NLAS44599

Low Voltage Single Supply Dual DPDT Analog Switch

The NLAS44599 is an advanced dual−independent CMOS double pole−double throw (DPDT) analog switch fabricated with silicon gate CMOS technology. It achieves high speed propagation delays and low ON resistances while maintaining CMOS low power dissipation. This DPDT controls analog and digital voltages that may vary across the full power−supply range (from V_{CC} to GND).

The device has been designed so the ON resistance (R_{ON}) is much lower and more linear over input voltage than R_{ON} of typical CMOS analog switches.

The channel select input is compatible with standard CMOS outputs.

The channel select input structure provides protection when voltages between 0 V and 5.5 V are applied, regardless of the supply voltage. This input structure helps prevent device destruction caused by supply voltage − input/output voltage mismatch, battery backup, hot insertion, etc.

The NLAS44599 can also be used as a quad 2−to−1 multiplexer−demultiplexer analog switch with two Select pins that each controls two multiplexer−demultiplexers.

- Channel Select Input Over−Voltage Tolerant to 5.5 V
- Fast Switching and Propagation Speeds
- Break−Before−Make Circuitry
- Low Power Dissipation: I_{CC} = 2 μA (Max) at T_A = 25°C
- Diode Protection Provided on Channel Select Input
- Improved Linearity and Lower ON Resistance over Input Voltage
- Latch−up Performance Exceeds 300 mA
- ESD Performance: Human Body Model; > 2000 V,
  Machine Model; > 200 V
- Chip Complexity: 158 FETs
- Pb−Free Packages are Available

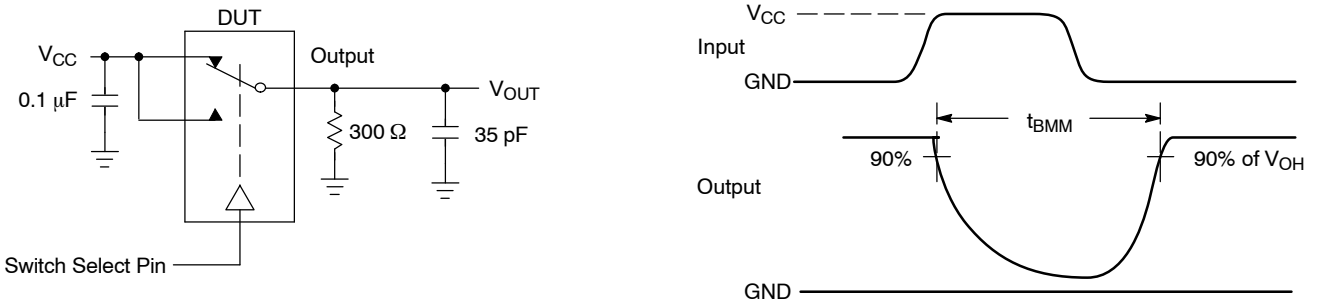

Figure 4. t_{BBM} (Time Break−Before−Make)

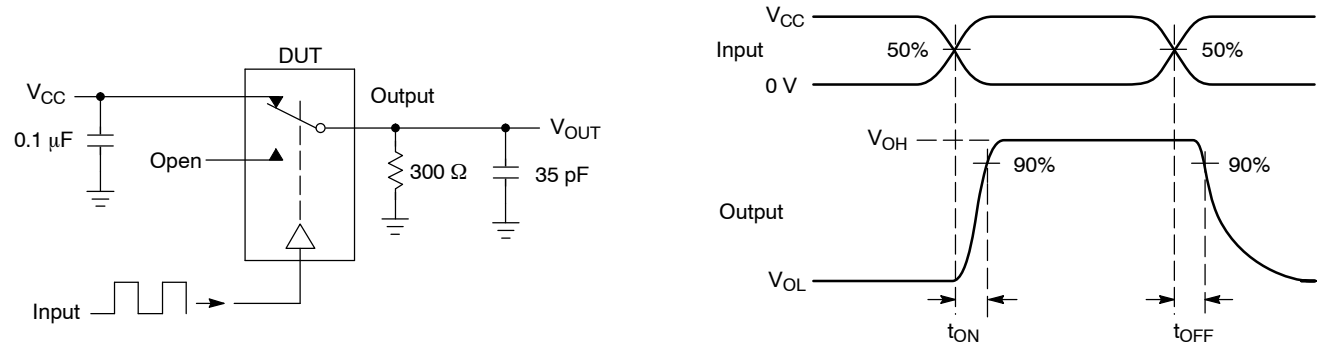

Figure 5. t_{ON}/t_{OFF}

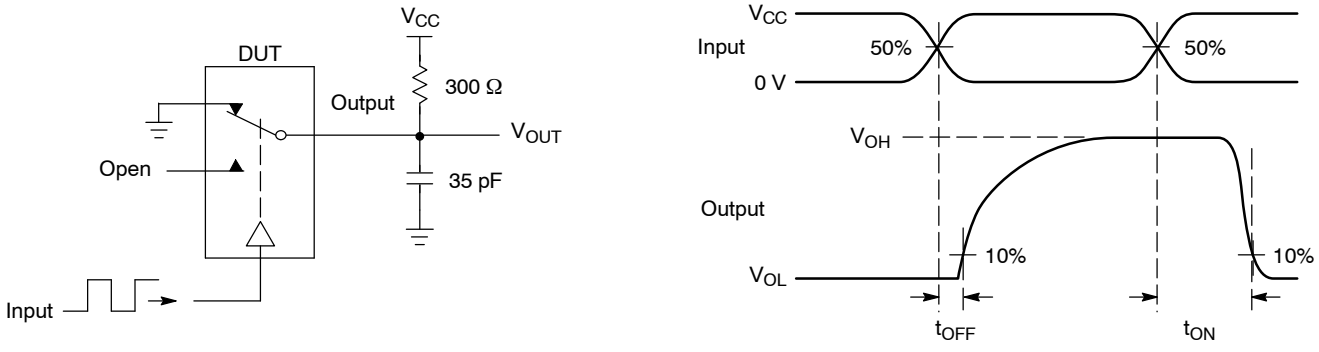

Figure 6. t_{ON}/t_{OFF}

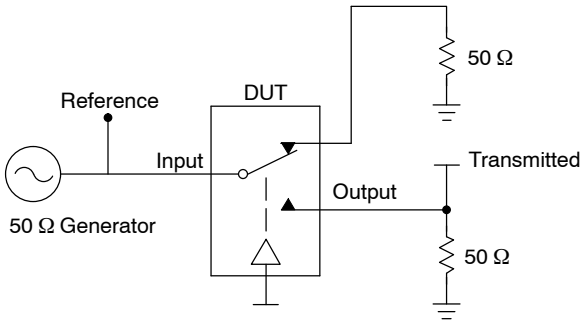

Channel switch control/s test socket is normalized. Off isolation is measured across an off channel. On loss is the bandwidth of an On switch. V_{ISO}, Bandwidth and V_{ONL} are independent of the input signal direction.

V_{ISO} = Off Channel Isolation = 20 Log $\left(\frac{V_{OUT}}{V_{IN}}\right)$ for V_{IN} at 100 kHz

V_{ONL} = On Channel Loss = 20 Log $\left(\frac{V_{OUT}}{V_{IN}}\right)$ for V_{IN} at 100 kHz to 50 MHz

Bandwidth (BW) = the frequency 3 dB below V_{ONL}
V_{CT} = Use V_{ISO} setup and test to all other switch analog input/outputs terminated with 50 Ω
