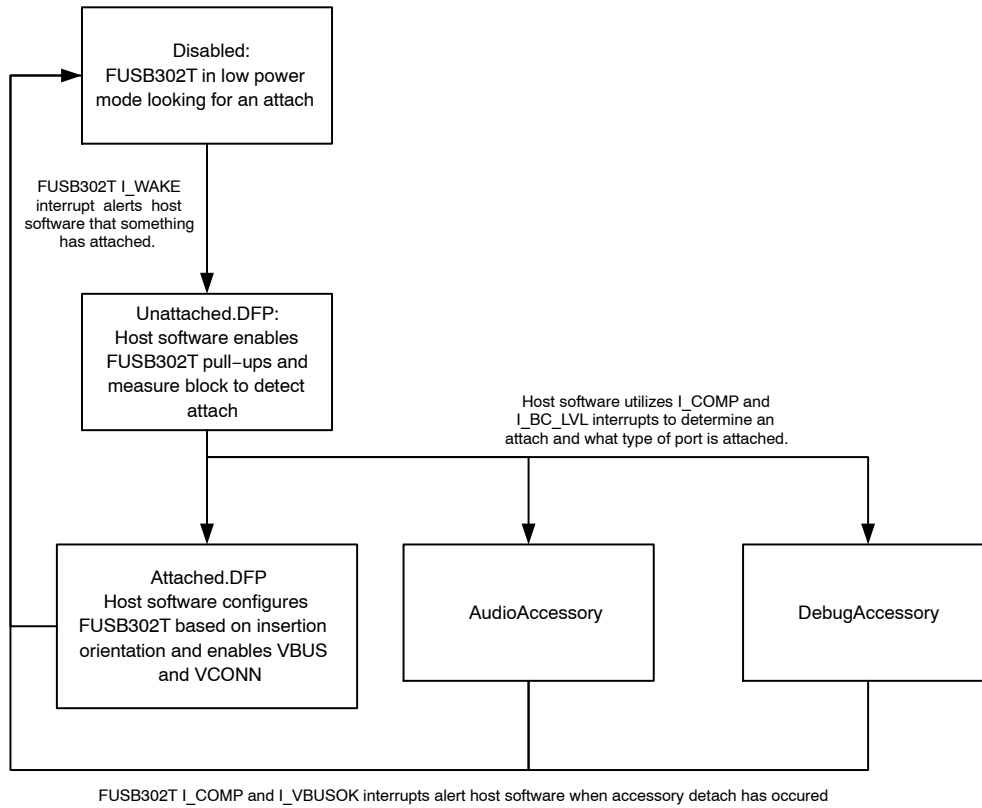

Figure 8. SRC Software Flow

Manual Dual-Role Detection and Configuration

The Type-C specification allows ports to be both a device and a host depending on what type of port has attached. This functionality is similar to USB OTG ports with the current USB connectors and is called a dual-role port. The

FUSB302T can be used to implement a dual-role port. A Type-C dual role port toggles between presenting as a Type-C device and a Type-C host. The host software controls the toggle time and configuration of the FUSB302T in each state as shown in Figure 9.

