### Notes:

- Initial calibration @ 25°C. ±2°C, for VCTCXO's Vc = 1.65V. Specifications at time of shipment
- Frequency stability vs. change in temperature.  $[\pm(F_{max}-F_{min})/(2 \cdot F_0)]$ . For VCTCXO's - Vc = 1.65V
- Inclusive of frequency stability, supply voltage change (±1%), aging, for 24 hours. Per STRATUM 3 GR-1244-CORE.
- Frequency change after reciprocal temperature ramped over the operating range. Frequency measured before and after at 25°C
- Two consecutive solder reflows after 1 hour recovery @ 25°C.
- Frequency drift over 1 year @ 25°C.
- Inclusive of calibration @ 25°C, frequency vs. change in temperature, change in supply voltage (±5%), load change (±5%), reflow soldering process and 20 years aging.
- BW = 12 KHz to 20 MHz
- Leave Pad 8 on the T Series unconnected if enable / disable function is not required. When tri-stated, the output stage is disabled but the oscillator and compensation circuit are still active (current consumption < 1 mA).
- Attention: To achieve optimal frequency stability, and in some cases to meet the specification stated on this data sheet, it is required that the circuit connected to this TCXO output must have the equivalent input capacitance that is specified by the nominal load capacitance. Deviations from the nominal load capacitance will have a graduated effect on the stability of approximately 20 ppb per pF load difference.
- Load components are required for proper operation of the device.
- Output is AC coupled.
