

## Description

The 8SLVP2102 is a high-performance differential LVPECL fanout buffer. The device is designed for the fanout of high-frequency, very low additive phase-noise clock and data signals. The 8SLVP2102 is characterized to operate from a 3.3V or 2.5V power supply. Guaranteed output-to-output and part-to-part skew characteristics make the 8SLVP2102 ideal for those clock distribution applications demanding well-defined performance and repeatability.

Two selectable differential inputs and four low skew outputs are available. The integrated bias voltage reference enables easy interfacing of single-ended signals to the device inputs. The device is optimized for low power consumption and low additive phase noise.

## Features

- Two low skew, low additive jitter LVPECL output pairs
- Two selectable, differential clock input pairs
- Differential pairs can accept the following differential input levels: LVDS, LVPECL, CML
- Maximum input clock frequency: 2GHz
- Output skew: 5ps (typical)
- Propagation delay: 225ps (maximum)
- Low additive phase jitter, RMS,  $f_{REF} = 156.25\text{MHz}$ ,  $V_{PP} = 1\text{V}$ , 12kHz – 20MHz: 36fs (maximum)
- Full 3.3V and 2.5V supply voltage
- Maximum device current consumption ( $I_{EE}$ ): 56mA (maximum)
- Available in lead-free (RoHS 6), 16-Lead VFQFPN package
- -40°C to 85°C ambient operating temperature
- Supports case temperature  $\leq 105^\circ\text{C}$  operations
- Accepts single-ended LVCMOS levels. See Applications section
- Differential PCLKA, nPCLKA and PCLKB, nPCLKB pairs can also accept single-ended LVCMOS levels. See Applications section  
Wiring the Differential Input Levels to Accept Single-ended Levels (Figure 1A and Figure 1B)

## Pin Descriptions and Characteristics

**Table 1. Pin Descriptions**

Number	Name	Type		Description
1	V <sub>EE</sub>	Power		Negative supply pin.
2	nc	Unused		Do not connect.
3	PCLKB	Input	Pulldown	Non-inverting differential LVPECL clock/data input.
4	nPCLKB	Input	Pullup/ Pulldown	Inverting differential LVPECL clock/data input. V <sub>CC</sub> /2 default when left floating.
5	V <sub>CC</sub>	Power		Power supply pins.
6	PCLKA	Input	Pulldown	Non-inverting differential LVPECL clock/data input.
7	nPCLKA	Input	Pullup/ Pulldown	Inverting differential LVPECL clock/data input. V <sub>CC</sub> /2 default when left floating.
8	V <sub>REF</sub>	Output		Bias voltage reference for the PCLK, nPCLK inputs.
9, 10	QA0, nQA0	Output		Differential output pair A0. LVPECL interface levels.
11, 12	QA1, nQA1	Output		Differential output pair A1. LVPECL interface levels.
13, 14	QB0, nQB0	Output		Differential output pair B0. LVPECL interface levels.
15, 16	QB1, nQB1	Output		Differential output pair B1. LVPECL interface levels.

NOTE: *Pulldown* and *Pullup* refers to an internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

**Table 2. Pin Characteristics**

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
C <sub>IN</sub>	Input Capacitance			2		pF
R <sub>PULLDOWN</sub>	Input Pulldown Resistor			51		kΩ
R <sub>PULLUP</sub>	Input Pullup Resistor			51		kΩ

## Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of the product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, $V_{CC}$	3.63V
Inputs, $V_I$	-0.5V to $V_{CC} + 0.5V$
Outputs, $I_O$ Continuous Current Surge Current	50mA 100mA
Input Sink/Source, $I_{REF}$	$\pm 2mA$
Maximum Junction Temperature, $T_{J,MAX}$	125°C
Storage Temperature, $T_{STG}$	-65°C to 150°C
ESD - Human Body Model (NOTE 1)	2000V
ESD - Charged Device Model (NOTE 1)	1500V

NOTE 1: According to JEDEC/JESD 22-A114/22-C101.

