

NB6L295

2.5V / 3.3V Dual Channel Programmable Clock/Data Delay with Differential LVPECL Outputs

Multi-Level Inputs w/ Internal Termination

The NB6L295 is a Dual Channel Programmable Delay Chip designed primarily for Clock or Data de-skewing and timing adjustment. The NB6L295 is versatile in that two individual variable delay channels, PD0 and PD1, can be configured in one of two operating modes, a Dual Delay or an Extended Delay.

In the Dual Delay Mode, each channel has a programmable delay section which is designed using a matrix of gates and a chain of multiplexers. There is a fixed minimum delay of 3.2 ns per channel.

The Extended Delay Mode amounts to the additive delay of PD0 plus PD1 and is accomplished with the Serial Data Interface MSEL bit set High. This will internally cascade the output of PD0 into the input of PD1. Therefore, the Extended Delay path starts at the IN0/ $\overline{IN0}$ inputs, flows through PD0, cascades to the PD1 and outputs through Q1/ $\overline{Q1}$. There is a fixed minimum delay of 6 ns for the Extended Delay Mode.

The required delay is accomplished by programming each delay channel via a 3-pin Serial Data Interface, described in the application section. The digitally selectable delay has an increment resolution of typically 11 ps with a net programmable delay range of either 0 ns to 6 ns per channel in Dual Delay Mode; or from 0 ns to 11.2 ns for the Extended Delay Mode.

The Multi-Level Inputs can be driven directly by differential LVPECL, LVDS or CML logic levels; or by single ended LVPECL, LVCMOS or LVTTL. A single enable pin is available to control both inputs. The SDI input pins are controlled by LVCMOS or LVTTL level signals. The NB6L295 LVPECL output contains temperature compensation circuitry. This device is offered in a 4 mm x 4 mm 24-pin QFN Pb-free package. The NB6L295 is a member of the ECLinPS MAX™ family of high performance products.

Features

- Input Clock Frequency > 1.5 GHz with 550 mV V_{OUTPP}
- Input Data Rate > 2.5 Gb/s
- Programmable Delay Range: 0 ns to 6 ns per Delay Channel
- Programmable Delay Range: 0 ns to 11.2 ns for Extended Delay Mode
- Total Delay Range: 3.2 ns to 8.8 ns per Delay Channel
- Total Delay Range: 6 ns to 17 ns in Extended Delay Mode
- Monotonic Delay: 11 ps Increments in 511 Steps
- Linearity ± 20 ps, Maximum
- 100 ps Typical Rise and Fall Times

Table 1. PIN DESCRIPTION

Pin	Name	I/O	Description
1	VCC	Power Supply	Positive Supply Voltage for the Inputs and Core Logic
2	EN	LVC MOS/LVTTL Input	Input Enable/Disable for both PD0 and PD1. LOW for enable, HIGH for disable, Open Pin Default state LOW (37 kΩ pull-down resistor). High forces Q LOW and Q̄ HIGH.
3	SLOAD	LVC MOS/LVTTL Input	Serial Load; This pin loads the configuration latches with the contents of the shift register. The latches will be transparent when this signal is HIGH; thus, the data must be stable on the HIGH-to-LOW transition of S_LOAD for proper operation. Open Pin Default state LOW (37 kΩ pull-down resistor).
4	SDIN	LVC MOS/LVTTL Input	Serial Data In; This pin acts as the data input to the serial configuration shift register. Open Pin Default state LOW (37 kΩ pull-down resistor).
5	SCLK	LVC MOS/LVTTL Input	Serial Clock In; This pin serves to clock the serial configuration shift register. Data from SDIN is sampled on the rising edge. Open Pin Default state LOW (37 kΩ pull-down resistor).
6	VCC	Power Supply	Positive Supply Voltage for the Inputs and Core Logic
7	VT1		Internal 50 Ω Termination Pin for IN1

22	IN0	LVPECL, CML, LVDS Input	Inverted differential input. Note 1.
23	IN0	LVPECL, CML, LVDS Input	Noninverted differential input. Note 1.
24	VT0		Internal 50 Ω Termination Pin for IN0
-	EP	Ground	The Exposed Pad (EP) on the QFN-24 package bottom is thermally connected to the die for improved heat transfer out of package. The exposed pad must be attached to a heat-sinking conduit. The pad is electrically connected to GND and must be connected to GND on the PC board.