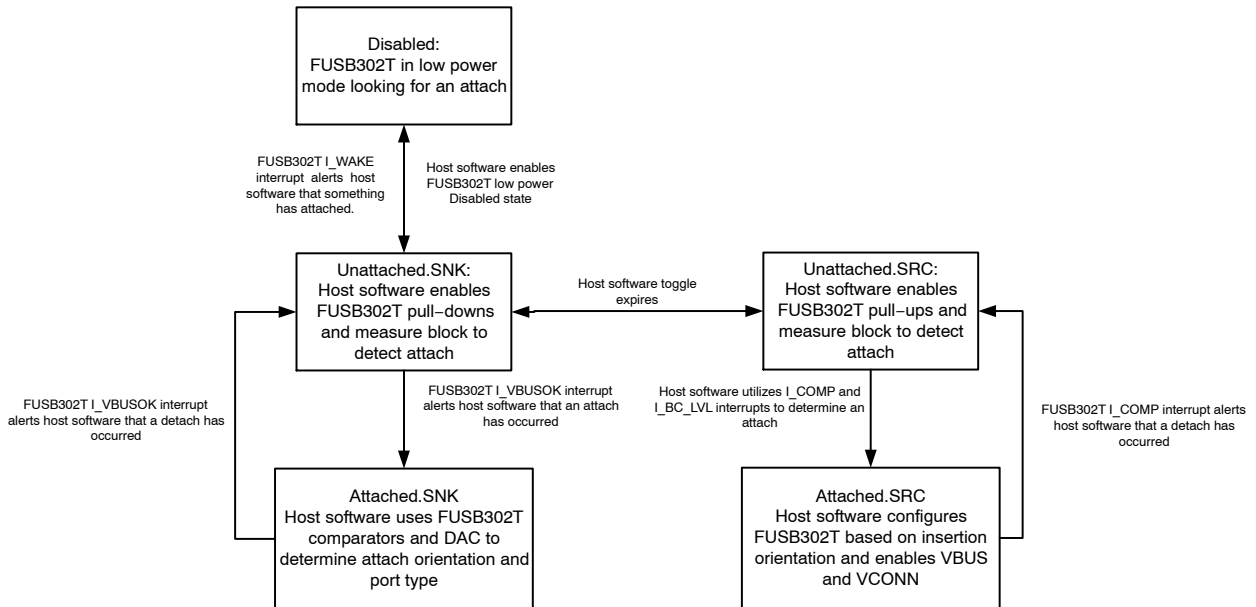

Figure 9. DRP Software Flow

FUSB302T

BMC POWER DELIVERY

The Type-C connector allows USB Power Delivery (PD) to be communicated over the connected CC pin between two ports. The communication method is the BMC Power Delivery protocol and is used for many different reasons with the Type-C connector. Possible uses are outlined below.

- Negotiating and controlling charging power levels
- Alternative Interfaces such as MHL, Display Port
- Vendor specific interfaces for use with custom docks or accessories
- Role swap for dual-role ports that want to switch who is the host or device
- Communication with USB3.1 full featured cables

The FUSB302T integrates a thin BMC PD client which includes the BMC physical layer and packet FIFOs (48 bytes for transmit and 80 bytes for receive) which allows packets to be sent and received by the host software through I²C accesses. The FUSB302T allows host software to implement all features of USB BMC PD through writes and

reads of the FIFO and control of the FUSB302T physical interface.

The FUSB302T uses tokens to control the transmission of BMC PD packets. These tokens are written to the transmit FIFO and control how the packet is transmitted on the CC pin. The tokens are designed to be flexible and support all aspects of the USB PD specification. The FUSB302T additionally enables control of the BMC transmitter through tokens. The transmitter can be enabled or disabled by specific token writes which allow faster packet processing by burst writing the FIFO with all the information required to transmit a packet.

The FUSB302T receiver stores the received data and the received CRC in the receive FIFO when a valid packet is received on the CC pin. The BMC receiver automatically enables the internal oscillator when an Activity is sensed on the CC pin and load to the FIFO when a packet is received. The I_ACTIVITY and I_CRC_CHK interrupts alert the host software that a valid packet was received.

Figure 10. USB BMC Power Delivery Blocks

Power Level Determination

The Type-C specification outlines the order of precedence for power level determination which covers power levels from basic USB2.0 levels to the highest levels of USB PD. The host software is expected to follow the USB Type-C specification for charging current priority based on feedback from the FUSB302T detection, external BC1.2 detection and any USB Power Delivery communication.

The FUSB302T does not integrate BC1.2 charger detection which is assumed available in the USB transceiver or USB charger in the system.

Power Up, Initialization and Reset

When power is first applied through VDD, the FUSB302T is reset and registers are initialized to the default values shown in the register map.

The FUSB302T can be reset through software by programming the SW_RES bit in the RESET register.

PD Automatic Receive GoodCRC

The power delivery packets require a GoodCRC acknowledge packet to be sent for each received packet where the calculated CRC is the correct value. This calculation is done by the FUSB302T and triggers the I_CRC_CHK interrupt if the CRC is good. If the AUTO_CRC (Switches1 register bit) is set and AUTO_PRE = 0, then the FUSB302T will automatically send the GoodCRC control packet in response to alleviate the local processor from responding quickly to the received packet. If GoodCRC is required for anything beyond SOP, then enable SOP*.

FUSB302T

PD Send

The FUSB302T implements part of the PD protocol layer for sending packets in an autonomous fashion.

Figure 11.