NOTE: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 1: Measured from the differential input crossing point to the differential output crosspoint.

NOTE 2: Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the differential crosspoints.

NOTE 3: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 4: Defined as skew within a bank with equal load conditions. Measured at the differential crosspoints.

NOTE 5: Defined as skew between outputs on different devices operating at the same supply voltage, same frequency, same temperature and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential crosspoints.

NOTE 6:  $V_{IL}$  should not be less than  $-0.3V$ .  $V_{IH}$  should not be higher than  $V_{CC}$ .

NOTE 7: Common mode input voltage is defined at the crosspoint.

NOTE 8: For single-ended LVCMOS input applications, please refer to the Applications Information, Wiring the Differential Input to accept single-ended levels, Figures 1A and 1B.

**Table 4B. AC Additive Phase Jitter Electrical Characteristics,  $V_{CC} = 3.3V \pm 5\%$ ,  $V_{EE} = 0V$ ,  $T_A = -40^\circ C$  to  $85^\circ C$**

## Additive Phase Jitter

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the **dBc Phase Noise**. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio

of the power in the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a **dBc** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements have issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated above. The device meets the noise floor of what is shown, but can actually be lower. The phase noise is dependent on the input source and measurement equipment.

Measured using a Wenzel 156.25MHz Oscillator as the input source.

### Wiring the Differential Input to Accept Single-Ended Levels

The IDT8SLVP2102I inputs can be interfaced to LVPECL, LVDS, CML or LVC MOS drivers. Figure 1A illustrates how to DC couple a single LVC MOS input to the IDT8SLVP2102I. The value of the series resistance  $R_S$  is calculated as the difference between the transmission line impedance and the driver output impedance. This resistor should be placed close to the LVC MOS driver. To avoid cross-coupling of single-ended LVC MOS signals, apply the LVC MOS signals to no more than one PCLK input.

A practical method to implement  $V_{th}$  is shown in Figure 1B below. The reference voltage  $V_{th} = V_1 = V_{CC}/2$ , is generated by the bias resistors  $R_1$  and  $R_2$ . The bypass capacitor ( $C_1$ ) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible.

The ratio of  $R_1$  and  $R_2$  might need to be adjusted to position the  $V_1$  in the center of the input voltage swing. For example, if the input clock swing is 2.5V and  $V_{CC} = 3.3V$ ,  $R_1$  and  $R_2$  value should be adjusted to set  $V_1$  at 1.25V. The values below apply when both the single-ended swing and  $V_{CC}$  are at the same voltage.

