RAD-TOLERANT CLASS-V FLOATING-POINT DIGITAL SIGNAL PROCESSOR

Check for Samples: SMJ320C6701-SP

FEATURES

- Rad-Tolerant: 100-kRad (Si) TID
- SEL Immune at 89MeV-cm2/mg LET Ions
- QML-V Qualified, SMD 5962-98661
- Highest-Performance Floating-Point Digital Signal Processor (DSP) SMJ320C6701
  - 7-ns Instruction Cycle Time
  - 140-MHz Clock Rate
  - Eight 32-Bit Instructions/Cycle
  - Up to One GFLOPS Performance
  - Pin Compatible With ’C6201 Fixed-Point DSP
- SMJ: QML Processing to MIL-PRF-38535
- SM: Standard Processing
- Operating Temperature Ranges
  - –55°C to 115°C
  - –55°C to 125°C
- VelociTI™ Advanced Very Long Instruction Word (VLIW) ’C67x CPU Core
  - Eight Highly Independent Functional Units:
    - Four ALUs (Floating and Fixed Point)
    - Two ALUs (Fixed Point)
    - Two Multipliers (Floating and Fixed Point)
  - Load-Store Architecture With 32 32-Bit General-Purpose Registers
  - Instruction Packing Reduces Code Size
  - All Instructions Conditional
- Instruction Set Features
  - Hardware Support for IEEE Single-Precision Instructions
  - Hardware Support for IEEE Double-Precision Instructions
  - Byte Addressable (8-/16-/32-Bit Data)
  - 32-Bit Address Range
  - 8-Bit Overflow Protection
  - Saturation
  - Bit-Field Extract, Set, Clear
  - Bit Counting
  - Normalization
- 1M-Bit On-Chip SRAM
  - 512K-Bit Internal Program/Cache (16K 32-Bit Instructions)
  - 512K-Bit Dual-Access Internal Data (64K Bytes)
- 32-Bit External Memory Interface (EMIF)
  - Glueless Interface to Synchronous Memories: SDRAM and SBSRAM
  - Glueless Interface to Asynchronous Memories: SRAM and EPROM
- Four-Channel Bootloading
  Direct Memory Access (DMA) Controller With Auxiliary Channel
- 16-Bit Host-Port Interface (HPI)
  - Access to Entire Memory Map
- Two Multichannel Buffered Serial Ports (McBSPs)
  - Direct Interface to T1/E1, MVIP, SCSA Framers
  - ST Bus Switching Compatible
  - Up to 256 Channels Each
  - AC97 Compatible
  - Serial Peripheral Interface (SPI) Compatible (Motorola™)
- Two 32-Bit General-Purpose Timers
- Flexible Phase-Locked Loop (PLL) Clock Generator
- IEEE Std 1149.1 (JTAG (1))
  Boundary Scan Compatible
- 429-Pin Ceramic Ball Grid Array (CBGA/GLP) and Ceramic Land Grid Array (CLGA/ZMB) Package Types
- 0.18-µm/5-Level Metal Process
  - CMOS Technology
- 3.3-V I/Os, 1.9 V Internal

(1) IEEE Std 1149.1-1990 Test Access Port and Boundary Scan Architecture

- **Engineering Evaluation (/EM) Samples are Available** (2)

(2) These units are intended for engineering evaluation only. They are processed to a non-compliant flow (e.g. No Burn-In, etc.) and are tested to a temperature rating of 25°C only. These units are not suitable for qualification, production, radiation testing or flight use. Parts are not warranted for performance over the full MIL specified temperature range of -55°C to 125°C or operating life.