PD Automatic Sending Retries

If GoodCRC packet is not received and AUTO_RETRY is set, then a retry of the same message that was in the Tx FIFO written by the processor is executed within t_{Retry} and that is repeated for NRETRY times.

PD Send Soft Reset

If the correct GoodCRC packet is still not received for all retries then I_RETRYFAIL interrupt is triggered and if AUTO_SOFT_RESET is set, then a Soft Reset packet is created (MessageID is set to 0 and the processor upon servicing I_RETRYFAIL would set the true MessageIDCounter to 0.

If this Soft Reset is sent successfully where a GoodCRC control packet is received with a MessageID = 0 then I_TXSENT interrupt occurs.

If not, this Soft Reset packet is retried NRETRIES times (MessageID is always 0 for all retries) if a GoodCRC acknowledge packet is not received with CRCReceiveTimer expiring (t_{Receive} of 1.1 ms max). If all retries fail, then I_SOFTFAIL interrupt is triggered.

PD Send Hard Reset

If all retries of the soft reset packet fail and if AUTO_HARD_RESET is set, then a hard reset ordered set is sent by loading up the Tx FIFO with RESET1, RESET1, RESET1, RESET2 and sending a hard reset. Note only one

hard reset is sent since the typical retry mechanism doesn't apply. The processor's policy engine firmware is responsible for retrying the hard reset if it doesn't receive the required response.

Flush Rx-FIFO with Built-In Self Test (BIST) Test Data

During PD compliance testing, BIST test packets are used to test physical layer of the PD interface such as, frequency derivation, Amplitude measure and etc. The one BIST test data packet has 7 data objects (28byte data), header and CRC, but the message ID doesn't change, the packet should be ignored and not acted on by the PD policy engine. The PD protocol layer does need to send a GoodCRC message back after every packet. The BIST data can arrive continuously from a tester, which could cause the FUSB302T Rx FIFO to overflow and the PD protocol layer to stop sending GoodCRC messages unless the FIFO is read or cleared quickly. The FUSB302T has a special register bit in the I²C registers, bit[5] of address 0x09, that when the bit is set, all the data received next will be flushed from the Rx FIFO automatically and the PD protocol layer will keep sending GoodCRC messages back. Once BIST test is done, tester sends HardReset, so with the HardReset, processor has to write the bit back to disable. Also, if the bit can be de-selected anytime, then the coming packet has to be managed by protocol layer and policy engine.

I²C INTERFACE

The FUSB302T includes a full I²C slave controller. The I²C slave fully complies with the I²C specification version 6 requirements. This block is designed for Fast Mode Plus traffic up to 1 MHz SCL operation.

The TOGGLE features allow for very low power operation with slow clocking thus may not be fully

compliant to the 1 MHz operation. Examples of an I²C write and read sequence are shown in Figure 12 and Figure 13 respectively.

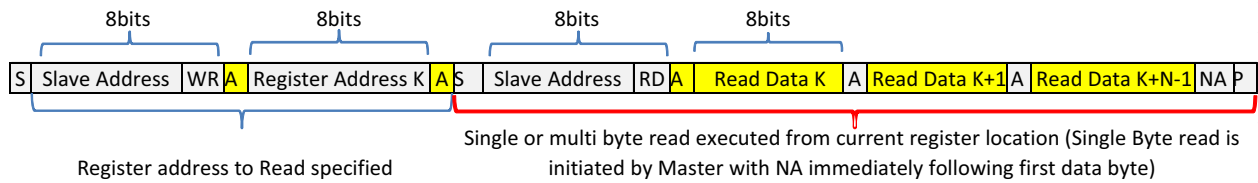

Figure 12. I²C Write Example

FUSB302T

Note: If Register is not specified Master will begin read from current register. In this case only sequence showing in Red bracket is needed

| | | | | | | | |
|---|----------------------|---|-----------------------|----|----------------------------|----|----------------|
| S | From Master to Slave | S | Start Condition | NA | NOT Acknowledge (SDA High) | RD | Read =1 |
| A | From Slave to Master | A | Acknowledge (SDA Low) | WR | Write=0 | P | Stop Condition |