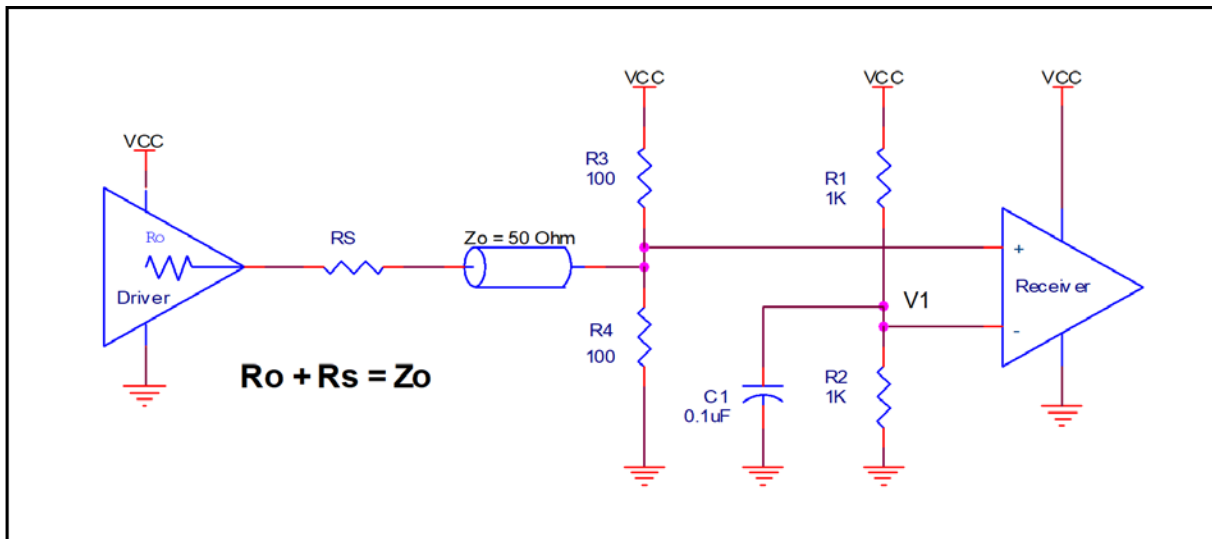

**Figure 1A. DC-Coupling a Single LVC MOS Input to the IDT8SLVP2102I**

When using single-ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVC MOS signaling, it is recommended that the amplitude be reduced, particularly if both input references are LVC MOS to minimize cross talk. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however  $V_{IL}$  cannot be less than  $-0.3V$  and  $V_{IH}$  cannot be more than  $V_{CC} + 0.3V$ .

Figure 1B shows a way to attenuate the PCLK input level by a factor of two as well as matching the transmission line between the LVC MOS driver and the IDT8SLVP2102I at both the source and the

load. This configuration requires that the sum of the output impedance of the driver ( $R_o$ ) and the series resistance ( $R_s$ ) equals the transmission line impedance.  $R_3$  and  $R_4$  in parallel should equal the transmission line impedance; for most  $50\Omega$  applications,  $R_3$  and  $R_4$  will be  $100\Omega$ . The values of the resistors can be increased to reduce the loading for slower and weaker LVC MOS driver.

Though some of the recommended components of Figure 1B might not be used, the pads should be placed in the layout so that they can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

**Figure 1B. Alternative DC Coupling a Single LVC MOS Input to the IDT8SLVP2102I**

## Recommendations for Unused Input and Output Pins

### Inputs:

#### PCLK/nPCLK Inputs

For applications not requiring the use of a differential input, both the PCLK and nPCLK pins can be left floating. Though not required, but for additional protection, a 1k $\Omega$  resistor can be tied from PCLK to ground.

### Outputs:

#### LVPECL Outputs

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

### 3.3V LVPECL Clock Input Interface

The PCLK/nPCLK accepts LVPECL, LVDS, CML and other differential signals. Both signals must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 2A to 2E show interface examples for the PCLK/nPCLK input driven by the most common driver types. The

input interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

Figure 2E. PCLK/nPCLK Input Driven by a 3.3V LVDS Driver

## 2.5V LVPECL Clock Input Interface

The PCLK /nPCLK accepts LVPECL, LVDS, CML and other differential signals. Both signals must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 3A to 3E show interface examples for the PCLK/ nPCLK input driven by the most common driver types. The

input interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

## VFQFPN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 4*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

**Figure 4. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)**

## Termination for 2.5V LVPECL Outputs

Figure 6A and Figure 6B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to  $V_{CC} - 2V$ . For  $V_{CC} = 2.5V$ , the  $V_{CC} - 2V$  is very close to ground

level. The R3 in Figure 6B can be eliminated and the termination is shown in Figure 6C.