DESCRIPTION

The SMJ320C67x DSPs are the floating-point DSP family in the SMJ320C6000 platform. The SMJ320C6701 (’C6701) device is based on the high-performance, advanced VelociTI™ very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making this DSP an excellent choice for multichannel and multifunction applications. With performance of up to 1 giga floating-point operations per second (GFLOPS) at a clock rate of 140 MHz, the ’C6701 offers cost-effective solutions to high-performance DSP programming challenges. The ’C6701 DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide four floating-/fixed-point ALUs, two fixed-point ALUs, and two floating-/fixed-point multipliers. The ’C6701 can produce two multiply-accumulates (MACs) per cycle for a total of 334 million MACs per second (MMACS). The ’C6701 DSP also has application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The ’C6701 includes a large bank of on-chip memory and has a powerful and diverse set of peripherals. Program memory consists of a 64K-byte block that is user-configurable as cache or memory-mapped program space. Data memory consists of two 32K-byte blocks of RAM. The peripheral set includes two multichannel buffered serial ports (McBSPs), two general-purpose timers, a host-port interface (HPI), and a glueless external memory interface (EMIF) capable of interfacing to SDRAM or SBSRAM and asynchronous peripherals.

The ’C6701 has a complete set of development tools that includes a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

Device Characteristics

Table 1 provides an overview of the ’C6701 DSP. The table shows significant features of each device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count.

CPU Description

The CPU fetches VelociTI advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VelociTI VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the ’C67x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files contain 16 32-bit registers each for the total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU (see the functional and CPU block diagram and Figure 1). The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all registers on the other side, by which the two sets of functional units can access data from the register files on opposite sides. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

The ’C67x CPU executes all ’C62x instructions. In addition to ’C62x fixed-point instructions, the six out of eight functional units (.L1, .M1, .D1, .D2, .M2, and .L2) also execute floating-point instructions. The remaining two functional units (.S1 and .S2) also execute the new LDDW instruction which loads 64 bits per CPU side for a total of 128 bits per cycle.

Another key feature of the ’C67x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The ’C67x CPU supports a variety of indirect-addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically "true"). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are "linked" together by "1" bits in the least significant bit (LSB) position of the instructions. The instructions that are "chained" together for simultaneous execution (up to eight in total) compose an execute packet. A "0" in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte, half-word, or word addressable.

Signal Descriptions

SIGNAL NAME	SIGNAL NO.	TYPE[1]	DESCRIPTION
CLOCK/PLL			
CLKIN	A14	I	Clock Input
CLKOUT1	Y6	O	Clock output at full device speed
CLKOUT2	V9	O	Clock output at half of device speed
CLKMODE1	B17	I	Clock mode select • Selects whether the output clock frequency = input clock freq ×4 or ×1
CLKMODE0	C17		
PLLFREQ3	C13	I	PLL frequency range (3, 2, and 1) • The target range for CLKOUT1 frequency is determined by the 3–bit value of the PLLFREQ pins.
PLLFREQ2	G11		
PLLFREQ1	F11		
PLLV[2]	D12	A[3]	PLL analog VCC connection for the low-pass filter
PLLG[2]	G10	A[3]	PLL analog GND connection for the low-pass filter
PLLF	C12	A[3]	PLL low-pass filter connection to external components and a bypass capacitor
JTAG EMULATION			
TMS	K19	I	JTAG test port mode select (features an internal pull-up)
TDO	R12	O/Z	JTAG test port data out
TDI	R13	I	JTAG test port data in (features an internal pull-up)
TCK	M20	I	JTAG test port clock
$\overline{\text{TRST}}$	N18	I	JTAG test port reset (features an internal pull-down)
EMU1	R20	I/O/Z	Emulation pin 1, pullup with a dedicated 20-kΩ resistor[4]
EMU0	T18	I/O/Z	Emulation pin 0, pullup with a dedicated 20-kΩ resistor[4]
RESET AND INTERRUPTS			
$\overline{\text{RESET}}$	J20	I	Device reset
NMI	K21	I	Nonmaskable interrupt • Edge driven (rising edge)
EXT_INT7	R16	I	External interrupts • Edge driven (rising edge)
EXT_INT6	P20		
EXT_INT5	R15		
EXT_INT4	R18		
IACK	R11	O	Interrupt acknowledge for all active interrupts serviced by the CPU
INUM3	T19	O	Active interrupt identification number • Valid during IACK for all active interrupts (not just external) • Encoding order follows the interrupt service fetch packet ordering.
INUM2	T20		
INUM1	T14		
INUM0	T16		
LITTLE ENDIAN/BIG ENDIAN			
LENDIAN	G20	I	If high, selects little-endian byte/half-word addressing order within a word. If low, selects big-endian addressing.
POWER-DOWN STATUS			
PD	D19	O	Power-down mode 2 or 3 (active if high)

(1) I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground
(2) PLLV and PLLG signals are not part of external voltage supply or ground. See the CLOCK/PLL documentation for information on how to connect those pins.
(3) A = Analog signal (PLL filter)
(4) For emulation and normal operation, pull up EMU1 and EMU0 with a dedicated 20-kΩ resistor. For boundary scan, pull down EMU1 and EMU0 with a dedicated 20-kΩ resistor.

