

NCP508

Very Low Noise, Fast Turn On, 50 mA Low Dropout Voltage Regulator

The NCP508 is a 50 mA low noise voltage regulator, designed to exhibit fast turn on time and high ripple rejection. Each device contains a voltage reference unit, an error amplifier, a PMOS power transistor, resistors for setting output voltage, current limit, and temperature limit protection circuits.

The NCP508 has been designed for use with ceramic capacitors. The device is housed in SC-88A and WDFN6 1.5x1.5 packages. Standard voltage versions are 1.5, 1.8, 2.5, 2.8, 3.0, and 3.3. Other voltages are available in 100 mV steps.

Features

- Very Low Noise at 39 μ Vrms without a Bypass Capacitor
- High Ripple Rejection of 70 dB at 1 kHz
- Low Dropout Voltage of 140 mV (typ) at 30 mA
- Tight Load Regulation, typically 6 mV for $\Delta I_{out} = 50$ mA
- Fast Enable Turn-On time of 20 μ sec
- Logic Level Enable
- ESR can vary from a few m Ω to 3 Ω
- These are Pb-Free Devices

Typical Applications

- RF Subsystems in Handsets
- Noise Sensitive Circuits; VCOs, PLL

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 13 of this data sheet.

NCP508

PIN FUNCTION DESCRIPTION

Pin No.	Pin Name	Description
1	V _{in}	Positive power supply input voltage
2	GND	Power supply ground
3	Enable	This input is used to place the device into low-power stand by. When this input is pulled low, the device is disabled. If this function is not used, Enable should be connected to V _{in} .
4	N/C	Not connected pin
5	V _{out}	Regulated output voltage

MAXIMUM RATING

Rating	Symbol	Value	Unit
Input Voltage	V _{in(max)}	13.0	V
Enable Voltage	Enable	-0.3 to V _{in(max)} + 0.3	V
Output Voltage	V _{out}	-0.3 to V _{in(max)} + 0.3	V
Power Dissipation and Thermal Characteristics (SC-88A) Power Dissipation Thermal Resistance, Junction-to-Ambient (Note 4)	P _D R _{θJA}	Internally Limited 200	W °C/W
Power Dissipation and Thermal Characteristics (WDFN6) Power Dissipation Thermal Resistance, Junction-to-Ambient (Note 4)	P _D R _{θJA}	Internally Limited 313	W °C/W
Maximum Junction Temperature	T _J	+125	°C
Operating Ambient Temperature	T _A	-40 to +85	°C
Storage Temperature	T _{stg}	-55 to +150	°C
Lead Soldering Temperature @ 260°C	T _{solder}	10	sec

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- This device series contains ESD protection and exceeds the following tests:
Human Body Model 2000 V per MIL-STD-883, Method 3015.
Machine Model Method 200 V
- Latch up Capability (85°C) ± 100 mA DC with trigger voltage
- Maximum package power dissipation limits must be observed.

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}}$$

- R_{θJA} on a 30 x 30 mm PCB Cu thickness 1 oz; T_A = 25°C.

RECOMMENDED OPERATING CONDITIONS

Rating	Symbol	Max	Unit
Maximum Operating Input Voltage	V _{in}	7.0	V

NCP508

ELECTRICAL CHARACTERISTICS ($V_{in} = V_{out(nom)} + 1.0\text{ V}$, $V_{enable} = V_{in}$, $C_{in} = 1.0\ \mu\text{F}$, $C_{out} = 1.0\ \mu\text{F}$, $T_J = 25^\circ\text{C}$, unless otherwise noted)