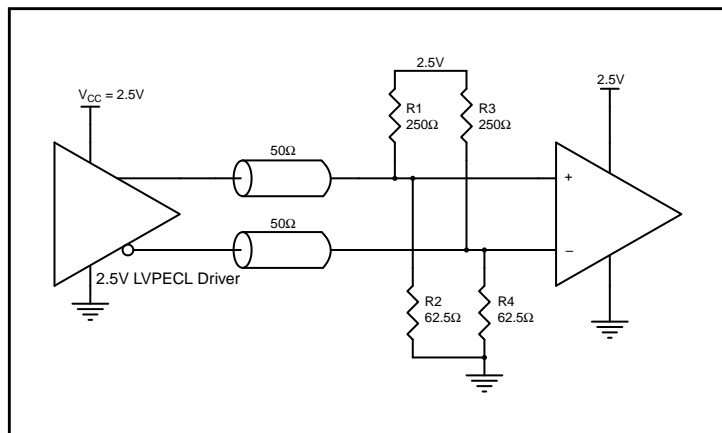

Figure 6A. 2.5V LVPECL Driver Termination Example

Figure 6C. 2.5V LVPECL Driver Termination Example

## Power Considerations

This section provides information on power dissipation and junction temperature for the IDT8SLVP2102I. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the IDT8SLVP2102I is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.465V$ , which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

The maximum current at 85° is as follows:

$$I_{EE\_MAX} = 56mA$$

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 56mA = 194.04mW$
- Power (outputs)<sub>MAX</sub> = **36mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $4 * 36mW = 144mW$

$$\text{Total Power}_{MAX} (3.465V, \text{ with all outputs switching}) = 194.04mW + 144mW = 338.04mW$$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature,  $T_j$ , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 74.7°C/W per Table 5 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 0.338W * 74.7^\circ C/W = 110.2^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

**Table 5. Thermal Resistance  $\theta_{JA}$  for 16-Lead VFQFPN, Forced Convection**

$\theta_{JA}$ by Velocity			
Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	74.7°C/W	65.3°C/W	58.5°C/W

### 3. Calculations and Equations.

The purpose of this section is to calculate the power dissipation for the LVPECL output pair.

LVPECL output driver circuit and termination are shown in *Figure 7*.

**Figure 7. LVPECL Driver Circuit and Termination**

To calculate power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CC} - 2V$ . These are typical calculations.

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.8V$   
 $(V_{CC\_MAX} - V_{OH\_MAX}) = 0.8V$
- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.4V$   
 $(V_{CC\_MAX} - V_{OL\_MAX}) = 1.4V$

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.8V)/50\Omega] * 0.8V = \mathbf{19.2mW}$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.4V)/50\Omega] * 1.4V = \mathbf{16.8mW}$$

$$\text{Total Power Dissipation per output pair} = Pd\_H + Pd\_L = \mathbf{36mW}$$

## Case Temperature Considerations

The IDT8SLVP2102I supports applications in a natural convection environment that does not have any thermal conductivity through ambient air. The printed circuit board (PCB) is typically in a sealed enclosure without any natural or forced air flow and is kept at or below a specific temperature. The device package design incorporates an exposed pad (ePad) with enhanced thermal parameters which is soldered to the PCB where most of the heat escapes from the bottom exposed pad. For this type of application, it is recommended to use the junction-to-board thermal characterization parameter  $\Psi_{JB}$  (Psi-JB) to calculate the junction temperature ( $T_J$ ) and ensure it does not exceed the maximum allowed junction temperature in the Absolute Maximum Rating table.

The junction-to-board thermal characterization parameter,  $\Psi_{JB}$ , is calculated using the following equation:

$T_J = T_{CB} + \Psi_{JB} \times P_d$ , Where

$T_J$  = Junction temperature at steady state condition in ( $^{\circ}\text{C}$ ).

$T_{CB}$  = Case temperature (Bottom) at steady state condition in ( $^{\circ}\text{C}$ ).

$\Psi_{JB}$  = Thermal characterization parameter to report the difference between junction temperature and the temperature of the board measured at the top surface of the board.

$P_d$  = power dissipation (W) in desired operating configuration.

The ePad provides a low thermal resistance path for heat transfer to the PCB and represents the key pathway to transfer heat away from the IC to the PCB. It's critical that the connection of the exposed pad to the PCB is properly constructed to maintain the desired IC case temperature ( $T_{CB}$ ). A good connection ensures that temperature at the exposed pad ( $T_{CB}$ ) and the board temperature ( $T_B$ ) are relatively the same. An improper connection can lead to increased junction temperature, increased power consumption and decreased electrical performance. In addition, there could be long-term reliability issues and increased failure rate.