| | | Min | Typ | Max | |
| t _{HardReset} | If a Soft Reset message fails, a Hard Reset is sent after t _{HardReset} of CRCReceiveTimer expiring | - | - | 5 | ms |
| t _{HardReset Complete} | If the FUSB302T cannot send a Hard Reset within t _{HardResetComplete} time because of a busy line, then a I_HARDFAIL interrupt is triggered | - | - | 5 | ms |
| t _{Receive} | This is the value for which the CRCReceiveTimer expires. The CRCReceiveTimer is started upon the last bit of the EOP of the transmitted packet | 0.9 | - | 1.1 | ms |
| t _{Retry} | Once the CRCReceiveTimer expires, a retry packet has to be sent out within t _{Retry} time. This time is hard to separate externally from t _{Receive} since they both happen sequentially with no visible difference in the CC output | - | - | 75 | μs |
| t _{SoftReset} | If a GoodCRC packet is not received within t _{Receive} for NRETRIES then a Soft Reset packet is sent within t _{SoftReset} time. | - | - | 5 | ms |
| t _{Transmit} | From receiving a packet, we have to send a GoodCRC in response within t _{Transmit} time. It is measured from the last bit of the EOP of the received packet to the first bit sent of the preamble of the GoodCRC packet | - | - | 195 | μs |

Table 12. IO SPECIFICATIONS

|-------|------------------------------|-------|-------------|---|
| 7:6 | Reserved | N/A | 2 | Do Not Use |
| 5:3 | TOGSS3, TOGSS2, TOGSS1 | R | 3 | 000: Toggle logic running (processor has previously written TOGGLE=1) 001: Toggle functionality has settled to SRCon CC1 (STOP_SRC1 state) 010: Toggle functionality has settled to SRCon CC2 (STOP_SRC2 state) 101: Toggle functionality has settled to SNKOn CC1 (STOP_SNK1 state) 110: Toggle functionality has settled to SNKOn CC2 (STOP_SNK2 state) 111: Toggle functionality has detected AudioAccessory with vRa on both CC1 and CC2 (settles to STOP_SRC1 state) Otherwise: Not defined (do not interpret) |
| 2 | RXSOP2DB | R | 1 | 1: Indicates the last packet placed in the RxFIFO is type SOP''_DEBUG (SOP double prime debug) |
| 1 | RXSOP1DB | R | 1 | 1: Indicates the last packet placed in the RxFIFO is type SOP'_DEBUG (SOP prime debug) |
| 0 | RXSOP | R | 1 | 1: Indicates the last packet placed in the RxFIFO is type SOP |

FUSB302T

Table 34. INTERRUPTA

(Address: 3Eh; Reset Value: 0x0000_0000; Type: Read/Clear)

| Bit # | Name | R/W/C | Size (Bits) | Description |
|-------|-------------|-------|-------------|--|
| 7 | I_OCP_TEMP | R/C | 1 | 1: Interrupt from either a OCP event on one of the VCONN switches or an over-temperature event |
| 6 | I_TOGDONE | R/C | 1 | 1: Interrupt indicating the TOGGLE functionality was terminated because a device was detected |
| 5 | I_SOFTFAIL | R/C | 1 | 1: Interrupt from automatic soft reset packets with retries have failed |
| 4 | I_RETRYFAIL | R/C | 1 | 1: Interrupt from automatic packet retries have failed |
| 3 | I_HARDSSENT | R/C | 1 | 1: Interrupt from successfully sending a hard reset ordered set |
| 2 | I_TXSENT | R/C | 1 | 1: Interrupt to alert that we sent a packet that was acknowledged with a GoodCRC response packet |
| 1 | I_SOFTRST | R/C | 1 | 1: Received a soft reset packet |
| 0 | I_HARDRST | R/C | 1 | 1: Received a hard reset ordered set |

Table 35. INTERRUPTB

(Address: 3Fh; Reset Value: 0x0000_0000; Type: Read/Clear)

| Bit # | Name | R/W/C | Size (Bits) | Description |
|-------|-----------|-------|-------------|---|
| 7 | Reserved | N/A | 6 | Do Not Use |
| 0 | I_GCRSENT | R/C | 1 | 1: Sent a GoodCRC acknowledge packet in response to an incoming packet that has the correct CRC value |