Characteristic	Symbol	Min	Typ	Max	Unit
Output Voltage Tolerance ($T_A = 25^\circ\text{C}$, $I_{out} = 10\text{ mA}$)	V_{out}	-2	-	+2	%
Output Voltage Tolerance ($T_A = -40^\circ\text{C}$ to 85°C , $I_{out} = 10\text{ mA}$)	V_{out}	-3	-	+3	%
Line Regulation ($V_{in} = V_{out} + 1\text{ V}$ to 12 V , $I_{out} = 10\text{ mA}$) (Note 5)	Reg_{line}	-	2	20	mV
Load Regulation ($I_{out} = 1.0\text{ mA}$ to 50 mA) (Note 5)	Reg_{load}	-	6	40	mV
Output Current ($V_{out} = V_{out(nom)} - 0.1\text{ V}$)	$I_{out(nom)}$	50	-	-	mA
Dropout Voltage ($V_{out} = 3.0\text{ V}$, Measured at $V_{out} - 100\text{ mV}$) $I_{out} = 30\text{ mA}$ $I_{out} = 40\text{ mA}$ $I_{out} = 50\text{ mA}$	$V_{in} - V_{out}$	-	140 155 180	250 300 -	mV
Quiescent Current (Enable Input = 0 V)	I_Q	-	0.1	1	μA
Ground Current (Enable Input = V_{in} , $V_{in} = V_{out} + 1\text{ V}$, $I_{out} = 0\text{ mA}$) (Enable Input = V_{in} , $I_{out} = 1\text{ mA}$) (Enable Input = V_{in} , $I_{out} = 10\text{ mA}$) (Enable Input = V_{in} , $I_{out} = 50\text{ mA}$)	I_{GND}	-	145 160 300 1100	200 260 500 1900	μA
Enable Input Threshold Voltage (Voltage Increasing, Output Turns On, Logic High) (Voltage Decreasing, Output Turns Off, Logic Low)	$V_{th(en)}$	0.9 -	- -	- 0.15	V
Enable Input Current ($V_{enable} = 2.4\text{ V}$)	I_{enable}	-	8.0	15	μA
Output Turn On Time (Note 6)	-	-	20	-	μs
Output Short Circuit Current Limit ($V_{out} = 0\text{ V}$)	$I_{out(max)}$	100	250	-	mA
Ripple Rejection ($V_{in} = V_{out(nom)} + 1\text{ Vdc} + 0.5\text{ V}_{pp}$, $f = 1\text{ kHz}$, $I_o = 10\text{ mA}$)	RR	-	70	-	dB
Output Noise Voltage ($f = 100\text{ Hz}$ to 100 kHz) ($V_{out} = 1.5\text{ V}$)	V_n	-	39	-	μV_{rms}

5. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
6. Turn on time is defined from Enable at 10% to V_{out} at 95% nominal value. Min and max values $T_A = -40^\circ\text{C}$ to 85°C , $T_{jmax} = 125^\circ\text{C}$. $V_{enable} = 0\text{ V}$ to V_{in} . $C_{out} = 1.0\ \mu\text{F}$.

DEFINITIONS

Load Regulation

The change in output voltage for a change in output current at a constant temperature.

Dropout Voltage

The input/output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. Measured when the output drops 100 mV below its nominal. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

Maximum Power Dissipation

The maximum total dissipation for which the regulator will operate within its specifications.

Quiescent Current

The quiescent current is the current which flows through the ground when the LDO operates without a load on its output: internal IC operation, bias, etc. When the LDO becomes loaded, this term is called the Ground current. It is actually the difference between the input current (measured through the LDO input pin) and the output current.

Line Regulation

The change in output voltage for a change in input voltage. The measurement is made under conditions of low dissipation or by using pulse technique such that the average chip temperature is not significantly affected.

Line Transient Response

Typical over and undershoot response when input voltage is excited with a given slope.

Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 125°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

Maximum Package Power Dissipation

The maximum power package dissipation is the power dissipation level at which the junction temperature reaches its maximum operating value, i.e. 150°C. Depending on the ambient power dissipation and thus the maximum available output current.

APPLICATIONS INFORMATION

Typical application circuit for the NCP508 series is shown in Figure 1.

Input Decoupling (C1)

An input capacitor of at least 1.0 μF, (ceramic or tantalum) is recommended to improve the transient response of the regulator and/or if the regulator is located more than a few inches from the power source. It will also reduce the circuit's sensitivity to the input line impedance at high frequencies. The capacitor should be mounted with the shortest possible track length directly across the regular's input terminals. Higher values and lower ESR will improve the overall line transient response.

Output Decoupling (C2)

The NCP508 is a stable regulator and does not require a minimum output current. Capacitors exhibiting ESRs ranging from a few mΩ up to 3 Ω can safely be used. The minimum decoupling value is 1.0 μF and can be augmented to fulfill stringent load transient requirements. The regulator accepts ceramic chip capacitors as well as tantalum devices. Larger values improve noise rejection and load regulation transient response.

Enable Operation

The enable pin will turn on or off the regulator. The limits of threshold are covered in the electrical specification section of this datasheet. If the enable is not used then the pin should be connected to V_{in} .

Hints

Please be sure the V_{in} and GND lines are sufficiently wide. When the impedance of these lines is high, there is a chance to pick up noise or cause the regulator to malfunction.

Set external components, especially the output capacitor, as close as possible to the circuit, and make leads as short as possible.

Thermal Considerations

Internal thermal limiting circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded.

The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material and also the ambient temperature effect the rate of temperature rise for the part. This is stating that when the NCP508 has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power dissipation applications.

The maximum dissipation the package can handle is given by:

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}} \quad (\text{eq. 1})$$

where:

- $T_{J(max)}$ is the maximum allowable junction temperature of the die, which is 150°C
- T_A is the ambient operating temperature
- $R_{\theta ja}$ is dependent on the surrounding PCB layout
