## 2.5V 1:5 Dual Differential LVDS Compatible Clock Driver

### Description

The MC100EP210S is a low skew 1-to-5 dual differential driver, designed with LVDS clock distribution in mind. The LVDS or LVPECL input signals are differential and the signal is fanned out to five identical differential LVDS outputs.

The EP210S specifically guarantees low output-to-output skew. Optimal design, layout, and processing minimize skew within a device and from device to device.

Two internal 50  $\Omega$  resistors are provided across the inputs. For LVDS inputs, VTA and VTB pins should be unconnected. For LVPECL inputs, VTA and VTB pins should be connected to the  $V_{TT}$  ( $V_{CC} - 2.0$  V) supply.

Designers can take advantage of the EP210S performance to distribute low skew LVDS clocks across the backplane or the board.

### Features

- 20 ps Typical Output-to-Output Skew
- 85 ps Typical Device-to-Device Skew
- 550 ps Typical Propagation Delay
- The 100 Series Contains Temperature Compensation
- Maximum Frequency > 1 GHz Typical
- Operating Range:  $V_{CC} = 2.375$  V to 2.625 V with  $V_{EE} = 0$  V
- Internal 50  $\Omega$  Input Termination Resistors
- LVDS Input/Output Compatible
- These are Pb-Free Devices

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

- Input and output parameters vary 1:1 with  $V_{CC}$ .
- All loading with 100  $\Omega$  across LVDS differential outputs.
- $V_{IHCMR}$  min varies 1:1 with  $V_{EE}$ ,  $V_{IHCMR}$  max varies 1:1 with  $V_{CC}$ . The  $V_{IHCMR}$  range is referenced to the most positive side of the differential input signal.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

- Measured with 400 mV source, 50% duty cycle clock source. All loading with 100  $\Omega$  across differential outputs.
- Skew is measured between outputs under identical transitions of similar paths through a device.
- Device-to-Device skew for identical transitions at identical  $V_{CC}$  levels.
- Duty cycle skew guaranteed only for differential operation measured from the cross point of the input to the cross point of the output.