Development Support

Texas Instruments (TI) offers an extensive line of development tools for the ’C6x generation of DSPs, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of ’C6x-based applications:

- **Software-development tools**
  - Assembly optimizer
  - Assembler/Linker
  - Simulator
  - Optimizing ANSI C compiler
  - Application algorithms
  - C/Assembly debugger and code profiler
- **Hardware-development tools**
  - Extended development system (XDS™) emulator (supports ’C6x multiprocessor system debug)
  - EVM (Evaluation Module)

The *TMS320 DSP Development Support Reference Guide* (SPRU011) contains information about development-support products for all TMS320 family member devices, including documentation. See this document for further information on TMS320 documentation or any TMS320 support products from Texas Instruments. An additional document, the *TMS320 Third-Party Support Reference Guide* (SPRU052), contains information about TMS320-related products from other companies in the industry. To receive TMS320 literature, contact the Literature Response Center at 800/477-8924.

See Table 2 for a complete listing of development-support tools for the ’C6x. For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

Device and Development-Support Tool Nomenclature

To designate the stages in the product-development cycle, TI assigns prefixes to the part numbers of all SMJ320 devices and support tools. Each SMJ320 member has one of three prefixes: SMX, SM, or SMJ. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (SMX/TMDX) through fully qualified production devices/tools (SMJ/TMDS).

Device development evolutionary flow:

SMX	Experimental device that is not necessarily representative of the final device's electrical specifications
SM	Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
SMJ	Fully qualified production device processed to MIL-PRF-38535

Support tool development evolutionary flow:

TMDX	Development-support product that has not yet completed Texas Instruments internal qualification testing.
TMDS	Fully qualified development-support product

SMX devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

SMJ devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (SMX or SM) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GLP), the temperature range, and the device speed range in megahertz (for example, 14 is 140 MHz). Figure 4 provides a legend for reading the complete device name for any SMJ320 family member.

Documentation Support

Extensive documentation supports all SMJ320 family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices; technical briefs; development-support tools; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the 'C6x devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the 'C6000 CPU architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 Peripherals Reference Guide* (literature number SPRU190) describes the functionality of the peripherals available on 'C6x devices, such as the external memory interface (EMIF), host-port interface (HPI), multichannel buffered serial ports (McBSPs), direct-memory-access (DMA), enhanced direct-memory-access (EDMA) controller, expansion bus (XB), clocking and phase-locked loop (PLL); and power-down modes. This guide also includes information on internal data and program memories.

The *TMS320C6000 Programmer's Guide* (literature number SPRU198) describes ways to optimize C and assembly code for 'C6x devices and includes application program examples.

The *TMS320C6x C Source Debugger User's Guide* (literature number SPRU188) describes how to invoke the 'C6x simulator and emulator versions of the C source debugger interface and discusses various aspects of the debugger, including: command entry, code execution, data management, breakpoints, profiling, and analysis.

The *TMS320C6x Peripheral Support Library Programmer's Reference* (literature number SPRU273) describes the contents of the 'C6x peripheral support library of functions and macros. It lists functions and macros both by header file and alphabetically, provides a complete description of each, and gives code examples to show how they are used.

TMS320C6000 Assembly Language Tools User's Guide (literature number SPRU186) describes the assembly language tools (assembler, linker, and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the 'C6000 generation of devices.

The *TMS320C6x Evaluation Module Reference Guide* (literature number SPRU269) provides instructions for installing and operating the ’C6x evaluation module. It also includes support software documentation, application programming interfaces, and technical reference material.