1. In the differential configuration when the input termination pin (VTx/VT̄x) are connected to a common termination voltage or left open, and if no signal is applied on INx/IN̄x input then the device will be susceptible to self-oscillation.
2. All VCC, VCC0 and VCC1 Pins must be externally connected to the same power supply for proper operation. Both VCC0s are connected to each other and both VCC1s are connected to each other: VCC0 and VCC1 are separate.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

- LVPECL outputs loaded with $50\ \Omega$ to $V_{CC} - 2.0\text{ V}$ for proper operation.
- Input and output parameters vary 1:1 with V_{CC} .
- V_{th} , V_{IH} , V_{IL} , and V_{ISE} parameters must be complied with simultaneously. V_{th} is applied to the complementary input when operating in single-ended mode.
- V_{IHD} , V_{ILD} , V_{ID} and V_{CMR} parameters must be complied with simultaneously.
- $V_{CMR}(\text{min})$ varies 1:1 with voltage on GND Pin, $V_{CMR}(\text{max})$ varies 1:1 with V_{CC} . The V_{CMR} range is referenced to the most positive side of the differential input signal.

Serial Data Interface Programming

The NB6L295 is programmed by loading the 11–Bit SHIFT REGISTER using the SCLK, SDATA and SLOAD inputs. The 11 SDATA bits are 1 PSEL bit, 1 MSEL bit and 9 delay value data bits D[8:0]. A separate 11–bit load cycle is required to program the delay data value of each channel, PD0 and PD1. For example, at powerup two load cycles will be needed to initially set PD0 and PD1; Dual Mode Operation as shown in Figures 3 and 4 and Extended Mode Operation as shown in Figures 5 and 6.

Figure 6. PD1 Shift Register

Refer to Table 6, Channel and Mode Select BIT Functions. In a load cycle, the 11–Bit Shift Register least significant bit (clocked in first) is **PSEL** and will determine which channel delay buffer, either PD0 (LOW) or PD1 (HIGH), will latch the delay data value D[8:0]. The **MSEL BIT** determines the Delay Mode. When set LOW, the Dual Delay Mode is selected and the device uses both channels independently. A pulse edge entering IN0/ $\overline{IN0}$ is delayed according to the values in PD0 and exits from Q0/ $\overline{Q0}$. An input signal pulse edge entering IN1/ $\overline{IN1}$ is delayed according to the values in PD1 and exits from Q1/ $\overline{Q1}$. When MSEL is set HIGH, the Extended Delay Mode is selected and an input signal pulse edge enters IN0 and $\overline{IN0}$ and flows through PD0 and is extended through PD1 to exit at Q1 and $\overline{Q1}$. The most significant 9–bits, D[8:0] are delay value data for both channels. See Figure 7.

Figure 7. Serial Data Interface, Shift Register, Data Latch, Programmable Delay Channels

Serial Data Interface Loading

Loading the device through the 3 input Serial Data Interface (SDI) is accomplished by sending data into the SDIN pin by using the SCLK input pin and latching the data with the SLOAD input pin. The 11-bit SHIFT REGISTER shifts once per rising edge of the SCLK input. The serial input SDIN must meet setup and hold timing as specified in the AC Characteristics section of this document for each bit and clock pulse. The SLOAD line loads the value of the shift register on a LOW-to-HIGH edge transition (transparent state) into a data Latch register and latches the data with a subsequent HIGH-to-LOW edge transition. Further changes in SDIN or SCLK are not recognized by the latched register. The internal multiplexer states are set by the PSEL and MSEL bits in the SHIFT register. Figure 6 shows the timing diagram of a typical load sequence.

Input \overline{EN} should be LOW (enabled) prior to SDI programming, then pulled HIGH (disabled) during programming. After programming, the \overline{EN} should be returned LOW (enabled) for functional delay operation.

The disabling of \overline{EN} (HIGH) forces Q_x LOW and \overline{Q}_x HIGH and is included during programming to prevent (or mask out) any potential runt pulses or extended pulses which might occur in the internal delay gates programming switching, but it is not required for programming.

NOTES:

- DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
- CONTROLLING DIMENSION: MILLIMETERS.
- DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.25 AND 0.30 MM FROM THE TERMINAL TIP.
- COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

DIM	MILLIMETERS	
	MIN	MAX
A	0.80	1.00
A1	0.00	0.05
A3	0.20	REF
b	0.20	0.30
D	4.00	BSC
D2	2.70	2.90
E	4.00	BSC
E2	2.70	2.90
e	0.50	BSC
L	0.30	0.50
L1	0.05	0.15