Example Calculation for Junction Temperature ( $T_J$ ):  $T_J = T_{CB} + \Psi_{JB} \times P_d$

Package type:	16-Lead VFQFPN
Body size:	3mm x 3mm x 0.9mm
ePad size:	1.7mm x 1.7mm
Thermal Via:	2 x 2 matrix
$\Psi_{JB}$	5.1 C/W
$T_{CB}$	105 $^{\circ}\text{C}$
$P_d$	0.338 W

For the variables above, the junction temperature is equal to 107 $^{\circ}\text{C}$ . Since this is below the maximum junction temperature of 125 $^{\circ}\text{C}$ , there are no long term reliability concerns. In addition, since the junction temperature at which the device was characterized using forced convection is 110.2 $^{\circ}\text{C}$ , this device can function without the degradation of the specified AC or DC parameters.

## Reliability Information

**Table 6.  $\theta_{JA}$  vs. Air Flow Table for a 16-Lead VFQFPN**

$\theta_{JA}$ at 0 Air Flow			
Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	74.7°C/W	65.3°C/W	58.5°C/W

## Transistor Count

The transistor count for the 8SLVP2102 is: 261

## Package Outline Drawings

The package outline drawings are appended at the end of this document and are accessible from the link below. The package information is the most current data available.

[www.idt.com/document/psc/16-vfqfpn-package-outline-drawing-30-x-30-x-09-mm-05-mm-170-x-170-mm-epad-ninlg16p2](http://www.idt.com/document/psc/16-vfqfpn-package-outline-drawing-30-x-30-x-09-mm-05-mm-170-x-170-mm-epad-ninlg16p2)

## Ordering Information

**Table 7. Ordering Information**

Part/Order Number	Marking	Package	Shipping Packaging	Temperature
8SLVP2102ANLGI	202AI	"Lead-Free" 16-Lead VFQFPN	Tube	-40°C to 85°C
8SLVP2102ANLGI8	202AI	"Lead-Free" 16-Lead VFQFPN	Tape & Reel, Pin 1 Orientation: EIA-481-C	-40°C to 85°C
8SLVP2102ANLGI/W	202AI	"Lead-Free" 16-Lead VFQFPN	Tape & Reel, Pin 1 Orientation: EIA-481-D	-40°C to 85°C

**Table 8. Pin 1 Orientation in Tape and Reel Packaging**

Part Number Suffix	Pin 1 Orientation	Illustration
8	Quadrant 1 (EIA-481-C)	
/W	Quadrant 2 (EIA-481-D)	

## Revision History

Date	Description of Change
March 13, 2018	Updated the package outline drawings; however, no technical changes Completed other minor changes
August 21, 2017	Added a feature about case temperature to <a href="#">Features</a> Added <a href="#">Case Temperature Considerations</a> Updated the Package Outline Drawings. No mechanical changes.
February 26, 2014	Ordering Info: Changed Tray to Tube.
January 28, 2014	Changed Note 6 to read "V <sub>IL</sub> should not be less than -0.3V. V <sub>IH</sub> should not be higher than V <sub>CC</sub> ."
January 30, 2013	Added Features Bullet: Differential PCLKA, nPCLKA and PCLKB, nPCLKB pairs can also accept single-ended LVCMOS levels. Added NOTE 8 to V <sub>PP</sub> , V <sub>CMR</sub> . Updated the "Wiring the Differential Input to Accept Single-Ended Levels" note.
July 31, 2012	Ordering Information Table - added additional row. Added Orientation Packaging Table.
June 20, 2012	Power Supply DC Characteristics Tables - changed I <sub>CC</sub> to 180mA. Added "±1" to test conditions (PCN #651).