TMS320C6000 DSP/BIOS User’s Guide (literature number SPRU303) describes how to use DSP/BIOS tools and APIs to analyze embedded real-time DSP applications.

Code Composer User’s Guide (literature number SPRU296) explains how to use the Code Composer development environment to build and debug embedded real-time DSP applications.

Code Composer Studio Tutorial (literature number SPRU301) introduces the Code Composer Studio integrated development environment and software tools.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the ’C62x/C67x devices, associated development tools, and third-party support.

A series of DSP textbooks is published by Prentice-Hall and John Wiley & Sons to support DSP research and education. The TMS320 newsletter, *Details on Signal Processing*, is published quarterly and distributed to update SMJ320 customers on product information. The TMS320 DSP bulletin board service (BBS) provides access to information pertaining to the SMJ320 family, including documentation, source code, and object code for many DSP algorithms and utilities. The BBS can be reached at 281/274-2323.

Information regarding TI DSP products is also available on the Worldwide Web at http://www.ti.com uniform resource locator (URL).

Clock PLL

All of the internal ’C67x clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To use the PLL to generate the CPU clock, the external PLL filter circuit must be properly designed. Table 3, Table 4, and Figure 5 show the external PLL circuitry for either x1 (PLL bypass) or x4 PLL multiply modes. Table 3 and Figure 6 show the external PLL circuitry for a system with ONLY x1 (PLL bypass) mode.

To minimize the clock jitter, a single clean power supply should power both the ’C67x device and the external clock oscillator circuit. Noise coupling into PLLF will directly impact PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section. Guidelines for EMI filter selection are as follows: maximum attenuation frequency = 20–30 MHz, maximum dB attenuation = 45–50 dB, and minimum dB attenuation above 30 MHz = 20 dB.

Table 3. CLKOUT1 Frequency Ranges(1)

PLLFREQ3 (C13)	PLLFREQ2 (G11)	PLLFREQ1 (F11)	CLKOUT1 FREQUENCY RANGE (MHz)
0	0	0	50-140

(1) Due to overlap of frequency ranges when choosing the PLLFREQ, more than one frequency range can contain the CLKOUT1 frequency. Choose the lowest frequency range that includes the desired frequency. For example, for CLKOUT1 = 133 MHz, choose PLLFREQ value of 000b. PLLFREQ values other than 000b, 001b, and 010b are reserved.

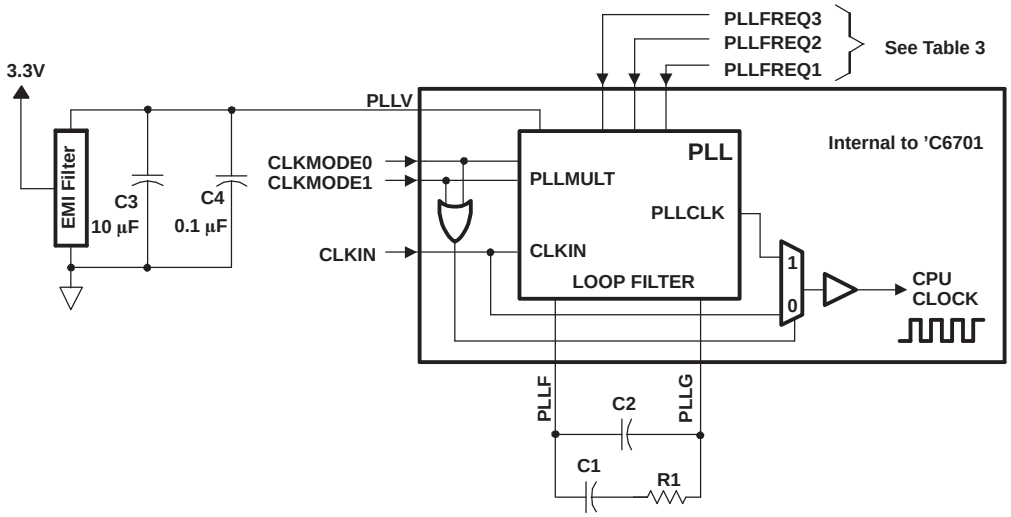
Table 4. 'C6701 PLL Component Selection Table

CLKMODE	CLKIN RANGE (MHz)	CPU CLOCK FREQUENCY (CLKOUT1) RANGE (MHz)	CLKOUT2 RANGE (MHz)	R1 (W)	C1 (nF)	C2 (pF)	TYPICAL LOCK TIME (µs)(1)
x4	12.5 – 41.7	50-140	25 – 83.5	60.4	27	560	75

(1) Under some operating conditions, the maximum PLL lock time may vary as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 µs, the maximum value may be as long as 250 µs.