FUSB302T

Table 36. STATUS0

(Address: 40h; Reset Value: 0x0000_0000; Type: Read)

| Bit # | Name | R/W/C | Size (Bits) | Description |
|-------|-------------|-------|-------------|--|
| 7 | VBUSOK | R | 1 | 1: Interrupt occurs when VBUS transitions through vVBUSthr. This bit typically is used to recognize port partner during startup |
| 6 | ACTIVITY | R | 1 | 1: Transitions are detected on the active CC* line. This bit goes high after a minimum of 3 CC transitions, and goes low with no Transitions 0: Inactive |
| 5 | COMP | R | 1 | 1: Measured CC* input is higher than reference level driven from the MDAC 0: Measured CC* input is lower than reference level driven from the MDAC |
| 4 | CRC_CHK | R | 1 | 1: Indicates the last received packet had the correct CRC. This bit remains set until the SOP of the next packet 0: Packet received for an enabled SOP* and CRC for the enabled packet received was incorrect |
| 3 | ALERT | R | 1 | 1: Alert software an error condition has occurred. An alert is caused by: TX_FULL: the transmit FIFO is full RX_FULL: the receive FIFO is full See Status1 bits |
| 2 | WAKE | R | 1 | 1: Voltage on CC indicated a device attempting to attach 0: WAKE either not enabled (WAKE_EN=0) or no device attached |
| 1:0 | BC_LVL[1:0] | R | 2 | Current voltage status of the measured CC pin interpreted as host current levels as follows: 00: < 200 mV 01: > 200 mV, < 660 mV 10: > 660 mV, < 1.23 V 11: > 1.23 V Note the software must measure these at an appropriate time, while there is no signaling activity on the selected CC line. BC_LVL is only defined when Measure block is on which is when register bits PWR[2]=1 and either MEAS_CC1=1 or MEAS_CC2=1 |

Table 37. STATUS1

(Address: 41h; Reset Value: 0x0010_1000; Type: Read)

| Bit # | Name | R/W/C | Size (Bits) | Description |
|-------|----------|-------|-------------|---|
| 7 | RXSOP2 | R | 1 | 1: Indicates the last packet placed in the RxFIFO is type SOP" (SOP double prime) |
| 6 | RXSOP1 | R | 1 | 1: Indicates the last packet placed in the RxFIFO is type SOP' (SOP prime) |
| 5 | RX_EMPTY | R | 1 | 1: The receive FIFO is empty |
| 4 | RX_FULL | R | 1 | 1: The receive FIFO is full |
| 3 | TX_EMPTY | R | 1 | 1: The transmit FIFO is empty |
| 2 | TX_FULL | R | 1 | 1: The transmit FIFO is full |
| 1 | OVRTEMP | R | 1 | 1: Temperature of the device is too high |
| 0 | OCP | R | 1 | 1: Indicates an over-current or short condition has occurred on the VCONN switch |

FUSB302T

Table 38. INTERRUPT

(Address: 42h; Reset Value: 0x0000_0000; Type: Read/Clear)

| Bit # | Name | R/W/C | Size (Bits) | Description |
|-------|-------------|-------|-------------|---|
| 7 | I_VBUSOK | R/C | 1 | 1: Interrupt occurs when VBUS transitions through 4.5 V. This bit typically is used to recognize port partner during startup |
| 6 | I_ACTIVITY | R/C | 1 | 1: A change in the value of ACTIVITY of the CC bus has occurred |
| 5 | I_COMP_CHNG | R/C | 1 | 1: A change in the value of COMP has occurred. Indicates selected CC line has tripped a threshold programmed into the MDAC |
| 4 | I_CRC_CHK | R/C | 1 | 1: The value of CRC_CHK newly valid. I.e. The validity of the incoming packet has been checked |
| 3 | I_ALERT | R/C | 1 | 1: Alert software an error condition has occurred. An alert is caused by: TX_FULL: the transmit FIFO is full RX_FULL: the receive FIFO is full See Status1 bits |
| 2 | I_WAKE | R/C | 1 | 1: Voltage on CC indicated a device attempting to attach. Software must then power up the clock and receiver blocks |
| 1 | I_COLLISION | R/C | 1 | 1: When a transmit was attempted, activity was detected on the active CC line. Transmit is not done. The packet is received normally |
| 0 | I_BC_LVL | R/C | 1 | 1: A change in host requested current level has occurred |

Table 39. FIFOS

(Address: 43h; Reset Value: 0x0000_0000; Type: (see column below))

| Bit # | Name | R/W/C | Size (Bits) | Description |
|-------|-------------|---------------|-------------|---|
| 7:0 | TX/RX Token | Read or Write | 8 | Writing to this register writes a byte into the transmit FIFO. Reading from this register reads from the receive FIFO. Each byte is a coded token. Or a token followed by a fixed number of packed data byte (see token coding in Table 40) |

Software Model

Port software interacts with the port chip in two primary ways:

- I²C Registers
- 8 bit data tokens sent to or received from the FIFO register
- All reserved bits written in the TxFIFO should be 0 and all reserved bit read from the RxFIFO should be ignored

Transmit Data Tokens

Transmit data tokens provide in-sequence transmit control and data for the transmit logic. Note that the token codes, and their equivalent USB PD K-Code are not the same. Tokens are read one at a time when they reach the end of the TX FIFO. I.e., the specified token action is performed before the next token is read from the TX FIFO.