AVAILABLE MULTIPLY FACTORS			
CLKMODE1	CLKMODE0	PLL MULTIPLY FACTORS	CPU CLOCK FREQUENCY F(CPUCLOCK)
0	0	x1(BYPASS)	1 x f(CLKIN)

AVAILABLE MULTIPLY FACTORS			
CLKMODE1	CLKMODE0	PLL MULTIPLY FACTORS	CPU CLOCK FREQUENCY F(CPUCLOCK)
0	1	Reserved	Reserved
1	0	Reserved	Reserved
1	1	x4	4 x f(CLKIN)



(1) Keep the lead length and the number of vias between the PLLF pin, the PLLG pin, and R1, C1, and C2 to a minimum. In addition, place all PLL external components (R1, C1, C2, C3, C4, and the EMI filter) as close to the 'C6000 device as possible. For the best performance, TI recommends that all the PLL external components be on a single side of the board without jumpers, switches, or components other than the ones shown.

(2) For reduced PLL jitter, maximize the spacing between switching signals and the PLL external components (R1, C1, C2, C3, C4, and the EMI filter).

(3) The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.

(1) For a system with ONLY PLL x1 (bypass) mode, short the PLLF terminal to the PLLG terminal.

(2) The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV_{DD}.

Figure 6. External PLL Circuitry for ×1 (Bypass) Mode Only

Power-Supply Sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time if the other supply is below the proper operating voltage.

System-Level Design Considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

Power-Supply Design Considerations

For systems using the C6000™ DSP platform of devices, the core supply may be required to provide in excess of 2 A per DSP until the I/O supply is powered up. This extra current condition is a result of uninitialized logic within the DSP(s) and is corrected once the CPU sees an internal clock pulse. With the PLL enabled, as the I/O supply is powered on, a clock pulse is produced stopping the extra current draw from the supply. With the PLL disabled, an external clock pulse may be required to stop this extra current draw. A normal current state returns once the I/O power supply is turned on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power up and the I/O supply power up can minimize the effects of this current draw.

A dual-power supply with simultaneous sequencing, such as available with TPS563xx controllers or PT69xx plug-in power modules, can be used to eliminate the delay between core and I/O power up [see the Using the TPS56300 to Power DSPs application report (literature number SLVA088)]. A Schottky diode can also be used to tie the core rail to the I/O rail, effectively pulling up the I/O power supply to a level that can help initialize the logic within the DSP.

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

16	$t_{oh(SSCLKH–WEV)}$	Output hold time, $\overline{SSWE}$ valid after SSCLK high	0.5P – 2.5		ns

(1) The effects of internal clock jitter are included at test. There is no need to adjust timing numbers for internal clock jitter. When the PLL is used (CLKMODE x4), P = 1/CPU clock frequency in ns. For example, when running parts at 140 MHz, use P = 7 ns. For CLKMODE x1, 0.5P is defined as PH (pulse duration of CLKIN high) for all output setup times; 0.5P is defined as PL (pulse duration of CLKIN low) for all output hold times.

(1) The effects of internal clock jitter are included at test. There is no need to adjust timing numbers for internal clock jitter. When the PLL is used (CLKMODE x4), P = 1/CPU clock frequency in ns. For example, when running parts at 140 MHz, use P = 7 ns.
For CLKMODE x1:
1.5P = P + PH, where P = 1/CPU clock frequency, and PH = pulse duration of CLKIN high.
0.5P = PL, where PL = pulse duration of CLKIN low.

HOLD/HOLDA TIMING

Timing Requirements for the Hold/Hold Acknowledge Cycles(1)

(see Figure 24)

NO.			MIN	MAX	UNIT
1	$t_{su(HOLDH–CKO1H)}$	Setup time, HOLD high before CLKOUT1 high	5		ns
2	$t_{h(CKO1H–HOLDL)}$	Hold time, HOLD low after CLKOUT1 high	2		ns

(1) HOLD is synchronized internally. Therefore, if setup and hold times are not met, it will either be recognized in the current cycle or in the next cycle. Thus, HOLD can be an asynchronous input.

Switching Characteristics for the Hold/Hold Acknowledge Cycles(1)

(seeFigure 24)

NO.	PARAMETER		MIN	MAX	UNIT
3	$t_{R(HOLDL–EMHZ)}$	Response time, HOLD low to EMIF high impedance	4P		(2)ns
4	$t_{R(EMHZ–HOLDAL)}$	Response time, EMIF high impedance to HOLDA low		2P	ns
5	$t_{R(HOLDH–HOLDAH)}$	Response time, HOLD high to HOLDA high	4P	7P	ns

8	$t_{d(CKO1H–BLZ)}$	Delay time, CLKOUT1 high to EMIF Bus low impedance(3)	1(4)	12(4)	ns
9	$t_{R(HOLDH–BLZ)}$	Response time, HOLD high to EMIF Bus low impedance(3)	3P	6P	ns

(1) P = 1/CPU clock frequency in ns. For example, when running parts at 140 MHz, use P = 7 ns.
(2) All pending EMIF transactions are allowed to complete before HOLDA is asserted. The worst cases for this is an asynchronous read or write with external ARDY used or a minimum of eight consecutive SDRAM reads or writes when RBTR8 = 1. If no bus transactions are occurring, then the minimum delay time can be achieved. Also, bus hold can be indefinitely delayed by setting the NOHOLD = 1.
(3) EMIF Bus consists of CE[3:0], BE[3:0], ED[31:0], EA[21:2], ARE, AOE, AWE, SSADS, SSOE, SSWE, SDA10, SDRAS, SDCAS, and SDWE.
(4) This parameter is not tested.

RESET TIMING

Timing Requirements for Reset

(see Figure 25)

NO.			MIN	MAX	UNIT
1	$t_{w(RESET)}$	Width of the $\overline{RESET}$ pulse (PLL stable)(1)	10(2)		CLKOUT1 cycles
		Width of the $\overline{RESET}$ pulse (PLL needs to sync up)(3)	250(2)		µs

(1) This parameter applies to CLKMODE x1 when CLKIN is stable and applies to CLKMODE x4 when CLKIN and PLL are stable.
(2) This parameter is not tested.
(3) This parameter only applies to CLKMODE x4. The $\overline{RESET}$ signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 µs to stabilize following device powerup or after PLL configuration has been changed. During that time, $\overline{RESET}$ must be asserted to ensure proper device operation. See the clock PLL section for PLL lock times.

2	$t_{w(ILOW)}$	Width of the interrupt pulse low	2P(3)		ns
3	$t_{w(IHIGH)}$	Width of the interrupt pulse high	2P(3)		ns

(1) Interrupt signals are synchronized internally and are potentially recognized one cycle later if setup and hold times are violated. Thus, they can be connected to asynchronous inputs.
(2) P = 1/CPU clock frequency in ns. For example, when running parts at 140 MHz, use P = 7 ns.
(3) This parameter is not tested.

19	$t_{h(HSTBL–HASL)}$	Hold time, $\overline{HAS}$ low after $\overline{HSTROBE}$ low	2(4)		ns

(1) $\overline{HSTROBE}$ refers to the following logical operation on $\overline{HCS}$, $\overline{HDS1}$, and $\overline{HDS2}$: [NOT($\overline{HDS1}$ XOR $\overline{HDS2}$)] OR $\overline{HCS}$.
(2) The effects of internal clock jitter are included at test. There is no need to adjust timing numbers for internal clock jitter. P = 1/CPU clock frequency in ns. For example, when running parts at 140 MHz, use P = 7 ns.
(3) Select signals include: HCNTRL[1:0], HR/$\overline{W}$, and HHWIL.
(4) This parameter is not tested.