The tokens are defined as follows:

FUSB302T

Table 40. TOKENS USED IN FIFO

| Code | Name | Size (Bytes) | Description |
|---------------------|---------|--------------|---|
| 101x-xxx1 (0xA1) | TXON | 1 | Alternative method for starting the transmitter with the TX-START bit. This is not a token written to the TxFIFO but a command much like TX_START but it is more convenient to write it while writing to the TxFIFO in one contiguous write operation. It is preferred that the TxFIFO is first written with data and then TXON or TX_START is executed. It is expected that A1h will be written for TXON not any other bits where x is non-zero such as B1h, BFh, etc |
| 0x12 | SOP1 | 1 | When reaching the end of the FIFO causes a Sync-1 symbol to be transmitted |
| 0x13 | SOP2 | 1 | When reaching the end of the FIFO causes a Sync-2 symbol to be transmitted |
| 0x1B | SOP3 | 1 | When reaching the end of the FIFO causes a Sync-3 symbol to be transmitted |
| 0x15 | RESET1 | 1 | When reaching the end of the FIFO causes a RST-1 symbol to be transmitted |
| 0x16 | RESET2 | 1 | When reaching the end of the FIFO causes a RST-2 symbol to be transmitted |
| 0x80 | PACKSYM | 1+N | This data token must be immediately followed by a sequence of N packed data bytes. This token is defined by the 3 MSB's being set to 3'b100. The 5 LSB's are the number of packed bytes being sent. Note: N cannot be less than 2 since the minimum control packet has a header that is 2 bytes and N cannot be greater than 30 since the maximum data packet has 30 bytes (2 byte header + 7 data objects each having 4 bytes) Packed data bytes have two 4 bit data fields. The 4 LSB's are sent first, after 4b5b conversion etc in the chip |
| 0xFF | JAM_CRC | 1 | Causes the CRC, calculated by the hardware, to be inserted into the transmit stream when this token reaches the end of the TX FIFO |
| 0x14 | EOP | 1 | Causes an EOP symbol to be sent when this token reaches the end of the TX FIFO |
| 0xFE | TXOFF | 1 | Turn off the transmit driver. Typically the next symbol after EOP |

RECEIVE DATA TOKENS

Receive data tokens provide in-sequence receive control and data for the receive logic. The RxFIFO can absorb as many packets as the number of bytes in the RxFIFO (80 bytes). The tokens are defined as follows:

Table 41. TOKENS USED IN RxFIFO

| Code | Name | Size (Bytes) | Description |
|---------------------------------------|------------|--------------|---|
| 111b_bbbb | SOP | 1 | First byte of a received packet to indicate that the packet is an SOP packet ("b" is undefined and can be any bit) |
| 110b_bbbb | SOP1 | 1 | First byte of a received packet to indicate that the packet is an SOP' packet and occurs only if ENSOP1=1 ("b" is undefined and can be any bit) |
| 101b_bbbb | SOP2 | 1 | First byte of a received packet to indicate that the packet is an SOP" packet and occurs only if ENSOP2=1 ("b" is undefined and can be any bit) |
| 100b_bbbb | SOP1DB | 1 | First byte of a received packet to indicate that the packet is an SOP'_DEBUG packet and occurs only if ENSOP1DB=1 ("b" is undefined and can be any bit) |
| 011b_bbbb | SOP2DB | 1 | First byte of a received packet to indicate that the packet is an SOP"_DEBUG packet and occurs only if ENSOP2DB=1 ("b" is undefined and can be any bit) |
| 010b_bbbb/ 001b_bbbb/ 000b_bbbb | Do Not Use | 1 | These can be used in future versions of this device and should not be relied on to be any special value. ("b" is undefined and can be any bit) |