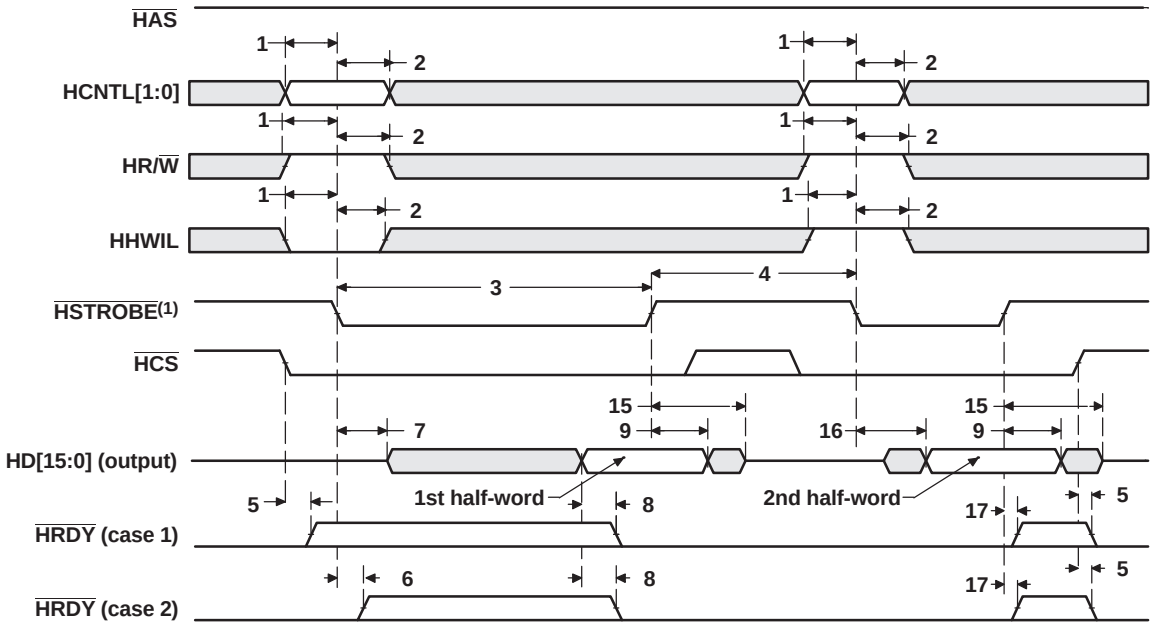
17	$t_{d(HSTBH–HRDYH)}$	Delay time, $\overline{HSTROBE}$ high to $\overline{HRDY}$ high(6)	1	12	ns

(1) $\overline{HSTROBE}$ refers to the following logical operation on $\overline{HCS}$, $\overline{HDS1}$, and $\overline{HDS2}$: [NOT($\overline{HDS1}$ XOR $\overline{HDS2}$)] OR $\overline{HCS}$.
(2) The effects of internal clock jitter are included at test. There is no need to adjust timing numbers for internal clock jitter. P = 1/CPU clock frequency in ns. For example, when running parts at 140 MHz, use P = 7 ns.
(3) $\overline{HCS}$ enables $\overline{HRDY}$, and $\overline{HRDY}$ is always low when $\overline{HCS}$ is high. The case where $\overline{HRDY}$ goes high when $\overline{HCS}$ falls indicates that HPI is busy completing a previous HPID write or READ with autoincrement.
(4) This parameter is used during an HPID read. At the beginning of the first half–word transfer on the falling edge of $\overline{HSTROBE}$, the HPI sends the request to the DMA auxiliary channel, and $\overline{HRDY}$ remains high until the DMA auxiliary channel loads the requested data into HPID.
(5) This parameter is not tested.
(6) This parameter is used after the second half-word of an HPID write or autoincrement read. $\overline{HRDY}$ remains low if the access is not an HPID write or autoincrement read. Reading or writing to HPIC or HPIA does not affect the $\overline{HRDY}$ signal.



(1) HSTROBE refers to the following logical operation on HCS, HDS1, and HDS2: [NOT(HDS1 XOR HDS2)] OR HCS.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
